The Elyria-Dean system is of the three-unit type. The motor is arranged to be geared to the flywheel or some other suitable part of the gasoline engine, while the dynamo is operated at magneto speed and can be mounted in such a way that the magneto driving shaft can actuate it. The dynamo may. if desired, be made to take the place of the magneto by mounting a combination timer distributer on the end of the armature shaft. thus giving a two-unit system. The motor is only in operation when used for starting a gasoline engine. No gears or other portions of the starting equipment are in motion normally. The act of throwing the gears into mesh closes the battery switch so that the electric motor cranks the engine and as soon as the latter takes up its regular functions an overrunning clutch within the gearing disconnects the two elements. The releasing of the starting lever allows the gears and switch to return to normal. The dynamo is arranged to charge the storage battery at an armature speed of between 190 and 250 revolutions per minute, depending on whether a starter is applied or not. The system works at 6 volts, using a standard three-cell, 6-volt starting battery. Both the dynamo and the motor are wound for this voltage. The electric motor winding is of the simple-series type, while the dynamo has a differential compound winding. A differential coil regulates the charging rate at high speed.

The amount of current drawn for starting will depend entirely on the nature of the gasoline engine and the effort necessary to turn it over due to surrounding conditions. Under average conditions, however, with a motor of about 30 horsepower, the running amperage will be in the neighborhood of 80 when turning the motor over at 80 revolutions per minute. A compression release is not necessary for this type of starter. A battery of 120 ampere-hours capacity, figured on a discharge rate of 10 amperes, is recommended for the Elyria-Dean system. The gear ratio between the Elyria-Dean cranking motor and the gasoline motor is arranged to suit the power plant and varies between twenty to one and forty to one. On an average it may be stated that effective cranking speed can be maintained for over 20 minutes.

Characteristic Generator Curves

In general there are four types of generator characteristic curves. examples of which are shown here, Figs. 15 to 18. The first, that of the Ward Leonard generator; second, one which might be obtained either from the Westinghouse or the Esterline apparatus; third, that obtained from the Gray & Davis dynamo, and last, that which is produced by the Adlake system.

The first one has a very flat maximum out-put line due to the external regulation which prevents the amperes developed by the machine from exceeding this value. On the Ward Leonard machine this is accomplished by a relay outside of the generator which cuts resistance in and out of the field circuit.

The second sample is characteristic of all machines that have inherent or electrical regulation. Such machines always have a curve which rounds up nicely and does not have a knee as in the first curve shown. Having two out-puts, one with and the other without the lamps, is due to the special method of connecting up the windings on both the Esterline and Westinghouse systems.

Gray & Davis is so connected in the shunt field circuit that whenever the lights are turned on the output of the generator increases in proportion. Notice how the supply of current increases as the lights are turned on.

The same characteristics are found on the Adlake machine, a curve of which is here shown. The regulation here is accomplished by changing the connections when turning on the head lights, not by electricity, as in the case of the Westinghouse, Esterline and Gray & Davis systems.

The four types of generators which are here characterized by their output curves represent the different methods of regulation, namely, electromagnetic, Ward Leonard machine; inherent on the Esterline and Westinghouse machines; a centrifugal governor on the Gray & Davis machine and variable resistance on the Adlake.

S. A. E. Papers Illustrate Progress

SIZING up the situation at the Winter Meeting of the Society of Automobile Engineers, the assembled members listened to the committee reports reproduced in last week's THE AUTOMOBILE, after which a number of special papers were submitted to them. During the commercial session of Thursday C. T. Myers, N. B. Pope, L. C. Freeman and B. B. Bachman read pertinent papers, followed by discussion, a gist of which appears below. Worm gears, truck motor starters and metal wheels were also discussed, although they were beyond the scope of the four papers. On Friday automobile motors and running gears were discussed after the reading of papers treating of various subjects. On Saturday the engineers heard papers on magneto couplings, the probable future of electric starting and lighting, the magneto and the six-cylinder motor.

ON Thursday, January 16, four articles dealing with freight automobiles, their design, equipment, handling and kindred phases of the subject were read. The first of these papers, dealing with truck performance, is reproduced below.

Comparative Data on Performance of Motor Trucks with Regard to Size of Motor and Gear Ratios

By Cornelius C. Myers

TWO years ago I was called upon to make a report of the gasoline motor trucks which were exhibited at the New York Show, for three concerns about to purchase nine trucks, varying in capacity from 2 to 5 tons. I was impressed by what I considered the large size of the motors installed to drive most of the trucks, and I tried to find out from several makers the points which governed their designers in the selection of the particular size and type of motor. I got almost no satisfaction, and was inclined to think that in some cases the size was an approximation somewhat on the order of the old rolling mill formula of "calculate it big enough and then multiply it by two."

Having done some little estimating myself on this point, I got together as much as I could of the data necessary for making a comparison of the rated motive power furnished with the various trucks, in relation to the duty to be performed. I compared these figures to see whether there was any uniformity, but found little to show that any particular rule had been followed. In scanning the details of the various trucks, however, I was not so surprised at this, for there was also evident in other features of design a considerable divergence from the ideal before the designer.

I think I can say without fear of contradiction **that all machine design is a compromise.** If you will admit this I think you will agree with me when I say that the design of our beloved motor truck is a compound of compromises. Large wheels mean easy riding, less power and more road clearance; but an increase in unsprung weight, higher body platforms and greater first cost. Large sprockets mean lighter, chain tension and less wear, but greater cost, less road clearance and in some cases lower efficiency. Inswept fronts of frames allow a shorter turning radius, but mean increased axle stresses and less room under the hood or floor-boards. Large motors afford power to overcome abnormally bad road conditions at high speed, but entail heavier construction and more dead weight, more expensive transmission systems, greater fuel consumption and tire expense, higher maintenance expense or depreciation charges, and greater manufacturing cost.

But in some cases it is hard to get absolute and authoritative data—and the motor truck design faces many such. In the absence of some of these facts we must proceed with caution toward a well-chosen ideal; certain standards must be assumed and experiments then carried on to check these standards and collect positive data.

Five Resistances to Overcome

I find but meager data on which to base the selection of motor sizes for trucks. This is the more regretable, in my opinion, because I believe that this point will have a very considerable bearing on the development and general expansion of the motor truck industry. At our meeting last summer Mr. Batzell presented a paper covering gasoline motor characteristics in a very thorough manner, and he advocated the adoption of motors much smaller than the average practice in motor trucks to-day. I will outline some of the conditions which must be considered in making the selection, and give the results of some work I have done along this line.

In order to operate a motor truck, its motor must be large enough to overcome a total resistance composed of five items.

(1) **The resistance due to the friction** in the component parts of the transmission system.

In chain-driven trucks this is generally based on an average efficiency of 70 per cent. This, I think, can be bettered now that the owners and drivers more fully appreciate the large returns to be netted by a little careful and regular attention to working parts; and now that designers understand the essential requirements of the transmission system in the way of proportion and suspension—the best compromise for those parts.

(2) **Wind resistance.** This is almost negligible except in the cases of high-speed delivery wagons and fire apparatus.

(3) **Acceleration.** This is generally covered if the motor can easily overcome the other items, and provided the gearbox is properly designed.

(4) **Grade resistance.** It goes almost without saying that the truck should be able to ascend light grades without shifting gears, unless the road resistance in Item five is unusually high. The truck, fully loaded, should be able to take grades up to 3 per cent. in high gear on good pavement.

Finding the Road Resistance

(5) **Road resistance.** This is the most important and complex item of the five. It will depend upon the total weight of the loaded machine, the character of the road surface, the diameter and width and compound of the tires, and the diameter and type of the wheel bearings.

In making comparisons with regard to motor size, I have used a formula which is a relative one, covering four-cylinder four-cycle motors, developing rated S. A. E. horsepower. This gives the tractive effort in ton of total weight on the tires for a transmission efficiency of 70 per cent.

$$E = \frac{23.52 \times d^2 \times s \times R}{D \times T}$$

E Tractive effort in lbs.	d Cylinder bore.
T Total weight in tons.	s Cylinder stroke.
D Diameter of driving tires.	R Gear reduction.

In the present state of the art of motor construction, I do not think it is unreasonable to expect a motor to develop 20 per cent. more torque at normal operating speeds than the equivalent of the S. A. E. rating. This may be questioned by some, but I know that better results are being obtained from several different makes of motors, and I see no reason why so important a machine as a motor truck should be burdened with an inefficient motor. On the contrary, I think it is very important that **only the most efficient and carefully designed motors should be considered fit for such service.** The constant in the formula then becomes 28.22, and if the result is divided by 2,000 we shall have the "tractive factor" of any particular truck and motor as a percentage of the total load on the tires. This "tractive factor" will denote the relative ability of a truck and its power plant to any other—provided, of course, that the motor is given an equal amount of power per cubic inch of cylinder displacement, and the transmission systems are equally efficient.

The following tractive factors are averages covering trucks of well-known manufacture as exhibited at the New York Show in 1911. They show what designers (or perhaps in some instances the sales department) considered good practice in 1910—the state of the art in that year:

1-ton	0.0864	3-ton	0.0700
2-ton	0.0730	5-ton	0.0616

Now let us figure, as well as we are able, the resistance to be overcome by a truck under average conditions. This resistance factor should be the measure of the power of the motor and equal to the tractive factor. In most of my calculations I have used the figures given by Mr. Churchward on page 9 of the S. A. E. Hand-book. Let us assume that with good tires the road resistance on hard, level asphalt is 20 tons, using this as a basis in the table that follows. If we divide this by 2,000 the resistance factor is .01 on this kind of road surface. Similarly, for the other six kinds of road surface there given we have:

Wood pavement	0.0115	Good dirt road	0.0110-0.0200
Level macadam	0.115 -0.0300	Ordinary country road (dirt)	0.0200
Plank road	0.009		
Cobble stones	0.0175	Sand	0.200

The French War Office has given much attention to the motor truck; in fact, the subsidies granted by the French Government through its War Office have had a very stimulating effect in increasing the average efficiency of the trucks made in that country and in promoting the sale of these trucks. Capitaine Renaud, the motor truck expert of the French War Office, gives the resistance factors as follows: City pavements—0.013-0.017, country roads—0.016-0.041. He uses a "tractive factor" = 0.041. Items (2), (4) and (5).

Grade resistance is readily reduced to an equivalent resistance factor by dividing the percentage by 100. Thus on a 3 per cent. grade it is 0.030.

I think the average resistance of a macadam road can be taken at 35 tons = a resistance factor of 0.0175, which, added to the grade, gives a total resistance factor of 0.0475. This is the measure of the power required of the motor when working under the conditions given above, and to which the "tractive factor" should be equal.

Referring now to the actual tractive factors of the 1911 show trucks. Under average level road conditions these motors would be operating at the following percentages of their S. A. E. load ratings: 21, 24, 24.8, 28.4. As against these figures the motor having a tractive factor of 0.0475 would be operating at 36.6 per cent. of full load; or, **the 1911 motors were respectively 75, 52, 48 and 28 per cent. larger than necessary.** If the greater part of the routes of a large majority of these trucks is over pavements having a lower resistance factor than 0.0175, the over-abundance of power is magnified, and by plotting these figures against the fuel consumption curve of the motor, the possible increase in gasoline mileage will be found to be very marked. Inasmuch as fuel now costs about 50 per cent. more than it did 2 years ago, and there are prospects of a further advance, this subject of fuel consumption must be seriously considered.

Motor Capacity Exceeds Load

Coming now to the trucks exhibited and offered for sale in 1912, the figures given below show some improvement, but it is not a very marked one.

Size	Percentage of aver. load on motor	Excess motor capacity	"Tractive factor"
1-ton •	22.1	66.0	0.0788
2-ton	26.3	39.0	0.0664
3-ton	28.8	27.0	0.0607
5-ton	28.9	26.5	0.0605

The averages were bettered to a large extent by the newcomers to the show; most of the manufacturers who exhibited the year before changed but little in their design in the respect we are considering.

While I do not claim that conditions in this country are the same as those in France, I think it will do no harm to set down here by way of comparison the "tractive factors" which French engineers have considered the best suited for economical truck operation. I give below comparative figures which to me are very interesting in the light of the results obtained in the matters of mileage per gallon of fuel and total tire mileage. These figures are averages of all but a few of the trucks which competed in the 1912 Trials conducted by the French War Office, and most of the trucks bear the names of firms celebrated throughout the world as masters in automobile construction:

Size	Percentage of aver. load on motor	Excess motor capacity	"Tractive factor"
2.5-ton	45.0	—19.0	0.390
3.5-ton	47.0	—22.0	0.0373
5.5-ton	48.0	—24.0	0.0356

These trucks will cover 11.7, 9.6 and 7.0 miles per gallon—performances certainly much better than those of our own trucks. It can hardly be claimed that these trucks lack power, either, for practically the same list of trucks entered the Russian War Office Trials, a short time after the French Trials, and all were accepted as eligible for army service in Russia, the Russian Government placing orders with every French firm which had a truck entered. From all reports, the trials were as gruelling as any which a motor truck ever entered.

As between the average "tractive factors" of the trucks in this country and those abroad, the figure I have given happens to stand about half way, although it was not arrived at by means of averages. Having assumed certain things as my standards, I made some experiments to check them, in accordance with the mode of procedure I mentioned early in this paper. These experiments confirmed, in a rather rough way, it is true, that my assumed tractive factor was on the safe side. The experiments were not confined to any one make of truck, or any one truck of a particular make. In some trucks substitutions of various parts were made for direct comparison. The trucks had all been in service from 1 to 4 years; all were of one type—double chains driven from a jackshaft—and in most cases they were handled by the owners' drivers. As examples I shall give the results of two tests.

Motors Too Large on Average

(1) A truck carrying 3,000 pounds, driven by a 3 by 4.5 four-cylinder motor, tractive factor 0.040. This truck repeatedly mounted a 2 3-4 per cent. grade over old, rough water-soaked, wood-block pavement, and mounted a 3 1-4 per cent. grade over a fair macadam pavement. The resistance factors overcome I estimated at not less than 0.0525 and 0.0300.

(2) A truck carrying 5.5 tons, driven by a 4.5 by 4.5 four-cylinder motor, tractive factor 0.0286. This truck mounted a 3 per cent. grade over a good brick pavement. Resistance factor estimated at 0.0400. With a greater gear reduction, gained by a change of jackshaft sprockets, so as to give a tractive factor of 0.0336, this truck mounted a 3.25 per cent. grade over a somewhat worn brick pavement. Resistance factor estimated at 0.0475.

Here are discrepancies due to the lack of positive data covering essential points in the problem. Either the efficiency of the transmission systems considerably exceeded 70 per cent. or the motors developed unusually heavy torques, or the road resistances were less than indicated. All my experiments, however, indicated that **motors of smaller average size than those now in use can be made to handle our trucks in a practical and economical manner, provided certain features are well carried** out in **design** and **construction.**

At our meeting last summer, Mr. David Fergusson, in discussing this subject, very rightly remarked in effect that the size of the motor must be chosen as the result of experience with a particular truck. Here, very likely, we may find the reason why some trucks have larger motors (in proportion) than others, and why a large majority of our trucks are burdened with so large a motor. Those particular trucks need the large motor, or their designers do not see how they can get along with a smaller one. The proper compromises have not been adopted or data is lacking to warrant them in risking the production of an underpowered car. That underpowered bogey of the pleasure car designer must be overpowered before it has a chance to give a most promising young industry a further setback. The surrounding conditions here are different and must be dealt with in the light of different ideals.

Calculating Resistance Factor

CORNELIUS T. MYERS, in summing up contents of his paper entitled "Comparative Data on Performance of Motor Trucks with Regard to Size of Motor and Gear Ratios" stated that the whole situation was in equating the resistance factor to the tractive factor at the point of ultimate attainment of the truck. The fact that his formula was made up of figures taken on the safer side is shown by the fact that where his tractive factor was calculated at .0286 with a motor measuring 4.5 inches mounting a .03 grade on a brick pavement with a resistance factor of .01 or a total resistance factor of .04.

He stated that his formula was assumed as to factors of tractive effort so as to reduce all motors on the same basis in the efficiency of transmission from motors to road wheels with double chain drive trucks, the only kind considered in the paper was 70 per cent., and added that at the same time he believed this assumed efficiency to be too low, but it was that generally taken in designing trucks of this type.

Foreign Tendency of Motor Truck Design

By Lowell C. Freeman

IT might as well be admitted in the beginning that the data presented in this paper do not justify the use of its comprehensive title, which was selected in sheer desperation after a futile search for one more expressive of the true character of the text. It is simply an attempt to set forth some of the details of design which are most interesting, together with some comments on their advantages and disadvantages, as they appeared to the writer in a recent trip abroad.

A composite picture of the predominant English motor trucks would show the motor under a hood in front of the seat as in conventional pleasure car practice; a cast-tank built-up radiator in front of the motor; right-hand drive; fixed spark magneto ignition; thermosyphon cooling; three-speed transmission; cast steel plain-bearing wheels; rear springs taking both drive and torque; both brakes on rear wheels, and worm, pinion or chain final drive. No one particular make embodies all these features, but they represent the writer's impression of the English truck, crystallized from information obtained and observations made.

Solderless Radiators Successful

There seems to have been a nearly universal and simultaneous adoption of the cast-tank built-up type of radiator. The top and bottom tanks are made for the most part of aluminum, the top tank being in some cases ribbed to secure increased radiating surface. The radiator seems to have the following points in its favor: It has very few soldered joints as compared with the "tin case" type, as the Englishmen call it, and the joints are stressed very little or not at all, as any forces acting on the radiator are transmitted through the side bars to the comparatively rigid tanks, and as long as there is no movement of the bolted joints or deflection of the tanks and side bars, the soldered joints cannot be stressed except by the action of inertia forces set up by the core itself. The filler and inlet and outlet connections may all be cast on the tanks if desired, while the side bars may be designed easily for practically any form of support. Hood ledges may be cast on, thus doing away with the trouble caused by relative movement of the hood and radiator cutting the sheet metal ledge. The core may be of any type whatsoever, either cellular or vertical tube; the latter either with or without fins as the individual designer may prefer.

It would seem that cast iron could be substituted successfully for aluminum if the percentage of efficiency per pound of weight were not considered important. The weight and cost of an aluminum-cast-tank radiator should not exceed greatly that of the usual type of the same capacity and efficiency. The greatest advantage, however, would be to the user. The cores can be made strictly interchangeable if master spacers are used in assembling, and as the cost of the core, which is the only part ordinarily liable to damage through accident, will be about 50 per cent. of the total cost of the radiator, the user's repair bills due to accidents to this part of his car will be cut exactly in half.

The fact that an ordinary wooden block seems to make a sufficiently flexible support is eloquent testimony of either the strength of the radiators or the excellence of the roads in England.

Brake hand-levers are big two-handed affairs that look as though they were really to be used for braking and not merely as locks to hold the car when standing still. There seems to be a marked tendency to place both service and emergency brakes on the rear wheel hubs, which I believe was originally a purely American construction. All brakes noted were practically without exception of the internal-expanding type with metal-to-metal and lined shoes apparently in about equal favor. The brakes were in most cases cam-expanded and usually equalized, some of the mechanisms to accomplish this being very ingenious.

Plain Floating Bushings Favored

Plain floating wheel bushings seem to be perfectly satisfactory, with low first cost, non-adjustability and cheapness of replacement as big points in their favor. Some have hardened sleeves in both the wheel hub and on the axle, while on others the bushing rotates on the soft axle. There are several different methods of lubricating, all of which seem to work very well and apparently considerable variation in design is allowable without materially affecting the service obtained.

While cast steel wheels seem to give very good results under certain conditions, they do not appear to be a universal panacea for all wheel troubles. One user who has operated a great many trucks of many different makes said that cast steel wheels were all right until the tires

---

FOLLOWING the reading of L. C. Freeman's paper, Slade discussed the need of more power in America on trucks than would be required in Europe and stated that at least 50 per cent. greater power of motors was required to carry a given load here than abroad on account of the difference in road conditions. Perkins, in comparing the widely varying conditions to be met in America with the more or less uniform requirements in Europe, stated that a motor which was suitable for one part of the country would be entirely inadequate to meet the requirements of another section. He suggested that motors of different sizes and horsepower be made with standard attachments to the chassis in order that these two motors would be interchangeable. It was also brought out that the motor truck was essentially the vehicle of good roads, and that where road conditions were poor the motor truck could not be made to pay. Also that the present motor is too large, for we do not need bigger motors here than in Europe, and, differing from Mr. Slade in this respect, Perkins prophesied that in a few years the motors will be the same size here as in Europe, and stated that commercial vehicles are run faster here than in Europe and much too fast for economical operation.

R. L. Morgan announced that the practice abroad was to keep motors as small as possible, that the underpowered truck, like the underpowered touring car, cannot attain great speed, but will stand up. B. B. Bachman stated that it was necessary to allow for average conditions in a motor designed to accommodate the demands of the truck buyer. In that respect it was necessary to have a motor which would have more power than necessary on good level roads, or small hills, and which would be somewhat underpowered on steep hills and very rough country. The heavy motor worked against this in that it meant heavier parts and hence actually required a higher power to carry it along. Mr. Bachman stated that he was a thorough believer in a small motor for commercial service, that economy was one of the most vital items, nad that was in direct relation to the motor size, that the big motors were more expensive in the fuel used per ton mile. This precipitated a general discussion in which it was brought out that possibly the reason for the employment of small motors in Europe was the question of economy, particularly since the cost of fuel over there was considerably greater than it is in America. It was also stated that the sale of trucks was restricted to a definite locality and that trucks could be built to meet definite conditions and be of less power than could those built to overcome such widely varying conditions of loads and grades as are met with in the localities where American trucks are marketed. It was declared that the power of motors obtained from Myers' formula would work in all parts of the country. In reference to this Myers stated that the relation of motors to truck size all goes back to the question of weight, that the question was to obtain pounds of effort per pound of weight, that by his formula all the various resistances, such as load resistance and so on encountered in service, could be reduced to a total tractive resistance.

Discussing Low-Grade Fuel Paper

The discussion of N. B. Pope's paper taking up the question of fuel for commercial vehicles brought out the fact that there were motors running on low-grade fuel. One was mentioned which has operated ever since it was manufactured on nothing but the low-grade fuel. This was also used by two concerns on the Pacific Coast which had never used anything else but the lower-grade fuel. While discussion was in progress on this paper, R. L. Morgan stated that he had observed a casting in which an electric coil was placed in a passage below the venturi and which permitted a start, with the low-grade fuel, 20 seconds after this coil had been thrown in.

Cornelius T. Myers, the author of the previous paper, had reduced his resistance factor to the figures shown in the discussion of the comparative data on Performance. He naturally worked on the basis that the tractive effort must equal the resistance or the truck would not be able to navigate. The discussion on this paper reflected back on Mr. Myers' treatise and brought out the fact that very few of the truck manufacturers, if any, had gone into the matter with a formula. Another point which was brought out was that the fuel consumption was of such importance that it was extremely necessary to cut the motor size to the utmost limit. The author of the paper, in speaking of this phase of the situation after having read the paper, stated: "The weight of the motor increases proportionately with its power. Therefore we have not only added power, which is necessary, but also an added weight, which renders it still more necessary to carry excess power." Several of the members present commented on the stand taken by the French and English war offices in subsidizing motor trucks. The fact that the English war office has only subsidized the bevel drive while the French war office refuses to subsidize the bevel drive was especially noted.

Comparing Pneumatic and Solid Tires

The last paper to be presented at the session was a discussion of truck tires by B. B. Bachman. The paper was entitled "Comparative Results with Solid and Pneumatic Tires on Light Commercial Vehicles." Bachman stated that his paper was a summary of results on one make of truck, 3,000 pounds capacity. Bachman stated that the comparative cost per mile with solid tires against pneumatic tires was 3 cents a mile for the solid and 5 cents per mile for the pneumatic. When the car maintenance action was considered it was found it was nearly 50 per cent. greater for the solid tire as compared with the pneumatic and that it was a 30 per cent. saving of gasoline in favor of the pneumatic-tired trucks. In fact, in all respects except tire maintenance the figures were in favor of the pneumatic.

Bachman completed his remarks by stating that the pneumatic tire for truck service has been given a black eye by most users on account of the very general under-tiring of trucks and excessively high speeds at which they are operated. In the discussion of this paper Mr. Myers suggested that the proper tire equipment and particularly the trouble with the pneumatic to date was a question of two things. First, that the tire pressure advance employed is not sufficient, that greater tire pressure is needed for the same size of tire in commercial vehicle service than is used for pleasure cars, and second, cost.

Tests on factory trucks showed an increase of tire cost with pneumatic but a lower maintenance cost. It was generally brought out as far as engine cost was concerned that the balance was in favor of the pneumatic tire on smaller trucks which were run at fairly high speeds. The vibration of the motor truck was stated to be its one weak point and in the lighter vehicles where the cost of pneumatic tires would not be beyond reason, they were in the long run more economical.

Slade inquired as to whether there were any cushion tires which were interchangeable with the present solid tires for motor trucks. This was wore thin. In this statement I think there is food for a great deal of thought. A built-up wheel of structural steel was giving him excellent service and almost no trouble.

The usual mounting of the chassis is on four semi-elliptic springs, although some cases of three-quarter fronts and semi-elliptic rears were noted. French designers seem to favor wider springs, the average being 25 per cent. wider than on the English cars of the same capacity.

The most interesting point is, however, that both torque and drive are taken through the rear springs, with evident success. There is possibly a little more trouble with the springs, but none at all with radius and torque rods and their attendant fittings. It has evidently been found that the maintenance cost of a Hotchkiss-drive truck is less than of one with radius or torque rods or both; the first cost is certainly less. This is the true test of the worth of a design—does it make the total cost of operation minimum? In the case of one truck noted it was a question as to how the torque was taken, as the long reinforced-wood radius rod flexed so much under load that the springs must have taken some of it.

Starters Progress Little Abroad

An interesting commentary on the favorable conditions for motor truck operation abroad is that a pleasure car chassis with a van body seems to make a perfectly good truck with a capacity of about one ton for retail delivery.

The opinion was advanced in some quarters that the three-wheeler is the solution of the problem of satisfactorily and economically replacing one horse with a motor vehicle. It is a question, though, whether it could be operated at a lower cost than a certain-priced American car, when "operated" is taken to mean the entire cost of the service.

In London there does not seem to be much attention paid to motor starters, and less still in Paris. In both cities traffic is about as hadly congested as could be imagined, and it would seem that if motor starters were worth while at all, such a condition would hasten their adoption. The answer probably is that more is lost than gained by their installation.

In regard to the final drive, there seems to be more unanimity of opinion than there is in the United States.

In England the worm has a shade the better of the argument at present, but is not gaining ground very rapidly; while in France, judging from the exhibits at the Paris show, it is not considered seriously. One of the advantages of the worm drive is, of course, quietness, but the pinion-drive Schneider buses in Paris are certainly as quiet as could be asked. Any one of the four types of final drive which are at the present time considered as possibilities, undoubtedly has certain points of superiority over any or all of the others, but is also subject to troubles which are peculiar to it and not found in the others.

Opinions Are Divided on Driving

Let us sum up the situation. When all the good and bad points of each are balanced, it will be found, everything considered, that no one of them is from the user's point of view so very much superior to the others. This was borne out by the things the writer saw in the different repair depots and garages which he visited and by the statements of the men with whom he talked. Each, of course, had formed his own opinion from experience with the various types, but the opinions and experiences were by no means uniform. Thus, of four different men interviewed, each of whom had had about the same amount of experience with the different types but under different conditions, one pronounced the chain drive to be still the most satisfactory; another was very enthusiastic about the worm; the third was best satisfied with the results he had obtained from the pinion drive; while the fourth was very strongly impressed with the possibilities of double reduction. So, while beyond question fairly good and consistent results can be obtained with any of the types, it seems that no one has yet heen developed to the point where it is all roses and no thorns, and that considerations other than those of a strictly engineering or technical nature will in the immediate future largely influence the choice of the type of final drive in new designs. Ultimately, of course, the design which will give the greatest number of users the maximum of service for the minimum cost will be the one to survive in the long run of operations.

---

followed by a statement that shortly one company was to put out cushion tires which could replace the solid, and this statement by expressions of widely varying opinions as to the relative efficiency and economy of the cushion and filler tires versus the solid tires.

The discussion was then turned to the subject of worm gears. Henry Souther, who had made a study of this subject while on a recent trip abroad with the American engineers, stated that while the manufacturers were in agreement as to the specific composition of the worm gear they did agree that the best results were obtained from hardened steel against bronze, the steel being of course the worm member. In some cases he went on to state where the bronze was not of the proper composition it has been known to flow under the pressure of the worm, and that the bronze should resist peening. He also added that the worm gearing as a whole required very careful machining and is known to obtain satisfactory results, and that the only disadvantage of the straight worm over the hourglass type is the resistance load clearance provided when the worm is under the axle.

Mr. Burgess stated that worm drive had proven successful in Europe and that it was being developed here, that the issue could not be pushed, but the adoption of worm was a question of time. 'It must be given a chance to grow. Mr. Burgess stated his belief that a worm gear, contrary to present practice, would be employed most extensively on trucks. He stated that simplicity was an issue, and that for success a device must have the minimum number of bearings, but that so far as worm gears were compared it was only a matter of cutting the worm teeth correctly, and that they required the development of special machinery. At present the engineers have not as yet had time to develop this phase properly. He stated that the Hindley shape of tooth will make a successful worm, that the nearer you get to the flat tooth the better efficiency, better lubrication, longer wearing qualities and less heat will be obtained.

C. T. Myers said that it must be remembered that the commercial vehicle industry is not the same as the pleasure car field, that designers must not go too fast but must work for a simple design of vehicle. He stated that the worm was less simple than the chain drive and had the further disadvantage of increasing the nonspring weight on the rear axle. He concluded by saying that the new ideas are good and that engineers should sit down and think about them but go slowly in their adoption.

Mr. Buckwalter then made the remark in referring to the several references to different formulæ throughout the discussions of the evening that it was his belief to accomplish anything practical by the mere use of a formula. Mr. Alden in replying to this stated that a formula was necessary in order to make a start and that it would be nearly blind work to attempt to proceed without them. The discussion on starters for motors was then opened.

Morgan Argues Against Truck Starter

Mr. Morgan stated, in discussing truck starters, that in his belief it was best to leave off the starter because if he hired men husky enough to handle freight and found that they were too lazy to turn over the motor he would get rid of the men. He also stated that on the truck simplicity was the biggest feature of design. Every part which could be left off without affecting the effort of the truck was so much gained. This was in his opinion the case where the larger trucks were concerned. There is not the need of economy of time. A motor starting on the smaller size that there is in the larger size of trucks because the non-production during the time the truck is idle is not so great in the smaller sizes. Mr. Cohan remarked that one reason that the electric truck is supreme in certain fields is that it is easily started, and said that when gasoline trucks become easy-starting it will improve on the field of the electric. He went on to say that huskies do not make the best drivers, and that the driver that is torn between duty in saving gasoline for his employer and letting the motor run to save his elbow is likely to take the former alternative unless the motor is equipped with a starter. Mr. C. T. Myers added that he had found starters not desirable and not in great demand for vehicles of over 1-ton capacity.

Bowers Declares Metal Wheel Useless

A general discussion then followed on the simplicity of motor trucks. It seemed to be the general opinion of the members who entered into the discussion that simplicity should be a cardinal factor. The discussion of the subject of metal wheels involved a wide variance of opinion among the truck makers and engineers present. Mr. Bowers, one of the wheel makers, stated that it was his belief that the metal wheel is utterly rigid, non-resilient and hence devoid of practicability.

It was stated that wood wheels used on trucks were found in many cases to be from .125 to .25 inch out of round, while the metal wheels would stay true. It was stated that the manufacturers of wood wheels have not developed with the truck industry and that the heavy weight causes many of the wheels to fail. Mr. Bowers responded to Mr. Morgan's criticisms by saying that wood wheels were now manufactured which remained perfectly true and which gave excellent service inasmuch as they possess resiliency, and thereby absorbed the road shocks and cut down to a remarkable degree the cost of upkeep on the entire car. The ensuing discussion brought out the fact that the members were in agreement in stating that excess weight must be guarded against. Some agreed that they had broken more axles with solid wheels than with the wood wheels while others claimed that, owing to bad wooden wheel construction, the life of the tire was shortened on the latter type. The difficulty of securing light castings was also mentioned. Mr. Haynes stated that it was his belief that the cast steel wheel would supersede the wood wheel in time, inasmuch as cast steel wheels can be made if the same material is employed as is used in making wheels for railroad cars.

A doubt was expressed as to the advisability of taking up the metal wheel inasmuch as the railroads were looking to the paper wheels. Mr. Bowers said that it seemed that engineers in the discussion have lost sight of the necessary balance of ear and parts in considering the metal wheeel.

Cornelius T. Myers, the author of a previous paper, had reduced his resistance factor to the figures shown in the discussion of the Comparative Data on Performance. He naturally worked on the basis that the tractive effort must equal the resistance or the truck would not be able to navigate. The discussion on this paper reflected back on Mr. Myers' treatise and brought out the fact that very few of the truck manufacurers, if any, had gone into the matter with a formula. Another point which was brought out was that the fuel consumption was of such importance that it was extremely necessary to cut the motor size to the utmost limit. The author of the paper in speaking of this phase of the situation after having read the paper, stated, "The weight of the motor increases proportionately with its power. We therefore not only have added power which is necessary but also an added weight which renders it still more necessary to carry excess power."

Points To Be Observed in Adopting Silent Chains for Camshaft and Magneto—Their Effect on Valve and Spark Timing—Graphic Method for Comparing Results Obtainable with Fire Engine Equipments Before Ordering Them

SILENT **Chains in Motor Construction.**—As silent chains of the Renold and similar types have been used only very sparingly in German automobile manufacture but are now under consideration by reason of the fashionable demand for noiseless operation, some observations with regard to their use in motors, mainly for driving the camshaft and the magneto, are offered the German public by Engineer L. Merz of Charlottenburg. Hans Renold Ltd., Coventry Chain Co., Westinghouse Railway Brake Co. (of Hannover, Germany), F. Stolzenberg & Co. and W. Wippermann, Jr., are mentioned as the sources of supply, and especial attention is called to the Westinghouse chain which is made under Morse patents and has fixed chainbolts, each made in two parts of which one rocks upon the other. The other models are considered as equivalent in design if not necessarily in quality.

The following summary of the information imparted in text and illustrations may be of general interest:

The silent chains used for motors have usually a one-half inch (12.7 mm.) pitch, but some as small as 8 mm. and also some larger ones are used here and there. The width, which is produced by the combination of a smaller or larger number of link plates of like thickness, varies, and it is to be noted that by some of the manufacturers the outer guide plates, which prevent lateral displacement of the chain upon the sprocket wheel, are not counted in the width, while by others they are counted. A single central guide plate in each link, riding in a groove in the sprocket wheel, is not considered as reassuring as the more customary design.

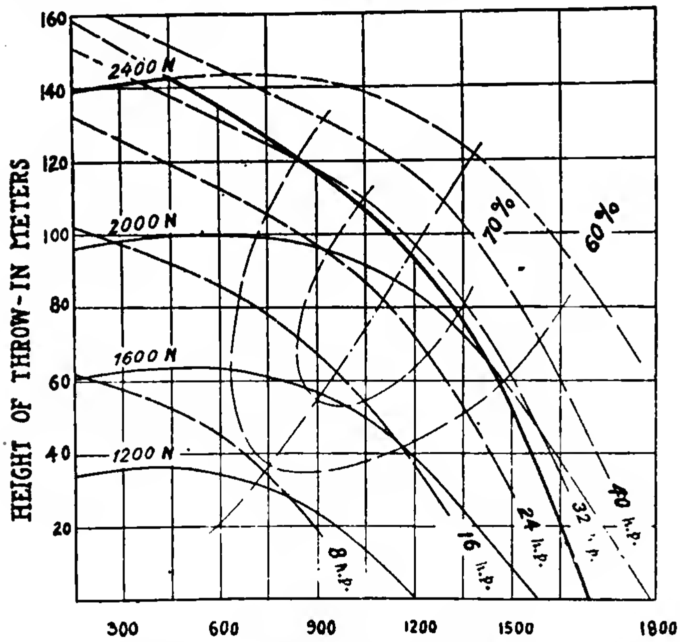

Fig. 1—Operating conditions and working range of fire engine driving centrifugal pump from automobile motor

The principal advantage over gear wheels is the silent running. Further, the time-consuming training of the gear wheels by running them in mesh on a test stand is obviated; the distance between shafts need not be so scrupulously accurate as with gears and the cost of assembling and testing are correspondingly reduced.

When only one camshaft is to be driven it should be located so that the chain runs more nearly horizontally than vertically. One shaft can never be vertically above the other as the slack must be on one side only and not at the teeth in engagement. The chain should be chosen so it can have an even number of links, because, with an odd number, the free ends cannot be joined without using one link with bent and divided plates, and a link of this kind is liable to stretch unduly. Manufacturers consider 15 to 17 the low limit for the number of teeth on the smallest sprocket wheel, and Renold goes further, recommending 21 and 42 as the most favorable numbers for camshaft driving. The Coventry company makes chains of special design for wheels with down to 12 teeth. The small wheel should always have an odd number of teeth (a "hunting tooth") so as to distribute wear on all links and teeth equally and independently of the inequalities of the work.

The distance between the shafts or the length of the chain is obtained from the formula:

$$L = 2A + \frac{Z_1 + Z_2}{2} + \frac{(Z_1 - Z_2)^2}{4\pi^2 A}$$

in which L is the number of chain links, A the distance between shafts in number of pitch unit lengths, Z_1 the number of teeth in the big wheel and Z_2 that of the small wheel.

Certain peculiarities of sprocket chains make it undesirable, it seems, to use them without a tension idler, especially for large motors. The chains, as they come from the factories, never correspond accurately to the length arrived at by multiplying the pitch by the number of links. According to Renold's own statements, the greatest care in manufacture still leaves an average difference of 0.025 mm. in the length of links, when the total lengths of two chains, which should be alike, are compared. It can therefore happen that new chains refuse to fit upon a construction laid out according to the above-mentioned formula. Hereto comes the fact that chains stretch. During the first 100 hours of use the stretch amounts to from 0.2 to 0.4 per cent. After this first "settling" of the chain, the stretch by wear sets in but amounts to only about a one-hundredth part of the figures mentioned, for the same amount of work. Some manufacturers therefore sell pre-stretched chains. Nevertheless, the conviction is growing that a tension idler is the best remedy for the troubles referred to.

An idler must always work on the slack side of the chain, and the adjustment-eccentric must be so used that the pull of the chain cannot draw the adjustment tighter but only looser. According to experience, the idler must work on the inside of the chain and must be shaped accordingly. It should engage at least three links of the chain. Adjustment by hand rather than by means of a spanner is of advantage to guard against too great tightness.

If not only one camshaft but perhaps two, and perhaps also the water pump and the magneto, are to be chain-driven, it is advisable to use more than one chain in order to avoid excessive lengths, by which the wear accumulates too fast. Usually a broad chain is used for the camshaft and a narrower one for the magneto. If a single tension idler is used for both these chains, it is to be foreseen that they may not stretch equally. The idler should therefore be so mounted that, when tightened, it will distribute the tightening effect automatically between the two chains. This may be done by means of a double eccentric, one concentric with the other, of which only the inner one is adjusted.

By reason of the chain stretch and the adjustments made to keep the tension right, the adjustment of the camshaft becomes gradually inaccurate, and it is therefore recommended to mount the camshaft sprocket wheel crown upon a flanged spider rather than direct upon the shaft, and to provide the sprocket wheel crown with oblique slits—say three of them—and the spider with similar slits running crosswise of those in the crown. By securing a bolt in each pair of slits, the crown and the spider are joined, and when the timing of the cams becomes inaccurate it can be corrected by loosening the bolts, turning the crown around the required small angle with relation to the spider and securing the bolts again at the new intersection of the slits.—From *Allgemeine Automobil-Zeitung*, January 3.

WORKING Range of Centrifugal and Pittler Fire Pumps.—Since it has become known through the developments in German fire-fighting practice that the greatest simplicity, economy and efficiency are obtained by coupling a rotary pump with the same internal-combustion motor which is used for propelling the fire engine vehicle, the data which should govern this combination of elements have been studied by all those members of the automobile industry who turn out commercial vehicles and who realize that the type of fire engine referred to is the only one which can be turned out in an automobile factory without interference with other routine production and that it, in fact, can be turned out there better than in any other industrial establishment. The desire to utilize old steam pumps, chemical engines and other material on hand for its allotted time and for keeping the equipment of each fire station uniform and unmixed, remains the only factor which can retard the new development, provided the working data of the simple new type of fire engine are made known and the most suitable construction is adopted by those who produce it.

Having in mind this situation, so interesting to the automobile industry as well as to insurance companies and the public, Engineer Hüpeden of Wiener Neustadt presents a comparison of the working results which may be obtained accordingly as the rotary pumps used are of the centrifugal and non-positive variety or of the design devised by the late v. Pittler, which may be designated as a rotary piston pump and is almost positive in action. These data gain further interest because the limitations of the Pittler pumps are found considerably aggravated in pumps with reciprocating piston action, if these are driven from an internal combustion motor, while their advantages are not similarly emphasized.

The accompanying diagrams, Figs. 1 to 5, summarize the findings and conclusions of Mr. Hüpeden which are reproduced in substance in the following:

The pumping work of motor fire engines is still too frequently estimated according to the height and reach of any stream thrown at a demonstration trial. While larger fire departments stipulate the amount of water which must be discharged at a given pressure and compliance with this condition may be readily tested out, it does not exhaust the requirements which must be made with regard to the adaptability of the pumping equipment to the widely varying conditions which may arise in fire-fighting work. The producers of motor pumps are often themselves not well informed with regard to this adaptability, as the pumps and the motors usually come from different factories between which the needed exchange of information is incomplete, while the time for searching trials of the completed apparatus is usually lacking. But a pre-determination of the working conditions is so important and decisive for the design that it seems very desirable to have made clear in words and drawings the mutual relations existing for the three elements: the pump, the motor and the work.

In order to represent actual conditions, the curves must show the work done not at only one but at a number of different pump speeds (N in the diagrams). So far as centrifugal pumps are concerned these data are now usually obtainable, and in addition there has recently appeared (in *Zeitschrift des Vereines Deutscher Ingenieure*, 1912, No. 47) an article by H. A. Janssen giving a new method by which all necessary details of the working results with rotary pumps may be deduced with sufficient accuracy from fragmentary data. The curves which may be drawn according to this method agree very well with the test results which have so far come to notice in practice and diagrams. The curves in Fig. 1, representing the work of a high-pressure centrifugal pump, have been drawn according to this method. They show directly the mutual relations between number of revolutions, capacity, throw and efficiency. [The word "throw," as used here and in the diagrams, inaccurately, does not refer to the stream thrown from the nozzle of the hose but to the height which the nozzle will deliver a stream.—Ed.] The power necessary throughout this range of conditions has been calculated in each case from the other data and entered upon the diagram. The pump chosen for illustration was a medium large one rated to give 1200 liters of water per minute at 8 atmospheric pressures. In practice the pump dimensions are properly so chosen that the demanded capacity falls within the limits of the maximum efficiency, corresponding to 70 per cent. in the diagram. When this is done, the required horsepower may then be read on Fig. 1 directly.

Fig. 2 shows the torque curve of a gasoline motor selected to suit this power requirement. It can be drawn with sufficient accuracy from a few data giving the power at different motor speeds. Usually the pump and the gasoline motor are designed for different speeds and a gear must be used to equalize them. There is then available for driving the pump only the motor power minus the friction loss in the gear. This loss, estimated at 10 per cent., is therefore entered upon Fig. 2. The gear ratio is in the present example taken to be 1 to 2.

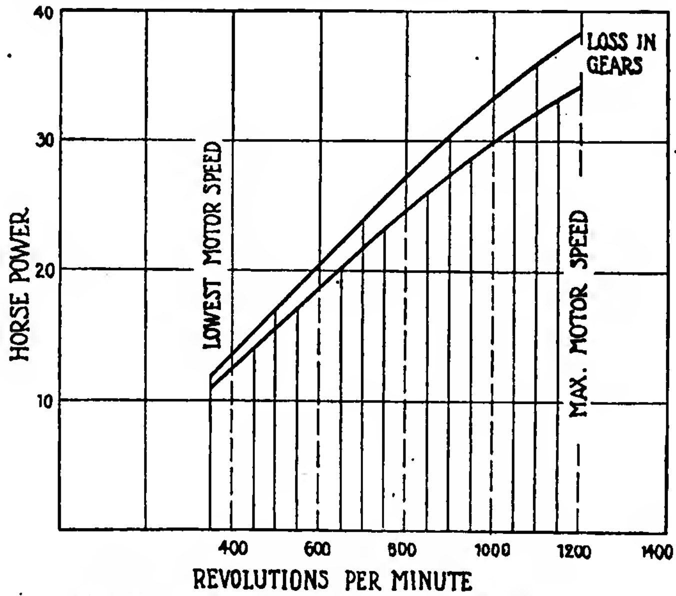

Fig. 2—Curves of motor power available for pump

When now the maximum torque of the motor at different speeds is carried into the diagram of the pump curves, Fig. 1—by connecting those intersections of revolution and capacity curves which according to Fig. 2 belong together, there is obtained the curve which is drawn thickest in Fig. 1 and represents the maximum obtainable performances of the whole motor pump for the complete series of working conditions.

All performances ranging below these maximum values can be obtained by simple throttling of the motor.

While in the case of stationary pumps the fuel efficiency of the motor is an important factor, it is of no consequence in fire engine service except in so far as it influences the range of performance. The latter, on the other hand, is a main issue, as the performances demanded vary very widely. An incipient fire in a dry-goods store, for example, should be extinguished with a discharge at the nozzle of, say, 200 liters per minute, in order to minimize the damage from water, while a fire in a warehouse should usually be fought with a maximum quantity of water. Similar differences apply to the pressure. While a cellar may be inundated with the smallest expenditure of motor power, churches and other tall buildings may demand a pressure of more than 100 meters. The adaptability of the pumping engine to these varying requirements is shown exhaustively by the curve of maximum performance in Fig. 1. It shows, for example, that the 200 liters per minute for the incipient store fire can be delivered at a pressure of 6 atmospheres (60 meters) with the motor throttled to 800 revolutions, giving 1600 revolutions for the pump; also that the cellar may be flooded with 1500 liters per minute at the same pressure and that, in the case of the church or high building, 300 liters can be delivered against 140 meters and about 800 liters against 120 meters pressure.

Other inferences from the performance curves are made clearer by a comparison with the results obtained with the rotary piston pump; a type designed by the late W. von Pittler and subsequently improved. As it gives results very similar to those obtained with the high-speed pumps with reciprocating pistons which have lately been employed in a few places, the remarks to be made with regard to it apply in the main to the latter as well. Fig. 3 shows the operating conditions of a Pittler pump. The curves showing performances at equal speeds deviate from the vertically running lines representing equal capacities only by reason of the volumetric losses sustained in the motor at the higher speeds, so that the capacity is almost proportionate to the number of revolutions. The efficiency increases with the pressure but drops with the number of revolutions. On this point no data from tests have been found obtainable because the motors used for factory tests were lacking in the required flexibility. But as the efficiency is of subordinate importance—within certain limits—the efficiency curves drawn into the diagrams, from such data as could be had, will be sufficiently accurate for the desired comparison.

By carrying the torque values from the motor diagram, Fig. 2, into the pump diagram Fig. 3, in the same manner as they were marked in Fig. 1, the complete working range for a fire engine with Pittler pump can now be shown, the pump dimensions being selected, for the purpose of a comparison on equal terms with the centrifugal pump, so that the normal performance is the same in both cases, this performance being taken as the delivery of 1200 liters per minute at a height of 80 meters, and the motor being the same.

The curves obtained in this manner, by combining the values of Fig. 2 and Fig. 3, and representing the working range of the Pittler pump is reproduced in Fig. 4 together with the corresponding curve for the centrifugal pump equipment from Fig. 1. The full-line represents the results of direct drive of the pump and the nearest broken line those obtained with a driving connection geared up in the ratio of 1 to 1.2. By the choice of gear ratio the working range of a Pittler pump may be materially changed, as further shown in Fig. 5 which is drawn on a basis of a 1 to 2 ratio of the gear. There is, however, a limit to this method for adapting the equipment to special requirements through the fact that the speed of a Pittler pump, in its present development, cannot very well exceed a certain maximum, which lies somewhere between 600 and 1000 revolutions per minute, by reason of the inertia of its unbalanced masses. If this maximum speed, which is taken as 1000 r.p.m. in the diagrams, is lower than that of the motor (here assumed to be 1200 r.p.m.) the highest power of the motor cannot be utilized by a direct-driven pump, but in practice the difference in best motor speed and best pump speed is often so small that, for simplicity's sake, the direct drive is preferred, even though a loss in working range and reach is involved.

With centrifugal pumps a best gear ratio cannot be in question. If the curves for any given equipment are plotted out as in Fig. 1, the gear of the drive can always be chosen from these curves, on the plan that the highest motor power should coincide approximately with the highest pressure requirement and with that capacity, in liters per minute, which is selected as minimum. Other gear proportions would only contract the working range without adding materially either to pressures in one direction or to capacity in the other.

The difference in the working ranges of centrifugal and of positive pumps operated under the same motor conditions is striking. The reason lies in this that the resistance-moment (which determines the efficiency) in the centrifugal pump drops by reduction of its delivery-rate even though the pressures are correspondingly increased, and thus the motor can reach higher speed and produce its highest power against the highest pressures. The resistance in the Pittler pump, and in ordinary piston pumps, on the other hand, increases with the pressure, so that the performance of the motor drops off when the water has to be

Front Wheel Design

Bearings Must Carry Part of Car Weight and Withstand Centrifugal Force at Turns

TOLEDO, O.—Editor THE AUTOMOBILE:—It is customary in choosing bearings for the front road wheels to estimate the weight on each wheei and then select bearings of such a size as to safely carry their proportion of the load, this proportion being determined by their respective distances from the vertical center line of the point of contact of the wheel with the road. As the wheels are usually tilted this center line does not always coincide with the center line of the wheel. As this selection is usually modified by judgment and a large allowance made for safety the bearings chosen for this work are usually ample. This is attested by the fact that the bearings in the front wheels of the present day cars give very little trouble indeed.

I wish to show the action of the forces involved and the pressures they produce on the bearings.

The front wheel of a car is acted upon by two forces: First, the force due to the weight of the car, and second, that due to the inertia of the car when making a turn. By the graphical solution of forces we may compose these forces into a single resultant. This is shown Fig. 1. In this figure the force F is shown acting upward. This upward force will be equal and opposite to the downward force and is equal to the reaction of the road on the wheel.

Fig. 1 shows a wheel in which the thrust is taken on the inner bearing. In this case the hub will pivot about a point somewhere near the center of this bearing. This point will be the center of moments. The force F will produce a moment about this point which will be equal to the product of this force multiplied by the perpendicular distance from the line of action of the force to the center of the inner bearing. This distance is denoted by L, Fig. 1. This moment will be resisted by an equal and opposite moment which will be equal to the product of the pressure on the outer bearing, multiplied by the distance between the bearings. This distance is denoted by D, Fig. 1.

From this we get the following formula for the pressure on the outer bearing: $P = \frac{FL}{D}$

The inner bearing will be acted upon by two forces, one of which will be equal to the force F and acting in the same direction. The other is equal to the reaction of the pressure on the outer bearing and acting vertically. These two forces may be composed to form a single resultant by the graphical method. This is shown at R, Fig. 2. This resultant may be again resolved into two components, one vertical and the other horizontal, shown at C, Fig. 2.

By reference to this force diagram it will be noted that **the vertical pressure P is equal to the sum of the force P and the vertical component of the force F, which is the weight on the wheel.** Then for the pressure on the inner bearing we get the formula: $P_1 = W + P$.

The thrust will be equal to the centrifugal force CF.

The magnitude of the force F will depend upon the proportion of the weight of the car that rests on this wheel when the car is turning. This cannot be very closely estimated and is a point open for argument. The proportion of the weight that rests on the front wheels when the car is standing still or traveling straight ahead may be easily determined, but as soon as the car begins to turn a greater proportion of the weight is thrown upon the front wheels, due to the inertia of the car.

It is generally conceded that the maximum coefficient of

Explaining the Differential—Reader Offers Suggestion—Discussion on Duryea Rotary Valve Continued—Some Points on Multiple Series—How Horsepowers Are Rated—Use of Two Flywheels—Making Oil Tests

Differential Action Explained

EDITOR THE AUTOMOBILE:—Define the construction of a full-floating rear axle ball bearing?

2—In jacking up my car and inserting into lower gear and running motor, one wheel will run much faster than the other. Explain why this is so.

Shinnston, W. Va. BROOKS F. MARTIN.

—1—The floating rear axle is one in which the load is carried by the housing of the axle. The driving members do not aid in the support of the car. The ball bearings used in supporting the driving members of a floating rear axle are of the annular type. The balls revolve between two cylinders. The cylinders are known as the inner and outer races. The balls are held apart so they cannot run upon each other and they are also held so they cannot fall out. The part holding the balls in place is known as the retainer or cage. These bearings are known as the annular type. They are designed to take a load in the direction of the radius of the bearing. They are capable, as a general rule, of sustaining an endwise or axial load of 10 per cent. of the radial load.

2—The reason that one wheel turns more rapidly than the other is because the resistance to turning of one was greater than the other. This might be due to a dragging brake shoe. If the resistance to revolving were equal on both wheels they would both turn at the same rate. On the other hand, if you jacked up but one wheel and started the car, the wheel that was in the air would revolve while the car would remain stationary.

Offers Valuable Suggestion

Editor THE AUTOMOBILE:—I would like to offer a suggestion as a source of help to garages and repair shops and owners through your columns. I would suggest in each issue that you set aside one sheet dealing with and giving some information on different subjects. For instance, ignition systems, their wiring; suggestions for locating trouble on same and the correcting of same. After exhausting the electrical end resort to other parts such as transmission, giving the names of manufacturers of parts, showing a clear cut of construction, different views where necessary. This would be of great value to repair departments where various types of cars are handled. I should think it well to run back to the early days or start back about 6 years and work up on cars in general.

Little is necessary other than a clear cut showing internal constructions. It would be well to know that the most valuable information would be on such construction as was not adopted as standard, as a good mechanic at this stage is well acquainted with the present equipments though there is always something new to one that might be old to another. Such I am sure would meet with a success and be of help to many and could be extended from one thing to another until each shop would have a volume of information dealing on everything in general.

Philadelphia, Pa. J. M. WHITE.

Discusses Timing Further

Editor THE AUTOMOBILE:—Thanking you for your kindness in answering my questions upon motor design in your issue of December 19, 1912, I must still beg leave to differ with you upon some of your answers:

1—It was the rotary valve of 1907 of Mr. Duryea's to which I had illustration of his later designs.

2—I have never seen a crankshaft that did not have the central cranks upon the same side, and never seen an illustration of but one that did not have them that way, and that was used in one of the first models of the Peerless and was made with 1 and 3 up and 2 and 4 down. I do not know what the timing for that was, but it must have been 1, 2, 3, 4, or it might have been 1, 4, 2, 3. I had supposed that the 1, 2, 4, 3 timing had become settled practice until reading the article upon the new Hudson machine in a recent number of THE AUTOMOBILE. I learned it had been changed to 1, 3, 4, 2 timing, which could also be correctly stated as 2, 1, 3, 4 timing, and was curious to know why.

4—With the flywheel in front, the cranks would be working between the resistance due to the load upon the rear end and the inertia of the flywheel upon the other, since, even if the flywheel is running at speed, the cranks under the influence of the kick of the cylinders are moving or tending to move with a greater angular velocity than the flywheel and if you will hold a shaft fast at both ends and apply a twisting effort to the center it will require a much greater effort to attain a given twist than it will by holding fast one end of the same shaft and leaving the other free. The Daimler vibration damper is in effect a flywheel with a slipping rim; why it would be allowed to slip, I do not know, unless they figure on allowing the cranks to spring and for the slipping rim to catch it, when it is springing back. Several engines I know of with the flywheel in front construction, the Maxwell in particular is a very smooth-running engine, but that any of its smoothness was due to the flywheel in front construction, I don't know that they ever claimed.

6—A S. O. Company wagon driver once told me that they figured on losing 5 gallons of gasoline a day per wagon from evaporation. All gas tanks not under air pressure have a breathing hole, and it is quite probable that some big tanks upon roadsters lose 1 quart or more a day from evaporation, an appreciable amount enough in the life of the car to more than pay for the cost of covering it. This point seems to ge given more attention upon the other side judging from illustrations of the Olympia and Paris shows. The only exposed tanks shown there were at the rear of the chassis partly under the tonneau and under pressure.

7—Have you any tables showing the coefficient of friction for smooth iron driving wheels (for tractors) and the ground or road and that for cleated drivers, same weight?

Mentone, Cal. JOHN LEFLER.

—7—THE AUTOMOBILE has no comparative figures on smooth and cleated tractor driving wheels as far as coefficient of friction goes. Weight for weight it would hardly appear that the increased tractive effort would compensate for the greater effort consumed in the drive.

Points on Multiple Series

Editor THE AUTOMOBILE:—I note in the questions and answer department of THE AUTOMOBILE in the January 16 issue where you answer a subscriber's query about why dry cells are better (more mileage) connected in multiple series than being in a single series. You are correct so far as you go, but I believe there are other features to this question which are still unanswered.

There are several sides to this idea why there is greater mileage per cell when connected in multiple-series than where a single series is used. To illustrate, a single series of cells, we will say, will ignite a car for 500 miles connected as in Fig. 1A. Now if we make a multiple-series connection as at B, using twelve cells instead of six as at A, instead of getting the even 1,000 miles we will easily get 1,100 miles. Now if we further increase the series in this multiple connection, as at C, we can still further increase the mileage per cell, say, about 1,700 miles.

There are several reasons for this; the main one, however, is that you are able to drain out the battery more completely. Take, for instance, one of the cells at A; after it is exhausted for ignition purposes and measure the amperes and it will still give 2 or more amperes, which is insufficient to energize the coil, but if there are two series of cells, as in B, you double the cells on the coil and have, hence, double the amperage output. This keeps the car going quite a while longer. This same idea is still further carried out with connections, as at C.

Another idea which favors multiple connection, as at B and C, is that there is a much lower discharge rate. Take, for instance C, where the rate of discharge per cell is only one-third what it is for A. A dry battery is by nature an open circuit battery and has to have time to recuperate between periods of service; therefore, if the rate of discharge is lower, it has a proportionately better chance to recuperate. Therefore the total mileage or total output per cell is increased when multiple-series are used instead of single series.

Woodsfield, O. J. K. MERCER.

Horsepower Difference Explained

Editor THE AUTOMOBILE:—Will you kindly explain the rating of the different makes of cars in your New York show issue:

	Horsepower	Cylinders	Cubic Inches
Ford Model T, 4 cyl., rated at....	22.50	3.75 by 4.00	176.7
Hupmobile C, 4 cyl., rated at.....	16.90	3.25 by 3.38	112.0
Lambert Buckeye, 40-4, rated at..	16.90	3.25 by 5.25	174.2
Oakland 35, 4-cyl., rated at......	19.90	3.50 by 5.00	192.4

I do not understand how they can figure the horsepower in the case of the Ford with 176.7 piston displacement cubic inches 22.50 horsepower, and the Oakland with 192.4 piston displacement only 22.50 horsepower.

Is the Ford motor superior to other motors according to size? If so, why?

Cotesfield, Neb. H. BLANCHARD.

—These horsepowers are all figured out by the S. A. E. formula, $\frac{D^2N}{2.5}$. Where D is the bore, N the number of cylinders and 2.5 a constant adopted by the S. A. E. This method of rating is not accurate and does not show the true horsepower developed by any motor. It furnishes a basis of comparison, however, and is used for that reason. This does not show superiority in any motor. It is purely a mathematical formula. Recently there has been more or less agitation among manufacturers, engineers and designers regarding the value of the S. A. E. rating which promises some interesting discussions.

Depends Largely on Leakage

Editor THE AUTOMOBILE:—Please advise through your Letters Answered and Discussed what pressure can be obtained from a compressor with 3 inches bore and 3 inches stroke. Rings and cylinders are in fine condition and compressor space is practically nothing. Should it be driven at a speed over 200 revolutions per minute?

Prattsburgh, N. Y. H. C. MORGAN.

—With good fits at the rings you should be able to get a pressure of 120 pounds to the square inch easily. This is figuring that the machine was originally designed for a compressor and was not a motor. If the compressor is water-cooled, you should get from 15 to 20 per cent. more than this. It would not be wise to drive this over 200 revolutions per minute if it is air cooled.

Suggest Two Flywheels for Motor

Editor THE AUTOMOBILE:—Why would it not be a good idea to put two balance or flywheels (one on each end) on the shaft of a motor? Make each one-half as heavy as at present, but not reduce the diameter. Make them one-half as thick.

It always looked to me that a heavy wheel on the end of a shaft when the explosion takes place, exerts an awful tendency to twist or yank the shaft. With one on each end, would it not minimize that twist, and at the same time steady the motor by equalizing the weight and thereby reducing the vibration?

Providence, R. I. J. J. COOPER.

—This idea has been worked out successfully before now and is in actual use at the present time on the Daimler-Knight motor. The distortion of the shaft at the time of rapid acceleration is cut down considerably by this means as the twist is taken up through both halves of the shaft instead of through one end alone.

Testing Oil at Home

Editor THE AUTOMOBILE:—Please inform me if there is a way that lubricating oil may be tested at garages for specific gravity, viscosity, flash and fire test.

Greenwood, S. C. C. M. OUZTS.

—The various tests on oil may be made at home, although the same accuracy as would be secured with a complete laboratory cannot be expected. There are five tests which are generally made on lubricating oil and all of them except one can be made within very close limits at the garage. The five are the specific gravity, flash, fire, cold and viscosity. The last named, the viscosity test, is the only one that cannot be made to great satisfaction without any other tools but a bunsen burner and a porcelain dish along with a few other equally common utensils. Taking these tests in order, the first to be considered is the

1—Specific Gravity: Place the oil in a long cylindrical vessel and with a hydrometer read off the specific gravity of the oil. The hydrometer is an instrument which is weighted at one end so that it will float in an upright position. It is made of glass

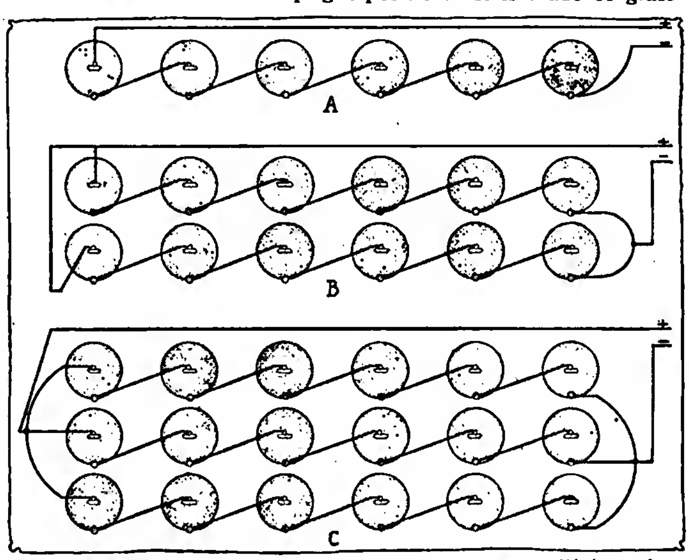

Fig. 1—A, Series; B, two multiple series; C, three multiple series

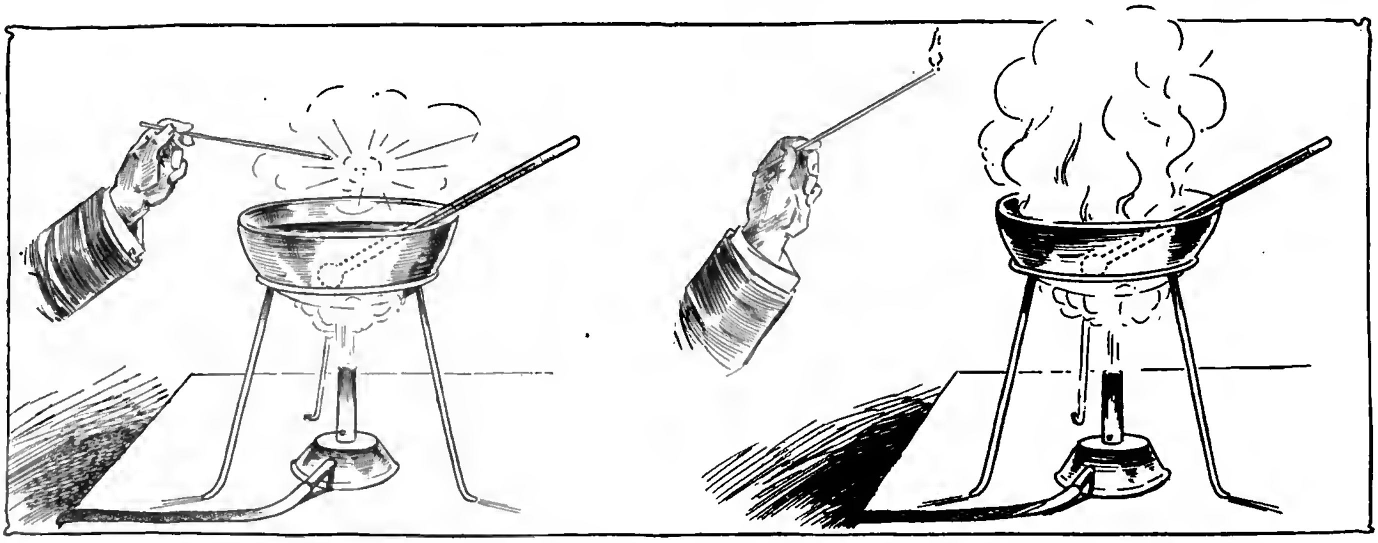

Fig. 2—Making flash tests and fire test on oil with porcelain dish, Bunsen burner and wax taper

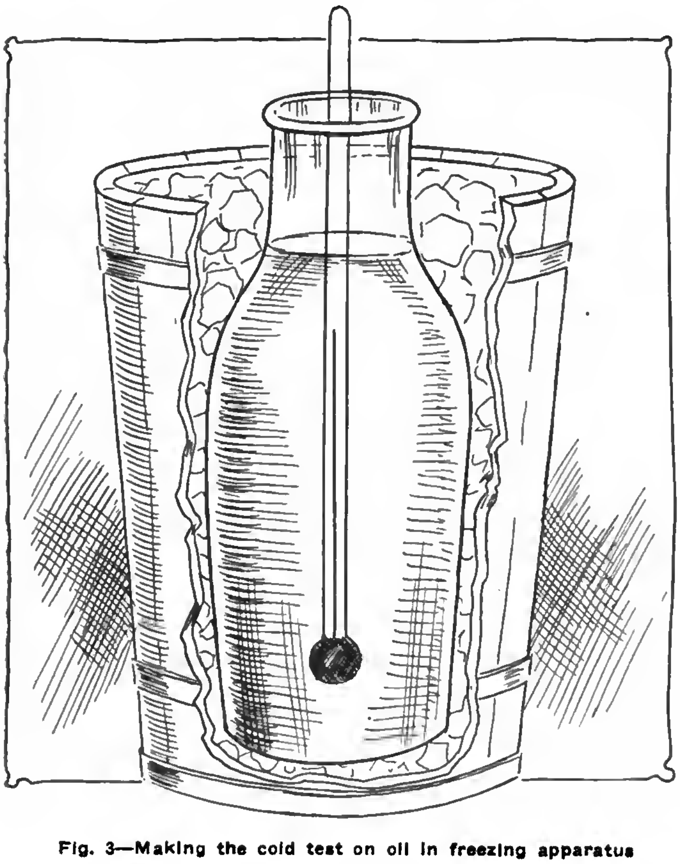

Fig. 3—Making the cold test on oil in freezing apparatus

and on it are imprinted the specific gravities. The level of the liquid furnishes the point at which the reading is taken. If it desired to convert this over to the Beaumé scale, a conversion table will be found in any mechanical or chemical handbook.

2—The flash point of an oil is that Fahrenheit temperature at which it will give off an inflammable vapor. This differs from the fire point in that the vapor need only flash and does not burn steadily. It may be found in the garage in the manner shown in Fig. 2. First secure a burner and a porcelain dish. Place a thermometer which registers between 300 and 475 degrees Fahrenheit in the porcelain dish and pour in a quantity of the oil to be tested. When the temperature of the oil has risen to 300, try the taper over the dish every 10 seconds, watching the thermometer carefully. At last there will be a point where the vapor above the oil will ignite with a flash. This is the flash point of the oil. Note the temperature at this point.

3—Fire Test: Continue the operation described under the flash test until the vapor above the oil ignites and burns steadily. The temperature reading at this point will give you the fire point. The fire point is always very close to 50 degrees above the flash point. With this knowledge it is easy to begin the tests at very close to the correct temperature.

4—Cold Test: This is sometimes called the cloud test. When the temperature of an oil drops to a certain temperature, the oil becomes cloudy and will not pour readily. The point at which the oil refuses to pour is the cold point. It can be secured by the method shown in Fig. 3. A bottle containing the oil is placed in a larger vessel packed in salt and ice in the same manner as in an ice cream freezer. A low-reading thermometer is placed in the bottle containing the oil and the temperature of clouding noted. At this point the oil will be found to have reached its cold point. The cold point may be expected somewhere in the neighborhood of 20 degrees above zero.

5—Viscosity: This is the rate of flow of the oil through an orifice. The actual viscosity must be taken through a Seybold or other viscosity meter. A comparative test may be made as shown in Fig. 4 by taking an oil of known viscosity and the oil of which the viscosity remains to be known. The funnel is closed in some manner so that a small opening is left. The opening in each should be the same. If necessary one oil can be run through and the drops timed with a stop watch and then the other run through the same opening. The temperature of both oils must necessarily be the same if the viscosity is to be tested anywhere nearly correctly.

Wants to Know Correct Tires

Editor THE AUTOMOBILE:—I have a Jackson car. Its weight is 3,100 pounds. I would like to know what size tires would be best. The ones I have on it are 34 by 4, and they blow out very often. If they are too small for the weight of the car, please tell me what size to use.

Luanna, Fla. HENDERSON BROS.

—The correct size tire to use with your car would be 35 by 4.5 inches. Any standard make of this size will go on your car and will fit the 34 by 4-inch rim.

Charging Magneto with Dry Cells

Editor THE AUTOMOBILE:—Can an ordinary low-tension, alternating-current magneto be charged with a set of dry cells, in the absence of a storage battery or direct current? If practical, how many dry cells of the ordinary ignition type would be necessary where the original magneto output is 5 amperes at 12 volts, normal speed.

Kindly give a diagram showing the correct way of connecting up for this purpose.

Maynard, Minn. O. HAWKINSON.

—This would be highly impractical and very costly. It would be a much cheaper plan to send the instrument to the manufacturer who would only charge about $2.50 to do the work. The only way it is possible to charge the magnet with a direct-current supply of any kind available would be to have a special winding made. The magnet must have a certain number of lines of force and the only way they can be properly secured without going to a considerable waste of time and money is by an electro-magnet.

Converting a Touring Body

Editor THE AUTOMOBILE:—I am driving a 1910 Cadillac touring car and wish to make a roadster out of it.

Can you tell me where I could find a firm making bodies that would be suitable?

Is there any in Indjana?

Salem, Ind. REED PHILLIPS.

—Either the La Porte Carriage Company, La Porte, Ind.; Robbins & Company, Eleventh and Canal streets, Indianapolis, Ind., or the Union City Body Company, Union City, Ind., should be able to handle the work for you.

Digest of Leading Foreign Journals

(*Continued from page 352.*)

raised to great heights. Another shortcoming of the positive pump is that it cannot handle small amounts of water. As the minimum speed of the motor is limited to about 300 revolutions and the capacity of the pump changes positively with the number of revolutions, there is always a minimum capacity below which the pump cannot work, and this minimum comes higher the larger the maximum performance is chosen. With the centrifugal pump the minimum falls below practical working requirements.

Fig. 5 shows the great change in working range of the positive pump which is secured when the gear ratio is made 1 to 2. The reach of the equipment is greatly increased and the minimum capacity is reduced—very desirably—from 525 liters to 260 liters per minute, but this is accomplished only by sacrificing the maximum capacity, reducing it from 1500 liters, on direct drive, to 900 liters. Only an optional gear ratio would give the adaptability to all working conditions, and the operation of a gear box in fire-fighting would represent a considerable complication.

The curves also permit an estimate of how the different equipments will behave in two frequently occurring instances. When the pressure channel is obstructed, as by the freezing or clogging of a hose or nozzle, the pump pressure rises while the capacity drops to zero. The centrifugal pump in this case partly unloads the motor but not sufficiently to make it run wild. If the motor was working under full fuel charges, the pump continues to work under maximum back-pressure, while the motor, according to Fig. 1, goes up to about 1300 r.p.m. Only the high pressure to which the hose is subjected consequently requires immediate attention. The positive pump under the same condition comes to a stop, since the minimum capacity is limited.

The other possibility referred to is that a hose may burst. The resistance in the centrifugal pump is then increased, since it depends upon capacity, and the pump drops automatically to a reduced speed; according to Fig. 1 to about 900 revolutions of the motor. The Pittler pump in this case takes most of the load off the motor, and the latter speeds up rapidly.

As may be seen from the foregoing a great need exists for diagrams from which it may be determined in advance what combination of motor and pump should be selected for a given set of local conditions in fire-fighting.—From *Zeitschrift des Mitteleuropäischen Motorwagen Vereins*, December 15.

Engineers' Forum—Front Wheel Design

(*Continued from page 353.*)

friction between rubber tires and the road surface does not exceed .6. In this case the lateral pressure on the wheel could not exceed .6 of the weight resting on that wheel. At this point the wheel would commence to slide sideways. I am confident that this pressure is never reached in the front wheel. I have carefully observed racing cars taking turns fast enough to slide sideways and have noticed that the rear wheels slide but the front ones do not. The reason for this is quite clear. **When the car begins to turn the greater proportion of the weight is thrown on the front wheels.** Thus the friction between the rear wheels and the road is decreased and they begin to slide.

The wheel, Fig. 1, is that put out by one of the prominent axle manufacturers. It is for cars weighing 3,000 pounds.

By reference to the accompanying table we find that a car of this weight making a turn of 100 feet radius at 20 miles per hour will have a centrifugal force of 807 pounds. If we assume that one-third of the entire weight of the car rests on the wheel, then the weight on the wheel will be 1,000 pounds, and the lateral pressure will be 269 pounds. By laying out these forces graphically as in A, Fig. 2, we find that F is equal to 1,035 pounds. The distance L in this case is 4.66 inches, and B is 3.5 inches. Substituting these values in the formula $\frac{1{,}035 \times 4.66}{3.5} = 1360$, or 1,360 pounds load on the outer bearing. The load on the inner bearing will be $1{,}360 + 1{,}000 = 2{,}360$ pounds radial load and 269 thrust.

The bearings in this wheel are numbers 306 and 308 ball bearings. One manufacturer gives a rating for these sizes of 1,320 pounds and 1,980 pounds respectively. Thus it would seem that the inner bearing was overloaded. This overload, however, would be easily taken care of by the overload capacity of the bearings.—F. C. SHEEHY.

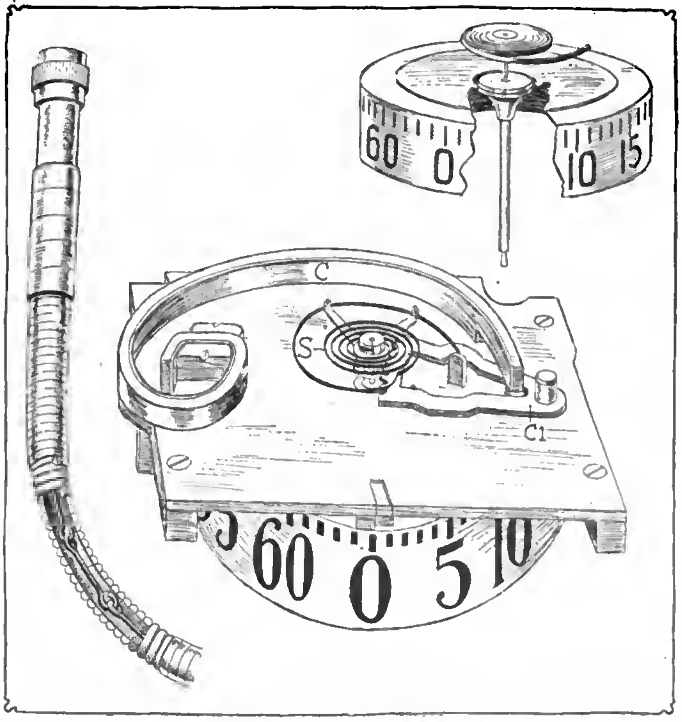

Fig. 1—Automatic temperature compensator and new shaft of Stewart speedometer

1913 Speedometers

Refinement of Details Makes For Exactness and Strength

IN the speedometer field practically no radical change has been made during 1912 and the 1913 exhibits resemble those of last year to a great extent. Most of the companies show the same models which they exhibited last year and the only differences in the constructions are of a nature of refinement and general strengthening of the mechanisms, making the latter more exact and more capable of withstanding shocks and vibration. In several cases improvements of a gratifying nature have been made in the swivel joints and in the flexible driving shafts. A new compensator which balances the expansion and contraction of the indicator control spring in the Stewart & Clark instrument deserves special mention as a simple and apparently efficient means for obtaining greater exactitude of the instrument under all conditions. Below short descriptions of the speedometers shown at the National Show are given, special attention being paid to the changes which have been made.

The maker of the Jones speedometer has made a new step in speedometer construction by introducing in one model a recorder mechanism which not only indicates the traveling speed of the car, but shows at what speed it moved every minute during half a day.

Stewart Has Automatic Compensator

Stewart speedometer, made by the Stewart-Warner Speedometer Corporation, Chicago, Ill., comprises two series of models, namely, magnetic and centrifugal. In the centrifugal type a governor by its deflection due to the rotation of the shaft carrying it moves an indicator hand which shows the speed of the car in miles per hour on a circular scale calibrated on the silver faced dial. In the magnetic type a vertical cylinder, which is dragged along by the attraction of the rotating magnet, indicates the speed. The disk or cylinder is not influenced by a change of temperature such as may be due to a warmer or colder climate, but the hair spring S which returns the disk to the zero position when the magnet-carrying shaft is at rest is subject to expansion and contraction in heat and cold respectively. To compensate for this change a compensator is usel consisting of a plate on which a laminated strip C of steel and brass is mounted. This combination of materials is very sensitive to a change of temperature and as it expands or contracts acts on a sector C1 and pinion lengthening the hair spring in warm weather or shortening it in cold, thereby counteracting for the expansion or contracting of the spring itself. The centrifugal types are likewise equipped with a compensator acting on the hair spring which returns the hand to zero when the shaft ceases rotating. The company makes 16 models for automobile speed indication, as follows: Models A, A2, A1 and A3 are known as Tachometers and are distinguished by the use of a hand operated compensator for increasing or decreasing the indication for given speed of the car. The latter two models are fitted with Seth-Thomas 8-day clocks. Models B, B2, B1, B3 and B4 are known as Speedometers and all of them excepting the first two are fitted with 8-day clocks; the entire series B is also equipped with a gradiator consisting of a cylindrical disk rotatable about a horizontal axis and operating on what the company calls a pendulum principle, that is the center of gravity lies at that point of the cylinder periphery which is 90 degrees below the point marked 0 degree. Models C, C2, C1, C3, E and 26 are lower priced products, the last named model being the only example of a centrifugal speedometer on this company's line. The principal improvements for this year are the above described automatic compensator and all steel flexible shaft; besides a steel dropped forged swivel joint is used. The corporation continues its Warner Auto-Meter without any change. This meter is of the magnetic type in which a magnet mounted on the rotating shaft which is driven by the flexible shaft, exerts a torque through magnetic attraction on a thin cylindrical metal disk surrounding it. A spring attached to this disk tends to hold it in the position when the zero mark is in alignment with the indicator point on the dial of the meter. As the magnet rotates it exerts a pull on this disk and tends to rotate it against the tension of the spring, the pull having a definite proportion to the speed of rotation of a magnet so that the torque may be used as a means for measuring this speed.

Jones Recording Speedometer New

Jones speedometers are continued from last year. No changes have been made in the models which are but carried over, but two new models are now being offered, the speedometer model 40 and the recording speedometer model 34/39. The latter combines all features of Jones speedometer with the construction of the recorder which was brought out by the Jones company a year ago and which records exactly the speed made by a car during the day and for how long each speed was kept up. The record is made on a wax-covered sheet by a metal point. The wax sheet turns once in 12 hours, being carried on a clock-driven pin, and the metal point which makes the record is moved up and down by a cam when the car moves. Consequently a zigzag line is produced, the pitch of which is an indication of the car speed, being determined by the travel of the pencil—which is proportional to that of the car—and the travel of the sheet proportional to the time during which the car moves. The sheet is concealed behind a glass plate held in a rim which locks on the body of the casing. The speedometer mechanism is of the centrifugal type and the dial is adapted to indicate speed up to 60 miles an hour; a 100,000-mile odometer and a 100-mile trip meter are also provided. The model 40 speedometer is built along the same lines as the other speedometer models, without the recorder mechanism, and is equipped with a 70-mile and hour dial and 100,000-mile and 100-mile odometer and tripmeter, respectively.

Six speedometer models are the 1913 product of the Hoffecker

Company, of Boston, Mass. Two of these models, K and L, include speedometer season meter and daily tripmeter only, while the remaining four are equipped with 8-day Waltham clocks. The operating principle of this speedometer is as follows: A three-disk governor rotates around the speedometer shaft, being held close to it by a spring which is wound around that shaft. When the shaft rotates the convex disks fly away from the axis of rotation and in doing so press upon a curved spring, one end of which is secured to the back of the indicator dial and the other end to a lever which transmits the deflection of the spring to the indicating needle on the face of the dial. Gears actuated by pinions on the governor shaft drive the odometer or season meter, which has a 10,000-mile capacity in the smaller types and a 100,000-mile capacity in the larger models. The daily tripmeter mechanism actuates a hand mounted on the central spindle, which also carries the speedometer hand. The changes in the 1913 models include the use of an adjustable shaft which permits setting the arm containing the swivel joint at any angle and therefore makes the mounting of the instrument easy on any car. The pleasure car meters of the model L type are fitted with a gradiator, so called, for indicating the incline of an upgrade over which the car travels; this gradiator is furnished at option, taking the place of the 100-mile daily indicator. In the truck meter the swivel joint has been done away with, having been supplanted by a single pair of pinions, one of which is mounted on the cross-shaft actuating the governor shaft and the other at the end of the driveshaft, to which the flexible shaft is attached. The latter is made of highly elastic steel, wound closely and giving a stronger and more elastic means for driving the meter than the ordinary shaft. At the same time vibration transmitted by the shaft is avoided at least to a considerable extent.

Dean Brings Out Centrifugal Type

A newcomer in the line of speedometer manufacturers, the Dean Electric Company, Elyria, O., maker of automobile horns, has exhibited its speedometers for the first time at the Garden and Palace. This instrument is of the centrifugal class, four steel balls being so connected to a spider that when the latter is rotated the balls are deflected from the axis and rotation and lift a cup which is directly connected to the hand on the dial. The flexible shaft enters a key in the spider shaft, so that no gears are required between them. The odometer and tripmeter mechanisms are driven by worm gears, and the latter meter may be reset to zero by means of a button in the side of the casing. The face of the meter is oxidized black with nickel or silver scales.

The Veeder Manufacturing Company, Hartford, Conn., has made practically no change in its product. The hubodometer mechanism is the same as last year, and the only difference is in the front cover which screws on the casing of the mechanism proper instead of being riveted to it as last year. After being thus attached the cover is pinned to the casing to prevent unscrewing of the former. The other instruments made by this company, including the odometer and tripmeter as well as the tachodometer, are continued without change.

The Standard Thermometer Company, Boston, Mass., continues its line of speedometers, which are of the centrifugal type. The changes which have been made since last year in these models are in the nature of refinement and increased strength of parts. By this practice the use of the meter is made practicable for commercial vehicles on which there is a great deal of vibrations and shocks that must not disturb the workings of the speed indicator. As the swivel joint is one of the placed subjected to most strains, the Standard company uses now gears which are made of nickel steel. Furthermore, to insure the good working of the device a practically unbreakable kind of flexible shaft is used for driving the meter. This casing is nickel-plated and looks as substantial as it is constructed.

The Corbin Screw Corporation, New Britain, Conn., which has taken over during 1912 the Brown speedometer, continues the latter without any changes. It will be remembered that this speedometer is of the centrifugal type and driven by a flexible shaft, the governor shaft carrying a gear which actuates the gear trains of the odometer and tripmeter mechanisms. The Corbin-Brown speedometer is made in two types, namely, as a simple speedometer and in combination with a clock.

Speedograph for Trucks Continued

One of the instruments in this class and which was shown at the Garden is the Speedograph made by the Recording Speedometer Company of Newark, N. J., which serves for recording the actual time during which an automobile moved during a day and the speed at which it moved. The instrument comprises an inclosed mechanism, the casing of which carries on its top cover the indicator mechanism. The latter consists of two spools, one of which is rotated by a clock incased in the housing and the other carries a paper tape which is wound up from it to the spool driven by the clock. A vertical shaft fixed to the top of the casing carries a pencil contacting with the paper, leaving the spool from which it travels to the other; the pencil is held against the paper by a spring. A flexible drive entering at the bottom of the casing actuates a vertical worm shaft meshing at its top with a worm gear turning about a horizontal axis and carrying a heart-shaped cam which alternately lifts and drops a follower, the latter carrying in turn the above mentioned pencil. The worm mechanism being actuated when the car moves causes the pencil to be reciprocated vertically through the height of one inch at a speed proportional to the traveling speed of the car. At the same time the clockwork draws the paper tape from one spool to the other at a uniform rate of speed during the day so that as the pencil reciprocates relatively fast a series of steep lines is made by it, while a lower travel of the car is indicated by a lesser incline of the line made by the pencil. When the car is at rest the pencil is stationary and describes the horizontal line on the tape. Excepting a slightly heavier construction this device has not been changed since last year.

The American Taximeter Company exhibited Jones and Popp taximeters in which a few changes have been made since last year. A star-driven collar is used instead of the gear drive of last year, and it is claimed that this construction makes the whole mechanism stronger than before. A foolproof casing is provided by the use of an overlapping front cover between which and the casing strips of metal are inserted to prevent tampering with the indicating mechanism.

Many New Spark Plugs This Year

Priming Plugs and Mica-Porcelain Designs Galore

FOR 1913 the American automobilist and automobile manufacturer are being offered a selection of spark-plugs greater in number and variety than ever before. As for the first, the plugs here described include hardly any except what was seen at the New York shows, whereas the variety is furnished by the use of all types, designs and materials. There are long and short, thin and stout plugs; plugs with steel and brass bushings, mica or porcelain insulation, or both; copper, asbestos or combination copper-asbestos packings; ordinary plugs, heavy-duty types, priming plugs and visible spark designs.

Several noticeable tendencies which are illustrated by the following review of the situation are: The trend toward a mechanically strong, if not unbreakable plug; the use of an absolutely insulating covering for the electrode, such as the combination of porcelain and mica offers; features permitting of quick inspection and removal of the plug, and, finally, priming plugs which combine the work of spark-plugs with that of cups for squirting gasoline or air into the cylinders.

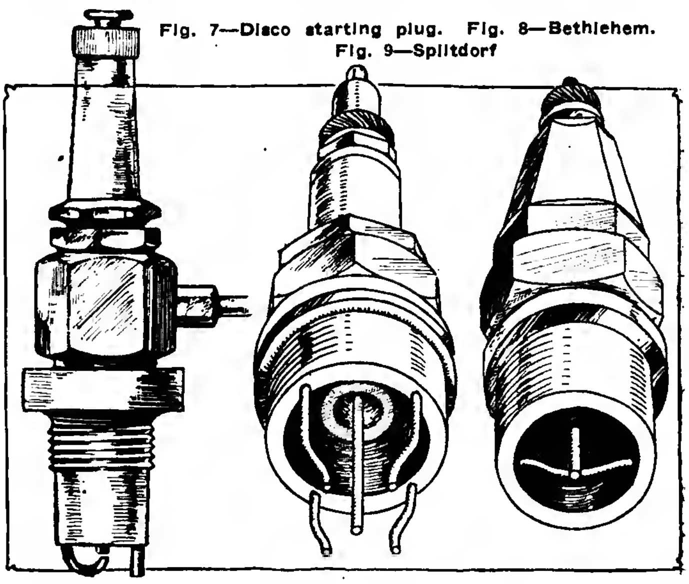
Red Head Priming and Combination

The Emil Grossman Company, New York City, has added three types of plug to its line of regular Red Head designs during the past year. These types are the Platinum Point, the Combination, Fig. 11, and the Priming plugs, the latter being shown in Fig. 12. The first is the highest priced plug of the line and while its shell and insulation are designed much the same as the regular plug, it differs from the latter in the shape and nature of the electrodes. The positive one is plated, from the point to .03 inch above it, with a layer of platinum .03 inch thick; the negative one is bent horizontally from the shell toward the center, making the entire plug more compact. The combination plug uses both mica and porcelain for protecting the positive electrode. A mica cover is wrapped around the metal and, in addition to this, the section of the electrode which is inside the shell is covered with porcelain, thereby making use of both the great heat-resistance of the latter and of the electrical strength of mica. A slight contraction of the shell above the point supplies a priming combustion chamber. The priming plug is different from all these types, due to the use of a brass priming cock and the adaptation of the porcelain to make the use of the cock efficient. The latter is so designed that the fuel squirted into it flows upon the porcelain insulation to the plug point where it is vaporized or at any rate is in readiness for combustion. The insulation used in this plug is of uniform porcelain.

Bosch Changes Electrode Shape

The spark plugs of the Bosch Magneto Company, New York City, are continued without essential changes, the only development being the new form of negative electrodes. The latter are three in number for every plug and are bent inward from the shell periphery, being shaped of heavy wire and with flattened ends; this gives a wide sector-shaped

Fig. 7—Disco starting plug. Fig. 8—Bethlehem. Fig. 9—Splitdorf



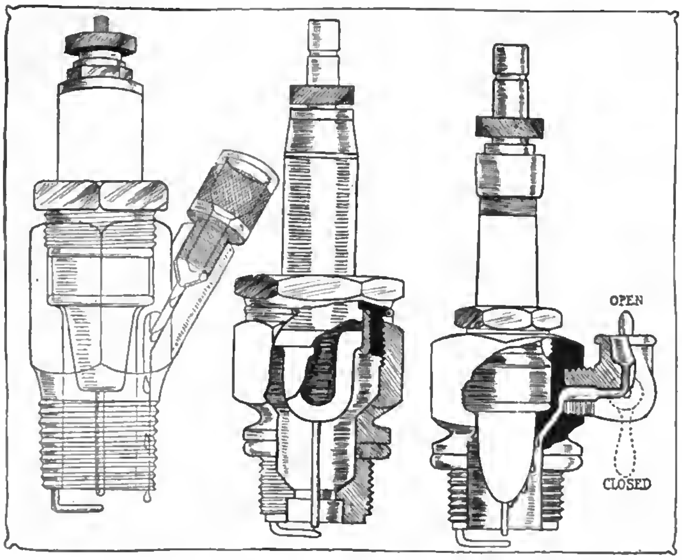


Fig. 10—Champion priming. Fig. 11—Red Head combination. Fig. 12—Red Head priming

sparking line, with all points equidistant from the central electrode. The negative electrodes are built somewhat heavier than last year. As for the positive electrode, this is a stout nickel rod welded into the steel terminal to give effective transfer of the heat from the former to the latter. The insulation is of steatite, a material adopted by the company as specially suited for its needs. The insulation is packed at its upper shoulder against the bushing by a washer of soft metal, which is compressed between steatite and metal; the lower shoulder is packed by a copper-asbestos ring.

Blake Plug's Many New Features

A spark-plug not exhibited in New York before the recent show which is suitable for use as a priming cup, without containing a cock used in other plugs for this purpose, is made by the Blake Spark-Plug Company, Boston, Mass. On this plug, the lower edge of the shell, Fig. 13, is formed with two diametrically opposed taper surfaces sloping in the same direction as the thread of the plug. These surfaces afford a tight engagement with projections formed on the bushing which holds the nut containing the porcelain. The bushing itself, Fig. 14, is ground to a taper fit against the inner face of the shell and is formed with a .06-inch shoulder at its upper end to insure gas-tightness. Attached to this shoulder is a wooden handle which permits of turning the bushing so as to engage or disengage the tapered projection at its bottom portion with the surfaces on the shell. If the turning of the handle is continued after the faces are disengaged, the plug shell is unscrewed from the cylinder. The electrode design is also original. The positive electrode extends but .04 inch below the lower edge of the bushing and the negative electrode is formed by a flat arch connecting the opposite points of the brass bushing and affording a wavering spark. The insulation is of porcelain down as far as .5 inch above the lower edge of the bushing.

Herz Plug Continued Unchanged

Herz & Company, New York City, are continuing their line of spark-plugs without any alteration whatsoever. This plug is distinguished by a funnel-shaped, positive electrode, from which four projections extend toward the surrounding shell, giving four sparks every time the secondary circuit is passed through the plug.

Mosler Junior Plug an Addition

A. R. Mosler & Company, New York City, continue their former spark-plug types and besides having developed, during 1912, a number of types specially adapted for certain makes of car, they have brought out the Junior plug in which the asbestos packing and wicking has been done away with, being supplanted by copper packing. Furthermore, a steel bushing is used instead of the brass part which constituted part of the former standard designs. The special plugs made by the Mosler company are designed for the following motors: Ford, Overland, R. C. H., Alco, Chalmers, Fiat, Hudson, Locomobile, White and Knight.

Bethlehem Five-Point Plug

A spark-plug having one positive and four negative electrodes is made under the name Bethlehem by the Silvex Company, New York City. On this plug, Fig. 8, the central electrode projects .5 inch below the edge of the shell, being surrounded by four negative points which are secured to the shell and are bent inward, offering four spark-gaps, so that there is always a possibility for firing the mixture even if one or two gaps are useless, due to deposits; the latter are burned in time by the explosions started from the other points. The Bethlehem plug is forged from cold-drawn Bethlehem steel and the porcelain is of German material which does not crack in any heat produced by a motor.

Heinze Priming Plugs

Another company making priming plugs is the Heinze Electric Company, Lowell, Mass., manufacturer of the Heco plug, Fig. 17. The ordinary type of plug made by this company contains either mica or porcelain as insulating material. The appearance of the plug is distinctive by reason of the peculiarly formed electrodes. The positive one is a straight point as in other plugs, while the negative electrode is formed by a straight, horizontal, diametrical bridge, the spark jumping downward through a gap of .03 inch. The priming plug known as Heco is shown in Fig. 1 and is of the mica-insulation type. The

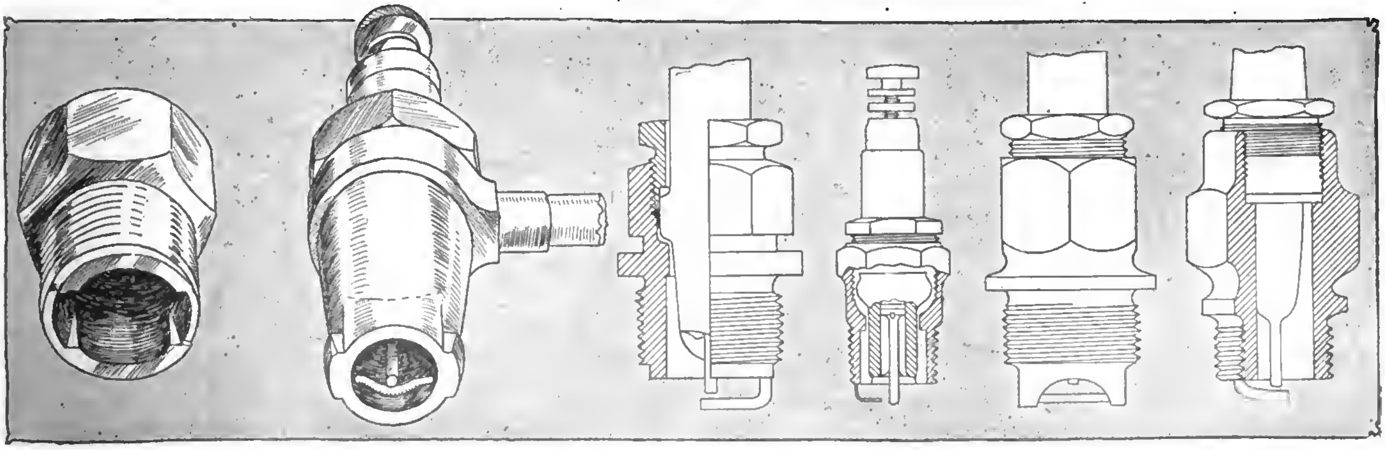

Fig. 13—Blake plug shell. Fig. 14—Blake body. Fig. 15—H. M. S. Fig. 16—Mezger Soot-Proof. Fig. 17—Heinze. Fig. 18—Bull's Eye

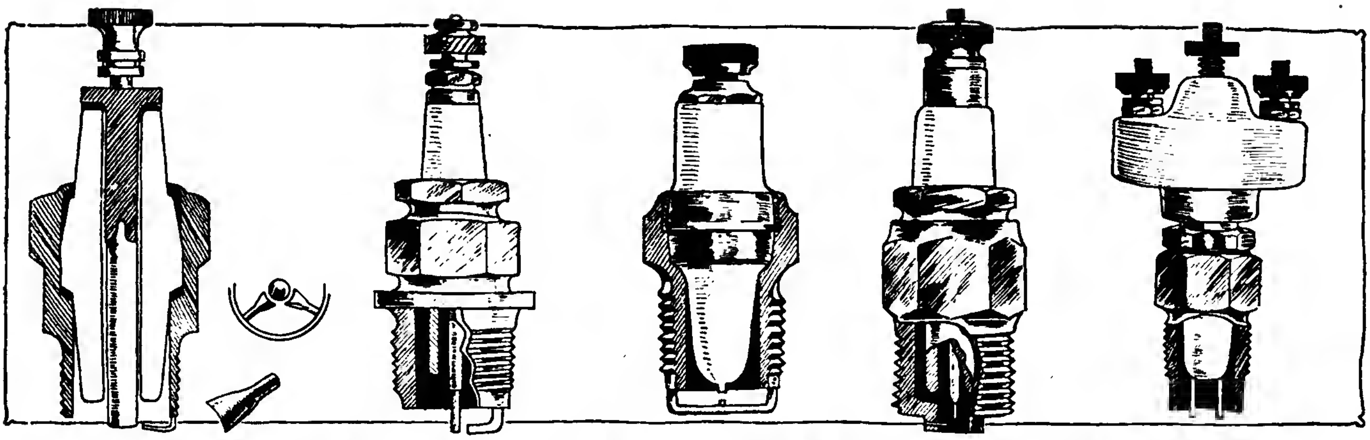

Fig. 19—Bosch. Fig. 20—Miller plug. Fig. 21—J-D heavy duty. Fig. 22—Janney-Steinmetz plug. Fig. 23—J-D two-point plug

positive electrode extends right through the plug as far up as the cock which when turned up forms a priming channel permitting of squirting fuel into the cylinder. A brass nut and washer between insulation and cock form the part to which the wire led from the magneto is attached. The shell carries a wire curved into a semi-circle and forming the negative electrode. A copper washer is fitted to the bottom of the priming channel which at the same time forms the positive electrode. Special priming plugs for Model T Ford motors are being made by this company.

V-Ray Plug Has Some Improvements

The V-Ray spark-plug, Fig. 6, made by the V-Ray Company, Marshalltown, Ia., differs from other plugs principally by the formation of the insulation. The latter issues from the shell into the cylinder without any clearance in which deposits of carbon and oil may form; the insulation is formed of lava for the lower part and mica for the top. The electrodes are of Bokers Meteor wire and four negative electrodes are arranged around a positive one. The plug has a wide shoulder, calling for the use of a packing to insure perfect tightness.

Kingston Plugs Unchanged

The Kokomo Electric Company, Kokomo, Ind., continues its line of Kingston spark-plugs without a change. These plugs are made in three sizes and are formed with stout mica insulations and shells and electrodes of conventional design.

Monarch Plugs of Two Types

Two principles of design are used in the plugs shown by the Benford Manufacturing Company, Mount Vernon, N. Y. The porcelain types are made with insulations fashioned much like those used in the majority of plugs and the electrode design is also the common sort, consisting of a single point extending from the shell to the central electrode. The magneto plug, so called, uses mica for the insulation and the positive electrode is formed as a star giving eight sparking points.

Pittsfield Insulation of Porcelain

The Western Electric Company continues its spark-plugs with few changes. All plugs may now be obtained with porcelain insulation instead of mica, which was the universal equipment before. Furthermore, single or multiple sparking points may be obtained with any type of plug. There is also a combination plug, combining the use of porcelain and mica for the covering of positive electrode.

Splitdorf—New Form of Electrode

Two minor changes have been introduced by the Splitdorf Electrical Company, Newark, N. J., in its spark-plug line. The principal one is the new form of electrode used on the standard plug. This was formed last year as a point projecting horizontally from the shell toward the positive electrode, while now it is shaped as a bridge extending from two diametrically opposite points of the shell periphery toward the positive sparking point, being arched around it, so that more sparking positions become available. This results in a series of sparks reciprocating from one side to the other, a desirable practice according to many experts. Another refinement of the standard plug is the use of a combination terminal screw, Fig. 9, which permits the use of a Rajah, Hedstrom, wire or punched sheet metal terminal. Otherwise the line of plugs, which includes the Standard, Metric and Common Sense designs, has not been changed.

Mac-Kae Blitz Spark-Plug

The Randall-Faichney Company, Boston, Mass., maker of the Jericho horn, handles the Mac-Kae Blitz spark-plug which is made with a combination insulation, an inner coat of mica and an outer one of porcelain protecting the positive electrode. The mica is designed primarily for the purpose of electrical insulation, while the porcelain protects it against moisture and oil. Tightness between the shoulder of the porcelain and the shell and bushing is insured by a copper gasket. The electrodes are designed as seen in Fig. 4 and are platinum-iridium plated.

Two H M S Types of Plugs

The H M S plug, Fig. 15, of the Hartford Machine Screw Company, Hartford, Conn., is being made in two types this year, the former type having been continued with the only change being the use of a steel bushing instead of the brass bushing of 1912. The new model, like the old one, is a porcelain-insulated type, the porcelain being conical in shape, while in the old type it is formed in such a way as to justify the name of the plug, namely, petticoat type. The electrodes are conventional in form.

Best Plug Has Button Electrode

The Best Ignition Equipment Company, New York City, makes the same type of plug which it has manufactured during 1912. In this plug the end of the positive electrode is formed as a button which acts also as a condenser and from which the spark jumps to a ring-shaped attachment of the shell, which serves as negative electrode. A detail of the construction worthy of mention is a helical spring which presses a nut washer against a lock nut on the end of the positive terminal, whereby the wire from the magneto is held tightly in place.

Jeffery-Dewitt's Novelties

Among the three spark plugs made by the Jeffery-Dewitt Company, Detroit, Mich., are three new types of plug—the visible-spark, heavy-duty and two-point plugs. The first type, not shown here, has a small, glass-incased gap interposed in the circuit, between the terminal nut and the sparking end of the positive electrode, which shows a spark whenever the circuit is closed. When a plug misses the gap shows no spark, thereby indicating the plug being foul. The heavy-duty plug is distinguished by the stout porcelain insulation making the plug, which otherwise is built along standard Jeffery-Dewitt lines, specially suitable for truck work. Finally, the two-point plug is adaptable for dual or double ignition, containing two positive electrodes which are connected to battery and magneto respectively. Depending on the system, either point may be used if dual ignition is the equipment, while with double ignition both electrodes operate, giving two sparks for every cylinder with but one set of plugs; the latter are made in standard threads and interchangeable with other spark plugs.

Bull's Eye Plugs Continued.

A visible spark feature plug is manufactured by the G. C. Blickensderfer Manufacturing Company, Stamford, Conn., under the name of Bull's-Eye. This plug is distinguished by the specially shaped shell, and has two glass windows at two opposite points of the shell, behind which visible gaps are in place. By means of this construction a blue light is radiated from the plug whenever it is firing, while, if it is foul, the windows are dark, indicating which plug is missing.

AC Plugs Make Up Wide Line

The Champion Ignition Company, Flint, Mich., offers a variety of spark plugs for 1913, consisting of the former models and several new types. The special Ford plug, Fig. 2, consists of a conical porcelain insulation, a brass bushing and steel shell specially threaded to fit into a Ford Model T cylinder. The electrodes are of wire, the positive being straight and fitted into the insulation in a conventional manner, while the negative is bent as in Fig. 2. The priming plug has its shoulder formed with a priming attachment, bored with a fuel passage which connects with a vertical bore through the shell, ending in the vertical tube arranged close to the negative electrode. All A C plugs are insulated with porcelain.

Champion Priming Spark-Plug

A priming plug constitutes also the leader of the line of the Champion Spark Plug Company, Toledo, O., being shown in Fig. 10. This porcelain insulated plug is formed with an inclined lateral shoulder bored and threaded internally so as to permit of inserting in it the priming cup, the end of which is formed as a needle. When the cup is screwed tight in the seat the needle closes the passage for the fuel which otherwise drips down as shown. The porcelain is so formed as to provide a primary combustion chamber around it, which makes the ignition of the priming fuel easy.

Wright Plug Continues Unchanged

Stevens & Company continue the Wright spark-plug without any change. The plug, Fig. 5, includes a conventional electrode design and a copper packing ring between the shell and the bushing. The insulation is of mica, East Indian material being used for the lower and South Dakota mica for the upper portion of the insulation.

Janney Steinmetz Flash Light

Janney, Steinmetz & Company, Philadelphia, Pa., make the Flash Light plug, Fig. 22. This plug is of the porcelain insulation type, this part being wrought heavily and with ample clearance between electrode and insulating material. The electrodes, both positive and negative, are made of platinum-covered steel wire and all parts of the spark plug are designed on such a scale as to produce a heavy-duty product capable of withstanding severe strains.

Mezger Soot-proof Spark-Plug

Under the name of the Soot-Proof spark plug the C. A. Mezger Company, Inc., New York City, manufactures a product distinguished from all other plugs by the form of the porcelain insulation. The latter is formed with a shoulder and a wide flare extending back into it at the lower side, so that there remains a considerable distance between positive electrode and porcelain. By this expedient sooting of the plug is averted, as a carbon deposit between electrode and porcelain would offer more resistance to the current than the air gap between the point and the negative electrode. The joints are kept tight by means of copper gaskets.

Disco Acetylene Starter Plug

The Ignition Starter Company, Detroit, Mich., brought out an acetylene starter plug during 1912. This plug, Fig. 7, is formed with a specially shaped shell. The latter has a vertical bore opening adjacent the spark gap and communicating with a laterally extending tube in the upper part of the shell which may be connected to the distributer valve of an acetylene starter. The insulation is porcelain.

Charles E. Miller Special Plug

Charles E. Miller, New York City, is having manufactured a special spark plug for his business. This plug is designed along conventional lines, consisting of a steel shell and bushing, a porcelain insulation, alloy steel wire electrodes and a terminal screw shaped in Fig. 20. The plug is said to be manufactured in large quantities and will be ready shortly.

Wasting Current in Garages

Among the principal items of garage overhead expense is the light bill. Anything that serves to reduce this expense must prove a great help to the garage operator, whose profits are, at any rate, limited. As in the garage and repair shops incandescent lamps installed as drop lights are used mostly, a great waste in their application is encountered. The fact is that it is very comfortable to light a drop light, as well as to pull the chain in order to turn it out; but few people think of the second act of the play and the lamp consumes electricity long after he who turned it on has ceased requiring it. Sometimes lights are burning for hours without any purpose and unnoticed by any one. It would pay for the garage owner to employ a boy for the express purpose of looking after the lights and see that tools after use are returned to their proper places. Furthermore, such a boy could give the men a hand, at least to the extent of procuring the tools, etc., which they require during their work, and the saving of the skilled men's time would almost pay for all of the boy's work. The owner of any fairly large garage who takes the trouble to inspect his establishment regularly with a view of verifying the above statement on the waste-light question will find that in many cases the saving of unnecessarily used current would more than pay for a boy's wages. Almost the same may be said for the lost motion incurred by men working around the garage and on cars, who often leave their work for 10 or more minutes to do some small job which might as well be done by a boy of 13 or 15 years. It is obvious that such a waste of labor is among the most serious influences which make for inefficient and uneconomic garage management.

—

The present practice for compression pressure in the modern touring car averages about 65 pounds to the square inch, cold. There are some cars, however, which run as high as 85 and 90, although it is very undesirable to go quite as high as the latter figure in a small or medium-powered car used for touring purposes. If your compression is above 85 pounds it would be well to reduce it. Take your compression, however, by gauge, which could be inserted in the spark-plug aperture, rather by attempting to determine it by volumetric computation.

Running with a rich mixture is a prolific cause of carbon trouble. Try cutting down the gasoline a little on your carbureter.

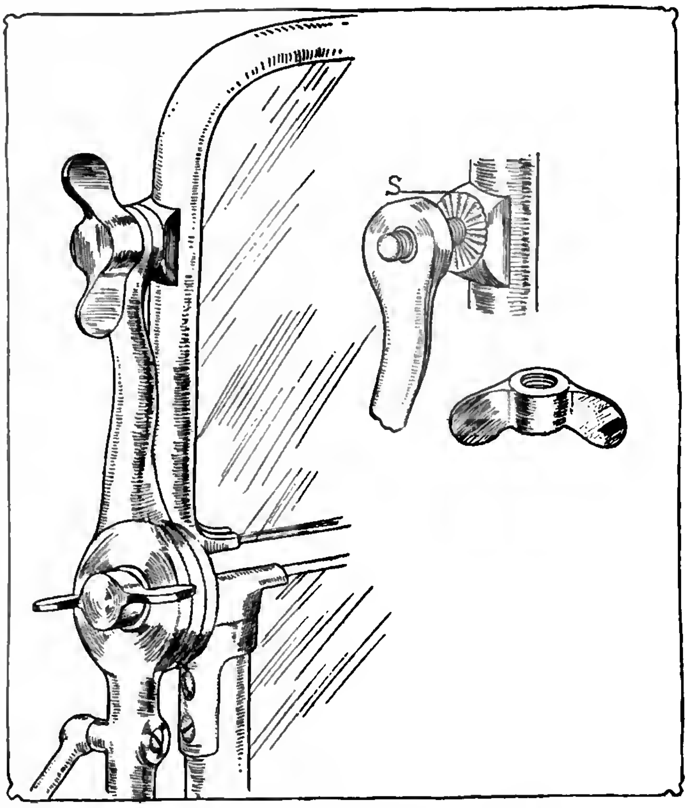

Fig. 3—Cox two-pane shield and joint design

Windshields at Show

Devices seen at the Garden and Palace show many new features which make for ease of operation and effective protection of the driver against air currents rushing against the traveling car. Heavy glass panes held in metal frames capable of varied adjustment constitute the majority of types, although flexible or elastic designs are also in evidence. Improvements tend to make the shields useful under any conditions, especially in inclement weather.

WINDSHIELDS seen at the Palace and Garden shows constituted by no means a complete exhibit of the products manufactured in this branch of the accessory industry. As a matter of fact the number of windshields exhibitors was small and the goods shown, therefore, far too sporadic to be truly representative of practice. This becomes very clear when one considers that fully four score manufacturers make windshields of some design or other, while less than half a dozen of these makers were represented at the show.

The exhibits formed, nevertheless, what might be termed an illustration of the manufacturing trend in windshields. They showed that in designing these accessories the producers always carry in mind certain ideas which tend to make the working of the shield easier and the shields themselves more effective than before. As several of the shields shown are designs which have continued without changes for 2 or 3 years a comparison of these products with the latest designs afford an excellent opportunity of studying just what changes windshield designs are undergoing and what specific ideas the makers endeavor to incorporate in their wares.

The advantages which are being striven toward seem to be great flexibility, more secure attachment, ample protection in combination with the directing of a slow air current toward the driver, perfect transparency of the shield at all times and strength of all parts to reduce the probability of breakage.

Taking up in turn these requirements it is interesting to note how they are being met at present by various designers of windshields.

1. **Flexibility**—While a year ago there seemed to be a decided trend toward the elastic shield made of celluloid or a similar material, glass seems now to have regained its former reigning position. Instead of making the transparent material flexible the makers seem to prefer, in most cases, the use of a number of rigid plates held in individual frame sections, which are individually movable and make possible the use of a variety of positions of the shield. Two and three-pane shields are appearing, in which the individual plates and their frames are connected by specially constructed joints, the latter being so designed as to permit the holding of a pane in four, eight or more positions. The joints themselves are supported on vertical and inclined rods, through which the whole shield or part of it may be shifted forward or backward, giving the possibility of a rain-vision arrangement of the plates.

2. **Secure Attachment**—This condition is fulfilled by the aforementioned vertical and inclined rods or struts. Each of the latter, namely, the inclined, is attached at one end to a shield side support and at the other to the floorboard of the car in such a way that the length of strut between the floor and the vertical side member may be lengthened or shortened to give the above referred to flexibility. Tight adjustment is obtained by various simple mechanical devices.

3. **Protection**—While the protection given by the elastic, curved windshield lies in the deflecting of the air currents above the head of the driver the glass shield achieves this end in a different manner. With multiple pane shields the upper pane is either vertical or slightly inclined so that practically all the air met is caught on its surface, striking the latter under an almost right angle and exerting a considerable pressure on the entire glass surface. The latter must therefore be substantially mounted, more so than the elastic shield, and this is done by the metal rods mentioned under 2. To obtain some ventilation for the passengers of the front seats the upper, and, in some cases, also the lower panes are movable and a little air is permitted to enter between both panes, and this

air being distributed all through the front compartment of the tonneau gives ample and pleasant ventilation.

4. **Transparency**—It stands to reason that the protection given by the shield must not be balanced by the evil effects of an impaired vision on the part of the driver. Especially in rainy weather it is a problem to keep the shield clear in front of the driver, and special windshield cleansers have been designed by various companies to remove moisture from the surface with one movement of the hand.

5. **Strength of Parts**—Multi-pane windshields are made of brass or steel rods and heavy plate glass. The latter feature is necessitated by the fact that every windshield is now and then struck with hard or soft objects and must be strong enough to withstand a moderate blow. Of course, plain glass cannot stand a collision with a metal or stone object at high speed, and though laboratory experiments have demonstrated wire-reinforced glass to be much better adapted for windshield requirements than plain glass not a single shield seen at the exhibition showed the adaptation of this knowledge. With flexible or elastic designs strength is not half so great a problem as in the case of glass models. Leather and metal strips afford the necessary rigidity and no more.

Individual Shield Makers

Coming to the specific exhibits the Cox Brass Manufacturing Company, Albany, N. Y., has seven different shields. All of these are of the metal-glass class, and two original designs are shown in Figs. 1 and 3. The first is a one-pane model which attaches to the dash and is adapted to swing forward with its lower edge, opposite movement being prevented by the upward projection of the base beam shown in cross section. The frame of the pane is of round section and is held in place by two grip members each attached to a joint J. The latter is a friction joint, the internal member of which may be turned after loosening the wing nut which holds the surrounding annular shoe tight upon it. The wing nut W holds the upright side arm in positive relation to the inclined strut and the horizontal base member of the shield, the arm ending in a flat ring, both sides of which are fashioned with ratchet faces and engage similarly shaped faces on the ring attachments of strut and base. The model, Fig. 3, has two panes, the lower of which remains stationary with a given length of the strut; the upper pane may be swung forward or backward by suitable adjustment of the vertical side arms, all joints being of the serrated or ratchet face type illustrated at S.

The Garage Equipment Manufacturing Company, Milwaukee, Wis., showed the shield, Fig. 4. The lower pane is held under an incline by the vertical strut, to the end of which a friction joint is fixed; a friction-material ring between two metal rings, which are attached to the upper and lower panes respectively, constituting a friction joint. The knurled nut holds the metal and material rings in engagement.

Fig. 6 shows the Polson windshield, made by the Polson Manufacturing Company, Buffalo, N. Y., which is constructed in a manner entirely different from the foregoing designs. The frame of the shield consists of two upward side members which have right angles at their lower ends, through which they are attached by screws to the dashboard. Both the upper and lower panes are independently movable, through a full circular arc, around their pivot joints. The latter consist of friction plates, as illustrated in the case of the shield, Fig. 4. Each pane is held in round-section frame arms, surrounding it on three sides, and the upper edge of the lower pane, as well as the lower edge of the upper, are free from metal, making a clear contact when both panes are vertical.

The only elastic shield seen at the show was the Perfecto, made by the Perfecto Wind Deflector Company, Boston, Mass. This shield consists of celluloid C slightly concave when seen from the front and reinforced at the edges by metal rods. The side edges are attached to leather strips by wing nuts T, Fig. 2, passing through eyes in the leather; the leather is part of the side element—there being two in every shield—and being secured to the car body by wing nuts as shown. A link L acts as a strut and holds the flexible side material tight and the celluloid shield in an approximately constant position.

Windshield cleaners for rainy weather were shown by the Emil Grossman Company, New York City, and the Gabriel Horn Manufacturing Company, Cleveland, O. The first device consists of a strip of so-called squeegee rubber clamped to a brass rod; the rod is movable along the shield by means of a split ring to which it is attached and which slides on the upper horizontal frame member. The Gabriel cleaner consists also of a rubber strip held in a longitudinal metal clamp and in contact with the glass pane. The upper end of the clamp is hinged to a split ring slidable on the top frame member; it may be turned around the hinge and moved over the glass surface by pulling a cable or cord suitably connected to the steering wheel or any other position desired.

Another novelty is the Tobey glare remover, Fig. 5, which is designed to protect the driver against the headlight glare of automobiles met on country roads. This device is a circular dark yellow glass plate attached to a rod and by the latter to a rubber-faced clamp which may be slipped over either a glass or metal edge. The device is so installed that when a car with glaring headlights is met with the driver bends his head slightly to the side and looks through the yellow glass.

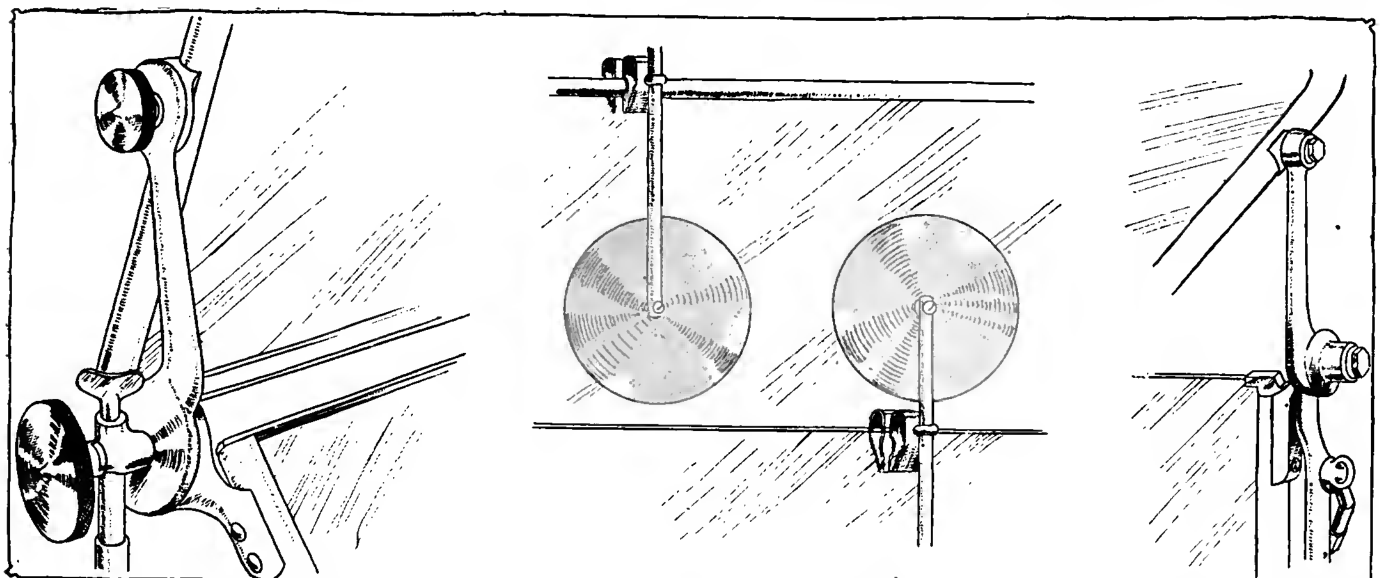

Fig. 4—Garage Equipment Manufacturing Company's shield. Fig. 5—Tobey headlight glare remover. Fig. 6—Polson two-pane windshield

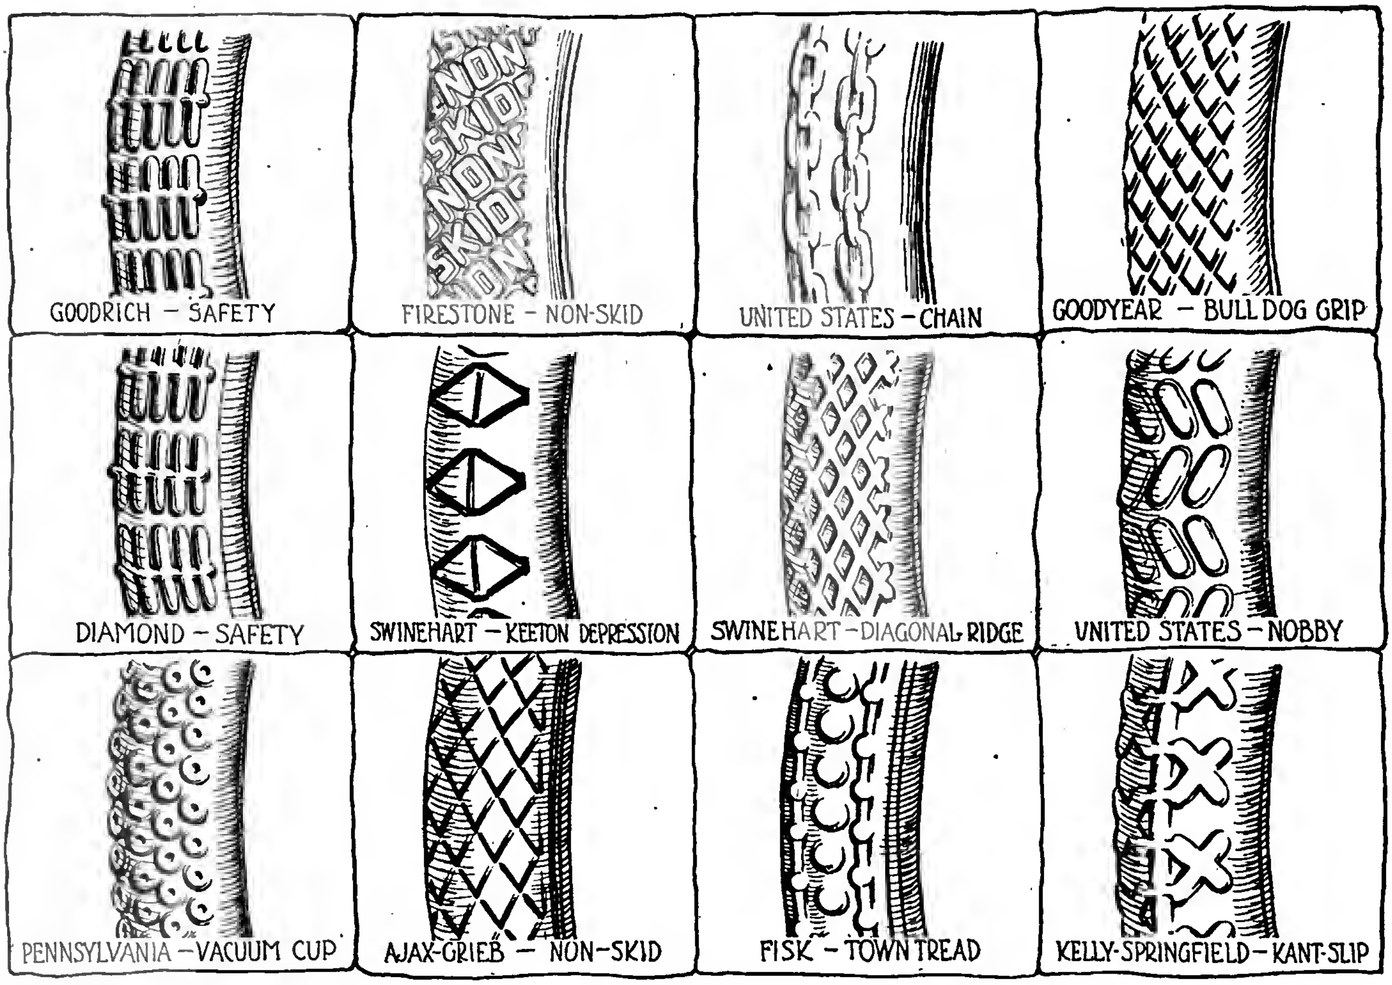


A dozen leading types of anti-skid tires for the present motoring season

Tire Progress Shown by Anti-Skid Treads

The progress of pneumatic tires during the year consists largely in the production of anti-skid tread types and in the manufacture of special pneumatics for electric passenger vehicles. There are over a score of different types of anti-skid treads now on the market by important tire builders and nearly as many more by tire makers of local territories.

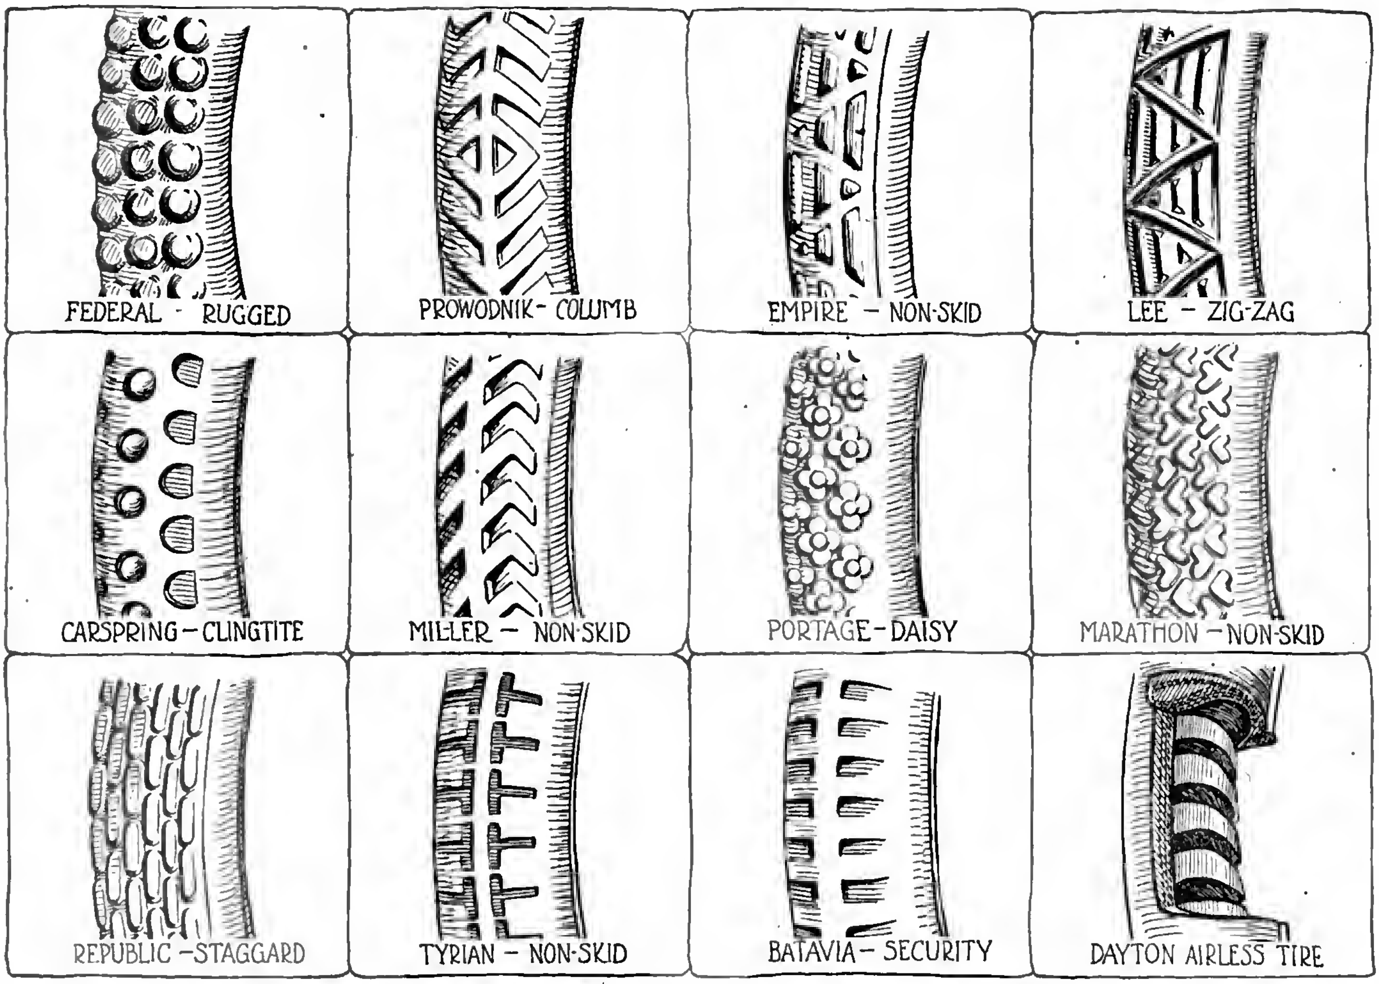
HOW many motorists keep a tire mileage book? Unfortunately, very few. The book must be kept by the chauffeur, or rather should be, and where there is one driver who will take the trouble to keep tab on tire expense, there are 99 who will not take the trouble. The tire mileage book will tell its tale, and if one takes the trouble to turn back the pages several years and compare the average mileage then with that obtained at the present day it will be immediately apparent that tires have very much improved.

From a superficial inspection of the pneumatic tires themselves very little would be learned. Process of manufacture and experience in choosing the right materials are the keynotes of the success.

The tread of the tire has received more attention than any other part during the last year, and in a few words this situation resolves itself into one of types of treads. Treads may be subdivided into two classes: first, where the design is, so speak, superimposed upon the main tread and, secondly, where the tread is indented so that a vacuum is created between the road bed and the tire and as soon as the tire starts to roll or skid, the sharp edges of the incisions reduce slipping to a minimum. In both cases there is an additional thickness in the tread than in the case of the plain round-tread tire, affording greater wearing surface and consequently increased tire life.

There is a growing tendency among the majority of owners to take advantage of the oversize standard tires that are manufactured by nearly every maker of repute. When the car is delivered by the makers, it is usually fitted with one of the standard size rims and tires of a corresponding size, but after the first set of tires have worn out, replacements are generally made by substituting for the worn tires others of oversize dimensions. Many people puzzle their brains to remember what the oversize standard is for some particular make. There is a simple rule which is not hard to remember, namely, by adding 1 inch to the diameter and .5-inch to the width of any standard size tire, one obtains the size of the oversize tire that will fit the standard rim.

The question of loss of power or absorption of energy in tires of different makes has stimulated makers to study the tire question from a different angle. The electric vehicle has been in a measure responsible for this and there are quite a number of makers of regular pneumatic tires who have turned their attention in this direction. The speed of the electric is nothing like that of the gasoline vehicle under normal conditions, and consequently the tires for the former type do not have to be so robust. Resiliency is the word that is usually employed to



Another dozen types of anti-skid tires for the present motoring season

describe a tire that is capable of absorbing part of the road shocks instead of imparting them through the mechanism of the vehicle. By making tires more resilient it is claimed that the current consumption of an electric car can be reduced by 25 per cent. If this is true, and official tests prove that it is, there is no reason why the power of a gasoline vehicle cannot be increased at the road surface or the same power that is now expended can be obtained with a reduction in the gasoline consumption. From the foregoing remarks it would appear that there is still scope for tire makers to increase the resiliency of their tires without reducing the wearing qualities. Of course, if the resiliency were left as it is and the lasting qualities increased the same results would be accomplished as by the other means.

Many of the tire companies which have had a type of non-skidding tread in the past and which have been satisfied with the results have continued the manufacture without any modifications. Among these may be mentioned the United States Nobby tread, the Firestone with the embossed lettering. Goodyear and Ajax with rectangular corrugations and the Republic Staggard tread. The fore-runner of the different treads to be found at present was undoubtedly the Bailey, and this type is still listed by many makers.

Many new designs of tread surfaces have been evolved during the last year or so. It would be impossible to enumerate all of these, but among them are the Vacuum cup, Safety and Chain types.

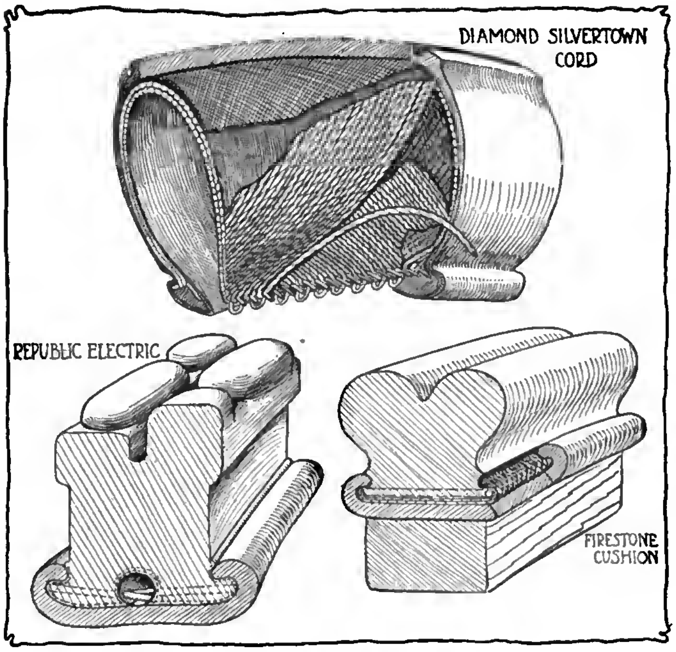
A type of tire that has earned a good reputation, owing to its freedom from rim cuts, namely, the straight sided tire, is being listed for the first time by several makers. Another type of tire that is not new, but which is receiving more prominence this year, may be cited as practically the only thing new in pneumatic tires. This is the cord tire. It consists of a series of cross strands of rubberized cord used where the conventional layers of duck or, as it is more often termed, fabric, are usually employed.

Goodrich—New Safety Tread

In addition to the regular line of plain tread, Bailey tread and metal studded non-skid tires the B. F. Goodrich Company, Akron, O., has placed a new type of tire on the market in the form of the Safety tread tire. A view of this tread is shown in Fig. 1. It consists of a series of five bars of rubber running parallel with the circumference of the tire, each series of bars being intersected in the middle by a single bar placed at right angles to the others. A suction effect is produced as the tire passes over wet ground and the numerous projections grip the roadbed, thereby preventing undue slipping. Another new tire made by this company is the Goodrich cord for electrics. Most types of tires may be had this year with a straight-sided bead.

Diamond—New Squeegee

A tire with a new tread was brought out by the Diamond Rubber Company, Akron, O., during the latter part of last year and forms one of the features of this year's line. The tread is known as the Diamond Safety Tread or Squeegee and is similar to that described above made by the Goodrich Company. The tire was first brought out by the Diamond Company. The tire is convex, and provided the correct pressure is maintained only three of the bars contact with the ground under normal running conditions until such time as the tread has worn down sufficiently to allow the two outside to come into contact. In going round a corner the tire is usually caused to bulge in the opposite direction to which the turn is being made, and this action *per se* brings the outside



Three 1913 tire types

bar into contact with the road surface and arrests skidding action. The Diamond Silvertown Cord tire is built up of a series of cord strands instead of fabric. Each strand of cord is composed of many finer units or strands thoroughly impregnated with rubber solution. The bead has a series of wire hooks and with the aid of special machines the cord is passed over a layer of coated fabric at an angle of 45 degrees to a cross-section of the tire. The machine regulates the tension of the cord rendering it uniform throughout. After the first layer of cord has been applied a layer of rubber is placed over it to separate the first layer from the second. This latter is applied in a similar manner to the first, only in the opposite direction. For example, if the first layer is applied from right to left the second layer runs from left to right crossing the first at right angles. The second layer of cord is covered with a sheet of pure rubber, which in turn is encircled with a layer of fabric acting as a breaker strip. The tread is then applied, after which the bead is put on.

A new composition known as Vitalized Rubber is being employed by the Diamond company this year and is being used in the treads of tires of this make.

Pennsylvania—Vacuum Cup Tread

The distinctive feature of these tires made by the Pennsylvania Rubber Company, Jeanette, Pa., is the form of tread employed known as the Vacuum Cup tread, Fig. 1. The entire tread is encircled with four rows of circulars protrusions with hollow hemispherical cores. As these pass over the road surface while the car is in motion each cup forms a suction grip. The suction action has no retarding effect, as the edge of each cup is automatically raised edgewise and its hold released by the rolling of the wheel.

A new departure in tire making was recently introduced by this concern by oil-proofing the treads of these tires. It is claimed that by a special compound a tread has been developed that is oil-proof.

Firestone—Adds Electric Tire

There is nothing new in the way of gasoline pneumatic tires being offered by the Firestone Tire & Rubber Company for the coming season. The non-skid tread with the words Non-Skid embossed forms a series of angular projections, increasing traction and preventing skidding.

A new Firestone clincher cushion tire for electrics is the latest addition to this product. A feature of this tire apart from any other is that it can be fitted to any ordinary standard clincher rim without alteration. The tire has somewhat the appearance of a dual tire with a single base, Fig. 3. The outer portion of the tire is built with an overhang and the base is of the same resilient compound as the tread. The dual tread, by means of the cut-in center, allows the rubber that is displaced when passing over obstructions free expansion. It is claimed that when the tire moves sideways in beginning a side skid the outer of the two treads rubs the moisture from the road surface, permitting the second tread to obtain a grip upon a dry place and thus prevent the skid. Further, the curved-in section creates a suction upon the roadbed.

Goodyear—Continues Bulldog Grip

The Goodyear Tire & Rubber Company is continuing the type of tread known as the Bulldog grip, which was placed on the market in 1911. It consists of a series of deep cuts in the tread forming a large number of diamond shaped blocks—Fig. 1. These present to the road surface countless edges and angles, facing in every direction. Each of the blocks widens out at the base, thus preventing any possibility of tearing loose.

The effect of widening the base is to evenly distribute the load over the entire width of the tread that contacts with the road. The non-skid tread is separate from the regular tread and is vulcanized over the latter. It is claimed that the passage of air through the corrugations of the tread assist in keeping the tire cool. A feature of Goodyear tires is the straight-sided bead which prevents rim cuts, at the same time affording increased air capacity. Goodyear tires are 10 per cent. oversize and a double cure process is employed in their manufacture.

Republic—Adds Staggard Electric Tire

These tires have undergone no material change during the last year and are manufactured either in plain tread or with a non-skid tread. A new electric tire has been added to the line known as the Republic solid staggard electric tire. Fig. 3. The studs on the tread are so arranged that the intervals between the studs in one row come exactly opposite the studs of the adjoining row. There is a deep depression or groove between the two lines of studs increasing the elasticity of the tire. This type of tire will fit any clincher or quick-detachable rim. Cross wires are inserted in the base, to prevent the tire from creeping or pulling off. They are made in four sizes.

United States—Three Types of Tread

United States tires for gasoline cars are manufactured with three types of treads; namely, plain, Nobby and Chain. The Nobby tread is too well known to need much explanation. It consists of a series of protrusions on the tread, three in a row, and placed alternately at opposing angles; that is to say, the knobs in one row run from left to right and the next row face in the opposite direction, Fig. 1. The effectiveness of the all-rubber non-skid tires is proportionate to the life of the raised sections and if these are high enough to offer broken contact to the road surface after several thousand miles running there is no reason why the effectiveness of the non-skidding properties should not remain.

A new tread in the form of a double chain encircling the tread was placed on the market last year. As the name Chain tread implies the new idea is an adaptation of the chain to pneumatic tire construction, Fig. 1. Additional traction is obtained and the links create suction upon wet surfaces, minimizing skidding. The protrusions of rubber which form the chains also offer lateral resistance besides affording additional wearing surface to the tire.

A special electric tire has recently been placed upon the market known as the United States special electric tire, for which greater resiliency is claimed. The fabric or inner framework, instead of heing made from square closely woven fabric, consists of plies of parallel cords entirely separated from one another by cushion rubber so arranged that each assumes its due proportion of the strain when the tire is in service. This in a measure allows the tire to absorb the obstructions of the road instead of repelling them and causing the wheel to be lifted. These tires are being made in a number of sizes and with plain round, Nobby and Chain treads.

Swinehart—Keeton Depression Added

The latest addition to the Swinehart line of pneumatic tires is the Swinehart non-skid tread, Keeton Depression type, Fig. 1. The tread is composed of a series of rectangular indentions in the tire with the corners squared and cut in half by a further indention. Triangular shaped blocks are thus formed with their apex toward the outside of the tread. No matter in whichever direction the tire is moving there are always a considerable number of sharp edges to prevent any slippage. The diagonal ridge type of tread is also manufactured. All Swinehart tires are wrapped tread and of two cure construction.

Fisk—Adds Town Tread

The latest addition to the Fisk line of tires is the Town Tread type. The other types have been continued, including the bolted-on type. The new Town Tread consists of a plain tread with rows of circular protrusions. In the center of the tread the disks are large and are not connected in any way. On either side there are rows of smaller disks, succeeding disks being connected with a rubber bridge, Fig. 1. The outer rows of disks are smaller than the center row. There are two ridges running circumferentially around the tire outside the smaller rows of disks. These ridges do not normally form part of the tread except when rounding a corner or when through a tendency to slip the tire is bulged sidewise.

Ajax—Rectangular Corrugations

The tread of the Ajax non-skid manufactured by the Ajax-Grieb Rubber Company, Trenton, N. J., consists of raised, beveled rectangular corrugations. Besides aiding traction on any road surface the numerous points of contact are of material aid in pulling a car out of bad places. The corrugations and their inter-spaces create a suction upon the road surface, while the tire is moving, thereby minimizing the possibility of slipping on wet roads. Straight-sided tires are beng manufactured for the first time this year. Another feature of these tires is that they are guaranteed for 5000 miles.

Kelly-Springfield—Kant-Slip Tread

The name given to the non-skid tread tire made by the Kelly-Springfield Tire Company, Akron, O., is Kant-Slip, Fig. 1. There is a central ridge running circumferentially around the tire and at either side there are rows of crosses, the sides of which contact with the center ridge, thus forming triangular depressions. These exercise suction upon the road surface, besides offering a large number of sharp protrusions in the event of any tendency to skid.

Michelin—Continues Semelle

The Michelin Tire Company, Milltown, N. J., continues the Semelle anti-skidding tread in which the prevention of side-skid is obtained by the use of flat-headed steel rivets. The tire consists of an ordinary pneumatic casing, identical with the plain Michelin fabric and rubber design, but differing from it by the tread. The latter is of leather, through which a large number of flat-headed rivets pass, the legs of which are bifurcated and bent open on the other side of the leather. These rivets pass through several layers of leather and are held from coming loose by a rubber layer vulcanized to the leather over the bent ends of the rivets. Due to the large number of the small rivets—there are 460 in a 36 by 40-inch tire—the anti-skidding effect produced by them resembles that of a chain; with the difference, however, that the metal objects, which hold on to the ground, are in an infinitely more intimate contact with the tire proper than a chain may be. The work of the rivet-studded tire remains the same for practically all speeds.

Portage—Daisy Non-Skid

The Portage Rubber Company, Akron, O., besides making regular round-tread tires has placed on the market a non-skid type known as the Daisy Non-Skid Tread, Fig. 2. The name is indicative of the form of the tread. There are three rows of rubber protrusions in the form of daisies offering countless edges and angles to the road surface. The daisies are added as an extra tread to the regular smooth casing. Portage tubes are also manufactured and delivered in sealed boxes.

Tyrian—Hold-Tite Tread

These tires are manufactured by the Tyer Rubber Company, Andover, Mass. They are distinguished by a white rubber tread. A non-skid type, known as the Hold-Tite, Fig. 2, is made, the tread of which consists of two rows of capital T's running around the entire circumference of the tire. This forms a tread with a plain center, two rows of intersected indentions parallel to the tire and a series of cross indentions formed by the base of the letter T.

Federal—Four Tire Types

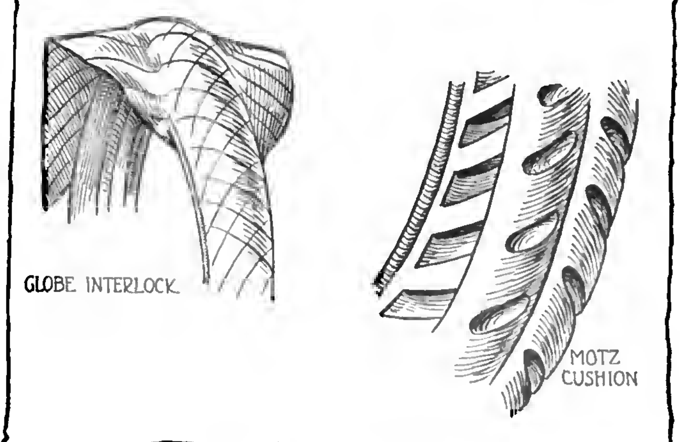
These tires are made in four types, by the Federal Rubber Manufacturing Company, Milwaukee, Wis. These are: The regular clincher round tread, quick-detachable round tread, straight sided detachable round tread and the Rugged non-skid tread. This latter, Fig. 2, consists of a series of large studs arranged parallel, three in a row, forming an integral part of the tread. These studs expand outwardly at the base, preventing them from tearing off under severe strains.

Globe Interlock

These tires are manufactured by the United & Globe Rubber Manufacturing Company, Trenton, N. J., and the principal point of difference between these rubber tires lies in the method of forming the carcass. Instead of wrapping the fabric circumferentially around the tire, strips of fabric are cut on the bias and laid diagonally across the body of the tire. Two layers of rubber-coated fabric are placed one upon the other, Fig. 4, thus forming intersecting strata, one ply running one way and the second in the opposite direction. The tire is made with either a plain or non-skid tread.

Dayton—Airless Tire

These tires are primarily intended to take the place of a pneumatic and perform in the same manner as a pneumatic only without the inconveniences of air. Externally the tire presents the appearance of an ordinary pneumatic, but instead of a tube the inside of the tire is built up of numerous sections



Two tire types for the present season

of rubber and straight cut fabric in the form of arch supports. These supports are spaced apart, so that when the tire passes over an obstruction, the rubber can be momentarily displaced and after passing the stone or rut resume its normal shape, the piers of rubber vulcanized to the casing becoming part and parcel of it, as can be seen in the illustration of a section in Fig. 2. These tires are manufactured by the Dayton Rubber Manufacturing Company, Dayton, O., with either plain or non-skid treads.

Empire—Uses Red Rubber

These tires are manufactured by the Empire Tire Company, Trenton, N. J., and are distinctive in appearance, being made from red rubber. The non-skid tread consists of four ribs, Fig. 2, running circumferentially around the tread of the tire and intersected at intervals by diagonal grooves. The grooves are zig-zagged so that the protrusions form a shape of a series of pyramids whose apexes alternate from one side to another. This concern also manufactures Peerless red tubes.

Motz—Electric Cushion Tire

The Motz Tire Rubber Company, Akron, O., manufactures a cushion tire especially adaptable to electrics. It is virtually a solid tire offering a dual profile to the road surface. In order to create a cushioning effect when going over road obstacles the sides of the tire are undercut slantwise, and the tread is of the tire is undercut at intervals to afford good traction and to prevent skidding. Increased surface contact is claimed for this tire.

Racine—New Trusty Tread

A new type of tread known as the Trusty has been placed upon the market by the Racine Rubber Company, Racine, Wis. It consists of three rows of elongated rubber studs, the center row being aligned with the circumference of the tire and the two outer rows being set irregularly so that the brakes between studs in the inner and outer rows do not come opposite each other.

Carspring—Introduces Clingtite

These tires are manufactured by the New Jersey Car Spring & Rubber Company, Jersey City, N. J., and are made in plain and anti-skid tread types. The Carspring anti-skid tread, known as the Clingtite tread, differs in many respects from others at present on the market. The tread is to all sense and purposes smooth with a series of holes indented at intervals, Fig. 2. The holes look as if a rubber ball were beneath them; that is to say the rubber comes to an apex in the center of the hole, tapering off to the sides. On either side of the row of holes there are a series of arches cut into the tread decreasing in depth from the point nearest the center of the tire. The center holes form a suction on the road and increase traction and the side slots or arches offer sharp edges to the road in the event of a slip. This concern also makes red inner tubes.

Miller—One-Cure Type

Miller tires are manufactured by the Miller Rubber Company, Akron, O., and the method employed is what is known as the one-cure, wrapped tread type. The wrapping of the fabric is effected by means of specially designed machinery and the final vulcanizing is carried on in live steam instead of molds. Besides the usual line of plain tread tires this concern makes the Miller non-skid, Fig. 2. The tread of the non-skid tire presents the appearance of two series of V's placed one over the other on either side of a center line. The apex of the V's on one side points in the direction in which the car is traveling, while those on the other side point in the opposite direction.

Batavia—Security Tread Continued

These tires are manufactured by the Batavia Rubber Company, Batavia, N. Y., in a variety of treads and beads. Among these may be mentioned the Security tread, Fig. 2. This consists of a series of corrugations or notches equidistantly spaced apart from a rib running circumferentially around the tire.

Favary—Mechanical Tire

This tire is made up of a series of rubber-coated bands of fabric spaced apart by small supports, the tread consisting of solid rubber. When an obstruction is encountered the supports beneath the layers of fabric move in such a manner as to allow the fabric to flex and thereby absorb the obstruction and giving the tire a degree of resiliency.

Brown Scientific Tubes—Extra-Thick

These tubes are manufactured by the Voorhees Rubber Manufacturing Company, Jersey City, N. J., and consist of a red rubber tube which has a layer of fabric running through the rubber at the point equivalent to the tread of the tire. This section of the tube is materially thickened. The fabric is non-elastic.

Interlock—Inner Tires

These inner tires consist of a series of layers of fabric vulcanized together, and placed inside of an ordinary outer casing between it and the inner tube. In order to prevent the inner tube from being pinched, the lining is made wider than the tire and the two edges lap one over the other. These have been improved and are now rubber coated externally.

Reason—Non-Blow-Out Inner Casing

This device consists of an interliner between the outer casing and the inner tube. As it takes up a certain amount of space inside the tire, a smaller inner tube than usual is used with it. In order to give the additional thickness a degree of elasticity, air pockets are introduced, forming cushions, the liner consists of two rows of rubber-coated fabric and one breaker strip a layer of white rubber in which there are a number of air cells. Between this layer of rubber and the inner tube there are two more layers of rubber-coated fabric.

Prowodnik—Non-Skid Columb

These tires are manufactured in Russia and handled in this country by the Russia Tire Sales Company, of New York City. A non-skid type known as the Columb, Fig. 2, consisting of a wide rubber ridge running around the center of the tread. This rim is supported by a number of ribs in the form of a herringbone. In order to insure equal traction and non-slipping properties the angles of the ribs alternate, that is to say several of the ribs face one direction followed by a series facing in the opposite direction.

Marathon—Angle Tread

Marathon tires are manufactured in round tread as well as angle non-skid treads by the Marathon Tire & Rubber Company, Cuyahoga Falls, O. The term Angle tread describes the type of tread employed. There are five rows of right angles, in the form of protrusions, above the surface of the tread as shown in Fig. 2, each successive row having the angle facing in the opposite direction.

Lee—Adds Lee Zig-Zag

In addition to the regular plain tread puncture-proof tire manufactured by the Lee Tire & Rubber Company, of Conshohocken, Pa., a non-skid tire has been added known as the Lee Zig-Zag. The puncture-proof device consists of three layers of circular disks, each layer overlapping the other and separated by a cushion of rubber. The new non-skid tread, as the name denotes, consists of protrusions passing diagonally around the tire from one side to the other, the spaces between the diagonal lines being partially filled with small projections increasing in size from the apex outwards, Fig. 2.

Shock Absorbers Show Improved Details

Friction, Spring and Dashpot Devices Mostly Unchanged and Number of New Apparatus Is Small

As in previous years, the large majority of shock absorbers produced operate on the friction principle, spring being used more frequently to act supplementary to the ordinary suspension, while dashpot designs are limited to expensive cars.

FEW new types of shock absorbers have appeared this year, although there have been several changes in existing types in order to make them more effective. The ideal absorber of road jars must dampen the great spring vibrations, but it must not perform this function at the expense of the resiliency of the springs. This difficulty has been experienced with earlier types, which, while they prevented big road inequalities from reaching the occupants of the car, had stiffened the spring action, taking from the suspension its smoothness and defeating the purpose for which it is intended.

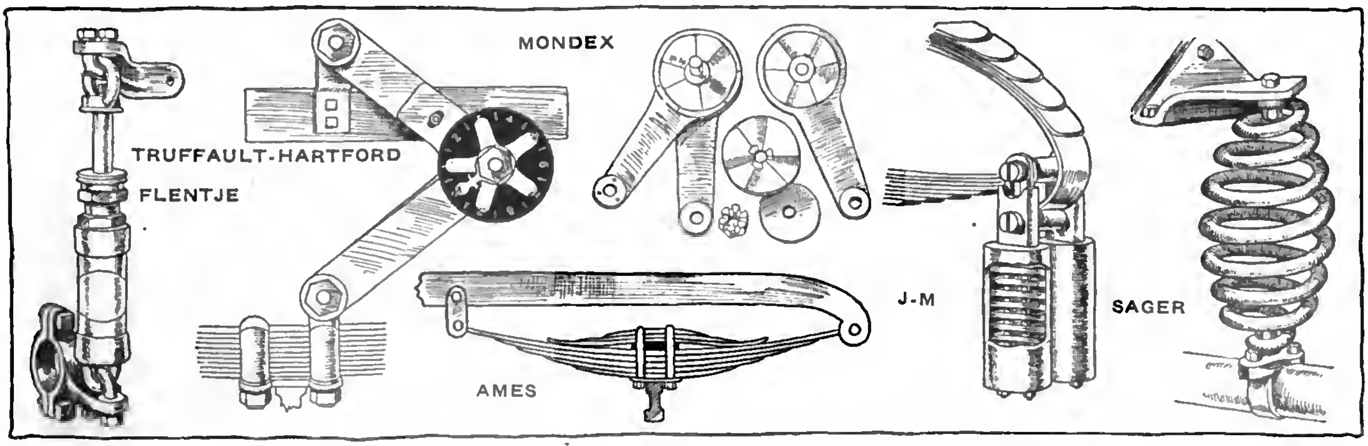
Shock absorbers generally operate on one of three principles, viz., friction, fluid resistance (dashpot action) or equalizer spring action. There are combinations of these various methods of operation. For instance, in one type both friction and spring action are utilized. Absorber makers have in the main designed their devices for application to all makes of cars, and have developed special brackets or other necessary attachment features to meet any conditions.

In lengthening the life of the automobile as well as in adding comfort for the passengers, some form of road equalizing arrangement is of great value. Many car manufacturers realize the part which shock absorbers play in the reduction of depreciation, and there is an increasing number of them who are fitting their cars with some form or other as standard equipment.

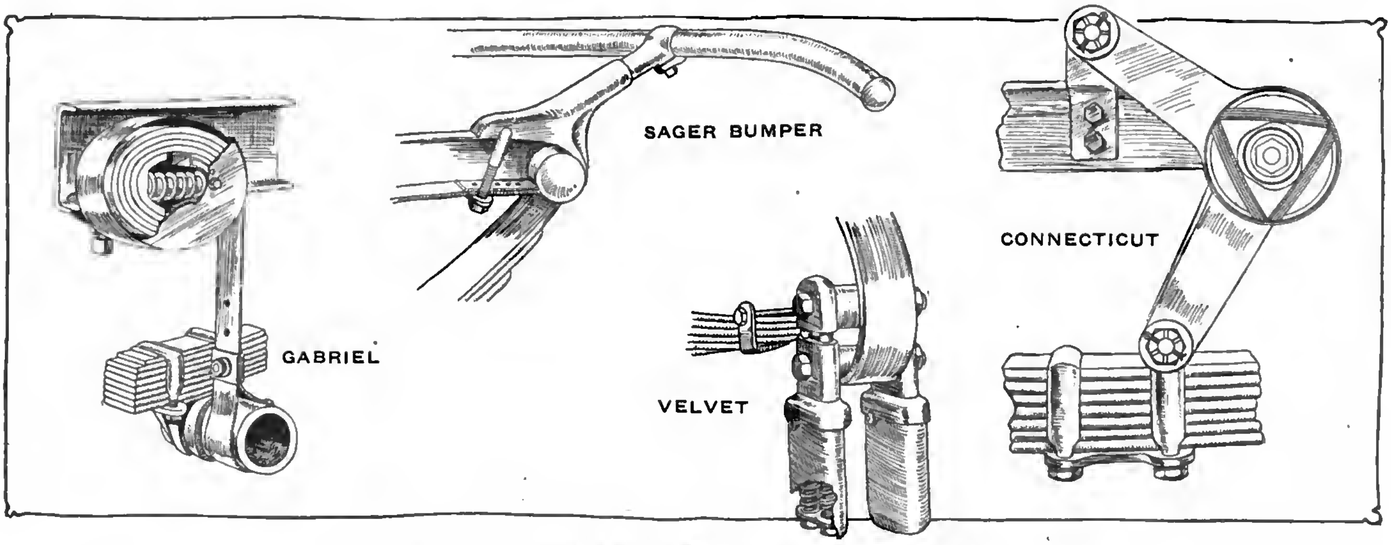
Truffault-Hartford—This shock absorber is of the scissors type, and consists of a single arm attached to the frame of the car and a double arm, frictionally jointed by a bolt and adjusting nut, as shown in the illustration. The upper arm works between the two parts of the lower, giving a straight up and down movement. The upper arm is made of spring steel and therefore allows for any side sway. This arm carries a flanged cover, forming a cup-like space on either side, in which spaces the friction plates are placed. Each of the friction plates is covered by a flanged steel disk which fits to the flanged cover and prevents dust and water from reaching the friction disks. A bolt carrying the friction adjusting nut holds the parts together. By tightening up on the nut any degree of friction is obtained, and the action of the shock absorber modified to produce soft or stiff suspension, in accordance with the wish of the car passengers or the driver.

The sketch shows the new Truffault-Hartford type, which is a refinement of the standard model. An auxiliary short arm has been inserted which follows the direction of the upper arm. It is placed between this upper arm and one of the friction disks. In its upper end, this short arm has a slot cut about 1 inch in length. A knob or projection from the upper main arm fits in this slot as shown. The idea of the new feature is to absorb small vibrations without in the least interfering with the resiliency of the springs. When the springs sink a small amount, the long arm descends a like amount and the metal projection slides down in the short arm slot. Since there is no friction between this short arm and the upper arm, they slide over each other and only one friction disk is brought into play, thus making for slight frictional resistance. But when the vibration is large, the upper arm is depressed a greater amount and its metal button finally reaches the end of the slot, when it moves the small arm also. This brings the outer disk which is in contact with the other side of the small arm into play, doubling the friction acting against the shock. Thus the frictional tension varies in proportion to the shock. In addition to the automatic model, there are four other sizes for different sizes of motor cars.

Mondex—This absorber is one of the scissors design. It is placed between the frame and the axle at the side, controlling the spring movement up and down. There is a single arm attaching to the frame, while a double arm is fixed to the axle. The lower arms are jointed one on either side of the upper arm. In the makeup of the joint of the two sets of arms, there is a series of inclined planes of high-carbon steel working against smooth brass. These ride upon one another on the wedge principle, thus expanding and contracting disks of firm resilient rubber. This rubber cushioning rapidly increases in resistance the further it is compressed, so that the magnitude of the shock is met by a corresponding resistance, it is claimed. The difference between the downward motion and the upward recoil of the spring is met by having a greater amount of rubber compression on the upward movement than on the downward. The illustration



Five types of shock absorbers designed to produce easy riding in 1913 cars



Four other shock absorber designs which have met with the public favor

shows the wedge disks and other parts which go into the makeup of the device.

Connecticut—The Connecticut is similar in outward appearance to the scissors types already mentioned, and it fastens to the car in much the same way. There is a single upper arm attached to the frame, while the lower part is in two sections. Referring to the sketch, it is seen that the working elements consist of a three-face cam working between three sets of flat springs of suitable tension to give the necessary resistance for different weights of cars. These springs are three to a set and placed in a triangle within the retaining shell or cup with an anti-friction material inserted between each cam face and its springs so as to minimize wear. The shell is packed with grease, which keeps the parts well lubricated. The case is made grease tight. When the arms are caused to close up in proportion to the road inequality, the cam is turned and presses put on the springs which resist an amount dependent upon the degree to which the axle is raised.

Gabriel Rebound Snubber—This shock absorbing device, which remains practically unchanged for this year, utilizes the friction principle. It does not work on the downward movement of the springs, but acts upon the rebound. The application of the device to the car and the internal construction are shown in the illustration. The snubber consists of a circular base split into two semi-circular parts around which a strap of fabric belting is wound four times. One of the halves of the base is stationary and is integral with the clamp which fastens the device to the car frame by means of two set screws. The other half of the base is free to move and is pushed outward by a coiled spring. This outward motion is opposed by the windings of belting. When the frame and axle come closer together than normally, the strap slackens and the spring expands to take up this slack. The coils must slip over one another to do this. But on the rebound when there is a tendency for axle and frame to get farther apart the belt is pulled and the coils tighten, increasing the friction between them in proportion to the pull. Thus the resistance to rebound is in relation to the severity of the shock. The device comes in models for all sizes of pleasure cars and trucks.

Sager—The Sager company offers a specially designed type of equalizing springs which dampen the excessive vibration of the main springs, and it is claimed for them that they do not destroy the resiliency of these main springs in any way. They are wound with the largest coil in the center and taper to the ends. The spring and its attachment to the frame and the axle is shown in the cut. In addition to these auxiliary springs, the concern makes all styles of bumpers for attachment to the front springs. One of these models is seen in the illustration. It is made of steel tubing and is adjustable for width. Concealed springs within the brackets take any shock to which the front cross tube is subjected.

J-M—Replacing the spring shackles at the rear of the car, the J-M shock absorber, which takes its name from the initials of Jacquet Maurel, a French mechanical engineer, consists essentially of a helical spring within a cylinder, which spring is compressed according to the amount of shock. The illustration shows the construction and mounting at the end of a three-quarter elliptic spring. The lower flat laminated spring end carries the cylindrical guide for the helical spring by means of the U-bolt passing to the bottom of the cylinder. This cylinder bottom also forms the seat of the helical spring. The end of the upper flat spring fastens to the head or piston, which rests on the coiled spring. The action of the device is self-evident, and in addition to absorbing shock it acts as a shackle to take care of the elongation of the laminated springs. The device is made with two coiled springs, as shown, or with a single coil for small cars. The latest type to be brought out is the model which is designed for the peculiar rear springs of the Ford car. This is a single coil type and is mounted upside down as compared to its usual application.

Velvet—The Velvet shock absorbing springs also take the place of the rigid steel shackles of the rear ends of the flat springs. They are simply resilient shackles. The construction is seen in the sketch as well as the attachment to the main springs. Each set consists of two pairs of helical springs on which the car weight rests. These are housed within the rectangular metal cases shown. Steel studs around which the helical springs are placed fasten to the lower part of the laminated spring. These studs carry plates held in place by nuts on which plates the coiled springs rest. The sliding sleeves to which the end of the upper part of the flat spring is bolted rest on the coiled springs. Compression of the main springs acts to compress these auxiliaries also, causing them to act as absorbers. The velvet springs are made in five sizes for various weights of cars.

Flentje—The Flentje is a cylinder and piston type of shock preventing apparatus, and is made for attachment to the axle at one end and the car frame at the other. The sketch herewith gives the outward appearance of the device, which is on the dashpot principle, similar to that used in connection with the valve operation of the Corliss type of engine. The Flentje consists essentially of a piston working within a cylinder, the former being attached to the frame and the latter to the axle. The piston is drilled with several holes or valves through which the mica and oil mixture, which fills the cylinder, may escape from above or below the piston depending on whether the piston is forced down or up. When a shock forces the piston down, it acts upon the liquid, which must escape through the piston holes, the resistance to flow increasing with the pressure exerted. When the spring recoil tends to draw the piston out of the cylinder the liquid is then above it and must be forced through the valves into the lower portion of the cylinder, the same fluid friction again acting as a compensating force against the recoil action. This is the principle of the device, although the details of the valves, etc., are somewhat complicated. The car weight is at all times suspended on the liquid cushion.

Westinghouse—The Westinghouse air spring, so called, is a device which is designed to be placed between the spring shackle and the frame. It consists essentially of two cylinders, one of which telescopes within the other. One of these is attached to the frame and the other to the spring shackle. Within the cylinders there is contained a volume of air normally at atmospheric pressure, and below this a certain quantity of oil. The lower cylinder is really a modification of the usual piston rod, and it carries a piston. The action of the device is similar to that of the dashpot. The car weight rests upon a fluid cushion, which consists of a quantity of air below which is the oil. Suitable valves are interposed which regulate the flow from the upper to the lower chamber or vice versa. After the air has been compressed a certain amount, the valves open and allow the oil to escape into the other chamber. Thus, when, due to the road inequalities, the axle is forced up nearer to the frame than normally, the tendency is to force the cylinders together. This serves to compress the air in to the top of the upper cylinder, the force being transmitted through the oil. When the air has been compressed somewhat, a valve opens, allowing it to escape into the lower chamber and permitting the oil to flow through the valves, the resistance to flow increasing with the pressure.

Ames—A new auxiliary spring shock absorbing device has appeared this year in the Ames, sketch of which is given. This spring is mounted directly on top of the lower main spring, and while it has no effect upon the resiliency of the main spring, it serves to smother the recoil vibrations. This device is a three-leaf affair, which bolts under the spring bolts, a metal block being interposed between the main spring and the oppositely-acting auxiliary leaves. When the main spring is normal, the ends of the longer leaf of the Ames spring are in contact with the upper leaf of the former. These leaves are not in engagement when the main spring is compressed, due to the use of the distance block. Thus the main spring vibrations are not imparted to the Ames device, which therefore tends to smother them when contact is again made on the recoil. The device is noteworthy for its simplicity.

Harking Back a Decade

FROM THE AUTOMOBILE for January 31, 1903:

So rapid is the progress of automobilism that principles which are laid down one day as established factors very soon become obsolete and have to be replaced by something more suitable to new and constantly changing requirements. Despite the wonderful development of the industry, it is far from having settled down on definite lines, and in striving at perfection manufacturers find themselves continually confronting new problems which lead them to unexpected issues.

In Pittsburgh there are 530 automobiles in use, of which 56 per cent, are used exclusively for pleasure parties, 40 per cent. for business and pleasure combined and 4 per cent. for commercial usage.

In 1759 Dr. Robinson, then a Glasgow student, talked about a wagon driven by steam and in 1772 Oliver Evans, of Philadelphia, actually did drive a wagon by steam, though the wagon was made for a boat, on the road, and in 1786 Evans tried to have the Pennsylvania Legislature give him a patent on steam wagons and did obtain a patent in that state on steam-driven flour mills and in 1787 the State of Maryland granted Evans an exclusive right to build steam wagons. Evans said then that he fully believed steam wagons to travel 15 miles an hour, or 300 miles in a day, and could carry passengers as well as goods; Most people thought Evans was crazy, of course.—Retrospect of the Steam Vehicle.

A novelty in after-dinner entertainments was sprung on the members of the Automobile Club of America and their guests on the occasion of the fourth annual dinner held at the Waldorf-Astoria recently. Between speeches a smart electric runabout came into the great banquet hall at a rate of speed that would have given a country constable palpitation of the heart.

"I don't claim that every man who runs an auto is a jackass, but I do claim that every jackass runs an auto. I run one myself."—Simeon Ford.

As a matter of fact, it is notorious that the drivers of horses are far more apt to be frightened than their beasts, and that when the horse takes fright it is commonly because he is notified by his sort of telepathy through the reins that the approaching object is to be feared. The driving public is in much more need of an education in this respect than the noble animal.—Editorial.

The feature of the annual report of the Secretary of Agriculture of Pennsylvania, John Hamilton, was the recommendation that $1,000,000 be appropriated for the construction and maintenance of concrete roads.

Express trains can dash across a public grade at the rate of 70 miles an hour and trolley cars can run at the rate of 30 miles an hour on a public highway for private gain, but an automobile, according to the government's idea, should not exceed 15 miles an hour.—New Jersey Drastic Law.

French visitors, of whom there were many, including well-known names among European manufacturers of cars and carriage bodies, must have been astonished at the vigorous prosecution of automobile designs not at all contenanced in their country.

Before the ladylike electric carriages of the various makes fair woman stepped with critical surveys of styles and upholstery, and the great improvement in design—mostly due to underslung batteries—probably did not escape them.

Descending to the level of male creatures, there is no more difficulty in picking out the centers of interest. They are grouped according to technical conviction, or perhaps more according to road experience, on the principle that he who paid full price for a spavined horse is likely to look out sharply for spavin, but, on the other hand, may be tripped again by weak kidneys or "thumps."

No doubt a large number of show visitors felt perfectly justified in declaring the cars here referred to the most interesting and promising in the whole display, especially as the Franklin and the Backus vehicles include a number of other highly original features, well worth studying. In the Backus car, for example, the ignition and the throttle are tied together for convenience in operation, but a special movement is introduced for increasing the dimensions of the valve parts, an accelerator, in other words—when full charges are required.

Magneto Field Well Stocked

Development Has Sought to Eliminate Vulnerable Points—Automatic and Fixed Control Gaining

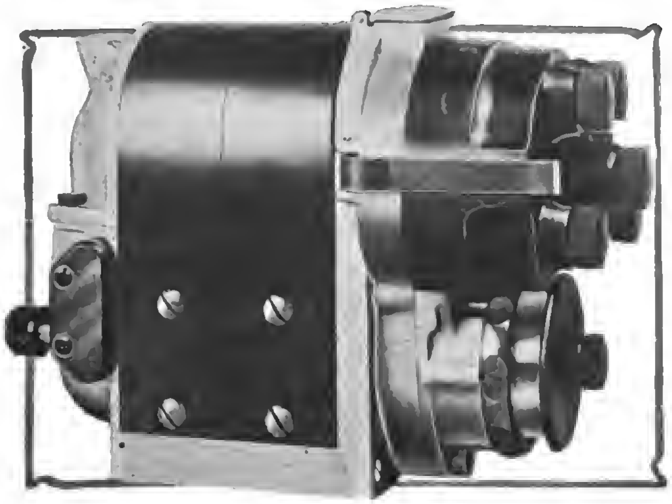


Fig. 1—The Bosch ZR 4 two-spark magneto which has a double distributer disk. The disk is held in position by two flat springs which have snap-on connection. The breaker-box cover has a bayonet lock catch, so that both of these parts are easily removable

SURVEYING the ignition field, development in general has sought to eliminate the vulnerable points, with the result that new types now appearing are a step further toward perfection. Radical changes are absent, but the big makers have tried to determine just where their instruments are weak, the principal aim being to eliminate the personal equation so far as possible in their manipulation.

Spark control has received considerable attention and in addition to the variable control, we now have fixed, automatic and governed methods of arriving at the proper time for exploding the several charges. The fixed-spark method has appeared on a number of cars, but its use is specially favored for trucks. For small motors this fixed ignition is well enough but it is doubtful if it is advantageous for large engines.

Automatic spark control is a system by which the spark is mechanically advanced or retarded, as the motor speed increases or decreases; while governed control is essentially the same as automatic up to a certain predetermined speed, above which the spark is not advanced further. This maximum point depends upon the motor in question.

Simplification of breaker box mechanisms by reducing the number of parts to the minimum is striven for with the result that the new instruments are much less liable to get out of order. Makers are also tending toward standardization of the parts which enter into the make-up of these breaker mechanisms, so that, where possible, the parts of all boxes are interchangeable.

The sturdier, lighter, more effective, more easily demountable and more readily attachable instrument of 1913 is in many cases also made water, dust and oilproof by the fitting of a protecting hood. This waterproofing is usually carried to the distributer connections as well. There is a general smoothing out of the devices, not only electrically, but also mechanically.

A few of the latest magnetos are provided with means for timing or setting without the removal of any of the parts. This is a specially desirable feature from the standpoint of repair, since it involves the time-saving element.

Several new schemes for intensifying the spark at low engine speeds, for use in starting have been produced to assist the cranking devices which are now in such profusion. A number of makers have also combined ignition with lighting in single units. To the ordinary lighting generator they have added a distributer and timer which take care of the ignition. The machine must then be driven in fixed relation to the speed of the engine, of course.

Bosch ZR Features Line

The Bosch standard types of magnetos are offered for 1913. The ZR series, which features the line and which was introduced 1 year ago, is being employed in those cars which heretofore used the D and DR types. The DU series retains its popularity, due to its special adaptability to engines of medium power. This type is supplied in either independent, dual, two independent or duplex systems.

The ZR magnetos—either as independent or two-spark ignition or in conjunction with battery systems, such as dual and two independent arrangements—are entirely inclosed, special packing being inserted between the magnets themselves and also between them and the end plates. By special arrangements, the cable connections are also made waterproof. The magneto being thus inclosed, any gear noise or that emanating from any other source is eliminated. The lubricant ducts are very accessible and are protected by suitable covers preventing the entrance of water and dust.

Fig. 1 shows the Bosch ZR4 two-spark type with double distributer disk. For ordinary purposes it is not necessary to remove the plug cables from the distributer, inasmuch as the disk can be easily detached for inspection of the rotating carbon or for cleaning of the segments. The disk is held in position by two strong, flat springs which have a snap-on connection, as shown. The timing-lever casing which carries the interrupter segments is fastened by a bayonet catch, a quarter turn of this casing allowing it to be removed without the use of tools so that the interrupter can be examined. The timing-control arm is no longer a part of the breaker-box casing, but is a separate piece in itself. A lug on its inner circumference is made to fit into any one of a number of evenly-spaced slots around the periphery of the breaker-box housing. The arm can therefore be fixed in any position about the interrupter casing, thereby greatly facilitating the connecting of the advance and retard mechanism of the car. Fig. 4 shows the interrupter mechanism of the ZR4 dual instrument. The interrupter lever is shown at B and the platinum contact points at C.

In the ZR types, the special toothed pole pieces, Fig. 14, are used, making it possible to produce a spark at low speeds or at any position of the advance lever. For the timing of these magnetos in relation to the motor, a method has been devised which makes it unnecessary to remove any of the parts. To set the older types, the distributer disk and dust cover of the interrupter housing must be removed. This new feature is shown in Fig. 3. Above the distributer gear there is a window through which the gear teeth may be seen. One of these teeth is marked while the edges of the window are also marked for reference. There is a second window in the face of the distributer plate through which the numeral 1 appears when the armature is revolved. In setting the magneto, the crankshaft is first turned until piston No. 1 is in full advance firing position, after which the magneto armature is revolved until figure 1 appears in the distributer window. The marked tooth will then be close to the upper window marks and should be turned until there is exact register between them. Distributer terminal 1 is then connected to cylinder No. 1 and the other wires connected in accordance with the firing order. The gear is then fastened in position and is now timed for full advance position.

The Bosch ZR types correspond in their principal dimensions with the DR models, so that one magneto may be substituted for the other in the same space. The ZR is made for both four and six-cylinder installations.

Eisemann Has New Low-Tension

In the list of Eisemann products for 1913 appears a new model low-tension magneto, type EB. With this instrument a separate coil is used to transform the current to high tension. All the special Eisemann features are incorporated in the new machine. The contact breaker and its cover and the front view of this type are seen in Fig. 2. The breaker mechanism is extremely simple, consisting of the ordinary platinum points held in contact by a flat spring. The points are pulled apart to break the circuit by a cam mounted on the magneto shaft, which cam bears on a follower connected to the flat spring.

The EM type magnetos for one, two, three, four and six cylinders are continued without change for both dual and single ignition of the direct high-tension variety. Models EA, EU and ED, in both manual and automatic spark control, are the products of the Stuttgart, Germany, factory of the Eisemann company. The principal importations of these models are of the automatic control design. This control is of the centrifugal-governor type and makes use of a cage which is rigidly mounted on an extension of the armature shaft. Within this cage there is a rectangular sliding block which is drilled and threaded to pass over the helically-cut driving shaft of the magneto. Governor balls are attached to the block through linkage, which fly out an amount proportional to the shaft speed. This causes the block to travel along the shaft, and to so move, the block must then rotate slightly, carrying with it the cage and thus advancing the armature with reference to the pole pieces. The opposite operation takes place when the speed falls off and the governor balls fall inward. To apply the automatic control to any motor the double shaft thread is made in varying pitches so as to give varying degrees of advance. By using a spring of varying tensions and lengths for acting against the centrifugal motion of the governor balls, any desired advance curve is possible.

In connection with these automatic spark control magnetos is the provision for setting the armature in relation to the crankshaft. The governor casing is slotted for the reception of a key which will fit into place only when the armature is in such a position that the breaker points are just about to part. The insertion of this key holds the cage stationary while the setting is made.

Numbered among the Eisemann products are also the low and high-tension types for slow-running stationary engines and the like. All Eisemann magnetos are constructed with the specially designed pole shoes which are pointed at the center of their length and so shaped that the extended portion is approximately in the plane of the theoretical axis of the armature core. The magnetic lines of force are thus concentrated, increasing the volume and intensity of the spark at the break.

Splitdorf Four New Magnetos

A new series of four magnetos has been brought out by Splitdorf. These are models W, X, Y, Z, all of which are of the low-tension type, which method of ignition has characterized the Splitdorf products for some time. The newcomers bear some of the familiar earmarks of Splitdorfs of the past, but they are refined in details to meet the growing demand for sturdy, light and effective mechanisms. The newcomers are compact and smooth in appearance and have vertical distributer blocks.

Model X is designed for use on all of the standard four-

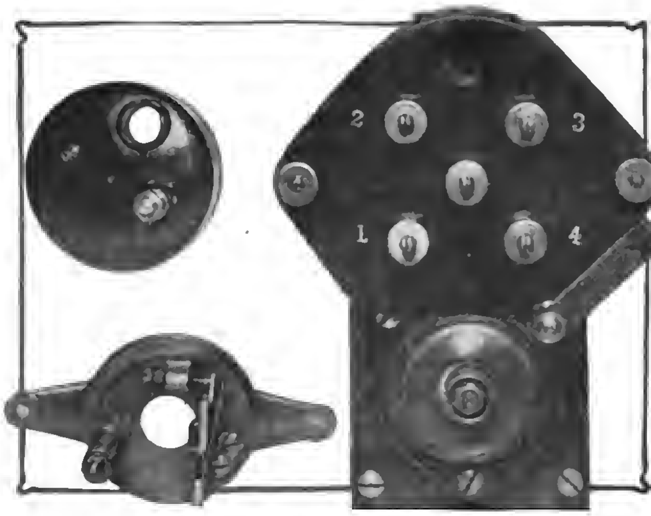

Fig. 2—The Eisemann type EB low-tension magneto arranged for four cylinders. The contact breaker and its cover are shown removed. The breaker mechanism is very simple

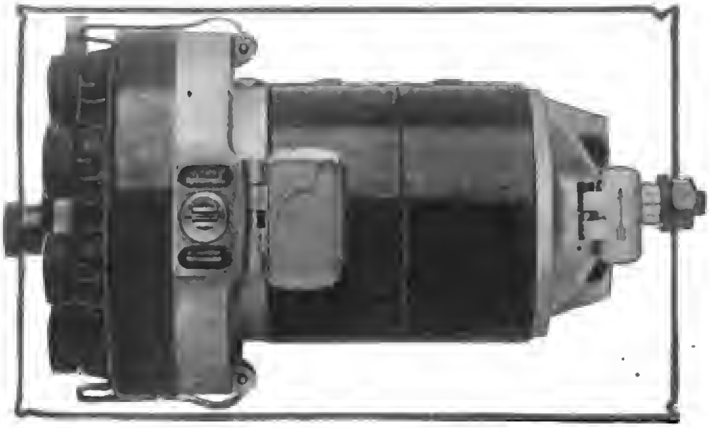

Fig. 3—Top view of the Bosch ZR6 magneto, showing the window through which the marked distributer tooth appears and the registering marks on the edges of the opening. At either side of the window is an oil hole. All three openings are covered

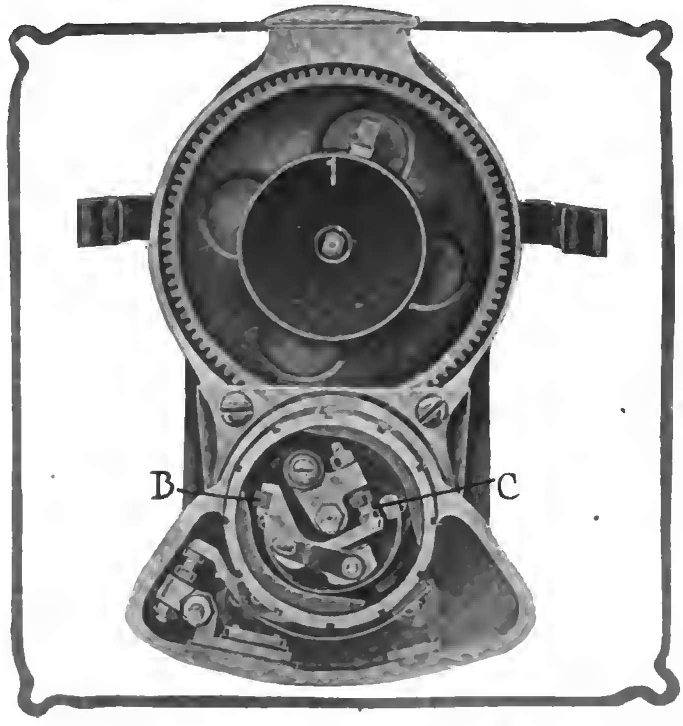

Fig. 4—Front view of the Bosch ZR4 dual magneto. The distributer and breaker housings have been removed. The interrupter lever is at B, while the platinum contact points are at C

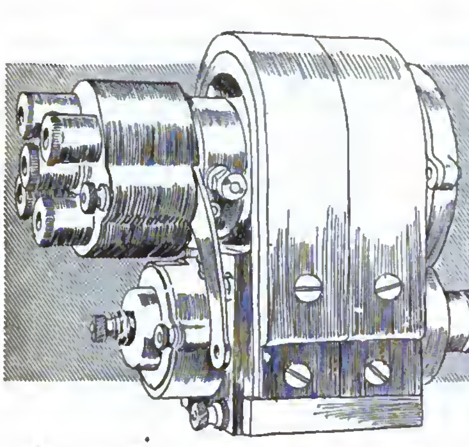

Fig. 5—The National type C4 which is used in connection with a double system and a transformer coil. A condenser is incorporated in the magneto

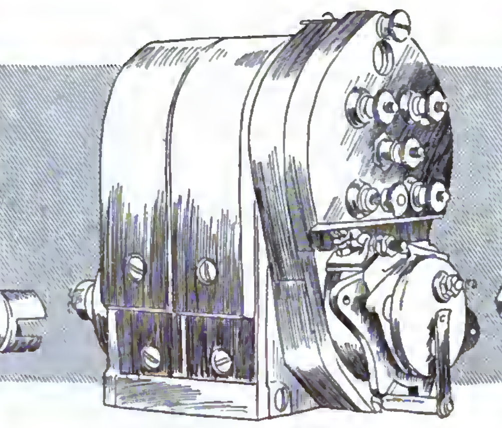

Fig. 6—Eisemann type EM four-cylinder magneto which is a dual direct high tension type. It uses the Eisemann center-pointed pole pieces

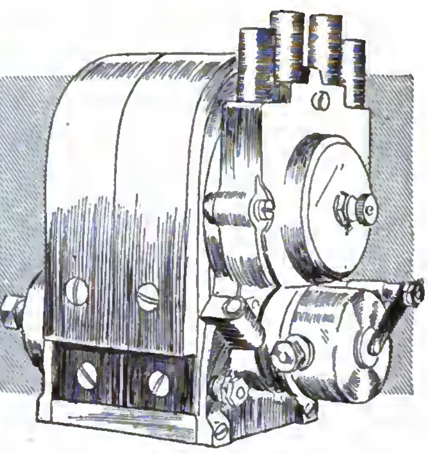

Fig. 7—The Splitdorf model X, which is designed for use on any of the standard four-cylinder motors. This is one of the four new low-tension Splitdorfs

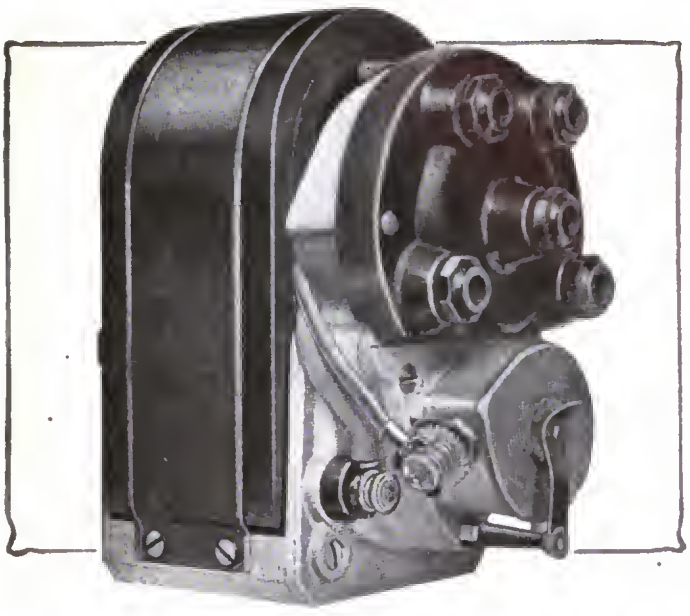

Fig. 8—The latest Remy type, model RL, which is a two double magnet machine operating on the inductor principle common to all Remys. This machine supersedes all types of this make. There are no moving contacts or windings in the inductor construction, the current being set up in stationary cells placed in the magnetic field

cylinder motors, while model Y, which is of the same general dimensions as the former, is made for the operation of any of the six-cylinder engines on the market. Both of these types are of the two-pair magnet design. Models W and Z are of the three-pair magnet variety and are constructed for use with heavy, slow-speed motors of four and six cylinders respectively.

The armature connection on each of these new models has been placed in the back plate of the instrument instead of being located at the front of the breaker box as formerly. The details of the breaker-box mechanism have been altered somewhat with the view of bringing about a greater degree of efficiency. One large contact brush replaces the two formerly used, thus insuring a better wiping contact with the armature. The breaker-box spring pillar has been lifted from the line of the base to a point above the breaker box. All breaker box parts in this series have been made interchangeable throughout and all have taper shafts of the same taper. The S. A. E. standard magneto dimensions have been adhered to in the design of these new instruments.

Along with its new magnetos Splitdorf has brought out a new vibrating coil known as model TS, which presents a durable and compact appearance. It is designed to extend through the dash and is inclosed in a water tight case effectively protecting the wire terminals. These are numbered for easy wiring reference. The coil proper is mounted on the base of the switch, which is provided with an ignition button for use in starting the car on battery. A lock is incorporated to prevent any of the switch operations.

Remy RL Retains Inductor Design

Remy has a new model, known as RL, which is provided with a waterproof distributer. It is a two-double magnet machine. Like former instruments of this make, it has a stationary winding, being of the inductor type. The only moving parts are the inductor shaft and inductors, between which the winding is placed. This winding is of coarse wire in which the current is set up and thence passed to the terminals. Besides being between the two inductor segments, the winding is housed on the sides by the pole pieces. Thus when the parts are all assembled it is completely protected. The principal advantage claimed for this inductor arrangement is the absence of moving wires and contacts.

The inductor segments are balanced for best efficiency mechanically, this balancing relieving undue strains on the shaft and bearings. The new RL models also have a timing push button for simplicity in installation. This button is located at the top of the distributer and connects with a small plunger. There is a small recess in the distributer gear which, when in register with the push-button plunger, locates a segment opposite a marked terminal on the distributer cover. The magneto is also so inclosed as to be waterproof. This new RL type is shown in Fig. 8.

New Mea Armature is Rocked

Mea has introduced a model which differs radically from standard construction of its make in that it does not involve the feature of rocking horizontal field magnets. This new model is waterproof, which result is accomplished by entirely covering the whole upper part of the instrument in a metal housing. The connections are so fitted that there is no possibility of water entering the housing to do damage to the armature or the contact features. The only portions protruding from the case are the driving gear, the terminals and the arm by which the spark is advanced or retarded by revolving the armature within the fields. By insulating the terminal plate in which the holes for the leads to the spark-plugs are drilled at an angle, protection is afforded for the high-tension terminals. Vertical holes in the top of the terminal plate take the connecting studs, the heads of which are beveled to close the holes. Instead of rocking the field magnets as in other types of Mea devices, this newer design accomplishes the same result by reversing the operation, keeping the field stationary and rocking the armature on its shaft. This permits of the housed character of the instrument.

In the ordinary Mea construction which has held exclusively up to this year, the instrument makes use of a bell-shaped magnet mounted horizontally on an axis so that it can be revolved through a certain angle around the armature. See Fig. 9. This magnet is so suspended as to be balanced in any position so as to be readily adjustable for any timing position. The idea of the peculiar bell-shaped magnets is that the armature receives full benefit of the magnetic field, being located so as to be in the path of the greatest number of lines of force. This makes for intensity of spark and permits of the production of an igniting spark when the motor is turned over slowly.

Simms Offers Two Models

The American Simms magnetos for this year are styled SU types, and are furnished in two models—independent and dual—for both four and six-cylinder motors. They are all of the high-tension, two-magnet design, in which the high-tension current is generated in the double winding on the armature. The independent magneto, with which no batteries are used, is intended for motors up to 5 inches bore, while the dual type provides a battery system of ignition in connection with the magneto ignition. The SU independent magneto for four-cylinders may be had with fixed spark if desired. In this case it is fitted with a stationary cam ring. But unless otherwise specified, this magneto comes with a timing lever permitting a timing range of 30 degrees. The dual system is so arranged as to give a vibrating battery spark for starting. It is said that this vibrating spark will fire a cold mixture.

When fitting these magnetos to the engine, the timing and setting is facilitated by a window in the distributer board in which the figure 1, which is marked on the distributer gear, appears when the distributer arm is making contact with the segment corresponding to cylinder No. 1. The distributer is water and dustproof. The distinctive Simms pole shoes are among the principal features of this design. They are notched on diagonally oposite ends, as shown in Fig. 13. This notching serves to concentrate the lines of force at the edges of the notches, making for a hot spark at the break. This spark is equally as intense in any position of advance or retard. These special pole shoes are fitted to both duals and independents, although the fixed-spark machines employ the ordinary straight form of shoes instead.

Both independents and duals are of the same general construction, the only difference being the addition of the commutator on the dual and the substitution on it, also of the dual contact breaker for the independent breaker. This commutator or battery timer on the dual is a new design and consists of a shell of condensite into which are moulded four bronze segments, Fig. 10. Two of these are connected to the commutator terminals, while the other two simply serve as a path for the contact breaker brushes and assure even wear of the commutator, which is fitted to the timing lever in place of the dust cover of the independent type, and held in position by a flat spring.

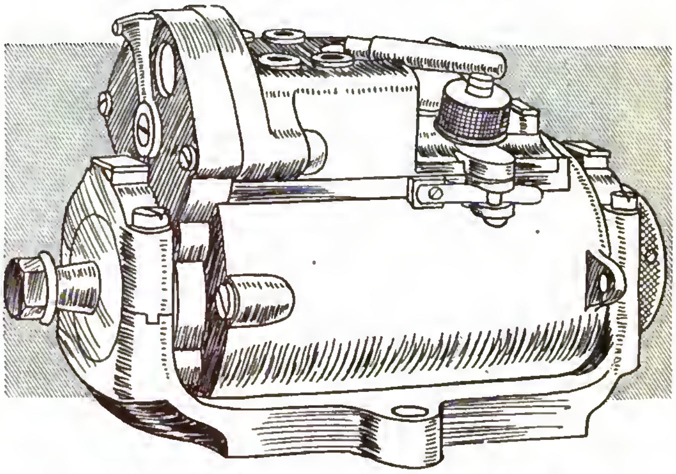

Fig. 9—One of the Mea rocking, bell-shaped magnet types. The field magnet is mounted horizontally on the same axis with the armature, causing it to get full benefit of the lines of force

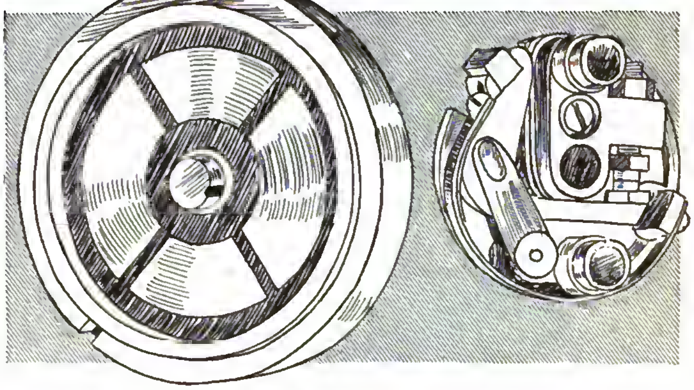

Fig. 10—The new Simms dual battery commutator which consists of a condensite shell into which are molded four bronze segments

Fig. 11—Simms dual contact breaker, showing the substantial contact arm and platinum points of ample size

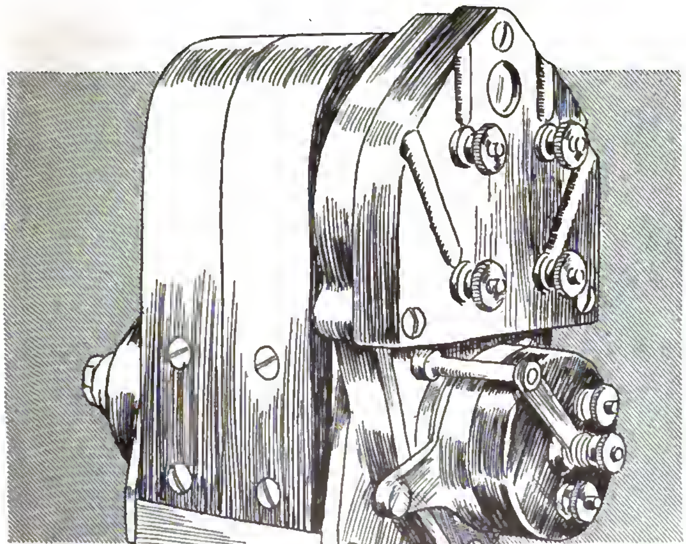

Fig. 12—The Simms SU4S dual magneto of the high-tension type. The window in the top of the distributer board to facilitate timing is shown. When the figure 1 appears it indicates that the distributer arm is making contact with segment number 1

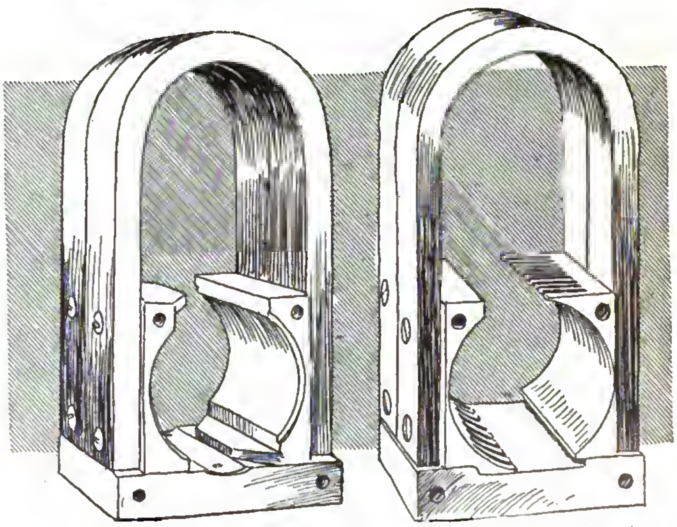

Two pole piece constructions designed to intensify the spark

Fig. 13—The Simms type. Diagonally opposite pole shoes are notched back from the ends, concentrating the lines of force at the extreme pole ends and producing an intensified spark

Fig. 14—The Bosch toothed pole pieces which serve to concentrate the magnetic lines at the ends of the teeth

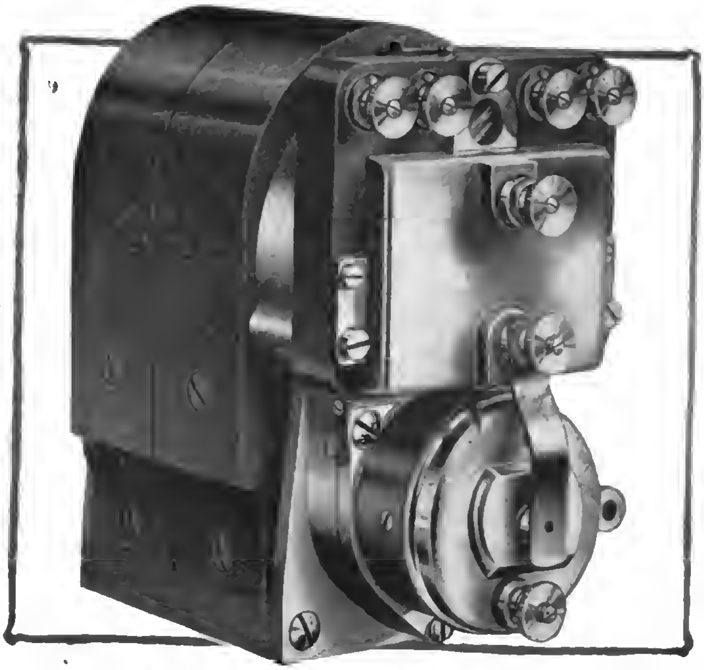

Fig. 15—The new magneto used in connection with the Hi-Fre-Co ignition system brought out by the Dean Electric Company. This instrument is a dual type and has the condenser mounted on the front of the distributer. The instrument is a low-tension device, the voltage being stepped up at the plugs

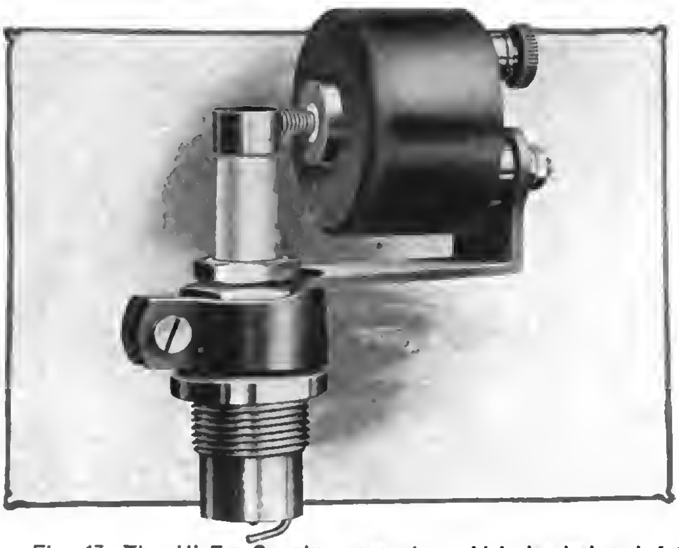

Fig. 17—The Hi-Fre-Co plug resonator which is designed for application to any standard spark plug. These plug transformers are used to step-up the voltage directly at the point of use so that there is no high tension wiring leading to the plugs

Westinghouse Regenerative System

After several years of experimentation the Westinghouse concern has finally placed upon the market a combination lighting and ignition system, the single generating unit, Fig. 21, forming the basis of the arrangement. This system is regenerative, that is, when the engine is not operating or when it is running at very low speed, power for ignition and lights is furnished by the battery and returned to it when the car is running at all usual speeds and at high speeds. The features of this system which apply to car lighting will be covered in connection with an article on electric light systems.

The ignition features consist principally of a dual system and automatic spark advance. Fig. 18 shows the interrupter and automatic advance mechanism. This interrupter or breaker has two series contacts, seen at the lower center. The sketch shows the position of the interlocking spark advance mechanism at high speed. The two metal segments or cams, which operate the breaker mechanism, fly out from their normal position an amount proportional to the speed. Thus they advance the time

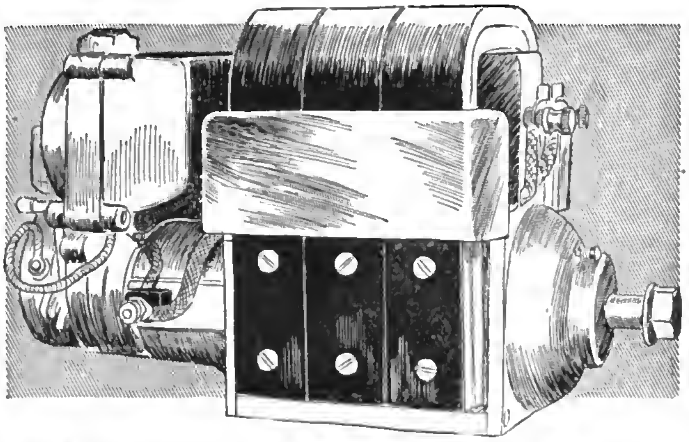

Fig. 16—The Deaco combination ignition and lighting generator, showing the mounting of the distributer and circuit breaker at the front end. Though combined in one unit, a special grounding feature entirely separates the ignition and the lighting circuits

of break in proportion to their position. This automatic centrifugal device adjusts the spark advance to all speeds, keeps the period of contact nearly constant at all speeds and prevents by its design any inequality between the two interruptions that occur in succession during each revolution. The distributer is of the ordinary magneto type and is detachable without interfering with the contact brush. Provision is made with this system for the manual operation of the spark if desired in addition to the automatic control. In this case the spark lever need only be used for the original adjustment and may then be locked in position. Running variations in spark are taken care of by the control. Since this instrument is primarily a generator, it may be had without the ignition parts and coil if desired.

Two Western Electric-Pittsfields

The Western Electric Company, which recently took over the Pittsfield Spark Coil Company, offers two types of magnetos for this year. These are type F, which is a fixed spark instrument, and type N, which is provided with variable spark. The magnetos themselves remain practically as they were, but a new dual system uses in addition to the magneto removable unit spark coils for the battery side. For starting purposes this dual system is supplied with a push-button switch, which throws two sets of dry cells in series, doubling the primary voltage. At the same time the current is automatically sent through a vibrating coil, making the starting spark of high intensity and long duration.

The Western Electric-Pittsfields are of the high-tension induction type. That is, the current is generated in a stationary winding within the field of the magneto. There are no moving contacts or windings. The armature which carries two iron segments but no winding is the only revolving part. Instead of placing the stationary winding between the rotor segments as in several other inductor types, the Pittsfield practice is to place it at the rear of the instrument, Fig. 20. This illustration depicts the variable spark model N. In outward appearance and general construction the two types are the same, differing only in internal construction. There are four poles in the magnetic field, two of which are the poles of the permanent magnets, while the other two with the iron core compose the field.

Deaco Has Combined System

The Detroit Electric Appliance Company makes a combination ignition and lighting system which remains practically the same as last year. While primarily a generator, the electrical unit is adaptable to the addition of distributer and circuit breaker so as to take care of ignition as well. The Deaco generator is treated in this week's installment of an article on starters running serially in The Automobile. Though combined in the one unit, the ignition and lighting systems are entirely separate and operate independently of one another. The distributer gear is carried at the rear and meshes with the armature gear. These are housed by the rear end plate. The distributer is fastened to the gear and carries the carbon brushes which distribute the high-tension current and make contact to the coil, which together with the condenser is fastened in a housing against the distributer block. The interrupter is fastened to the rear end plate by a retaining spring. No pole of the generator, battery or interrupter is directly grounded, a grounding scheme being used which causes both ignition and lighting systems to perform their functions independently of each other.

Briggs High-Tension Unchanged

Briggs model C magnetos are continued practically as heretofore, although slight changes in the finish are to be noted. This magneto is designed for dual ignition for four and six-cylinder motors. It is a high-tension type and provided with two magnets. The breaker-box mechanism and the distributer parts are inclosed within a cover plate which is easily removable for inspection. In this magneto an oil tank is placed in the arch of the magnets, which has a capacity of 6 ounces of lubricant. The oil feeds automatically to the bearings from this small tank. The circuit-breaker mechanism is of simple form and has the usual platinum contact points. The distributer is constructed of hard rubber. For automatic spark control a centrifugal governor is provided. The breaker for this mechanism is fixed in relation to the armature at the point of best efficiency. The governor acts to advance the spark according as the motor speed increases, and vice versa. In addition to magnetos, the Briggs products include a combination lighting and ignition outfit and a lighting and starting system.

Atwater-Kent K Unisparker New

In addition to its standard type F Unisparker system of ignition the Atwater Kent concern is now furnishing a new model, known as type K, which has automatic spark advance and an insulated primary circuit, designed especially for use in connection with lighting and starting equipment. The automatic spark governor is of the centrifugal type, the amount of advance depending on the deflection from their normal position of the metal segments which take the place of balls. The outward motion of the segments is opposed by springs. The principle of the sparker is the transforming of the low voltage sent to the sparker from the battery into high-voltage electrical energy, which is then distributed to the spark-plugs in the usual way. Fig. 19 shows the type F Unisparker, which is furnished for any number of cylinders up to six. The type K system is made for two, three, four and six cylinders.

Hi-Fre-Co Uses Step-Up Plugs

The Dean Electric Company has developed a system which gets its name from the high-frequency oscillatory discharge at the spark points. The magneto used is of the conventional type, Fig. 15, while there is a separate resonator coil mounted on each spark-plug, as shown in Fig. 17. These plugs may be of any standard type. The resonators are used to step up the voltage of the high-frequency current directly at the plugs so that all of the wiring to the resonators can be of low voltage. The coil winding is imbedded in a special insulating material which will withstand heat, oil and water and which is durable. The system combines a dual arrangement by means of which a combined dash coil and switch is employed utilizing battery current instead of magneto. In connection with each of the spark coils there is a small condenser for intensifying the oscillatory discharge. The frequency of this is given at from 500,000 to 1,000,000 oscillations per second. The magneto is a two-pair type having distributer and breaker box at the forward end. The magneto differs slightly from other conventional types in that the armature has one winding of comparatively coarse wire. The condenser is mounted on the front of the distributer. This distributer and all electrical circuit portions of the instrument carry low voltages.

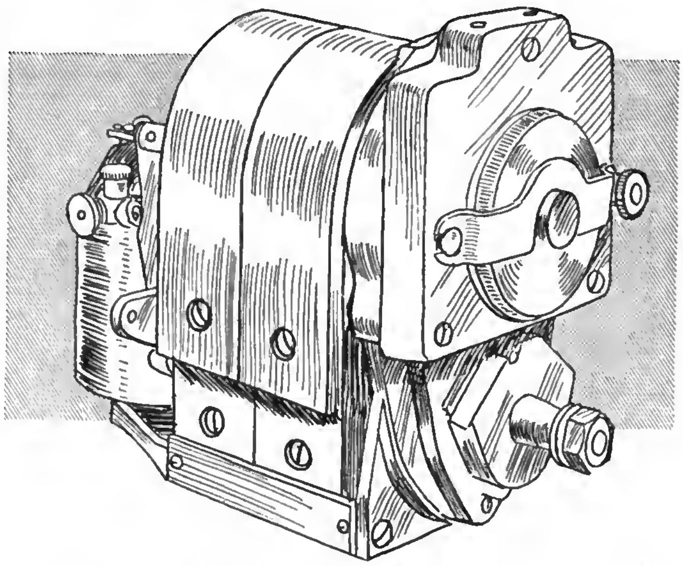

Fig. 20—The Western Electric-Pittsfield type N variable spark instrument. It is a high-tension inductor type, the winding in which the current is set up being stationary and placed at the rear of the machine as shown. Type F which has fixed spark is similar to this in outward appearance

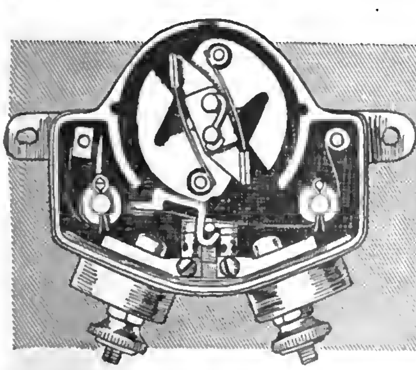

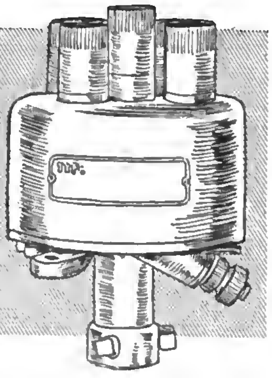

Fig. 18—Sketch showing the position of the Westinghouse centrifugal automatic interlocking spark advance mechanism at high speed

Fig. 19—The type F Atwater-Kent Unisparker, a combined transformer and distributer which steps-up the low battery voltage before sending the current to the plugs

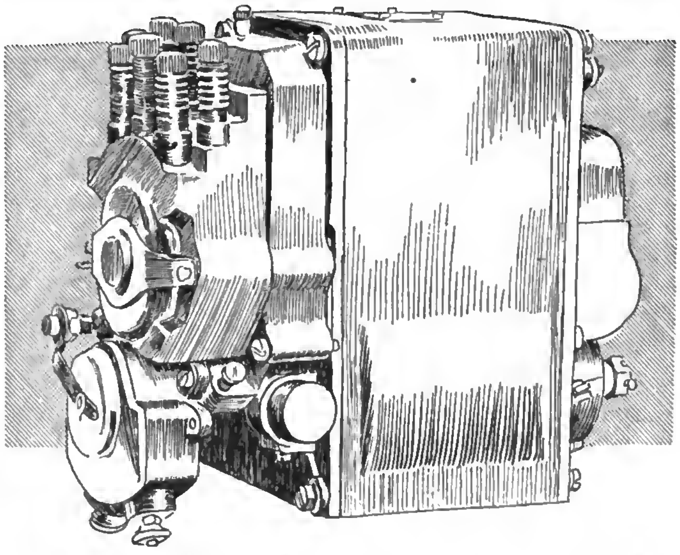

Fig. 21—The Westinghouse combined generator and magneto which is used in connection with a regenerative system. The magneto portion of the apparatus has automatic spark advance and it is of dual type. The generator has an electro-magnetic and not a permanent magnetic field. The entire front plate carrying breaker and distributer is removable

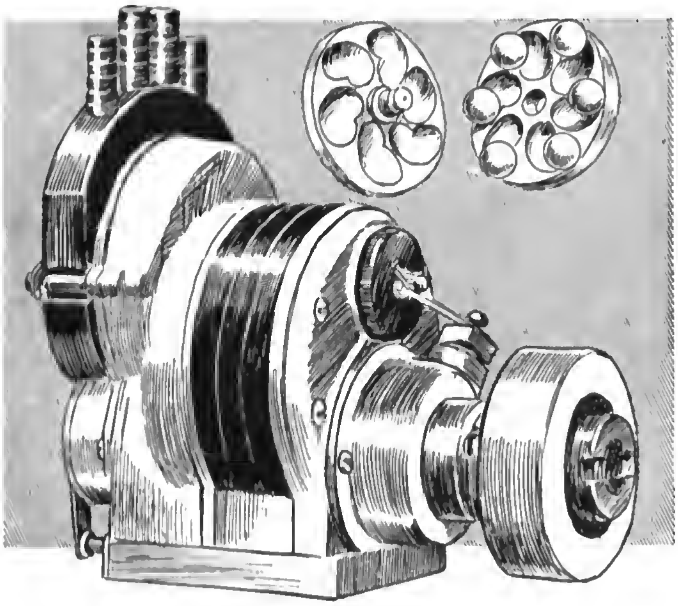

Fig. 22—A Herz magneto equipped with the Herz centrifugal automatic timing adjustment. In the upper corner are shown the two disks in which are cut six grooves for the insertion of balls, which act as governor weights and twist the armature in proportion to the speed

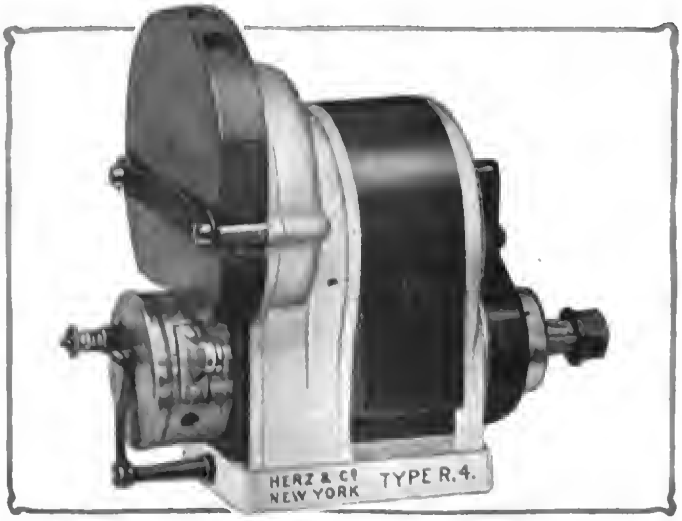

Fig. 23—The latest Herz model type R4 which is a fully inclosed high-tension type. The magneto makes use of double U-shaped magnets in place of the round flat variety

Connecticut Magnetos Not Changed

Connecticut magnetos remain practically as heretofore, although an igniter has been added to the line. This is really a transformer coil which steps up the battery voltage sent to the ignition point. The Connecticut magneto is completely housed and is made for either independent or dual ignition. To facilitate timing, an indicating arrow is placed on the rear of the housing, together with proper reference marks on the armature shaft. The distributer and breaker box are carried at the front end.

K-W Has New Low-Tension

K-W magnetos are of the inductor type, having no moving windings. The rotor or armature carries two segments which are mounted with their axes at right angles. The windings are fixed between these rotors in the center of the magnetic field and the cutting of the lines of force passing between the magnetic poles induces a current in the windings which current passes to the terminals at the front of the instrument. The K-W types are made with three, four and five magnets in both high and low-tension models. The largest high-tension type of this make is shown in Fig. 26. This is model HT, which is designed for the largest engines without the use of starting batteries. The complete line includes, in addition to this model, the model J, a three-magnet instrument for medium-size motors, and model H four-magnet type, for large engines. These are all high-tension types. In the low-tension class are models A, E, M, D and U, which are all of the four-magnet design and differ in the method of mounting and drive. The latest of these low-tension designs to be brought out is the three-magnet machine, model LS. All these low-tension instruments may be used for lighting purposes.

National Uses Double System

The National Coil Company is producing a double ignition system, which makes use of the National type C-4 magneto and on the battery side operates with either five dry cells or a 6-volt storage battery. Fig. 5 shows the C-4 instrument, which is a two-pair magnet machine, and which carries distributer and breaker-box mechanism at its front end. This double system uses a transformer coil which is designed to be mounted near the magneto to avoid long runs of cable. The magneto carries the condenser and it is also provided with a self-oiling system with a reservoir holding .25 ounce of lubricant. At the drive end there is a timing dial for facilitating magneto setting.

Briggs and Stratton Is Complete

The Briggs & Stratton igniter is the combination of a spark coil, distributer and contact maker within a single unit. The system works with either a 6-volt storage battery or six dry cells, and operates to transform the low voltage from this electric source into high-tension current, which is then sent to the cylinder in which the charge is ready for firing.

Rhoades Improved in Details

The Rhoades ignition system has been refined and a type has been brought out for use on cars which have lighting and starting systems of the electric design. This new igniter is entirely insulated from the ground by making the shaft in two sections insulated from each other by a fiber bushing. Other changes have been in the utilization of a round coil and the addition of a small condenser which eliminates sparking at the breaker points. Another improvement is in the use of weatherproof terminals which are so constructed as to permit of the attachment of the wires without solder or tools. The general appearance of the instrument remains the same.

Herz New R4 Has U Magnets

The latest Herz model is known as type R4, which is a fully inclosed high-tension device. It has double U-shaped magnets which are exactly ground to fit together within an aluminum housing. The instrument is waterproof, distributer and breaker mechanisms being completely inclosed. The secondary connections are all well insulated and also protected against dust and water. The apparatus is small and light in weight.

The Herz centrifugal automatic timing adjustment is continued in an improved form. It consists essentially of two mating disks, Fig. 22, which are placed between the magneto shaft and the main magneto driveshaft. Each of these disks has cut in it six curved grooves which when mated form chambers in which are placed balls, one to a pair of grooves. These balls being free to run in these combined grooves act the same as governor weights and fly out from their innermost positions an amount proportional to the speed, imparting a twist to the armature and thus advancing the ignition a corresponding amount of its total range of 40 degrees.

Kingston Condenser in Magneto

For automobile ignition, the model B Kingston is the principal type made by the Kokomo Electric Company. This magneto is a two-pair, high-tension type, in which the principal change for the year is the incorporation of the condenser within the magneto, whereas it was formerly located with the spark coil. This change is made necessary due to the replacing of the box type of coil by a tubular design which is placed back of the dash, the switch plate to which it is attached being flush with the dash. However, the ordinary box coil carrying the condenser and the magneto without condenser may be had if desired. The magneto is inclosed so as to be impervious to water, oil and dust.

Another Kingston instrument is the model D, which is the same in construction as model B except that it has three pairs of magnets and is generally used on heavy, slow-running engines. Single-cylinder magnetos and make-and-break types are also made. The combining of condenser with magneto is also optional in the case of model D.

Heinz Has Circular Magnets

The Heinz magneto is of the compound-armature type, so that no outside coil is needed. The magnets are of the circular type which is a characteristic feature of the instrument. This year both of the primary winding ends are grounded, whereas formerly only one of them was so connected. The instrument is made for use with either four or six-cylinder engines.

Motsinger Is Driven by Friction

The Motsinger direct-current magneto is really a small electric generator designed for use without batteries. It is made to operate with any make-and-break coil and is intended to be driven by friction connection with the flywheel face. A sketch of the instrument is given in Fig. 24. The poles are made up of fourteen laminations, which are bolted together. To keep the speed and output of the instrument constant, it is equipped with a centrifugal governor which varies the engagement of the frictlon wheel with the flywheel according to the motor speed.

Holtzer-Cabot Friction Types

The Holtzer-Cabot Electric Company makes several types of low-tension magnetos to be driven through friction pulleys with flywheel face engagement. These are usually fitted with centrifugal governors for keeping the driving speed constant. The magnets used with these instruments are thinner than the conventional type, while the armatures are laminated.

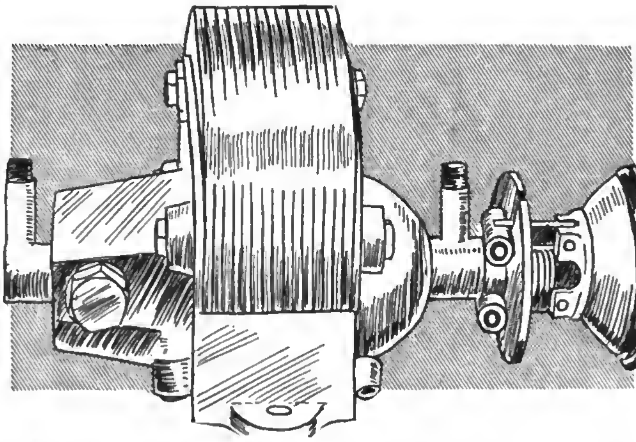

Fig. 24—The Motsinger direct current magneto which is of the low-tension type designed to be driven by friction pulley from the flywheel face. The poles consist of fourteen laminations bolted together as shown. It is fitted with a centrifugal governor to keep the speed and output constant

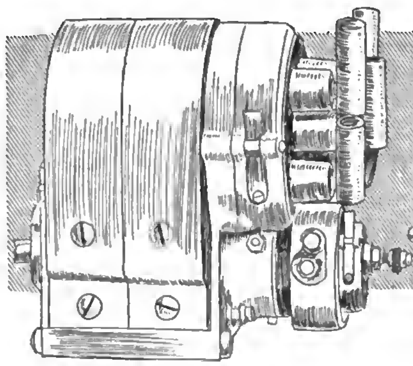

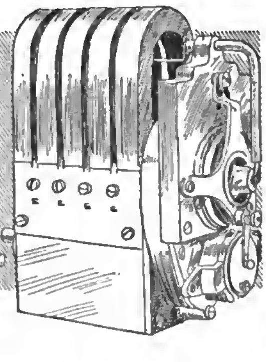

Fig. 25—The two-pair Kingston model B magneto, which is of the dual type. The condenser is incorporated within the machine in its latest refinement

Fig. 26—The K-W five-magnet machine, HT, for large engines. This make of magneto is of the inductor type, there being no moving contacts or windings

Year's Progress in Vulcanizers

Among the new vulcanizers on the market is the Shaler Vulkit. It consists of a cylindrical metal pot with a flat bottom inside of which there is a smaller cylinder, with a pointer in the center. The inner cylinder is covered with a removable lid around which is wound an asbestos fabric. Gasoline is poured into the inner receptacle and on to the asbestos fabric and the whole body clamped into position over the inner tube to be vulcanized. A suitable clamp is supplied by the tool. The gasoline being lighted sufficient heat is generated to vulcanize the tube, which is prepared beforehand in the usual manner for such work. The outfit is manufactured by C. A. Shaler, Waupun, Wis. In addition to the Vulkit, the company continues its regular line of electric and steam-heated vulcanizers for use by motorists and garages in mending tubes and casings.

For those who have electric light in their houses and garages the Gibney Eleck-Trick vulcanizer is a useful repair outfit. It is constructed of nickel-plated cast-steel body with a heat-resisting handle. A concealed coil is arranged inside the instrument to give the necessary heat, the temperature being automatically maintained at the proper degree for vulcanizing by means of a thermostat which forms part of the instrument. With it tubes and casings can be repaired. The outfit consists of the vulcanizer with 10 feet of cord, with plug for lamp socket, asbestos pad, clamp and the necessary tools and repair materials. In addition to the Eleck-Trick, James L. Gibney Rubber Company, of Philadelphia, also makes the Gibney rheostat and Gibney steam vulcanizer. These instruments resemble that of the Eleck-Trick, but in the case of the rheostat the temperature can be controlled to the required degree by means of a rheostat and in the case of the steam vulcanizer the heat is furnished by an alcohol fire pot and controled by an adjustable ventilator.

The B'Co. gasoline vulcanizer, manufactured by the Brown Company of Syracuse, N. Y., consists of a small oblong metal receptacle with a concave base and provided with a chain for use with outer casings to hold the vulcanizer in position and a flat base for inner tubes, slightly convex on one side to follow the contour of the base. The inside of the main body of the vulcanizer is hollow and has several small verticals cast integral, the heads of which are slightly larger than the main body. A measuring cup is supplied to determine the correct amount of gasoline to use.

The National vulcanizer manufactured by the National Motor Supply Company, Cleveland, O., is an instrument upon which the side of the tread of an outer casing can be repaired, or three inner tubes can be repaired at the same time. The main body of the machine forms a water chest below which there is a gas heater. A steam gauge denotes the amount of pressure which can be regulated by a safety valve. When it is desired to use gasoline for heating purposes a special heater and tank are provided for a small extra charge. However, the gas equipment will meet all requirements.

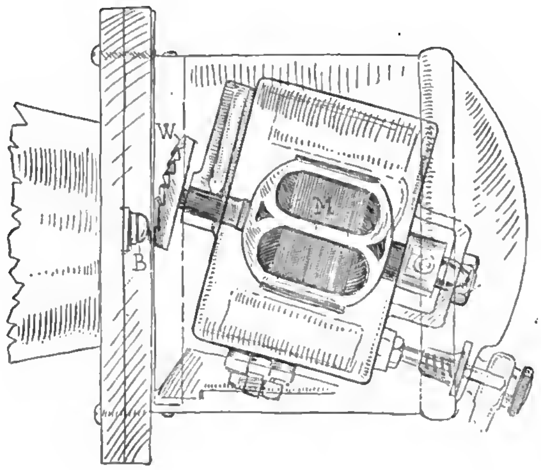

Fig. 2—Klaxonet medium-sized signal

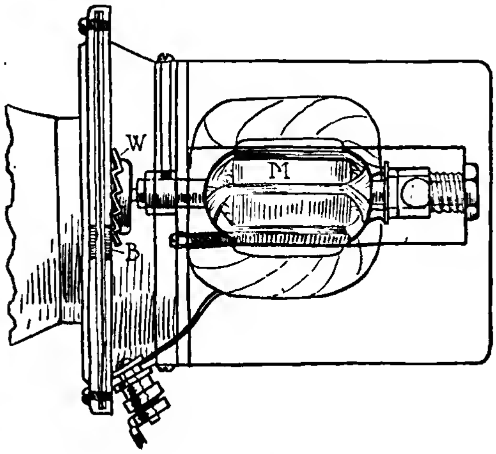

Fig. 3—Klaxet small horn

Automobile Signals

¶ In tha following review of 1913 warning signals for motor cars, THE AUTOMOBILE gives a statement of the situation by illustrating the new types of horns which this year's market affords, as well as the improvement made in the devices continued from 1912. Tha trend pointed out by thasa examples is toward small, electric signals of effective sound and comfortable operation of the horn from the steering wheel.

THE past year has been a period of fruitful activity so far as the manufacture of sound signal for automobiles is concerned. Besides most of the manufacturers who were in the field a year ago, a number of firms which have not made horns heretofore have exhibited this line of products at the national shows. Outside of these makers, however, there are a great number who did not show their goods at all either at the Garden or the Palace.

The trend in the horn line is toward the electric signal. As a proof of this statement it is only necessary to compare the number of electric horns now on the market as compared with what it was 2 years ago. To be sure, the exhaust horn is holding its own, but as manufacturers drop the making of bulb horns, the majority turns to the manufacture of electric signals rather than to the exhaust type. The explanation is probably that the installation and care of an electric horn is certainly as simple as that of the exhaust signal and the operation is easier. There can hardly be any argument as to the great ease with which an electric horn is operated by pressing a button on the steering wheel; it may be just as little work to press a pedal operating an exhaust horn, but it seems that automobilists feel that their feet are already attending to enough pedals.

That manufacturers of exhaust horns recognize the truth of this situation, is shown by the example of one which now brings out a push-button operated exhaust horn, while another company has practically dropped the manufacture of the pedal-operated horn, and now uses a bulb on the steering wheel, to which position it has been brought through the favor of the public toward the latter *modus operandi*. The electric horns themselves have gained in number so far as both the motor and the vibrator types are concerned. A noticeable tendency exists toward the small type of electric horn. The makers of the Klaxon began this movement by the announcement of the Klaxet and since then several well-known makers of vibrator and motor horns have brought out so-called junior types which are specially fitted for the needs of the small car. These horns consume a little less current then the other types and the noise they produce is generally not as strong as that made by the larger types and therefore better adapted for small cars.

The new horns seen at the show are the double-diaphragm Jaco, the Tuto-Ette, the Sparton motor horn, the Newtone Superior and Fire-Alarm types, the Electra, which is made by the same company as the Newtone; the Klaxet, the models JS, JM and D, Long Horn, the electrically operated Jericho, the Jericho Ford Special, the Nonpareil hand-operated ratchet horn, the Cubit vibrator horn type and the Riley-Klotz nòvelties.

Klaxon, Klaxonet, Klaxet—The line of signals made by the Lovell-McConnell Manufacturing Company, Newark, N. J., is being continued practically the same as what it was in the middle of last year. The Klaxon, Fig. 1, Klaxonet, Fig. 2, and Klaxet, Fig. 3, as well as the Combination Klaxon, have not been altered. The fact that the Klaxet is a new

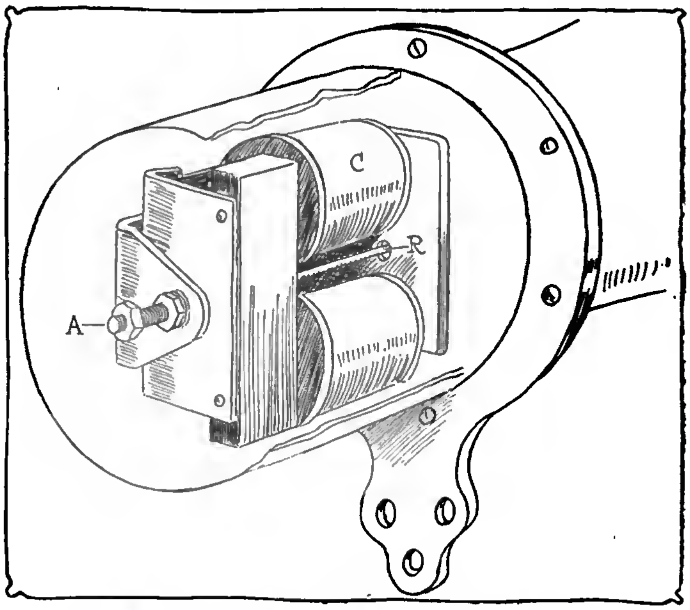

Fig. 4—Electra vibrator made by Newtona company

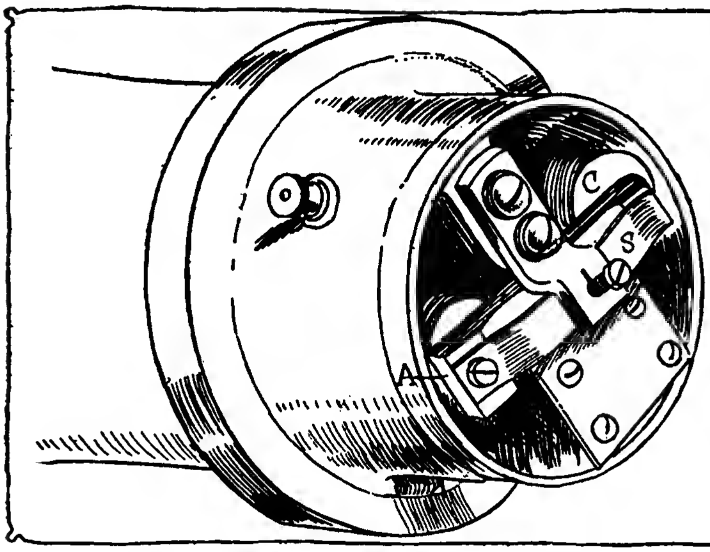

Fig. 5—Vibrator mechanism of Monoplex

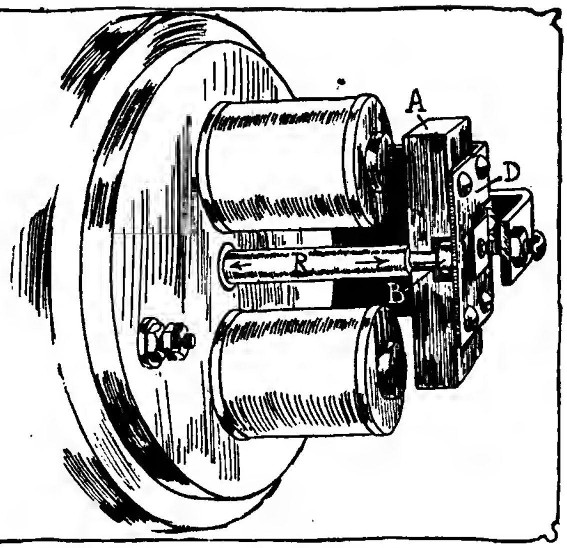

Fig. 6—Jaco double-diaphragm horn

device and one of the first attempts to produce a low-priced and high-class electric signal makes it advisable to give a short description of it here. It resembles in all essential features the larger horns made by the company, and differs from them principally by its lesser size and the arrangement of the motor M which is located horizontally in the casing, while in the Klaxon it is in a vertical position and in the Klaxonet inclined under approximately 40 degrees. A few details of constructions which are included in the larger type have been obviated in the case of the Klaxet, but the points of adjustment and lubricating details have been transferred to it from the larger designs. The current consumption is, of course, less than that of either of the large types. The sound is produced by the wheel W striking the button B on the diaphragm.

Newtone—Continuing its line of horns and adding to it three new devices, the Automobile Supply Manufacturing Company, Brooklyn, N. Y., is represented by five models. Models M, N and Torpedo are all dash designs and are continued practically without a change. The Newtone Superior is a novel product, built along similar lines to the larger models, but somewhat smaller than they. Finally, there is the Newtone Factory Fire Alarm type which is also well adapted for use on small cars. This type differs radically from all others in appearance, being equipped with a short and strongly flaring reflector and a casing finished in brilliant vermilion. The sound produced by the Superior and the Fire Alarm types—which latter, by the way, owes its name to the fact that the Fire Department of Jersey City has recommended it for installation in factories—is of the same pitch as that of the other types, but the Superior is distinguished by the large and the Alarm type by the smaller volume of the sound. One feature of the entire Newtone line for 1913 is the use of laminated armatures, which last year were used only on the Torpedo and M models. The field is likewise of laminated construction, being built up of seventy-five thin steel disks; and this new feature has made it possible to operate the same sizes of horn motors with much less current than before. An average consumption of 2.5 amperes is claimed.

Electra—The maker of the Newtone line of horns has added to this a new type of signal, named the Electra, Fig. 4, which is of the vibrator type. The construction is not radical in any way and simply embodies the principle of the buzzer which is also used in many other signals. The horn is about 3 inches in diameter, with a projector 6 inches in length and 4.5 inches wide. The finish is either brass or black and all horns are adapted for mounting on the dash. A core C moves the armature, adjustable at A, which has a rod R striking the diaphragm.

Jaco—The J. Alexander Manufacturing Company, New York City, continues the Jaco electric horn. Last year this signal employed a single diaphragm which was vibrated by the enlarged end of a rod attached to the armature of the

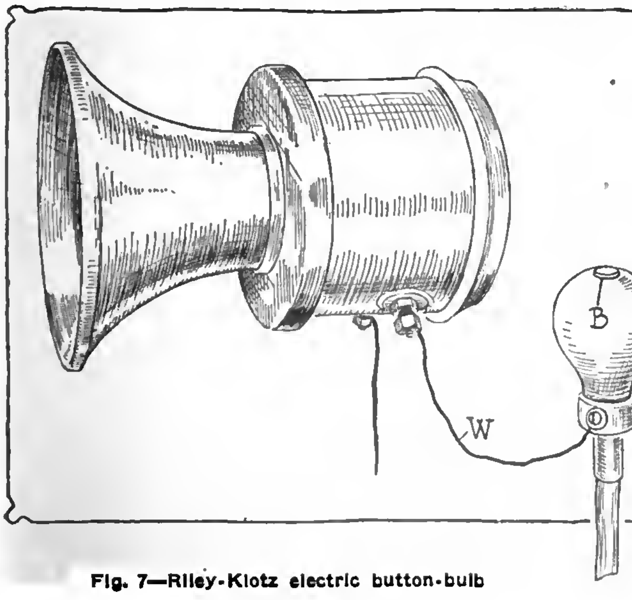

Fig. 7—Riley-Klotz electric button-bulb

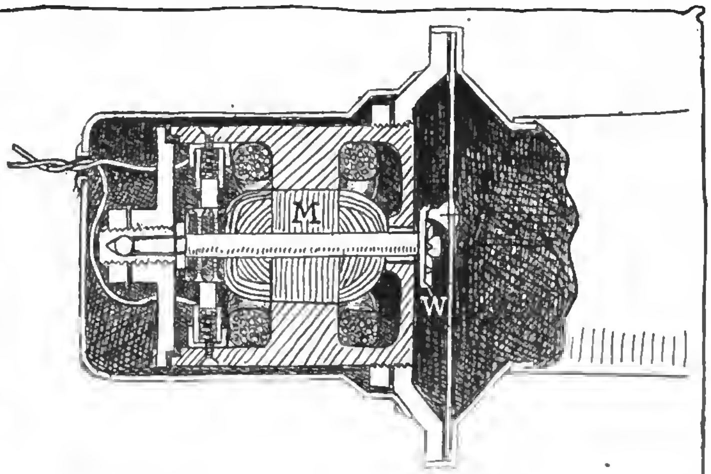

Fig. 8—Sparton electric motor horn

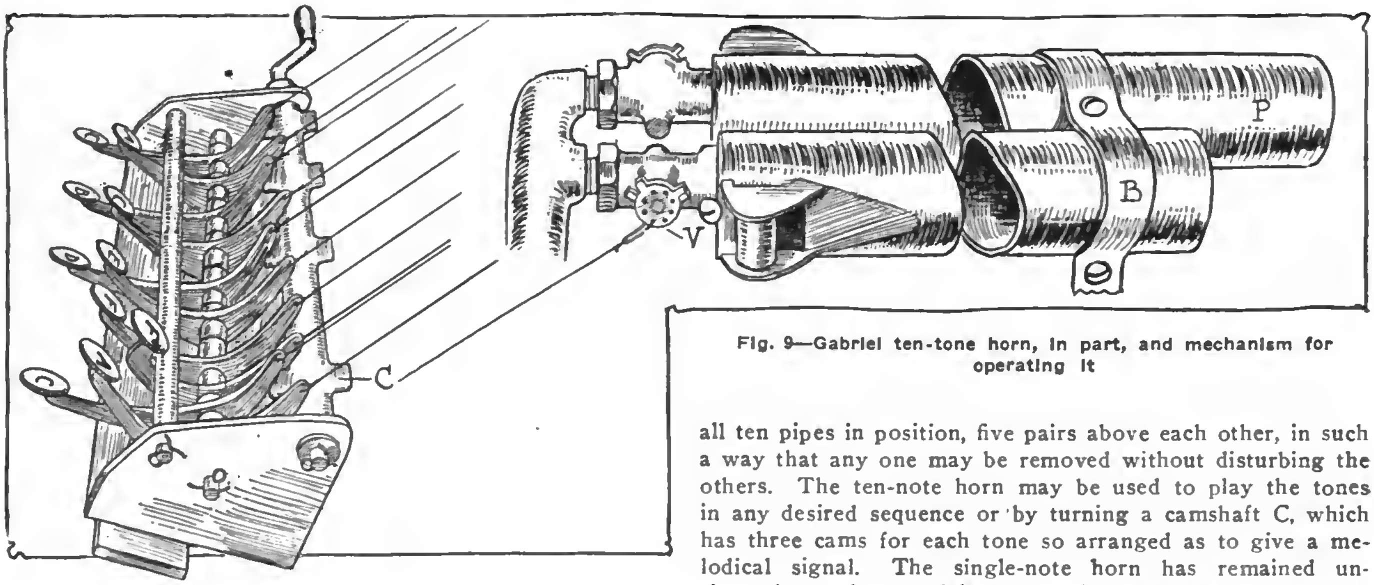

Fig. 9—Gabriel ten-tone horn, in part, and mechanism for operating it

magnetic coil, but for 1913 a small diaphragm D, Fig. 6, which is fastened to the side of the coil opposite to that attracting the armature A, has been added. A button B on the armature rod R strikes this small diaphragm when being attracted and the large one when being repulsed, so that a double series of sounds is produced, both of which follow each other alternately and rapidly, melting into a practically continuous tone. This is the only new development. The horn may be obtained in any of the finishes used nowadays for automobile signals.

Sparton—The Sparks-Withington Company, Jackson, Mich., known as a manufacturer of fans, has brought out a motor-driven horn, Fig. 8, coming in two types, the dash type and that going under the hood. The former is 12 inches long and has a resonator of the parabolically divergent type, while the latter has a shorter and narrower resonator. The construction differs in no essential from conventional practice. The armature shaft of the motor M carries a ratchet wheel W which, when the armature is rotated, strikes a button mounted eccentrically on the diaphragm, which is thereby caused to vibrate. The armature and field are laminated. This horn is finished in brass.

Monoplex—The Atwater Kent Manufacturing Works, Philadelphia, Pa., makes its Monoplex vibrator horn, Fig. 5, in two sizes which have not been changed since last year, except that the little type has a somewhat smaller diaphragm than before. Both types may be obtained in either nickel and black or brass and black finish. The average amperage necessary for working the horns is 2.5 amperes. The Atwater Kent company, due to increased manufacturing facilities has found it possible to reduce the price on this line of product.

Gabriel—The Gabriel Horn Manufacturing Company, Cleveland, O., continues its three types of musical horn, one of which has one note, the other four notes and the third ten, both in two sizes. The principle of this horn and the characteristic and pleasing signal it produces are well known; the horn is of the muffler-operated class and consists of as many pipes as it can produce tones. A manifold which is secured to the muffler outlet divided the exhaust into a number of leads, each conducting gas opposite the mouth of a pipe, where it streams freely into the air. If a valve V controlling this passage is closed, the exhaust is forced through a reed into the pipe P, producing a sound. The 1913 type of Gabriel horn includes several improvements. All the valves on the ten-tone horn, Fig. 9, which are of the perforated, rotary disk order, operate now in the same direction, while formerly some were operated clockwise, and others vice versa. A combination bracket B holds all ten pipes in position, five pairs above each other, in such a way that any one may be removed without disturbing the others. The ten-note horn may be used to play the tones in any desired sequence or by turning a camshaft C, which has three cams for each tone so arranged as to give a melodical signal. The single-note horn has remained unchanged, and the materials used in all the horns are the same as before. There is also a four-tone horn with all pipes in one.

Sireno—An electric horn operating on the siren principle and which has not been changed since last year is the Sireno, made by the Sireno Company, New York. This device consists of an incased motor, the shaft of which carries an impeller fan. When the latter is rotated as the motor turns it forces a current of air forward, after having drawn it in through an opening in the rear wall of the casing. The air current is passed through a siren device which interrupts it and produces undulations of the air, resulting in sound. This interrupting device consists of a drum, the two plain surfaces of which have perforations in alignment with one another, and which contains a rotating wheel which is also perforated. The wheel which is turned by the air current interrupts the latter and is thus the generator of sound. A projector serves to intensify the sound. This type of signal is made in three sizes: Sireno, consumption 6.5 amperes; Junior, consumption 5 amperes; Midget, consumption 4 amperes.

Tuto—The line of vibrator horns made by the Dean Electric Company, Elyria, O., continues from last year with none but minor improvements. It will be remembered that the principle of this horn is along vibrator-signal lines, the circuit of the sound-producing current being made and broken, by the armature of the magnetic coil in the horn. It is stated by the makers that this year's Tuto produces a much louder signal than the previous model and the sound carries about one-third farther than before. The smaller types of this horn, known as Rexo and Tuto-Ette, respectively, are built on similar lines as the larger model. Instead of producing either of two sounds—such as may be obtained from the Tuto by pressing a button to one of two stops whereby various resistances are inserted in the circuit—the Rexo is capable of goving only one sound, but the Tuto-Ette is fitted with a two-tone button. The vibrator principle is the same as in the Tuto. Adjustment of the sound is by a screw which varies the limit of movement of the armature spring returning the armature to its original position, when the current is interrupted. Both types of horn are furnished with either a long or a short projector and in any desired finish, the standard being brass and any other finish being furnished on a very small additional price.

Jericho—The Randall-Faichney Company, Boston, Mass., continues the former types of Jericho and Jubilee horns which operate on the exhaust of the motor if the latter is forced through the reed of the horn by closing a by-pass valve. The Jericho horn may this year be obtained with an electric-operating mechanism, consisting of an incased solenoid coil S, operated by a push button B and on a dry battery, which pulls the cable controlling the by-pass mentioned above, thereby causing the exhaust to pass through the horn. Another addition to the Jericho line is a miniature model specially designed for Ford cars which may be slipped over the exhaust pipe of the Ford muffler without the use of a coupling. This Ford horn is 8 inches long, finished in aluminum, and is guaranteed for the life of the car.

Aermore—The Aermore Manufacturing Company, Chicago, Ill., continues its exhaust horn without a change. This horn, designed to give a strong but pleasing signal, consists of a manifold pipe which is attached to the end of the exhaust pipe or to a side pipe entering the exhaust pipe; from this manifold, four small outlet pipes lead to the signal pipes, four of which signal pipes are provided, all being different in length. If the signal is operated a valve directs the exhaust into the manifold and thence through the signal pipes, producing a four-tone accord.

Cubit—A new electrical horn, operating on the vibrator principle, was shown by the Kosmak Electrical Company, Jersey City, N. J. This horn has the vibrating armature attached by a single screw to the center of the diaphragm which is held in place along its periphery, being fastened to the casing by means of screws. A make-and-break current vibrates the armature and with it the center of the diaphragm, creating a series of undulations resulting in sound. The horn requires for its operation from 1.5 to 2.5 amperes of a 6-volt current.

Waymaker—The Lee Tire & Rubber Company, Conshohocken, Pa., continues its Waymaker horn, Fig. 11, without any radical changes but simplified in one or two minor respect. The bulb control of the horn, with the bulb secured to the steering wheel, is now practically standard and it is hardly probable that the company will once more replace this convenient method of operating the horn by the pedal formerly used.

Nightingale—The Riley-Klotz Manufacturing Company, Newark, N. J., shows a full line of bulb horns in many styles as well as its Nightingale whistle which is being continued from last year. The new features of this company's line are: A chime horn, 15 inches in length and operated by a bulb, which may be attached to the steering wheel of the car and the Alpha whistle which is exhaust-operated and fitted to the exhaust pipe. It consists of a resonator drum into which exhaust gas enters through a reed passage, if its free exit from the muffler into the atmosphere is prevented by the closing of a valve. The latter is operated by a chain from the dash, which chain may be connected to either a pedal or a hand lever. Another novelty is the button-bulb which serves for operating both a bulb and an electric horn. This bulb is fitted over the end of the flexible casing through which the air is forced into the horn, and in its apex contains a button B controlling a contact; the latter closes an electric circuit when the horn is pressed as shown in Fig. 7, while the ordinary operation of the bulb produces a sound in the bulb horn.

Long Horn—One of the cleverest productions of the horn field during the year 1912 was the Long Horn, made by the G. Piel Company, Long Island City, N. Y. This horn creates the signalling sound much in the same way as motor-driven horns, namely, by the striking of a ratchet wheel on the steel button mounted on an acoustic diaphragm. The wheel is actuated by a rack when the handle of the horn is pushed down; the handle being returned to its original position by the pressure of a spring. Model S which was brought out last year is being continued, and models JS, JM and D have been constructed during the latter months of 1912. Model JS is a smaller reproduction of model S, and JM differs from JS by the shorter type of resonator. In model D the handle which operates the ratchet and diaphragm has been supplanted by a Bowden wire which slides in a flexible casing and pulls down the rack instead of pushing it down as the handle does. The way of operating it is by means of a cam, to which the Bowden wire is fixed, which is depressed and pulls the wire from under the rack, whereby the pinion is operated.

Nonpareil—The Nonpareil Horn Manufacturing Company of New York City, besides its usual line of bulb horns is now bringing out a hand-operated ratchet and diaphragm signal in which the ratchet is connected to a handle fitted diametrically across the back cover of the horn; the turning of this handle operates the ratchet, and the pitch of the teeth engaging the button on the diaphragm is such that a piercing signal is thereby produced.

Non-Skid Devices

Weed Tire Chain

The Weed tire chain made by the Weed Tire Chain Grip Company, New York City, is the most widely used accessory to be found in this country. The principle is simple, consisting of a series of cross chains lying on the surface of the tire attached to two circumferential side chains. There have been no material changes in the construction during the past year. In order to maintain uniform tension of the chains over the tread of the tire chains adjusters are used. These consist of several springs connected with lengths of chain, the ends of the latter being fitted with hooks to fasten on the outside body of the chain proper which prevents skidding.

Woodworth Tire Grips and Treads

The Woodworth tread manufactured by the Leather Tire Goods Company, Niagara Falls, N. Y., consists of a leather covering for the tire in which a number of metal rivets are imbedded. A new type has been added called the double grip, in which the studs previously employed have been supplemented by more studs standing higher than the major portion. The tread is applied over the outer casing and held in position by a series of hooks.

Truck Maker's Burden

READ the letter on the opposite page from the Commissioner of Docks in New York City before reading this editorial.

This letter should be read and re-read by every manufacturer of motor trucks and delivery wagons, if he markets them in New York City or in any of the other big cities of America.

It should be read and meditated upon by every builder of motor commercial vehicles in the country, whether building fire-department machines or tractors for agricultural uses. There is a note of common interest in it to all.

This letter tells the reason why so many industrial houses in New York City and in other cities hold back from buying motor vehicles to replace their present horse-drawn equipment.

This letter suggests to the manufacturers of motor freight vehicles the necessity for co-operating with municipal authorities, and insisting on modernizing steamboat and railroad terminals not only in New York City but also in Chicago and a score of other cities, where the present antiquated means of handling freight are inflicting an enormously heavy toll on the introduction of the motor truck.

When the Commissioner of Docks in New York City reports as follows, then it is high time that manufacturers of trucks and our national automobile organizations get together with dock and terminal commissioners and give them all information on what physical requirements the modern motor truck calls for at these terminals.

First—Great cities of modern times are made possible only by improved transportation methods which permit raw materials, food and fuel to be regularly supplied to concentrated masses of population.

Second—Improved transit methods and cold storage have revolutionized city living conditions and if railroad and steamship terminals shall be properly co-ordinated so that unnecessary handling, storage and truckage shall be avoided city living conditions will be materially benefited.

Third—The administration of the Port of New York is a great national responsibility rather than a local city affair.

Fourth—New York in recent years has grown at the rate of over 4 per cent. per annum, yet during the past three years virtually nothing has been done to provide for the growing demands of commerce.

Fifth—New York's orderly development is hampered by lack of modern terminals and connections between them more than by anything else.

Sixth—All of the railroad and steamboat terminals of the port should be ultimately converted into public terminals publicly controlled.

Seventh—Local retail markets, like local postoffices, distributed about the city at convenient points, may later on be found necessary as adjuncts to wholesale terminal markets.

Eighth—Wherever it is practicable for suburban farmers to bring their produce by drays into the city, street markets should be provided for their convenience.

Ninth—The Dock Department of New York City is planning for the construction of public terminal markets near the water front in Manhattan, the Bronx, at Staten Island and at South Brooklyn.

Tenth—The railroad and steamship companies, being common carriers, have no interest in the commodities handled except to deliver safely the goods at the station called for by the bill of lading.

It would be wrong to expect that architects laying out plans for modern terminals and devising modern means for handling freight can design what is best for motor truck efficiency if the truck-making organizations fail to place before them the requirements. It is useless to wait until plans for these new terminals are completed and building commenced only to find entirely inadequate facilities provided. The situation calls for immediate united action on the part of the truck industry.

The motor truck is annually playing a greater part in city transportation and social conditons will demand that it play a still greater part. Hence the necessity of well-organized, rational, concerted action at the present time.

The tenth excerpt from the Commissioner's report shows that little may be looked for from the railroads excepting insofar as it concerns them and that their concern ends with delivery of freight at the terminal, the point at which the concern of the truck maker begins, hence if he looks to the railroad to protect his interests in this new terminal plan he will meet with disappointment.

The third excerpt, namely, that the administration of the Port of New York is a national rather than a local responsibility, points to the great influence that proper New York terminals will have on all of the other cities of the country; and if every facility to lay out these terminals to save loss of motor truck time in

The Motor Truck Maker's Burden

EDITOR THE AUTOMOBILE: *I understand economy of motor trucks is most noticeable on long hauls. I presume it would be equally true to state that short hauls would be more remunerative, providing the delays incident to loading and unloading could be materially cut down. With celerity of despatch at both ends, a series of short hauls under such conditions might approximate in economy the long haul where loading and unloading took more time.* The terminal delays at the railroad and steamship piers on the west side of Manhattan are the heaviest charge to which the commerce of the Port of New York is subjected. *These delays are serious enough in connection with the old-fashioned inexpensive horse dray, but in my judgment* they will materially diminish the opportunities for using motor trucks in city deliveries, unless remedied. *Frequently the horse trucks make only one trip a day to the west side steamship and railroad terminals.*

Modernization of these terminals I believe to be necessary if there is to be a general use of motor trucks in Manhattan. *In this connection I commend to your consideration the plans of the Dock Department for modernizing the terminals. The marginal railway, over which traffic should be as public and unobstructed as is the water in front of the docks, I believe to be a controlling factor.*—CALVIN TOMKINS, *Commissioner of Docks, New York City.*

loading and unloading is accomplished, these means will be widely imitated throughout the entire country. It is an opportunity not to be overlooked, and offers an economical solution so far as motor truck interests are concerned.

Excerpt eight points to the erection of local retail markets throughout the city for suburban farmers, or truck gardeners. These terminals must be adapted to motor truck needs, because within 5 years this work will practically all be done by motors. The track makers should lay before the necessary parties what they consider rational arrangements in such markets.

That motor trucks are losing much time in loading and unloading at the New York freight terminals was proven in a paper read before the National Association of Automobile Manufacturers at its Detroit Convention last November on this subject. Observations made at the terminals of the west side of Manhattan showed that on one day the delays of trucks and horse vehicles averaged 11 minutes per vehicle and on the following day 15.5 minutes per vehicle. Some individual cases showed delays of over 2 hours waiting to load or unload. These facts are corroborated by Commissioner Tomkins' letter, namely, "frequently horse trucks make only one trip a day to the west side steamship and railroad terminals."

These terminal delays are due to a variety of causes, some because of the drivers, some because of the clerical forces within the terminals, some because of the physical arrangements of the terminals, and others because of the inadequate space and objectionable loading and unloading methods used. No matter what the cause of the delay, the net result operates against the motor truck maker. He bears the burden. If only one trip per day can be made to some of these terminals by horse vehicles what hope is there to sell motor trucks to such owners of horse vehicles?

Truck makers must unite; they must put their shoulders to the wheel; they must get out of the narrow sphere of manufacturing and testing; they have to go out into the field of operation and insist that antiquated horse-pace environments be eliminated and modern facilities installed. When dock commissioners realize the forlorn situation, no better opportunity could possibly present itself. Immediate action is needed.

Business at the Truck Show

WHILE there were some who were dissatisfied on the whole, the New York truck show which closed Saturday night was conceded by the manufacturers who exhibited, to be a great success. It must be remembered that people who walk into a showroom and buy a truck without any previous arrangements are very scarce indeed, yet there were many instances where that very thing occurred both at the Palace and at the Garden. Some of the exhibitors sold as many as six trucks at retail to purchasers who had not been prospects before the show opened.

One of the most promising features of the show was the large number of new agencies secured. Many of the exhibitors who did not sell a single truck during the entire show week more than made up for this lack of retail business by the agencies closed in large centers. From all reports it is evident that many of the up-state people were in town to look the trucks over and to select that which they would like to represent in their town.

The number of foreign agencies closed this year was remarkable. An example of this Lippard-Stewart, which, according to sales manager W. F. Reynolds, appointed as a direct result of the show, agents in Australia; Cape Town, South Africa; Venezuela; Philippine Islands; Buenos Ayres and Montevideo. This concern made ten actual retail closures at the show nearly all of which, however, were prospective buyers before the opening day. The Service Motor Car Company also closed a number of foreign agents according to Jean Marks. Those who signed up represented Colon, Australia and New Zealand.

In most cases it was difficult indeed for a sales manager to tell what the net result of the show would be. The number of prospectives secured was in some instances high while the actual sales were few.

Big contracts secured during the show week were not scarce and although these cannot be published owing to the fact that details are still pending it can be stated that the General Vehicle Company, according to F. N. Carle, closed a sale of twenty-five 5-ton electric trucks with Jacob Ruppert, and twenty 5-ton trucks with George Ehret. The Atterbury company closed an order for six trucks with the La France Auto Garage Company of Elmira, N. Y. Two of these were 2-ton trucks, the other four consisting of a 5-ton, 3-ton, 1-ton and a 1,500-pound wagon. This concern sold, according to F. Lindoerfer, sales manager, twenty-seven commercial vehicles as a result of last year's show.

The attendance at the Garden show was good, that at the Palace not so good. In fact the exhibitors of accessories during the truck week, closed up their stands and left before the show was over. They were located on the upper floors and nobody got up their except a few stragglers. During the pleasure car week conditions were different, all the exhibitors being kept constantly busy.

General interior of Belgium's combined automobile and aviation show

European Exhibition Circuit Is Closed

Belgium's National Show a Representative One—Few New Makes Shown

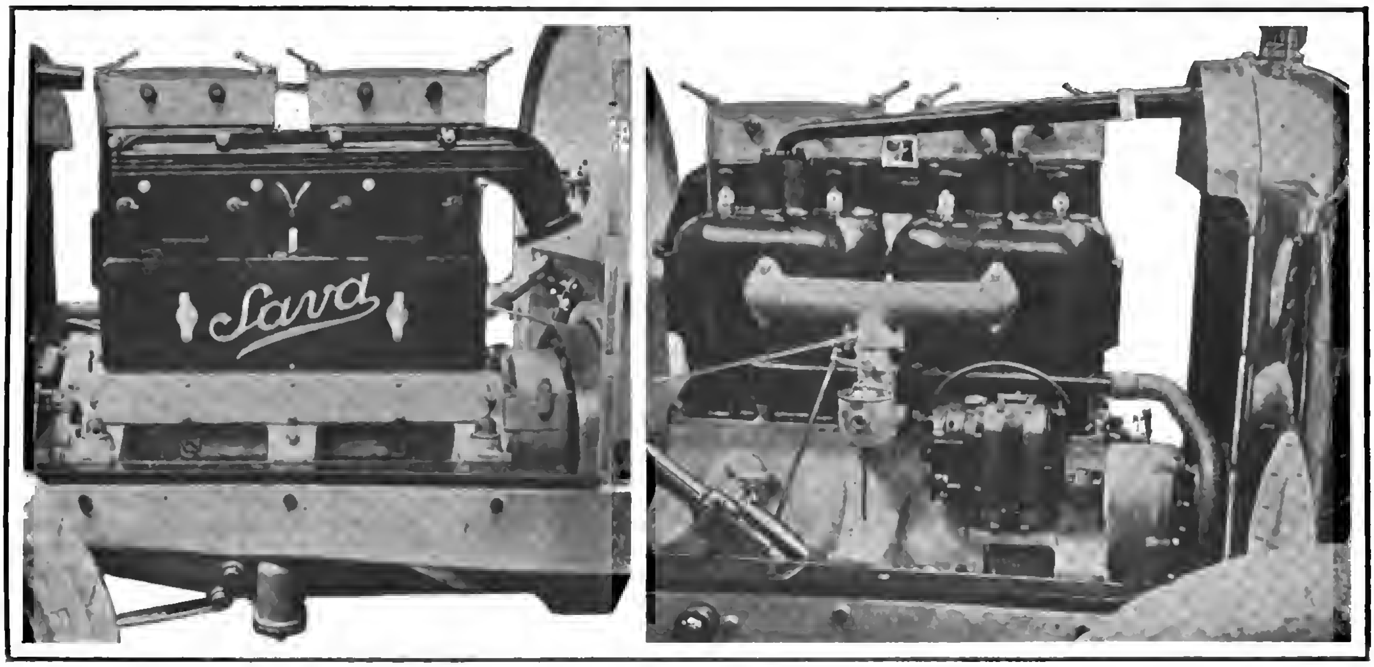
BRUSSELS, Jan. 13.—With the Brussels show the series of important European motor exhibitions comes to a close, for although there are a few more shows they are all of a provincial nature and will not reveal anything not previously seen at London, Paris, or in the Belgian capital. The present show, the twelfth of a series, is being held in the Palais du Cinquantenaire, and unites 196 exhibitors, compared with 175 last year and eighty-two in 1911.

Although Belgium is an automobile manufacturing country of considerable importance, the native manufacturers are outnumbered by the French, the number of French car makers having stands in the hall being twenty-one; Belgians, sixteen; German, seven; English, three; Spanish, one, and America has as its representatives Ford, Hupmobile, Overland and Flanders. The total value of the exhibits is estimated at $750,000, of which aeroplanes are responsible for $180,000.

Among the few entirely new models is a four-cylinder Sava car with its 4.3 by 6.2-inch cylinders in pairs. The valve disposition is of the superimposed type, commonly applied to all Sava cars, the intakes being operated by overhead rocker arms contained within an aluminum housing and working in oil. The pushrods being within the cylinder casting and the valve stems being inclosed, there are no visible moving parts. The gas passages are cast with the cylinders, but the exhaust manifold is bolted on, this being the disposition adopted on the large majority of Belgian cars, and indeed on most European cars. The integrally cast water-cooled exhaust manifold is less commonly employed on account of its tendency to overheat the cooling water if special provision is not made. This new Sava chassis has timing gears at both front and rear. At the rear the camshaft is driven by silent chain, the top of the housing being detachable in order to give admission to the chain and the camshaft pinion. The chain drive for the magneto and water pump is at the front. There is a detachable cover over the camshaft housing and a compression release on the camshaft for ease in starting up. Ribs are cast on the base chamber for cooling.

The shaft between the cone clutch and the four-speed gearbox is incased by an extension of the gearbox in a manner adopted this year for the first time by Renault. A feature of the gearbox is the method of forced-feed lubrication instead of by grease churned up by the gears. In the base of the gearbox is an oil reservoir from which a pump draws lubricant and directs it onto the face of the teeth in contact. The gearwheels do not dip in the oil. There is an aluminum housing round the transverse gearshifter rod, this housing also combining the sector, and being entirely independent of the frame member. The housing being merely bolted onto the gearbox, is made in various lengths to suit individual requirements, thus making it possible to bring the sector directly over the frame member or within it, as desired. Overhead worm drive is employed, the Sava company appearing to be the only one in Belgium preferring this to bevel gearing. The worm is carried in a concentric sleeve and can be adjusted externally with the greatest ease. The driving effort is taken through the springs, and the torque provided for by a tubular housing with forked arms, around the propeller shaft. Greasers are also provided for the trunnion mounting of the radiator. The rear brake mechanism is rather an interesting feature. On the forward end of the torque tube is a transverse bar carrying a grooved pulley mounted on a vertical axis. One end of the bar is pivoted, and the other end is connected by a ball-and-socket joint to the connecting rod going to the brake pedal. A cable passes round the pulley, one end being attached to each of the rear brake levers. The arrangement is neat and simple and gives a perfect equalizing effort.

Non-poppet valve types of motors are not a strong feature in Belgium. The Minerva company is building the Knight exclusively, and Germain has one model with the Knight motor. There appear to be no other non-poppet valve motors built in Belgium. Germain has produced a new model for the coming



The Sava motor was one of the new features at Brussel's show

season, but it is of the poppet valve type, its dimensions being 3.1 by 5.5 inches bore and stroke, with the four cylinders cast in one block and offset in relation to the crankshaft. Two independent chains are used for driving the magneto and water pump and the crankshaft, and are placed at the flywheel end. Lubrication of the motor is under a pressure of 40 pounds to the square inch, the pump being driven off the camshaft and the oil leads to the three main bearings being external.

Among the outstanding features of the Belgian construction are three and five-bearing crankshafts for four-cylinder motors, forced-feed lubrication to either all or to the main bearings, with constant-level troughs for the connecting rod ends; a tendency to put the chain or timing gears at the rear of the motor; high-tension ignition with either variable or automatic advance; metal clutches more frequently than cone type; four-speed gearboxes, and shaft drive with a torque tube surrounding the propeller shaft. A considerable effort has been made to reduce the unsprung weight of the rear axle by the use of higher-grade material. Wire or detachable steel wheels are very commonly employed. Cranking motors are altogether unknown, but electric lighting dynamos are either fitted or provision is made for fitting them on the majority of chassis.

Quakers' Show A Success

Week's Attendance 35,000—New Business Done 50 Per Cent. in Excess of That Done Last Year

Sixty-nine Makes of Cars on View and Score of Accessory Displays

PHILADELPHIA, PA., Jan. 25—Neither in point of attendance nor in the amount of business transacted has any former automobile show approached the record established by the twelfth annual motor car exhibition held in the mammoth new garage of the Automobile Club of Philadelphia, under the auspices of the local Automobile Trade Association, Part I of which closed tonight.

While no accurate figures upon which to base a comparison are available, the week's attendance has been conservatively estimated to have been 35,000, a daily average of 5,000, while as a business proposition the amount of new business actually consummated will show an average increase of 50 per cent. over last year, with an exceptionally strong list of prospects. For the most part the visitors at this year's show were a discriminating lot, and the expectations engendered by last Saturday night's record-breaking opening that this would be the most successful automobile show ever held in Philadelphia were fully realized. Individual exhibitors to a man are enthusiastic over the results attained.

Sixty-nine Makes of Cars Shown

Sixty-nine different makes of cars were represented on the three floors of the Automobile Club's building, occupying approximately 90,000 square feet of space. In addition there were over a score of accessories dealers. Probably 90 per cent. of all the displays had been installed when the show opened on Saturday night, but an almost entirely changed view presented itself on Monday, the transformation having been accomplished over Sunday, when many of the exhibits temporarily placed for opening night gave way to others brought over from New York upon completion of the pleasure car exhibit there. Many minor changes looking toward the relief of congestion similar to that which characterized Saturday night had also been made by the management. The service of the two 20-foot elevators used to haul passengers was rearranged, one being confined to carrying visitors up and the other down only. A hand rail dividing the wide stairway had also been built.

Wednesday evening was observed as Club Night, the 1,600 members of the Automobile Club of Philadelphia having been specially invited to attend the show as guests of the Philadelphia Automobile Trade Association. Representatives of the Rambler car from eastern Pennsylvania and New Jersey also attended the show on Wednesday, piloted around by F. E. Devlin, local manager of the Rambler agency.

Thursday was set aside as Society Day, when the price of admission was doubled, and although it rained most of the day and night a good attendance was noted, the automobile owner and prospective owner predominating. This was the day the electric came into its own. the fair sex lingering around the booths where the electrics were being demonstrated eagerly absorbing information.

Following a close second to the pleasure car exhibit both in the variety of displays and in general interest, Part II of the show will open on Monday morning with the most comprehensive collection of motor trucks ever assembled in this city. Thirty-one different makes will be shown, ranging from 500 pounds capacity to 10 tons. This less handsome but more utilitarian exhibition will comprise commercial vehicles adapted to every purpose of every business in which the transportation problem figures. Demonstrating the maximum of efficiency with the minimum of expense appeals to the business man, consequently the coming week's show will be a strictly business proposition, so a decided falling off in attendance is anticipated. No change in the interior decorative scheme will be made for the coming week's show and the nightly musical concerts will continue.

Notwithstanding the immense exhibition conducted in the Automobile Club of Philadelphia building, Twenty-third and Market streets, the first annual domestic and importers' exhibition conducted under the auspices of the Philadelphia Board of Trade, Ltd., in the First Regiment Armory, Broad and Callowhill streets, closed a successful week tonight. Indeed, so successful was this initial effort at a combination show that a permanent organization has been effected, with the object in view of making the Importers' Salon an annual fixture.

Costly and luxurious foreign models ranging in price from $8,000 to $18,000, none of which had ever before been exhibited in Philadelphia, were the magnet that attracted motor car enthusiasts. Side by side was shown a representative collection of American cars.

Tire Makers Adopt Standard Guarantee

At a meeting of the Motor and Accessory Manufacturers' Association held during the show period in New York City a standard form of tire guarantee has been adopted. Some false reports have been circulated that this will mean the forced abandonment of all mileage guarantees. This is not true, although it is likely that the ultimate result will be that several concerns now guaranteeing a definite mileage will abandon this policy. This is a matter, however, which is up to the individual manufacturer. The wording of the new guarantee is as follows:

We guarantee all Pneumatic Automobile Tires, bearing our name and serial number, to be free from imperfections in material and workmanship. Tires returned for consideration under this guarantee will be accepted only when all transportation charges are prepaid. If, upon examination, it is our judgment that tires are defective, they will be repaired or replaced at our option.

When tires are replaced by us, charges will be made to owners at the time new tires are delivered, for such amounts as in our judgment will compensate for the service rendered by such replaced tires.

Tires worn out in usual or unusual service, abused knowingly or unknowingly, misused, used on rims not bearing these stamps, injured through accident or design, are not covered by this guarantee.

(Manufacturer's name) Pneumatic Automobile Tires are not guaranteed to give any definite miles of service and any and all guarantees are expressly waived by any purchaser of these tires who uses therein any substitute for air; or who uses them under weights or in excess of those for which the various tires are recommended, or who does not keep tire inflated to the pressure recommended by us.

Two Interesting Opinions Rendered

ST. PAUL, MINN., Jan. 27—Two opinions affecting automobile companies have been handed down by the Supreme Court. In the first, that of the Travelers' Casualty Company against the Fawkes Automobile Company, the court held that in the case it devolved on the defendant to show he exercised ordinary care in keeping the property which he admitted inability to return to meet a *prima facie* breach of contract. "Where the proprietor of an automobile repair shop had notice that his foreman had proclivities rendering it likely that he would injure cars left at the shop for repairs, by taking them out at improper times and make unauthorized use of them, it was such proprietor's duty to exercise ordinary care to protect such cars from the danger of injury to which they were thus subjected. The action of the court, in an action for injury to an automobile in a collision which occurred while the foreman of the defendant's repair shop was using it for his own private purposes, in submitting to the jury the question whether the defendant was guilty of negligence in retaining such foreman in his employ is sustained. The contention that the complainant failed to state a cause of action held in any event too late when made for the first time on appeal. Where the facts litigated were known to the defendant, a variance, if any, between the complainants and his proofs is held harmless. Where the defendant in an action for injury to an automobile had acted virtually as appraiser between the plaintiff, an insurance company and the owner of the machine, and the plaintiff had paid the owner the amount of the loss fixed by such appraisement, the defendant was estopped to introduce evidence as to the value of the machine. Other claims were held to be without merit."

In the second case, F. W. Geiss against the Twin City Taxicab Company, appellant, the court's opinion read: "First, where a servant, without authority from the master, permits a stranger to assist him in his work for the master, and such stranger, in the presence of the servant and with his consent, negligently does such work, the master is liable for such negligence."

Briscoe Heads French Company

PARIS, Jan. 18—On the latest list of French joint stock companies appears the announcement "Briscoe Freres, a company for experimental and research work in automobile construction, with headquarters at Billancourt, Seine." Inquiries revealed the fact that the new French company has Benjamin Briscoe at its head and that work is actively progressing on a car for the American market. Interviewed by THE AUTOMOBILE representative, Mr. Briscoe admitted that he was laying plans for a big business campaign. His intention in coming to France was not primarily to enter the European market, but to get on the American market on a larger scale and on a more solid foundation than ever before.

The car would be sold in America fully equipped for less than $1,000. It was learned that the preliminary work is well advanced and that the first models will be entirely completed and tested out in France. When all the preliminary work has been completed, its construction in large quantities is to be commenced in America. It is stated that the car will be ready in ample time for the 1914's season's trade.

Stephenson vs. Case Suit in Court

MILWAUKEE, WIS. Jan. 25.—Arguments are now being heard in the circuit court of Milwaukee county, Branch IV, in the case of the Stephenson Motor Truck Company against the J. I. Case Threshing Machine Company and Pierce Motor Company of Racine, Wis., since merged under one name. The Stephenson company sues for $100,000 for breach of contract, claiming that the Case concern contracted to purchase its entire output and later the entire plant and real estate. The trial of the case lasted nearly a month, and the volume of testimony on which arguments are now being made cover more than 5,000 typewritten pages. A decision is expected early in February.

Hughes and Mercer Company Sued

MILWAUKEE, WIS., Jan. 27.—Hughey Hughes and the Mercer Automobile Company of Trenton, N. J., have been made defendants in a suit for $10,000 damages for personal injuries by Charles Hoch, a farmer residing near the Wauwatosa course, on which the last Vanderbilt cup and grand prix races were held. Hoch alleges that Hughes struck his wagon, throwing him out and injuring him, probably permanently. He asks $10,000.

Indiana Branch of S. A. E. to Meet

INDIANAPOLIS, IND., Jan. 27—The Indiana branch of the Society of Automobile Engineers will discuss motor fuel at the monthly meeting of the branch to be held February 18. John A. Secor is to be one of the principal speakers.

INDIANAPOLIS, IND., Jan. 27—The Empire Automobile Company announces that owing to the fact that it was unable to secure adequate space at the National Automobile Show at Chicago, it will have a special exhibit at the salesroom of the Ralph Temple Automobile Company. The concern manufactures a five-passenger touring car.

Chicago Ready for Show

Exhibition to Open on Schedule Time—There Will Be 600 Exhibitors—Many Accessories To Show

Pleasure Car Exhibits Will Number 100 and Those of Commercial Vehicles Seventy-eight

CHICAGO, ILL., Jan. 27—As usual, Samuel A. Miles, general manager of the National Association of Automobile Manufacturers, will have his show ready on time. Since the middle of last week his decorators have been busy in the three buildings which comprise the show unit this year, and by next Thursday afternoon it will be possible for those exhibitors, who so desire, to install their cars or sundries, and the show will open on schedule time at 1 o'clock next Saturday afternoon. Through the securing of the Wilson building, which is to the immediate south of the Coliseum annex, Miles has secured a little more room than he ever had before. For the first time in the history of the Chicago show there will be no foreign cars displayed. The Fiat is in, but it is now so thoroughly Americanized it is not now regarded as of foreign extraction.

In all there will be in the neighborhood of 600 exhibitors at the show, with 100 of these exhibiting pleasure cars and seventy-eight motor trucks. This is a slight increase over last year, when there were ninety-six pleasure car makes and sixty-five trucks. In the accessory line there are from thirty to thirty-five more exhibitors than last year, the majority of whom are going to exhibit both weeks of the show.

40,000 Attendance at Toledo Show

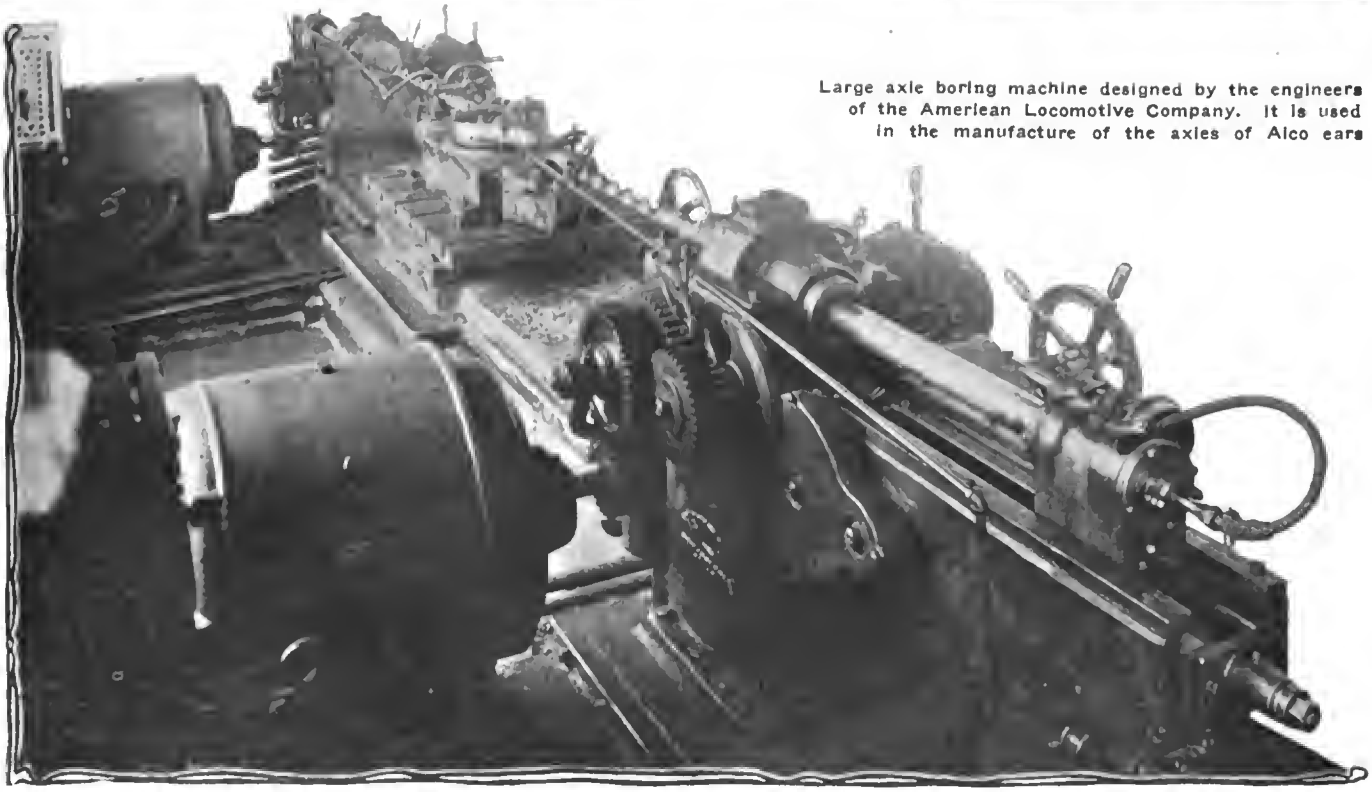
TOLEDO, O., Jan. 25—There were more than 40,000 persons in attendance at the Automobile Show given in the Terminal building on Cherry street by the Toledo Auto Shows Company, a large percentage of whom were farmers and persons living in small cities within a radius of 50 miles of Toledo. There were more than fifty exhibitors, and about 250 cars, of all classes, on the floor. Toledo manufacturers were well represented, especially in electric cars and trucks. The buying is being done by the farmers, this year, and they are buying $1,200 and $1,500 cars for the most part.

HARTFORD, CONN., Jan. 28—(*Special Telegram*)—Twelve makes of gasoline pleasure cars, one electric and two makes of gasoline commercial cars, were displayed at the second annual automobile show which opened Monday evening for the week at Waterbury, Conn. The attendance was fairly good and all indications point to a successful exhibition. The affair is being conducted shown by Hartford dealers. The decorations were effective.

PROVIDENCE, R. I., Jan. 25—Two motor car shows opened here this evening, one under the auspices of the Rhode Island Automobile Dealers' Association in the Armory and the other at the Narragansett Hotel held by some of the dealers who were unable to get space at the big show. The two shows will run for a week.

MILWAUKEE, WIS., Jan. 24.—A team match trophy tour between the Milwaukee Automobile Club and the Milwaukee Athletic Club and a match run with the Chicago Automobile Club are being figured out as the principal touring events of the Milwaukee motoring organization, which this year for the first time intends to engage in competitive touring.

Factory Miscellany



Large axle boring machine designed by the engineers of the American Locomotive Company. It is used in the manufacture of the axles of Alco cars

THE above illustration shows an extraordinarily large axle boring machine. Although built by a prominent manufacturer of machine tools this machine was designed in the factory of the American Locomotive Company, Providence, R. I., for use in the manufacture of the Alco pleasure axles. As may be noted the machine is driven by an electric motor which actuates the boring shaft through a train of gears. There are in reality two machines mounted in opposed fashion, the two cutting tools working toward each other. The illustration shows an axle in place, it having both its ends bored at the same time. Since the boring shafts are accurately aligned the axle is sure to be bored true by this machine. Although automatic in its action the rate of feed of the drill is under instantaneous control of the man in charge of the machine.

KEETON'S Big Factory—The Keeton Motor Company, Detroit, Mich., recently purchased the immense automobile plant formerly occupied by the Oliver Motor Car Company, paying $50,000. The property consists of three buildings of modern factory construction 220 feet by 80 feet each, and one building 140 feet by 40 feet. With other smaller buildings, the factory will comprise 50,000 square feet. Building No. 1 will be given over to the chassis assembling, and building No. 2, which is 110 feet by 80 feet, will be the rough test department. In building No. 3, which is of equal size to building No. 1, will be the rough and finished stock, receiving and shipping. The fourth building will be the machinery room, 140 feet by 80 feet, and the fifth building will be the painting and trimming room, same being 220 feet by 80 feet in size. The offices are contained in a projecting wing at the corner of the factory group.

Goodwin Car Company Building—The Goodwin Car Company, Chicago, Ill., is erecting a one-story factory, 60 feet by 200 feet, costing $20,000.

Mohawk Using Stein Plant—The Mohawk Rubber Company, Akron, O., has taken over the plant of the Stein Double Cushion Tire & Rubber Company.

Morrow's Plant—The Morrow Manufacturing Company, Elmira, N. Y., has adopted plans for a new addition, 700 feet by 100 feet, to its present automobile plant.

Falls Tire Increases Capacity—After March 1 the Falls Tire & Rubber Company, Cuyahoga Falls, O., will increase its tire capacity by installing new machinery.

Pennsylvania Rubber's Addition—The Pennsylvania Rubber Company, Jeannette, Pa., have plans in progress for a three-story factory addition, costing $100,000.

National to Build—The National Motor Vehicle Company, Indianapolis, Ind., is planning to build a three-story building, 83 feet by 97 feet brick addition to its factory.

Hanna Equipping Plant—The Hanna Motor Manufacturing Company, Kansas City, Mo., recently incorporated with a capital of $60,000, will equip a plant for the manufacture of motors.

Drop Forge Company's Addition—The Park Drop Forge Company, Cleveland, O., manufacturer of automobile forgings, has awarded contracts for the erection of an addition, to cost $9,000.

Speedway Recently Organized Builds—The Speedway Tire Company, recently organized in Louisville, Ky., with a capital of $250,000, will erect a large plant for the manufacture of automobile tires.

Amplex Builds Assembling Room—The Amplex Motor Car Company, Mishawaka, Ind., will erect an addition to be used as an assembling room. It will be one story high and 120 feet by 255 feet.

General Vehicle's Planning—The General Vehicle Company, New York City, has plans for a large factory which will be erected in the automobile manufacturing district of Long Island City, N. Y.

Michelin Adding—The Michelin Tire Company, Milltown, N. J., is adding a large wing to building No. 14. It will be one story high, with a second story over one portion of it. It will be constructed of reinforced concrete, with roof of saw-tooth design.

Automobile Foundry Destroyed—An explosion in the brass and aluminum foundry of the Buick Motor Car Company's plant at Flint, Mich., recently, destroyed that building and the machinery it contained. The total loss was estimated at $40,000. No one was seriously hurt.

Dayton's Branch Factory—It is stated that the Dayton Motor Truck Company, Dayton, O., will establish a branch factory at Chattanooga, Tenn.

Fire at Studebaker Factory—Fire broke out in the basement of the plant of the Studebaker Corporation, South Bend, Ind., but no damage was done.

Ravenna Erecting Plant—The Ravenna Auto Truck Company, Ravenna, O., is erecting a plant 50 feet by 150 feet for the manufacture of the Ravenna automobile truck.

Beaver's Vancouver Plant—The Beaver Automobile Company, Portland, Ore., recently incorporated with a capital of $150,000, will erect a plant at Vancouver, Wash., for the manufacture of automobiles.

Morgan & Wright Adds—The Morgan & Wright Company, Detroit, Mich., tire manufacturer, is beginning work on a five-story addition to its plant, 94 feet by 250 feet, to cost about $100,000.

Automobile Works Sold—The Findlay Motor Works, Findlay, O., have been sold to J. G. Cleary, of Milwaukee, Wis., who will dismantle the plant and remove the machinery to that city. The price paid was $50,000.

Garage Equipment's Building—The Garage Equipment Manufacturing Company, Milwaukee, Wis., is receiving bids for rebuilding its factory recently destroyed by fire. The building will be one-story high and 100 feet by 93 feet.

Abolishes Factory Manager Office—The management of the Abbott Motor Company, Detroit, Mich., has abolished the office of factory manager, the duties formerly attached to this position being divided between the general manager and the factory superintendent.

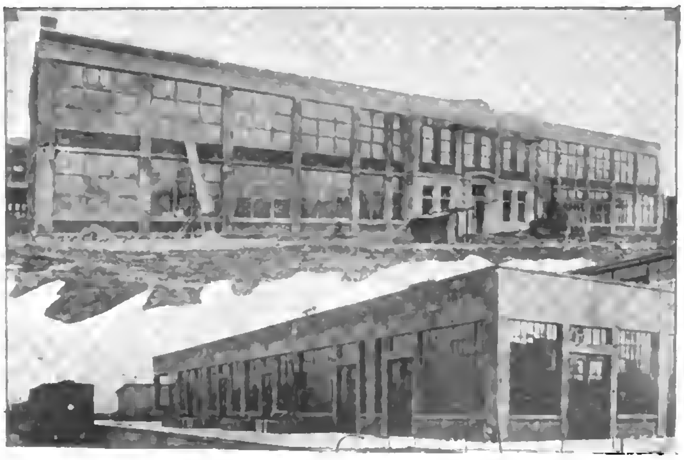
Factory Additions at Passaic—The Manhattan Rubber Manufacturing Company, Passaic, N. J., is contemplating large additions to its factory. There is at present being completed the erection of a hose department building, as well as a box factory and machine shop.

Nova Scotia's Plant Completed—The main building of the Nova Scotia Carriage & Motor Car Company, Amherst, N. S., and the power house and dry kilns have been completed. It is 60 feet by 340 feet and four stories high. The automobile department is being transferred from Kentville, N. S.

Beckman Looking for Site—J. E. Beckman, of Chicago, Ill., president of a company producing transmissions and gears for automobiles and trucks, is in Kenosha, Wis., to look over the ground with a view to establishing a factory. The company is capitalized at $100,000, and is employing from 50 to 75 men in its temporary factory at Chicago.

Cumberland Equipping Factory—The Cumberland Motor Company, Pineville, Ky., recently incorporated for $50,000, will equip a factory to manufacture a patented spring motor. The machinery required includes automatic gear-cutting machines, lathes, scrapers, screw machines, drills and spring coilers.

Timken's Offices Installed—The offices of the Timken-Detroit Axle Company, Detroit, Mich., will soon be installed in the new office building recently erected by the company at the plant. The new office building is about 60 feet by 200 feet and four stories high. It will give the company a frontage of 750 feet on Clark street. The parent company, the Timken Roller Bearing Company, has completed a new grinding room at the Canton, O., plant.



The Prest-O-Lite Company's new plant at Indianapolis, Ind., costing over $500,000 with four times the capacity of the present factory. There are ten buildings in the group occupying 15 acres of ground

Testimonial banquet tendered to Past-President W. H. Blood, Jr., at Delmonico's January 16 by the Electric Vehicle Association of America

WOULD Change Show Dates—Harry Fosdick, director of sales for the Hupp Motor Car Company, Detroit, Mich., recently asserted himself in regard to the time of automobile shows, stating that the dates are too late now for the manufacturer who has his entire output sold at the time the shows come along and that September would be a much more preferable month.

Five Fords for Columbus—The post office at Columbus, O., has installed five Fords in its parcel post service.

Hobron McGraw Manager—The McGraw Tire & Rubber Company's New York City branch is now under the management of R. F. Hobron.

Hoyme Philadelphia Alco Manager—C. R. Hoyme has been appointed manager of Alco trucks and cars in Philadelphia, Pa., and in charge of both sales and service.

Clark & Hubbell Handle Alco—V. L. Clark and G. C. Hubbell have formed a company in Des Moines, Ia., known as the Commercial Motors Company, and will handle Alco trucks.

KisselKar for Stockton—The Kissel Motor Car Company, Hartford, Wis., has just delivered a 50-horsepower police patrol to the city of Stockton, Cal. In test this car developed 46 miles an hour.

Rayfield Service Branch in New York—The Findeisen & Kropf Company, manufacturers of the Rayfield carbureter, has established its own sales and service branch in New York City at 1902 Broadway.

Overland's Quarterly Dividend—It is officially stated that the dividend of 1.5 per cent. recently declared on Willys-Overland common stock is a quarterly dividend, thereby placing the stock on a 6 per cent. basis.

Sanders Abbott Sales Manager—The Abbott Motor Company, Detroit, Mich., has appointed L. B. Sanders sales manager. Mr. Sanders formerly occupied a like position with the Lion Motor Car Company, Adrian, Mich.

Davis King Manager—Archie B. Davis, formerly assistant manager and sales manager for the United Motors Detroit Company, has become manager of the Michigan branch of the King Motor Car Company, with headquarters at Detroit, Mich.

Credit to Wire Wheels—The detachable wire wheels on which speeds from 84 to 92 miles per hour were made on Brooklands track in England, as mentioned on page 270 of the January 23 issue of THE AUTOMOBILE, were of the Rudge-Whitworth type.

Columbus Aims for Safety—The Columbus Automobile Club, through President N. J. Ruggles and its legislative committee, will seek for several laws before the Ohio General Assembly which will tend to make the operation of an automobile on the streets and highways of the country more safe.

Bosch Appoints Three Distributors—The Bosch Magneto Company, New York City, has appointed the Doubleday-Hill Electric Company, Pittsburgh, Pa.; the Phœnix Automobile Supply Company, St. Louis, Mo., and The Motor Parts Company, Boston, Mass., as distributors of its product in their territories.

Philadelphia Forbids Loud Siren—In an order issued by Superintendent of Police Robinson of Philadelphia, Pa., automobilists are prohibited from using high power siren horns. The order states that as the new automobile fire apparatus is equipped with the high power sirens private automobilists are prohibited from using the warning signal.

Michelin Granted Drawback—The treasury department at Washington, D. C., has issued a ruling allowing drawback, under section 25 of the tariff act of 1909, on tire containers manufactured by the Michelin Tire Company, Milltown, N. J., with the use of imported special wrapping paper in conjunction with domestic corrugated paper. The allowance shall not exceed the quantity of imported special wrapping paper used.

Liquor Revenue for Roads—The idea of applying one-half of the total moneys collected by towns, villages and cities of Wisconsin for retail liquor, or saloon licenses, to the state aid for highway improvement fund, has come before the Wisconsin Legislature in the form of a bill by Senator Howard Teasdale, of Sparta. He believes about $1,000,000 can be raised for permanent road work in Wisconsin every year by this means.

Crude Oil Supply Diminished—Wisconsin municipalities which have been using oil for laying dust and preserving macadam streets and roadways, are wondering if the recent action of the Standard Oil Company in greatly diminishing the supply of crude oil and sending the price from $2.50 and $3.50 to $5.50 and $6 will affect that grade of oil used for street work. The material is the final residue of petroleum after distillation. New contracts are being delayed by common councils until the situation clarifies.

Chattanooga's Two Automobiles—In order to handle the increased business of the Chattanooga, Tenn., post office two automobiles have been added to the delivery equipment of the office.

Each County to Draw $2,000—Every one of the sixty-seven counties in Alabama has been authorized to draw $2,000 as its share of the first installment of the state road assistance fund.

Knight Tire in Baltimore—The Knight Tire & Rubber Company, Baltimore, Md., has opened offices and salesrooms at 1417 North Charles street. W. T. Kuhns and C. B. Chambers are in charge.

Spitzley Resigns—Carl J. Spitzley, who has been connected with the sales branch of the Abbott Motor Company at Detroit, Mich., for a long time, has resigned his position to enter the real estate business in that city.

Venezuela's Good Roads—Due to the government appropriation of 1,000,000 bolivars for the improvement of highways near the capital city of Venezuela, a much greater demand for automobiles is expected.

Acquits Mayor Shank—A jury in a justice of the peace court at Oakland, Ind., has acquitted Mayor Shank of Indianapolis, Ind., on the charge of fast driving while he was catching and arresting another speeder.

Moyer Brings Out Car—H. A. Moyer, a pleasure car manufacturer in Syracuse, N. Y., has brought out a new two-passenger roadster equipped with a 4 1-2 by 5-inch motor, combination electrical self-starter, ignition and a lighting device.

Glover's New Quarters—Permanent quarters on the third floor of a new building in Indianapolis, Ind., have been taken by the Glover Equipment Company of that city, manufacturers of the Antidam radiator protector, tops, dust hoods and seat covers.

Wabash Club Formed—An automobile club has been formed at Wabash, Ind., with C. H. La Salle as president and William Dixon as secretary. There is a large number of charter members. Particular attention is to be paid to obtaining better roads.

New Electric Service Station—There is to be included in the Syracuse, N. Y., agency for Baker electric pleasure and commercial cars a large garage and public service station equipped with the latest type of General Electric Company's charging apparatus in charge of experts.

Kelly Baltimore Branch Discontinued—The Baltimore, Md., branch of the Kelly-Springfield Motor Truck Company has been discontinued and hereafter the Kelly truck will be handled in Maryland and the District of Columbia territories by the C. B. B. Motor Company, Baltimore.

Sheen Purchasing Agent—Frank J. Sheen has been appointed purchasing agent of the Abbott Motor Company, Detroit, Mich. Until his new appointment Mr. Sheen was in charge of the stores and tracing department of that company, with which he has been connected for several years.

Seagrave's Fire Apparatus—The city of Madison, Wis., state capital, has just placed in service its first motor fire-fighting apparatus, a six-cylinder Seagrave flying squadron car manufactured according to the Madison departmental specifications by the Seagrave Company, of Columbus, O.

Henderson in Indianapolis Race—The Henderson Motor Car Company, Indianapolis, Ind., has confirmed a report that it expects to enter a car in the 500-mile race to be held at the Indianapolis Motor Speedway, Memorial Day. Bill Knipper is to be nominated as driver. Details concerning the car to be entered are not forthcoming at this time, but it is reported that the entry will be a four-cylinder machine.

New Indiana Light Bill—Another bill of interest to automobile owners has been introduced in the Indiana Legislature. This provides that the tail lamp shall be arranged to illuminate the registration numbers after night. The bill is the result of several instances where pedestrians have been run down after night and the drivers have not stopped, and it has been impossible to identify either the car or driver.

Indianapolis' New Show Space—It is regarded as likely that the Indianapolis, Ind., Automobile Trade Association will decide to hold its annual automobile show, which is to be held in March, in the downtown district. Last year the show was held in a huge tent near the business district, but this year a plan to hold it at the coliseum at the state fair grounds north of the city has been discussed. It has now been suggested that the show be held in the first three stories of the Murphy power building in Georgia street, which is a fireproof structure and within one square of the center of the business district.

Building a road in the desert near Phoenix, Ariz., showing what the builders faced when they started work on the Arrow Weed Road

The first stage in the building of the Arrow Weed Road, showing Mexicans shovelling sand from the road bed

Nashville to Hold Show—Nashville, Tenn., automobile dealers have decided to hold a show in March. The date is to be selected later.

Washington Firm Moves—The Commercial Auto & Supply Company, Studebaker agents, will remove in the near future to 817 Fourteenth street.

Fire Wagon for Malden—The Boston, Mass., branch of the White Automobile Company has just delivered to the fire department of Malden, Mass., a combination hose and chemical wagon, and it has gone into commission right away. It is mounted on the 40-horsepower chassis and has a number of features new to fire vehicles.

To Motorize Fire Department—Complete motorization of the Hartford, Conn., fire department is desired by the board of fire commissioners. About $200,000 is needed to accomplish the end. Four-wheel drive tractors, combination chemicals to replace the present horse wagons, and various other pieces of apparatus are considered in the budget.

Automobile Incorporations

AUTOMOBILES AND PARTS

Detroit, Mich.—Standard Tool & Manufacturing Company; capital, $20,000; to manufacture tools. Incorporators: J. G. Heal, R. C. Dorman, T. P. Penniman.

Hamilton, O.—George Automatic Roller Bearing Company; capital, $550,000; to manufacture and deal in roller bearings and parts of vehicles and automobiles. Incorporators: Walter H. Miller, Geo. T. Reise, Chas. E. Heiser, Edward Ritchie, C. R. Greer.

Indianapolis, Ind.—John Brothers' Motor Company; capital, $70,000; to manufacture motor car, marine and aeroplane motors and monoplanes. Incorporators: Louis J. Johnson, Harry Johnson, Julius Johnson, J. W. Sackrider, Demas Deming, Chas. Minshall, Ora D. Davis.

Massillon, O.—Massillon Rubber Company; capital, $25,000. Incorporators: Robert R. Hess, Albert Geis, F. McLain, W. Arnold, Harry V. Hess.

New York City.—Safety Auto Control Corporation; capital, $500; to manufacture devices for automobiles. Incorporators: Howard K. Wood, H. O. Coughlan, Joseph F. Curtin.

New York City.—Eureka Machine Company, Incorporated; capital, $5,000; to manufacture automobile accessories. Incorporators: Joseph Prosky, Philip Frankel, Frank A. Dillingham.

New York City.—The Club Garage, Inc.; capital, $5,000. Incorporators: Jerome L. Davis, Thos. A. Kilfoil, Samuel I. Goldberg.

St. Louis, Mo.—T. J. Moss Motor Car Company; capital, $10,000; to establish a garage and repair shop. Incorporators: T. J. Moss, J. W. Fristoe, E. J. Dykstra.

Waco, Tex.—Waco Auto Supply Company; capital, $5,000; to deal in accessories. Incorporators: W. H. Montz, H. B. Lyne, James Harrison.

Yoakum, Tex.—Yoakum Machine Shop & Garage; capital, $10,000; to do a general garage business. Incorporators: W. L. Orth, L. A. Orth, M. S. Orth.

Yonkers, N. Y.—Ralph B. Hibbard, Incorporated; capital, $5,000; to do a general garage business. Incorporators: Ralph B. Hibbard, Louise P. Hibbard, Elliott W. Pitkin.

GARAGES AND ACCESSORIES

Brooklyn, N. Y.—Williamsburg Plaza Garage, Inc.; capital, $1,000. Incorporators: Louis Cantoni, Frank Furnell, Adolph Furnell.

Buffalo, N. Y.—F. A. M. Auto Supply Company; capital, $20,000. Incorporators: Frank A. Marburg, R. A. Felthousen, John B. Green, Geo. D. Shaw, R. T. Templeton.

Chicago, Ill.—Burgess-Hovey Company; capital, $25,000; to manufacture automobile accessories. Incorporators: F. O. Koepke, F. W. Bigelow.

Cincinnati, O.—Model Garage Company; capital, $10,000; to operate a garage and repair shop and to run a taxicab business. Incorporators: Edward Hine, Martin Fette, Carl Riechelman, Clara Hine, Della Cottrell.

Cleveland, O.—Coronet Mfg. Company; capital, $60,000; to manufacture a speedometer for automobiles. Incorporators: Harry W. Garberson and others.

Cleveland, O.—Universal Accessories Company; capital, $5,000; to deal in automobile accessories and machinery of all kinds. Incorporators: Carl Spero, T. W. Rutlege, R. E. Vernes, H. C. Roth, F. C. Baisch, Jr., J. J. Ripner, H. C. Clarke.

Cleveland, O.—Krankless Starter & Mfg. Company; capital, $25,000. Incorporators: A. G. Freeman, F. A. Sweet, Fred H. Gerher, J. B. Label, R. E. Andrews.

Detroit, Mich.—Detroit Flash Curtain Company; capital, $25,000; to manufacture automobile curtains, windshields and other accessories. Incorporators: F. J. Schaffer, W. H. Goodfellow, H. M. Vaughn.

Hudson Falls, N. Y.—Kingsbury Motor Sales Company; capital, $10,000; to deal in autos. Incorporators: Earle H. Wells, Esther L. Wells, Leonard Wetsell.

Indianapolis, Ind.—Ray Harroun Company; capital, $30,000; to manufacture and sell automobiles and automobile parts. Incorporators: Ray W. Harroun, L. R. Townsley, U. G. Baker.

Louisville, Ky.—Standard Auto Company; capital, $25,000. Incorporators: George A. Dunham, Clifford L. Alderson, J. H. Alderson.

Muskogee, Okla.—Pioneer Motor Company; capital, $5,000; to manufacture automobiles. Incorporators: G. S. Waddell, H. G. Butts, M. L. Waddell.

New York City.—Bell & Waring Steam Vehicle Company; capital, $25,000; to deal in automobiles. Incorporators: Harry G. Waring, Harvey W. Bell, Howard G. Phillips.

New York City.—Brown Car Corporation; capital, $30,000; to deal in automobiles. Incorporators: W. P. Fargo, H. W. Torney, E. E. Beyer.

New York City.—Duplex Gasoline Motor Company; capital, $200,000; to manufacture motors, etc. Incorporators: G. W. Woodruff, A. B. Nevin, T. U. Parker.

New York City.—Favary Tire Company; capital, $300,000; to deal in automobile tires. Incorporators: E. Favaary, M. W. Brashears, C. S. Boyd.

New York City.—Gildale Motor Corporation; capital, $30,000; to deal in automobiles. Incorporators: R. W. Strauch, T. P. Gilman, E. S. Peck.

New York City.—Owners Purchasing Association, Inc.; capital, $5,000; to do a general automobile business. Incorporators: Leonard J. Field and Irving P. Regensburger, Charles Olsen.

Akron, O.—Mohawk Rubber Company; capital, $30,000; to manufacture and deal in automobile tires and rubber goods of all kinds. Incorporators: R. M. Pillmore, J. K. Williams, S. S. Miller, F. J. Mishler, Francis Sieberling.

Aledo, Ill.—Aledo Machine Company; capital, $50,000; to do a general automobile business. Incorporators: C. A. Miller, G. D. Venable, R. D. Watson.

How the lumber road appeared just after boards were laid on the ties and before the road bed had been filled in

BROOKLYN, N. Y.—Newkirk Avenue Automobile Company, Inc.; capital, $5,000. Incorporators: Wm. Backus, Jennie Hunton, W. D. Maxwell.

BUFFALO, N. Y.—Glide Sales Company; capital, $10,000; to deal in autos. Incorporators: J. Francis Lyncb, Louis P. Fuhrmann, Edward T. Danaby.

CAMDEN, N. J.—United States Tire Filler Company; capital, $125,000; to deal in automobile tires, automobiles, etc. Incorporators: R. B. Patton, H. E. Patton, H. R. Gorman.

CLEVELAND, O.—Automohile Clearing House Company; capital, $2,500; to deal in new and second hand motor cars. Incorporators: Tbos. A. Reilly, Ed. P. Bernardi, Samuel P. Bromley, Arthur N. Hirscb, Jobn B. Bromley, Jr.

CLEVELAND, O.—Ohio Auto Carriage Company; capital, $10,000; to manufacture automohile bodies. Incorporators: Alfred A. Benescb, Ralph Goldsworthy, F. A. Federman, Reuben Shapiro, E. H. Chaloupka.

CLEVELAND, O.—Obio Cutting Sales Company; capital, $10,000; to deal in motor vehicles and accessories. Incorporators: W. K. Stanley, John C. Koepke, J. N. Wolfinger, E. D. Tanner, A. V. Kindel.

COLUMBUS, O.—Park Motors Company; capital, $30,000; to manufacture and deal in electrically propelled vehicles of all kinds. Incorporators: Scott Van Etten, Chas. Parkison, Amelia Van Etten, Wm. C. Horton, Chas. F. Hodge.

CONNERSVILLE, IND.—Central Car Company; capital, $100,000; to manufacture automobiles. Incorporators: J. E. Huston, J. W. Burk, E. W. Ensted, R. T. Huston, F. I. Barrows, J. M. Heron.

CONNERSVILLE, IND.—Howard Motor Car Co.; capital, $10,000. Incorporators: Guilford C. Babcock, Harry Tuttle, Clarence Millard.

DETROIT, MICH.—Kessler Detroit Motor Car Company; capital, $10,000; to manufacture automobiles. Incorporators: H. C. Brooks, Jr., Robert McCormick.

DETROIT, MICH.—Detroit Motor & Machine Company; capital, $150,000; to manufacture motors, etc. Incorporators: H. J. Hayes, H. H. Smith.

DUQUESNE, PA.—Duquesne Automobile & Wagon Company; capital, $5,000; to deal in automobiles and trucks. Incorporators: J. J. McCloskey, Jr., Walter Gray, J. F. Walton, R. P. Morrow.

NEW YORK CITY.—Maxim Tricar Manufacturing Corporation; capital, $100,000; to manufacture and deal in automobiles. Incorporators: Otto Kuhneman, Chas. F. Novotny, A. A. Meschutt.

NEW YORK CITY.—F. W. Ofeldt & Sons; capital, $20,000; to manufacture motor trucks. Incorporators: E. G. Ofeldt, F. A. Ofeldt, E. Y. Eltonhead.

NEW YORK CITY.—Mills Motor Radiator Corporation; capital, $650,000; to manufacture and deal in radiators. Incorporators: H. R. Bingham, A. F. Carbe, C. A. Cole.

NEW YORK CITY.—Shepherd Auto Company; capital, $5,000; Incorporators: Irving R. Shepherd, Fannie E. Shepherd, Joseph A. Shepherd.

NEW YORK CITY.—Webster-McGowan, Incorporated; capital, $50,000; to manufacture motors, engines, etc. Incorporators: G. H. McGowan, Wm. H. Webster, H. F. Monroe.

NEW YORK CITY.—Western Vebicle Company, Inc.; capital, $1,000; to manufacture motor vehicles. Incorporators: Harry Davis, Wm. R. Williams, Chas. M. Frost.

PITTSBURGH, PA.—Kline Car Motor Company; capital, $5,000; to deal in automohiles. Incorporators: J. D. Kerr, S. E. Kerr, R. N. Gibson.

RICHMOND BORO.—K. & K. Motor Car Company; capital, $10,000; to deal in automobiles. Incorporators: Lillian E. Killian, Agnes E. Killian, Frank B. Killian.

ROCHESTER, N. Y.—Ball-Washburne Motor Company, Incorporated; capital, $25,000. Incorporators: Ward H. Ball, Cbas. H. Washburne, Asa R. Ball.

SALT LAKE CITY, UTAH.—Alkire-Smith Auto Company; capital, $25,000. Incorporators: Fred W. Alkire, Raymond B. Smith, Myron L. Smith.

SOUTH ORANGE, N. J.—K-W Garage, Incorporated; capital, $25,000; to do a general automobile business. Incorporators: G. E. Krug, T. R. Were, C. L. Krug.

ST. LOUIS, MO.—Coller-Reitz Motor Car Company; capital, $5,000; to do a general motor car business. Incorporators: Anthony Coller, Frank G. Reitz, Edwin Oldendorph.

ST. LOUIS, MO.—Pioneer Steel Block Tire Company; capital, $25,000; to manufacture a patented tire for use on automobile trucks. Incorporators: Wm. Dee Becker, J. Geo. Ganahl, Nicholas Le Brun, Fred A. Gerher.

TARRYTOWN, N. Y.—J. D. Maxwell Motor Corporation; capital, $10,000. Incorporators: Jonathan D. Maxwell, James P. McManus, Leander F. Sniffen.

TOLEDO, O.—Maumee Motor Car Company; capital, $10,000; to deal in automobiles. Incorporators: Richard D. Logan, A. J. Gallagher, R. E. Frankberger.

INCREASE OF CAPITAL

AKRON, O.—American Tire & Ruhher Company; capital increase from $200,000 to $500,000.

Taylor with Erie Supply—W. O. Taylor has joined the Erie Supply Company, Toledo, O., as secretary and treasurer. He will manage the tire department.

U. S. Tire's Agency—The U. S. Tire Company has opened a branch agency at 218 North Erie street, Toledo, O., for an E. & W. tire treatment agency. The E. & W. treatment, it is claimed, seals punctures automatically and reduces tire expense 75 per cent.

Washington Club's Election—The Washington Motorists' Association, Washington, D. C., which succeeds the Automobile Club of Washington, has elected the following officers: President, Harrington Mills; vice-president, W. W. Chiswell, and secretary-treasurer, John K. Heyl.

Goodyear's Banquet—O. A. Richards, of the U. S. Tire Company, was the guest of honor and principal speaker at the annual banquet given by the Goodyear Rubber Company, Milwaukee, Wis., to department heads, salesmen and traveling representatives at the Hotel Pfister recently.

Automobile Incorporations

DETROIT, MICH.—Ely Auto Parts Company; capital increased from $25,000 to $45,000.

DETROIT, MICH.—Federal Motor Truck Co.; capital increased from $100,000 to $200,000.

LOUISVILLE, KY.—Brenner Motor Car Company; capital increased from $25,000 to $35,000.

LOUISVILLE, KY.—Rommel Motor Car Company; capital increased from $15,000 to $25,000.

MOLINE, ILL.—Velie Motor Vehicle Company; increase of capital from $400,000 to $600,000.

NASHVILLE, TENN.—E. O. Elliot & Company; capital increased to $50,000.

ROSSLYN, VA.—District Automobile Service Corporation; capital, $35,000 to $50,000. Incorporators: Geo. R. Cowie, Edmund S. Wolfe, L. Bert Nye.

SYRACUSE, N. Y.—H. H. Franklin Manufacturing Company; capital increased from $300,000 to $1,500,000.

One of the road builders' trucks in the heart of the desert

SPRING-TIRE Construction—Helical springs arranged in two planes dished relatively to the wheel plane.

Fig. 1 shows the subject matter of this patent, a wheel in which helical spoke springs S take the place of the solid spokes and make possible the use of a solid tire. The wheel consists of a rim and a hub to which the helical-spring spokes are attached with their ends. These springs are arranged in two series extending radially from the center of the wheel under a slight angle, to both sides of the wheelplane. The springs lie in radial indentations R of face plates P, which inclose the spokes and are attached to the rim and hub, by means of opposed peripheral flanges. The indentations on one plate are approximately flat at their inner ends, while those on the other face plate at their inner ends have a depth which is substantially equal to the coil diameter of the springs.

No. 1,051,178—to Thomas Whitehead, Blackpool, Eng. Granted January 21, 1913; filed December 12, 1911.

Automobile Cushion Tire—Constructed with two air spaces, one of which is made up of sections and the other continuous.

The tire described in this patent consists of a resilient casing formed with two annular air spaces in it, one of which is nearer to the rim than the other and is separated from the other by independently yieldable walls. The tire is constructed of transverse abutting sections S which are independently removable and have their places formed with interlocking projections and recesses; one of the projections surrounds the outer annular space and the other projections are located at either side thereof.

No. 1,050,861—to Andrew Minetree Smith, Petersburg, Va. Granted January 21, 1913; filed July 27, 1912.

Automobile Suspension Spring—Consisting of a semi-circular leaf spring supplementary to a full elliptical spring.

This patent refers to a spring construction shown in Fig. 3, S being a full elliptical leaf spring to which an auxiliary spring T, shaped in a semi-circle, is attached. Spring T is attached at its center to the center of the lower half of the main spring S and at its ends to points halfway between the center of the upper spring and its respective ends, there being a sliding connection between the spring ends of T and the leaves of the spring S. Due to its shape and the peculiar method of mounting the spring T does not interfere with a normal working of S, but checks extreme deflection and rebound on part of the latter.

No. 1,050,863—to Walter O. Smith, Petaluma, Cal. Granted January 21, 1913; filed October 16, 1912.

Pneumatic Automobile Tire—Which is automatically inflated by the rolling motion of the car, air being forced into an inner tube through a check valve.

The self-filling tire, Fig. 4, includes a main inner tube T around which a collapsible tube S is arranged; these two tubes are separated by a stiffening device M, which prevents air pressure in the tube T from collapsing the outer tube S. The tube T is equipped with a valve device V, which normally holds the collapsible tube open to the atmosphere and suitable means is used for preventing a back flow of air from tube T to the tube S. The means M is sufficiently yielding to permit of being forced outward by the expansion of the tube T and to operate V so as to close the tube S to the atmosphere when the pressure inside the tube T becomes sufficiently high.

No. 1,050,886—to Anson B. Wetherell, Pittsburgh, Pa. Granted January 21, 1913; filed February 23, 1910.

Electric Horn—Consisting of a motor-driven ratchet which strikes a button mounted eccentrically on a diaphragm.

This horn is of the motor-driven type, the shell of the motor being shaped as a cup with an open end over which fits a removable cover. The latter has a bearing for the motor shaft and the fields are wound about projections of the motor case. An amplifying projection extends beyond the closed end of the cup and to this amplifier the diaphragm and the projector are attached. A toothed disk for ratchet, which is attached to the front end of the motor shaft, strikes a button mounted eccentrically on this diaphragm when the motor revolves, thereby producing a signalling sound.

No. 1,048,466—to William Sparks, Jackson, Mich. Granted December 24, 1912; filed May 9, 1912.

Regulator for Leaf Springs—Consisting of mechanism for adjusting the flexibility of laminated springs by separating the blades.

Wedges are introduced for this purpose between the leaves and means for clamping the whole after adjustment is provided. A short shaft with oppositely screwed ends is arranged immediately under the axle, and by turning this the clamping shackles at each side of the axle are brought down firmly on the springs. The wedges are carried on disks and the action just referred to simultaneously operates them.

No. 1,050,138—to Maurice Houdaille, Paris, France. Granted January 21, 1913; filed July 24, 1911.

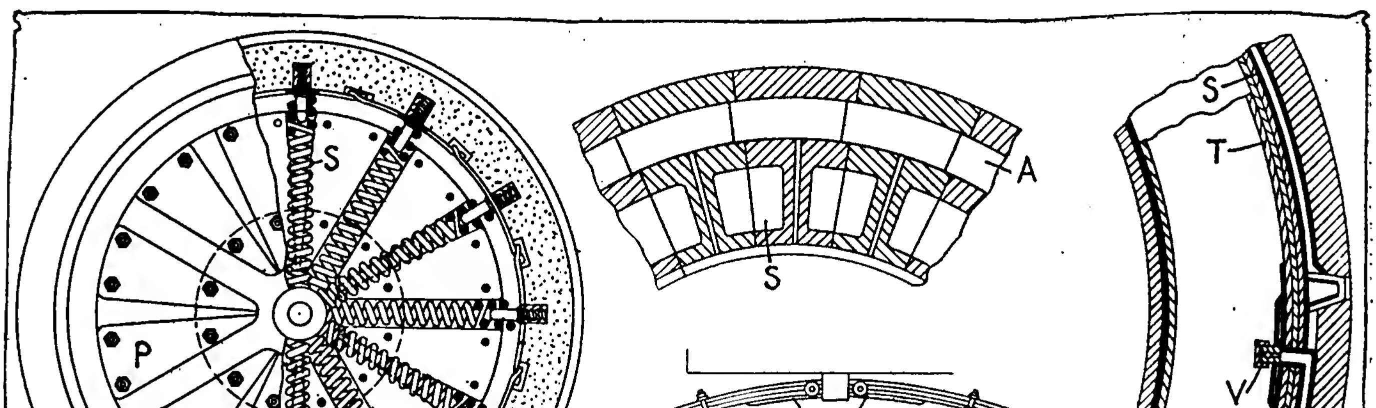

Fig. 1—Whitehead wheel. Fig. 2—Smith tire. Fig. 3—Smith spring. Fig. 4—Whetherell tire

Chicago the Automobile Mecca

Thirteenth Annual Exhibit Surpasses Any Previous Exhibition
Biggest Automobile Show Held in this Country

CHICAGO, ILL., Feb. 3—Thirteen is a lucky number for automobile Chicago. The Thirteenth Annual Automobile Show, held in 1913, which opened its doors last Saturday night is the biggest exhibition of motor vehicles the city of Chicago, or the entire country for that matter, has ever known, on a total floor space of 147,990 square feet. The passenger car exhibits outnumber those at the recent great national show at New York by eleven makes, Chicago having a total of ninety-nine to New York's eighty-eight. This year's Chicago show surpasses that of 1912 in the matter of passenger car exhibits by three. For the second week of the show there will be seventy-six makes of commercial vehicles on exhibition, seventy-two gasoline trucks and six electric vehicles. As compared with the New York show this indicates a total numerical superiority of eleven makes for the Windy City. At New York there were six exhibitors of electric trucks though there were only fifty-nine makers of gasoline-propelled machines. Chicago is to have eleven trucks more this year than in the 1912 show which had a total of sixty-five, or the same as in New York in 1913. The increase in commercial vehicles at Chicago, which is justly considered as the distributing center of the Middle West, might be taken to indicate that the manufacturers of these vehicles expect a still greater market for their product in the growing cities of the western states than in the crowded municipalities of the East.

In the way of accessory exhibits, there are 205 makers of accessories represented during the first week of the show, as compared with 340 which had space in New York. Probably this difference in favor of the Metropolitan exhibition is due to the large number of small accessory in the vicinity of New York and in New England which considered the trip to Chicago too great an expense in time and money to pay for the advantage of being represented at the show. During the second week of the Chicago exhibition there will be 133 accessory exhibitors, twenty-four of whom were not present the first week of the show. There were 141 makers represented in New York which did not show in Chicago.

The show is held in the Coliseum proper, the Coliseum annex, the basement of the Coliseum and the Wilson building, which form one group, being practically under one roof, and the First Regiment Armory. To reach the latter from the Coliseum, it is

View across the Coliseum, showing arrangement of the cars on the main floor, accessory exhibits in the gallery, decorative scheme and lighting of the gigantic exhibition hall

necessary to traverse an alleyway about 100 yards long but the management has protected this from the weather by roofing it over with canvas.

The show is held under the auspices of the National Association of Automobile Manufacturers and is under the immediate direction of Major Samuel A. Miles, who has so successfully staged the greatest American automobile shows since the inception of the custom of holding annual national displays of motor vehicles.

The show was opened to members of the trade at 1 o'clock Saturday afternoon, but the general public was not admitted until 6.30 when a steady stream of humanity poured into the Coliseum and from there down the canvas-roofed alley-way to the armory in spite of the weather, which was by far the coldest of the winter, the thermometer standing only a few degrees above zero all day and dropping a little in the evening.

There were a great many first-nighters, of course, people who came to see the show purely and simply as a spectacle, but there were also a goodly representation of the class which comes to see and to learn. These inspected the cars intelligently and their inquiries showed a considerable interest in their construction and some understanding of the present trends and the developments of the past year.

The main features of design in which the cars shown at Chicago differ from those of 1912 are the same as those which attracted attention at the New York shows, and have been fully reviewed in THE AUTOMOBILE for January 9 and for January 16. The public in Chicago, or at least that part of it which attended the opening of the show, took the same interest in these tentative indications of the car of the future and asked the same questions which were in the mouths of the show public in New York. The same curiosity was manifested in the cranking devices, the greatest interest centering in the electric types, wire wheels excited the same comments and inquiries while remarks on the improvements in body design were frequent. A few observed the tendency toward standardization of the medium-sized wheel and a great many commented on the large proportion of six-cylinder cars shown as compared with last year. The six seems a universal favorite, from the sentiments expressed by the majority of the people on attending the opening night

One of the panels above the accessory gallery, showing the leaded glass effect, somewhat similar to the appearance of old cathedral windows

The Decoration Scheme

THE dominant idea in the decoration of the Chicago Automobile Show which opened last Saturday night is that of cathedral glass and stained window effects. This theme is carried out consistently throughout the decorations, even the lighting giving a somewhat dim and semi-religious atmosphere which is exceedingly novel for an automobile show, but which bestows upon it an air of quiet simplicity enriched by the artistic quality of the mural decorations. In fact, this year's effects are especially welcome as a change from the extremely ornate decorative scheme employed last year. The principal features at the Coliseum are found in the ceiling and on the balcony front.

Great arches of lights strung across ceiling produce a very pleasing effect. The numerous bulbs suspended from the ceiling may be readily seen in the above illustration

of the show. Many of the people showed an interest in the unit power plant, the position of the gear-box, type of suspension of motor and gear-box, drive of magneto and lighting generator and other details. Some were interested in the adoption of left drive, generally expressing a liking for center control, though a great many were indifferent as to these details. Demountable rims as standard equipment seemed to be generally in favor.

A canvass of the exhibitors as to whether or not they expected many of their dealers to come to Chicago for the show revealed a considerable diversity of opinion, some of the exhibitors saying that they expected a great many established dealers, some in special excursions, while others stated that most of their dealers are so far from Chicago that probably comparatively few would make their appearance. As for the appointment of new agents, a number of the exhibitors stated that their territory is all closed up, while others expect to appoint a number of new representatives.

It is still too early in the show week to determine whether many sales will be made during the week but from the optimistic reports of some of the exhibitors there may be a great many sales consummated before the close of the show. One exhibitor stated that he sold a car within 2 minutes of the opening of the doors.

The decoration scheme employed is described in full on pages 400 and 401. A band furnishes music while the show is in progress in the Coliseum while orchestras drown the shuffling of feet as the crowds throng through the other buildings.

Chicago has greater floor-space for the annual automobile show this year than ever before, the Coliseum, Coliseum annex and basement, the Wilson building and the First Regiment Armory giving a total available space of 147,990 square feet as compared with 89,000 square feet available last year. Only 135,615 square feet will be required during the second week as the makers of commercial vehicles are still fewer in number than the manufacturers of passenger cars. In the number of exhibits, this year's show comprises ninety-nine displays of passenger cars and 244 accessory stands. There will be seventy-six makes of commercial vehicles represented during the second show week and 200 makers of accessories. All in all, Chicago's

Each of the many panels of this description shows a tremendous amount of painstaking care not usually found in ephemeral decorations

The Decoration Scheme

THE balcony front in itself produces an extremely pleasing effect the full length of 1000 feet being beautified by panels depicting rural scenes, three of these being shown in each of the 26 sections between the girders of the building. The settings of these pictures are massive, much like the old-fashioned frames of pictures to be seen in ancient buildings in Europe. The general impression produced is one of dignity and beauty. The center of the building is decorated in a very simple manner, practically all of the space being given up to the cars. Ornamental posts bound the various exhibits, each post supports a cluster of large milk-white light globes as well as a number of cathedral lanterns.

1913 exhibition is the largest, as regards the number of cars on view, that has ever been held in America.

An idea of the compactness of the exhibits can be gained by a comparison with the recent New York show at which eighty-eight passenger car and 379 motorcycle and accessory exhibits occupied some 275,000 square feet of floor-space, or nearly twice the total floor-space available at the Chicago exhibition. The New York show, as a matter of fact, exceeded the great Paris display in floor-space by some 15,000 square feet. In Chicago, of course, it must be taken into consideration that the motorcycle manufacturers and dealers are conducting a separate show in the Furniture Exposition building on South Michigan avenue, whereas in New York these machines helped to swell the grand total of exhibitors.

Of course, there are several companies, which from failure to get space or for some other reason, decided to hold separate shows of their respective lines in their own showrooms during the 2 weeks of the show. The same plan was adopted in New York by about ten makes. Among those conducting individual shows in this manner in Chicago there are the Apperson, Empire, Marion, Detroiter, Ford and the Howard six. The latter is a new car, introduced to the public during the past week.

One of the great features of the Chicago show is the fact that a goodly representation of the electric cars is gathered together, sixteen makes in all, or 57.1 per cent. of the industry, twelve makes being housed together in the armory, while four others are given space in the basement of the Coliseum. Those in the armory are: Anderson, Argo, Baker, Borland-Grannis, Broc, Buffalo, Columbus, Ohio, Rauch & Lang, R. C. H., Waverley and Woods. In the Coliseum basement are: Century, Chicago, Church-Field and Standard.

One of the combination light posts and exhibit name plates. The name of the exhibitor is on a leaded glass transparency and stands forth clearly against the background

Twelve of these makes of electric were not exhibited at the New York show, the only manufacturers showing there being those of the Buffalo, Church-Field, Columbus, Hupp-Yeats and Standard. This shows the pre-eminence of Chicago as a city for electrics, 42.7 per cent. of the electric passenger vehicle industry being represented at the Chicago show while only 18.5 per cent. of the makers thought it worth while to display their lines at New York. Of course, it must be remembered that one reason for the small number of electric exhibits at the metropolitan show was the fact that many of the makers had space at the big electrical show held there October 9-19 and that, still later, the dealers held a litte electric pleasure vehicle show of their own.

A new feature of the electric car displays this year is the exhibition of chassis. Heretofore, the makers and dealers said that there was no use in exhibiting electric car chassis as the chief buyers of this type of vehicles are women, who are interested in body fittings and appointments rather than in mechanical features of construction. Apparently either the women are beginning to take an interest in something besides the mere external appearance and comfort of the electric passenger vehicle or else the many advantages of these cars for city use, combined with the rising price of gasoline, have begun to make a strong appeal to the masculine element of the population. The interest manifested in these electric chassis at the show and the appreciation evinced by the people inspecting them indicated that the innovation is of value and that it will be a feature of future exhibitions.

Curiously enough, the number of makes of gasoline cars exhibited at Chicago which

South end of the Coliseum giving an idea of the decoration at the end of the hall and depicting a grand stairway in keeping with the rest of the decorative scheme

Quarter view across center aisle of the Coliseum, showing how compactly the cars are arranged and giving an idea of the lighting scheme and the arrangement of the cars

did not appear at the New York show is exactly the same as the number which were represented at New York but which do not have space in Chicago. These cars, it is interesting to note, are all of different makes, that is, each list is made up of different names. Those shown at Chicago which did not appear in New York are: Austin, Colby, Crow-Elkhart, Glide, Great Western, McIntyre, Midland, Pratt-Elkhart and Staver. On the other hand, those present at the New York show which are not represented at the Windy City exhibition are: Detroiter, Empire, Havers, Keeton (the Canadian car), King, Lenox, Marion, Only and Cunningham.

It is significant to observe that for the first time the old-time line of demarcation between the products of the East and those of the West is not to be found this year at the Chicago show. In former years it was, for the most part, the cars of the East for the East but the cars of the West for the West. Now, however, with the standardization of automobile construction made possible to a large extent by the greatly improved condition of the roads throughout the country, there is no longer any necessity for embodying different principles in cars for the West from those followed in designing cars for any other part of the country. A study of the list of the cars which did not show at New York but which are represented at Chicago would seem to indicate that, as most of them are cars made in the Middle West, there would be some difference in construction, but while these cars are apparently built for Western rather than Eastern trade an inspection reveals no radically different ideas applied to the mechanical details. As a matter of fact, great numbers of these cars are sold in the East. Looking at the list of makes which were represented in New York but which are not found at the Chicago exhibition, we find a mixed assemblage of several cars made in the East, about as many in the Middle West and one Canadian make. All of the cars, both those which appeared in New York and those which are on view in Chicago were fully described in the January 9 issue of THE AUTOMOBILE.

One of the lighting posts placed between the exhibit spaces, showing milk colored glass globes and cathedral lantern lights throwing soft glow about the neighboring exhibits and at the same time fitting in well with the general decorative scheme of the exhibition room

One respect in which the Chicago show of 1913 differs from that of last year is in the absence of foreign-made cars. In the 1912 exhibition several of these were represented, among them the Renault and the Darracq. This year the Renault, Metallurgique and other foreign creations are to be seen only at their respective salesrooms. Chicago has never been a very good market for the machines built across the ocean but apparently the stability and value of the American-made automobile are making more and more of the people of the Windy City ask "What is the use of buying a European car when you can get a good car built in a factory nearer to the purchaser than the width of the Atlantic Ocean?"

Manufacturers can do much more by way of accessibility of grease cups, brake adjustments and other adjustments than they are doing at present, this being particularly so in respect to brakes and grease cups. The most inaccessible grease cups are those around the rear axle and universal joints of the propeller shafts. On some chassis eight to ten grease cups have been counted on a rear axle and of these not a solitary one is accessible in some makes of cars. It is a prima facie case of where the designing engineer does not drive his own car, or, if he drives, then the grease cups are always prepared for him by some mechanic, so that so far as he is concerned he does not know that grease cups exist. There are half a dozen makers who are now fitting grease

(*Continued on page* 436.)

Pennsy To Reduce Fees

Quakers May Draft City Regulation To Formulate Own Speed Limit—Badgers for Rigid Law

Findlay Works May Be Changed—Buffalo Companies Accused of Violating Tax Law

PHILADELPHIA, PA., Feb. 3—A number of proposed bills have been prepared and are ready for introduction before the Pennsylvania legislature making new regulations for motor trucks. It is proposed to increase the license fees on trucks, because of their greater wear and tear on streets and roads. They now pay $5, $10 or $15 according to their horsepower, the same as pleasure vehicles.

The city of Philadelphia will ask the right to make its own rules for motor cars, irrespective of the uniform state law. Organized motorists will fight this. Under the present law the speed limit in the country is 24 miles an hour and in built-up sections 12, and no municipality can enforce other limits.

There is prospect of a fight over the licensing of drivers. The present law requires a license of every person desiring to operate a motor vehicle as a chauffeur or paid operator. The State highway department contends that this includes every one driving a car except the owner who has paid a license fee for the car. The Pennsylvania Motor Federation got a decision from the Philadelphia courts that "chauffeur" and "paid operator" were one and the same. The department sticks to its requirement that members of an owner's family or other who wish to drive must obtain drivers' licenses. The Federation has advised its members to disregard the department's requirement.

The Federation is prepared to amend the law to provide beyond question that only paid drivers require licenses. On the other hand an effort will probably be made to prohibit any one from operating an automobile except after examination and licensing as in Massachusetts. All motor organizations will oppose this.

The motorists will renew their efforts of previous sessions to get a law compelling all vehicles to carry lights at night. The Grangers have succeeded in beating this bill in the past. On the other hand the automobilists anticipate having to fight an effort to raise the fees on pleasure vehicles. Their organization had a hard fight 2 years ago to defeat a bill to increase the minimum from $5 to $25 and the maximum from $15 to $75. The present rates bring in a revenue of nearly $1,000,000 a year.

Omnibus Bill Proposed in Wisconsin

MILWAUKEE, WIS., Feb. 3—Stirred to action by the unusual flood of bills in the present Wisconsin legislature, which relate to the use and operation of motor cars, the various organizations of Milwaukee and Wisconsin representing dealers, manufacturers and private owners, held a conference at the Hotel Pfister in Milwaukee on February 1, and outlined plans for a determined fight against such bills as are deemed bad and indifferent. It is believed that the outcome of the conference will be the presentation to the Legislature of an omnibus bill covering every possible angle of the question. In fact, a special committee was appointed, with James T. Drought, secretary of the Wisconsin State A. A., and counsel of the Milwaukee A. C. and W. S. A. A., as chairman, to frame the omnibus bill and see to it that it is introduced in the regular form and note made of the fact that the bill has the solid backing of the motoring interests of Milwaukee. The principal demands will be for a universal light law: uniform signal law: a single annual registration and license fee for every owner, instead of one for each car owned at any time during one year; jail sentence for thieves; more severe penalty for joy riders, and more considerate laws covering the liability of motorists in cases of accidents.

A noteworthy bill, already introduced, and which will be made an amendment in the proposed omnibus bill, is that of Assemblyman I. N. Stewart, of Appleton, who proposes to make the punishment for the theft of a motor car for any purpose not less than 1 nor more than 15 years in prison. This makes the penalty for motor car stealing equal to that for horse stealing.

Assemblyman Conway has a bill which provides that a motor car passing any vehicle on the public highway at a closer distance than 6 feet must slow down to a speed of 10 miles per hour.

The proposed section covering signals, in the omnibus bill, will attempt to require every owner to equip his car with a horn sounding a harsh, abrupt tone, which will thenceforth be distinctive of motor vehicles. The bulb-horn will be made illegal by the proposed statute.

May Reorganize Findlay Company

FINDLAY, O., Feb. 3—J. G. Cleary, of Milwaukee, Wis., who recently purchased the Findlay Motor Works for $50,000, which was sold under direction of the United States Court, is in the city talking about reorganizing the company and beginning operations at once. At first he contemplated removing the machinery to Milwaukee.

Suits Against Buffalo Concerns

BUFFALO, N. Y., Feb. 4—John Lord O'Brian, United States Attorney, filed the past week suits for $10,000 each against four automobile concerns of Buffalo. The motor firms are charged with violating the federal corporation tax law, which requires a statement from all corporations, giving also the amount of business done. This statement is used as a basis for levying a tax. In the papers filed by Mr. O'Brian it is charged that the defendants have neglected to file a statement since 1910. Mr. O'Brian intends to prosecute several other companies for violation of the corporation tax law. Following are local motor firms against which Attorney O'Brian has filed suits: Buffalo Electric Vulcanizers Company, 1219 Main street; the Glidden Garage, 1114 Elmwood avenue; Dixon Motor Car Company, Edward and Main streets, and Werick Brothers, of Cheektowaga, N. Y.

Minnesota Association Directors' Meeting

MINNEAPOLIS, Feb. 3.—The directors of the Minnesota State Automobile Association will clear up a lot of work at their annual meeting February 11 at the Hotel Radisson. In the evening they will be entertained by the Automobile Club of Minneapolis at a dinner. Asa Paine, vice-president of the A. A. A., will be in charge of the dinner. The officers are to report, and good roads and pending automobile legislation will be discussed. The question of road signs and the annual tour will arise. Having completed posting the road to Watertown, S. D., from the Twin Cities for connection at Watertown with the Meridian road, other sections will be taken care of. The association at present has thirty-seven club memberships and 3,178 by individuals.

The trustees of the Automobile Club of Minneapolis will meet February 11 at the Hotel Radisson. Pending state legislation on automobile matters will be taken up.

Howard Motor Car on Market

CHICAGO, Feb. 1—Manufactured by the Central Motor Car Company, Connersville, Ind., and marketed by the Howard Motor Car Company, also of Connersville, the Howard Six has just been placed upon the market. After the demise of the Lexington Motor Car Company the old Lexington plant was leased by the Central interests and the manufacture of motor cars commenced. The first car to be delivered was a demonstrator received two days ago by the McDuffee Automobile Company, Chicago. The McDuffee concern has been appointed distributor for the states of Illinois, Indiana, Michigan, Wisconsin and Iowa. Howard L. Babcock, G. C. Babcock, Harry Tuttle, and C. L. Millard are officers of the sales company. But one model will be turned out for the first series of 500 cars.

St. Louis Studebaker Center

St. Louis, Feb. 1—The Studebaker Corporation will make this city a central distributing point for all of its automobile lines by establishing a large branch house here. The new branch house will be in charge of Carl G. Simon, and will take in Missouri, Illinois, Tennessee, Arkansas, Mississippi, Louisiana, and a part of Kentucky, Oklahoma and Texas.

Atlas Foreclosure Affects Merger

Springfield, Mass., Feb. 4—*Special Telegram*—With the execution of the foreclosure recently of a second mortgage for $19,400, held by the Union Trust Company of Springfield, Mass., against the Atlas Motor Car Company, also of this city, and the subsequent purchase at public sale of the Atlas plant by C. D. Whitney, manager of the Victor Sporting Goods Company, a new development in the Orson merger proceedings was brought to light. Negotiations have been under way for some time leading to the combining of several Springfield concerns, namely, the Atlas company, the Springfield Metal Body Company, the Brightwood Manufacturing Company and others by the monied interests which fathered the Orson Automobile Company, and which interests are centered around the National City Bank, New York. The Atlas plant, which is about 200 feet deep and three stories in height, was particularly desirable to the promoters of the project since it is conveniently located with respect to the other holdings. Accordingly, the Orson interests put in a bid for the plant, but were outbid by Whitney, who bought it for $55,000, the payment down being very small, it is stated. Since the location and size of the plant were the principal reasons for the New York capital's smiling upon the Atlas Motor Car Company, the Whitney move has put a different face on the matter and it is probable that the merger will not include the Atlas company.

However, the merger plans are very indefinite at present, according to H. M. Kilborn, of the National City Bank, and may not even include the Springfield Metal Body Company, for reasons which are kept under cover. Whitney states that it is the intention of his concern to convert the Atlas factory into a plant for the manufacture of sporting goods, although the Atlas people will be given a reasonable amount of time to remove from the building.

Smith, Sales Manager of Lozier

Detroit, Mich., Feb. 3—Paul Smith, former sales manager of the Flanders Motor Company, has been engaged as sales manager of the Lozier Motor Company to succeed C. A. Emise, resigned. Mr. Smith will have full charge of branches and dealers. The announcement is made by President H. M. Jewett, who also denies a rumor which has been current that the interests of the Lozier and the Paige-Detroit concerns were to be merged in the near future.

Michigan Magneto Creditors Meet

Detroit, Mich., Feb. 3—Referee in Bankruptcy, Lee M. Joslyn, has sold the property of the Michigan Magneto Company, which recently filed a petition in bankruptcy in the federal court, to Louis Duscoff, of Detroit, for $4,600. The first meeting of the creditors was held last Thursday and a dividend of 7 per cent. was declared.

Maxwell Plan Announced

Four Maxwell Models To Be Built and Five Models of Old U. S. Motor Continued

Heir to U. S. Motor and Flanders Has $21,000,000 Operating Capital and No Liabilities

A FORMAL statement announcing that the Maxwell Motor Company, Incorporated, has taken over property and assets of the U. S. Motor Company, Maxwell-Briscoe Motor Company, Dayton Motor Car Company, Columbia Motor Car Company, Alden-Sampson Manufacturing Company and Brush Runabout Company, has been issued by the New York office of the Maxwell concern, over the name of Carl Tucker, treasurer of the company. In addition to this, the combination of the former U. S. Motor with the Flanders interests is announced.

In this statement, it is declared that the Tarrytown, N. Y., Auburn, Ind., Newcastle, Ind., Detroit, Mich., factories of the two former corporations will now be all operated by the Maxwell company. Four models of Maxwell cars will be built at these plants, as follows: The Maxwell Six, model 50, formerly known as Flanders, being a seven-passenger car and selling for $2,350; the Maxwell Six, model 40, formerly Flanders, a five-passenger touring design which sells for $1,550; Maxwell, model 35, four-cylinder, five-passenger touring car, $1,085; and the Maxwell, model 25, a four-cylinder, five-passenger touring car, the price of which has not been announced yet. All these cars, which cover a range of from 25 to 50 horsepower, will be fully equipped, and the sixes will have electric self-starters fitted to them. For the present season, the Maxwell designs known as models 22—three-passenger roadster—and 40—five-passenger touring car—are being built to fill orders on hand and to respond to the public demand. The Stoddard-Dayton models 30, 38 and 48 will also be continued for the near future. The latter model will be equipped with the Gray & Davis electric starting and lighting system at the option of the purchaser.

The officers of the company, whose names appear on the statement, are: Walter E. Flanders, president; W. F. McGuire, vice-president; W. B. Anthony, comptroller; C. A. Forster, commercial manager; Carl Tucker, treasurer; Jas. C. Brady, Harry Bronner, Eugene Meyer, Jr., Henry Sanderson, Wm. E. Potter, George H. Burr, W. Catchings, Wm. J. Maloney, W. F. McGuire and Walter E. Flanders.

Besides the free property of the affiliated U. S. Motor and Flanders companies, worth $18,000,000, the new Maxwell company, has on hand $3,000,000 cash with which to carry on its manufacturing, selling and service operations. Service departments will be operated at New York City, Chicago, Boston, Philadelphia, San Francisco, Pittsburgh, Los Angeles, Minneapolis, Omaha, Kansas City, Dallas, Atlanta, St. Louis, Indianapolis, Denver, Memphis, Portland, Ore., and Charlotte, N. C. It is understood that the guarantee written by the older companies on their products will be respected by the Maxwell company.

The Maxwell Motor Company, Incorporated, in its statement by Mr. Tucker, announced that it will pay promptly the receiver's obligations for any unpaid invoices dated January 11, 1913, or prior, for shipment received by the following companies:

United States Motor Company, Maxwell-Briscoe Motor Company, Dayton Motor Car Company, Columbia Motor Car Company, Alden-Sampson Manufacturing Company and Brush Runabout Company.

Invoices dated January 13, 1913, and subsequent, will also be paid by the Maxwell Motor Car Company, Incorporated, upon proper advice that the goods have been received and accepted.

Prest-O-Lite Dismissed

New York Court Rules Trademark Invalid on Technicality—Prest-O-Lite Has Filed Application

Will Continue Fight with New Mark Registered—Radical Automobile Law Proposed for Ohio—Colorado Boosters Busy.

JUSTICE SPIEGELBERG, in the Municipal Court of New York City, Borough of Manhattan, Ninth District, dismissed a bill of complaint brought by the Prest-O-Lite Company against the American Auto Supply Company, New York City, claiming violation of section 367 of article 34 of the general business law of the State of New York. This article imposes a penalty of $100 on any person violating the following regulation:

"Any person or corporation engaged in manufacturing, packing, bottling or selling any article of merchandise, put up by him, for sale in any bottle, vessel, box, package or other receptacle, with his name, trademark, label or private mark appearing in any way thereon, or branded, stamped, affixed, blown or impressed thereon, may file in the office of the Secretary of State and in the office of the County Clerk."

The defendant was stated to have filled empty Prest-O-Lite tanks with acetylene gas produced in searchlight generators, being a customer of the Searchlight Gas Company, and to have sold a tank thus filled to an employee of the plaintiff. Before, however, selling the tank the defendant pasted a label over the word "Prest-O-Lite" on the tank, stating that the tank contained Searchlight gas and not Prest-O-Lite gas.

The essence of the opinon of Justice Spiegelberg is as follows:

The Prest-O-Lite trademark and name were registered in 1898, and when the new trademark regulations were brought out in 1909 the Prest-O-Lite Company did not take any further steps, assuming that under section 367 of the business law its trademark and the use of the tanks made by it for Prest-O-Lite gas exclusively were protected by the following passage of that section:

"Any person or corporation that has heretofore filed in the offices mentioned in sections 360 or 361 a description of the name or names, marks or devices upon his or its property, therein mentioned, and has caused the same to be published according to the law existing at the time of such filing and publication, shall not be required to again file and publish such descriptions to be entitled to the benefit of this article."

The regulations referred to in this section deal with the registration of trademarks only for such products as soda and mineral waters, porter, beer and other beverages, without mentioning in any clear way such compounds as the solution of acetylene gas in acetone.

During November last the Prest-O-Lite Company filed an application for registration of its tradename and trademark under the new law.

The Prest-O-Lite Company was represented in court by Winter & Winter, while Lewis F. and Jacob Lande represented the defendant.

The Prest-O-Lite Company has filed four more cases which will come up in the Municipal Court of New York before Judge Spiegelberg on February 14, the defendants being Smith-Haines; Richards Auto Supply Company; Economical Tire & Supply Company; Brickner's Auto Garage, all of New York City.

Colorado Road Boosters to Meet

COLORADO SPRINGS, COL., Feb. 1—The second annual convention of the Lincoln Highway Association of Colorado will be held at Colorado Springs on Wednesday, February 12. The official call for the meeting has been issued by President Leonard E. Curtis and Secretary-Treasurer A. W. Henderson.

The counties holding membership in the association are: Kit Carson, Lincoln, Elbert, El Paso, Teller, Park, Chaffee, Lake, Eagle, Pitkin, Garfield and Mesa, and delegates may be appointed by mayors, county commissioners, commercial, good roads, automobile, agricultural and stock growers' associations, as well as by editors and proprietors of newspapers.

Plans for the next year's work, the election of officers and the reports of the first year's accomplishments will be taken up at the meeting, and in view of the fact that it comes on Lincoln's birthday, special ceremonies appropriate to the day will be arranged.

The recent annual convention of the association, held in Denver, occupied itself with discussion and action on the problem of legislation which will make available for use on the roads of the state the internal improvement fund, which now amounts to about $750,000. The convention recommended to the Legislature the adoption of a bill creating a highway commission with an advisory board composed of the governor and representatives of various sections of the state, and placing in the hands of this commission the internal improvement fund.

DENVER, COL., Jan. 31—If Colorado will build a good automobile road across the state to the Utah line, along the route of the Midland trail as recently marked out by A. L. Westgard of the American Automobile Association, Salt Lake City will provide a fund of $1,500,000 to carry the highway across Utah. This challenging proposition has just been made to the motorists and other good roads promoters of Colorado by President B. F. Redman of the Salt Lake City Automobile Club, who has been visiting in Denver.

DENVER, COL., Jan. 30—Two measures of vital interest to motorists have been introduced in the Colorado Legislature by Senator Tobin. The first provides for the appropriation and use of funds for building and maintaining a system of good roads throughout the state, and the second provides for the state registration of motor vehicles and the licensing of operators and all drivers.

Proposed Ohio Speed Law Radical

TOLEDO, O., Feb. 1—Heavy fine and long imprisonment will face automobile speeders if a bill drawn by City Solicitor Schrieber and which he will have introduced in the Legislature becomes a law. A fine of not more than $500 or not more than 6 months in the workhouse is provided for the first offense. A fine of $500 and 6 months' imprisonment is the penalty for any subsequent offense. The owner or master who knowingly consents to high speed is made equally culpable with the driver. The new law would make the owner and operator of any motor vehicle violating the provisions of the act jointly liable in damages for any injuries inflicted. The fact of excessive speed would be prima facie evidence of negligence and would throw the burden of defense on the owner and operator of the car. The bill provides that where anyone is struck by a motor vehicle the offense shall be construed as assaut and battery unless the injuries warrant a more serious charge.

No More Roads for Hardin County

TOLEDO, O., Feb. 1—According to a decision handed down by the Court of Appeals in the case of William Gibson, a farmer, against the Hardin County Auditor and others, all pikes which have been built in this county for the past 30 years have been illegally constructed. The decision has stopped $70,000 worth of road work now under way in that county.

Marylanders to Pay D. C. Fees

WASHINGTON, D. C., Feb. 1—Beginning February 16 the district authorities will begin a strict enforcement of the new regulation imposing upon motor car owners of Maryland the same license fees as are assessed Washington motorists by

Maryland. The law is now in effect but no penalty can be enforced until February 15.

Residents of Maryland who live just over the boundary line between the District of Columbia and that state, but are engaged in business in Washington and pay taxes here, claim that the hardship of the new law will fall principally upon them. Through a committee they have asked the district officials to make an exception in their case but the commissioners, while realizing the hardships that will be imposed in individual cases, point out that the best remedy for them is to obtain an amendment to the Maryland motor car law providing for reciprocal relations between the District and Maryland.

Texas Road to Be Rebuilt

AUSTIN, TEX., Feb. 1—Steps have been taken to rehabilitate what is known as the King's Highway which runs from San Antonio to Nacogdoches, Tex., a distance of 300 miles. At a meeting just held in Austin of a number of men who are interested in this movement preliminary arrangements were made for effecting a permanent organization to carry on the restoration work. Among those attending this meeting were J. W. Young, mayor; J. C. Miller, L. A. Daniel, John Legory, all of Crockett, Tex.; J. C. Hesslit, of Caldwell; Paul D. Page, of Bastrop; J. W. Warren and D. E. Colp, of San Antonio. George D. Marshall, federal highway engineer, who is also president of the State Good Roads Association, attended the meeting. It was decided at this meeting to log the highway throughout its length. The loggers are to be accompanied by Prof. R. J. Potts of the State Agricultural and Mechanical College, and Mr. Marshall. It is estimated that the road can be rehabilitated and placed in first-class condition for approximately $2,500 a mile.

Onondaga May Use Convicts

SYRACUSE, N. Y., Feb. 3—Dr. Sargent F. Snow, chairman of the highway committee of the Automobile Club of Syracuse, today presented before the Board of Supervisors of Onondaga County the advantages of employing convict labor in the county construction of state highways, following the progressive ideas advanced by County Superintendent Frank E. Bogardus. The recommendation follows some experiments in employing convicts from the penitentiary at Jamesville in road building in that vicinity.

As the result of numerous complaints by members of the Automobile Club of Syracuse against construction and maintenance of highways in Onondaga County the club has decided to appoint a grievance committee of three members to investigate the complaints. It is claimed much of the contractors' work on new stretches of state road is extremely poor.

Gov. Baldwin Against MacDonald

HARTFORD, CONN., Feb. 3—Governon Simeon E. Baldwin desires the removal from office of Connecticut State Highway Commissioner James H. MacDonald. He filed this week with Attorney-General John H. Light charges alleging incompetence. The charges will be formulated by the attorney general and service will be made on the commissioner, who must appear before a judge of the Superior Court. Just who that judge will be is at present a matter of speculation. Governor Baldwin has filed twenty-one specific charges against the commissioner and these, it is said, cover the commissioner's entire term of office.

The Governor has been opposed to the commissioner ever since he assumed office two years back. He endeavored to have him ousted. MacDonald remained. The Governor has named William H. Cadwell, of New Britain, as Highway Commissioner. MacDonald's term of office expired July 1, 1911, but the commissioner held over, under the provision of the law that he should remain in office until his successor was duly appointed. He has not yet been appointed.

Hartford Writ Is Denied

Republic Rubber Company Re-elects Old Officers at End of Fiscal Year—Closes Successful Season

American Tire and Rubber Increases Its Capitalization—Dorian Remountable Rim Company Sold at Auction

HARTFORD, CONN., Feb. 3—The United States Supreme Court denied a writ of certiorari filed by the Hartford Rubber Works in which the second circuit upholding the validity of the Adams' patent be set aside and a new trial ordered. The Hartford Rubber Works took this step in patent litigation to attack the validity of the patent granted to Adams and controlled by the Metallic Rubber Tire Company which, it is claimed, was infringed by the Hartford Midgeley tread tires. The Connecticut District Court had decided in favor of the Hartford Rubber Works, while the Circuit Court reversed the decision. The refusal of the United States Supreme Court to issue the writ of certiorari signifies the final closing of the litigation.

Republic Rubber Had Banner Year

YOUNGSTOWN, O., Feb. 3—At the annual meeting of the Republic Tire & Rubber Company recently at Youngstown, O., all the old officers and directors were re-elected. The year 1912 was a banner one and a number of improvements were made, including a new shop, which greatly increases the capacity of the plant. The officers and directors chosen follow: President, T. L. Robinson; first vice-president and sales manager, J. H. Kelly; second vice-president, L. T. Peterson; secretary, C. F. Garrison; treasurer, M. I. Arms; general superintendent, A. H. Harris; directors, John and David Tod, J. C. Wick, H. K. Wick, M. I. Arms, C. H. Booth, Robert Bentley, J. H. Kelley, A. H. Harris, L. T. Peterson and T. L. Robinson.

American Tire and Rubber Capital Increased

AKRON, O., Feb. 3—The annual stockholders' meeting of the American Tire & Rubber Company, of Akron, O., was held recently when the following directors were elected: Adam Duncan, Charles F. Fosnight, F. L. Kryder, F. M. Lapp, Frank Pfeiffer, James Shaw, Gus Seiberling, C. M. Wertz and G. C. Waltz. Adam Duncan was elected president, G. C. Waltz vice-president, Frank Pfeiffer treasurer, and F. E. Rowe secretary and assistant treasurer.

The stockholders authorized the board of directors to increase the capital stock from $200,000 to $500,000, of which but $50,000 will be issued at this time. The company is waiting for final patent papers before following their intention of placing a solid tire upon the market.

Dorian Property Sold at Auction

The Dorian Remountable Rim Company, New York City, which went into the hands of the receivers some time ago, is not to be reorganized, according to Olcott, Gruber, Bonyinge & MacManus, who ordered the receiver's sale. The company's property, consisting of rims, nuts, bolts and similar paraphernalia, was disposed of at three sales, the last of which was held on February 3. The amounts received at these were $6,100 at the first, $3,447 at the second and $70 at the final sale, making a total of $9,617 realized from the proceedings.

Champion Plug Features In Patent Litigation

Thirty-Five Per Cent. Automobile Company Sued by Bernard Morgan Who Claims Infringement of His Patent

Plug in Question is of the So-Called Priming Type with Threaded Inclined Passageway Containing Priming Cup

THE Thirty-five Per Cent. Automobile Company, New York has been sued by Bernard Morgan, of Newport, R. I., the latter claiming infringement of his patent on priming cocks by the act of the defendant selling Champion plugs, made by the Champion Spark Plug Company, Toledo, Ohio. The Champion plug in question is of the so-called priming type, consisting of a plug, the shell of which is threaded with an inclined passageway, into which fits a priming cup, screwing into the bored portion of the plug. When the cup member is screwed tight into the thread in the plug, a needle formed on the end of the cup member makes a tight fit against the plug shell, keeping gases from leaking out through the passage.

The principal point of the complainants patent No. 982,009, filed March 1, 1910 and granted January 17, 1911, lies in the following claims:

A test or priming cock, comprising a cylinder plug having a seat, and a closing plug screwing in the said cylinder plug and adapted to be seated on the said seat to close the cylinder plug, one of the plugs having a reservoir for the explosive fluid, and an outlet port leading from the bottom of the reservoir to discharge the fluid into the cylinder plug on unseating the said closing plug.

Munn & Munn, New York City, represent the plaintiff.

Hitchcock Takes Bids for Trucks

WASHINGTON, D. C., Feb. 1—the most important purchase of motor cars ever made by the United Sates Government is about to be consummated. Postmaster General Hitchcock today opened bids for furnishing as they may be ordered during the fiscal year ending June 30, 1913, approximately 100 motor vehicles. suitable for the rapid delivery of parcels in cities. It is expected the contract will be awarded within the next 30 days.

Tom Hay with Staver Carriage

CHICAGO, ILL., Feb. 1—Tom Hay has taken over the Staver line for northern Illinois, eastern Iowa, all of Indiana and southern Michigan. For years Tom Hay has been one of the most talked about men in the automobile business. He holds a record, perhaps unequaled, of the sale of from 15,000 to 16,000 cars in a territory practically parallel to the one he will handle for the Staver Carriage Company. Mr. Hay will make his headquarters, as well as the retail selling headquarters for Staver automobiles. at 1725 Michigan avenue.

Willys Buys Hexter Company

T. K. Hexter, formerly connected with the Hexter Motor Truck Company, New York City, which has handled the Gramm line of trucks for years in the Metropolitan district, has resigned his position with the company, having sold his entire interest in the concern to John North Willys. It is being rumored that the Overland company will transform the Hexter concern into a service department of the manufacturing corporation, further details being held back at present until all details are settled.

Mr Hexter, while refraining from announcing his plans in detail, is intending to manufacture a new make of freight automobile operating on principles original in motor truck manufacture. The name of the company which he will found in the near future has not been decided upon, but the enterprise will probably bear his name as soon as a certain period has elapsed, as Mr. Hexter's arrangement with the Overland interest prevents him from making use of his name in the truck manufacturing business within the next six months.

The present Overland service department is located at the Silver sales agency which handles all the Overland cars, both pleasure and commercial at present. Whether the new plant will supplant the Silver agency or not has not been stated at present.

London Taxis May Decrease

LONDON, Jan. 25—The police have not been slow to make note, during the present strike, of the difference in the regulation of the traffic with some 9,000 taxicabs off the streets, and it is quite probable that when the trouble is finished with that something new will be awaiting the drivers in the form of a limitation of the numbers of motor cabs allowed on the streets. It is in the congestion that the danger of accidents arise, and the motor-omnibuses, which are easily discernible, have proved to be of no such danger as was generally supposed. The public have also noticed the difference of the condition of traffic, and now darts across the roads hurriedly as it is quite capable of avoiding danger now that the taxicabs, that dodge in and out of the traffic, and sometimes appearing from "nowhere," are idly locked in the garages. In this way what little inconvenience there has been in hailing a motor-cab has been amply made up for.

Market Changes for the Week

There was considerable activity in tin in the local market yesterday, following the break in prices on the previous day to $49.25 per 100 pounds, a decline of $.90. Copper showed no improvement in demand from either domestic or foreign consumers, and the tone of the market was weaker, with a sympathetic decline of $.00 1-8 and $.00 1-4 in electrolytic and lake. Oil Petroleum, Pa., still continued to climb with predictions of higher prices. After resting a few days the advance of $2.47 per barrel came yesterday bringing it $.03 of the goal for which oil producers have long sought, $2.05. Cottonseed oil remained firm, due to a little more active trading conditions, following a general demand, colsing at $6.31 a barrel at an advance of $.03.

Zenith Brings Suit Against Stromberg

Refutes Stromberg's Abara and Richard Patent Basic Claims on Plain Tube Carbureters

Counter Action Alleges Infringement of Francois Bavery Patent Assigned to French Zenith Company

DETROIT, Feb. 3—The Zenith Carbureter Co. of this city has begun suit in the Federal courts here against the Stromberg Motor Devices Co., Chicago, maker of the Stromberg carbureter, for infringement of the Baverey patent, No. 907,953, under which patent the Zenith company is building its present type of Zenith carbureter. This suit is of unusual interest in that on December 24, 1912, the Stromberg Motor Devices Co. filed suit in the Federal court of this city against the Zenith company asking that an injunction be granted prohibiting the Zenith company from making the Zenith carbureter on the ground that it was an infringement of two patents owned by the Stromberg company, namely, the Ahara patent, No. 684,662, and the Richard patent, No. 791,501.

The situation is perhaps one of the most unusual on record to date in that both Stromberg and Zenith companies consider that they control respectively basic patents covering a type of carbureter without moving parts and operating upon a principle of atmospheric control in which two nozzles are used, one a conventional nozzle fed direct from the float chamber, as in the standard type of carbureter today, and the other a compensating supply nozzle. Apparently each concern has every confidence in its patents and it will be up to the courts to decide which really owns the basic one. The Zenith company has been manufacturing its carbureter for some time and the Stromberg concern has been exhibiting at the shows its model E, which it believes to be in accordance with the Ahara and Richard's patents.

In order that the respective merits of the patents may be understood, the following digest of each sets forth the features.

F. Baverey secured his patent, No. 907,953, December 29, 1908. The object aimed at in this patent is outlined as follows: "With ordinary spray carbureters the proportion of fuel in the mixture increases with the speed of the motor, the passage of fuel (gasoline) through the orifice heading into the suction conduit being not uniformly proportional to the quantity of air sucked into the conduit, but increasing on its acceleration of the motor at a higher rate than the quantity of air owing to the higher degree of vacuum produced at high speeds. The purpose of the present invention is to remove this disadvantage and to render the proportions of the mixture constant at all speeds of the motor * * * there is used a supply nozzle for gasoline, the feed of which increases too rapidly with increasing motor speed, and in conjunction a compensating supply nozzle, the flow of gasoline through which increases either at a lower than a normal rate or preferably not at all. These nozzles can be so regulated that the aggregate amount of fuel passing through them increases in the same proportion as the quantity of air sucked in, so that the richness of the mixture remains constant.

In construction there are two nozzles side by side in the venturi mixing chamber. One communicates direct with the gasoline in the float chamber. The other communicates with a vertical standpipe at the side of the float chamber and into this standpipe gasoline flows through a regulated valve, so that the flow through this valve is constant for any setting of it. The standpipe is of larger diameter than the nozzle and gasoline collects in it so that when starting the motor there is a surplus supply of fuel available, but as soon as the fuel in the standpipe is exhausted, which happens with higher motor speeds, then the supply is fixed so that bubbles of air pass through the compensating nozzle instead of gasoline. By this compensating arrangement it is claimed to obtain a mixture weaker in gasoline as the engine speed increases.

G. V. Ahara obtained his patent, No. 684,662, October 15, 1901, and it was acquired during the past fall by the Stromberg company. The object aimed at in the patent is set forth as follows: "The purpose of this invention is to avoid varying the mixture of fuel and air by providing for an excess of fuel in relation to the quantity of air for the first explosions occuring after a cut-out to compensate for the greater quantity of air at present in the cylinder. * * * Also, to provide means by which the quantity of fuel to be drawn into the cylinder after a cut-out may be varied, depending upon the length of the time during which the suction, or feed of fuel to the engine, is omitted or cut-out."

In construction the Ahara patent has two nozzles located side by side in the same mixing chamber. The main nozzle feeds direct from a fuel chamber having a controlling cone-type regulating valve in the passage between the float chamber and the nozzle. The compensating nozzle is supplied from the main nozzle and has a collector tube, the upper end of which is open to the atmosphere. This collector tube fills from the main nozzle and affords a ready volume of gasoline for starting purposes, irrespective of the regulation of the cone valve which controls the flow between the float chamber and the two nozzles.

F. Baverey claims as follows: Fig. 4. In a carbureter the combination of a suction control fuel gap with an additional fuel feed regulated to give a constant supply per unit of time, the two jets being relatively proportioned so that their combined supply is proportional to the air supply.

1—In a carbureter the combination of a suction controlled fuel feed jet with an additional fuel feed regulated to give a constant supply per unit of time.

G. V. Ahara claims in his patent:

1—A feeder for explosive engines comprising a fuel reservoir having a feed outlet below the fuel level therein, to affect a continuous feed. a passage communicating with the atmosphere and with said outlet from said reservoir to receive fuel therefrom, and means adapted to control the communication between said reservoir and said passage.

7—In a feeder for explosive engines, a casing having a fuel reservoir therein provided with a continuously-open gravity-feed outlet in its lower portion, and a passage having a portion communicating with the atmosphere and with said reservoir-outlet, whereby fuel is adapted to collect by gravity in said passage.

Automobile Securities Quotations

The stock market during this week showed a general strength, in response to the healthy condition of the industry which expressed itself by a number of dividends declared during the past month. Notable advances were made by several issues, especially rubber stocks, Goodyear common rising 15 points, and Miller 35. Garford preferred also displayed great strength and advanced 5 points over last week's closing figure, on account of rumors of changes in management.

January Record for Incorporations

The month of January, 1913, was a record period for incorporations, the capitalization for the new charters taken out in the states of Delaware, Pennsylvania, New Jersey, New York, Rhode Island, Massachusetts and Maine totalling $749,927,500, as compared with $452,400,000 in December, 1912, and $541,399,000 in January, 1912. The increase for the past month over December last is therefore 66 per cent., and over January, 1912, 20 per cent. The total automobile incorporations and their relation to the total charters of the several states stands as follows:

State	Total Incorporations	Automobile Incorporations	Per Cent.
Delaware	$94,595,000	$37,450,000	39.4
New Jersey	100,560,000	1,300,000	1.29
New York	77,492,500	3,600,000	4.65
Massachusetts	39,105,000	27,500,000	70.5
Maine	57,800,000	3,000,000	5.7
Miscellaneous	29,000,000	2,500,000	8.65

Average per cent., $21.69.

The average total percentage of automobile charters in the states considered is 21.69, or more than one-fifth.

Value of Recuperating Gas Ovens for Forging and Heat-Treatment Greatly Advanced by Modified Construction—Principle of Mixing Air with the Fuel in the Jet Illustrated in New Carbureter—How the Germans Build for 1913

RECENT Improvement in Gas Furnaces.—Complete combustion accomplished with a minimum of air is the first condition for fuel economy in a furnace. This is one of the reasons why coal or coke furnaces, in which the great surplus of air needed for the combustion of the solid fuel carries a very large percentage of the heat away with it through the flues, have given way to gas or oil furnaces in most well-organized metal-working establishments. In the case of gas furnaces, either the coal is first turned into gas in a generator furnace or gas from an independent source is used, but under both conditions the exhaust gases of the furnace are utilized for pre-heating the air, and frequently also the gas, before it is admitted. As, furthermore, the amount of air may be regulated to a nicety and can be held down to just what is required for burning the gas, the economy is decisive, while the distribution of the heat or its concentration, if desired, can also be accomplished with great facility.

According to the nature of the pre-heating system such furnaces or ovens are classified as (1) regenerative, if the direction of the flame and the draft alternates, and (2) recuperative, if the flame does not change direction and either the air or both the gas and the air is pre-heated in socalled recuperators. The regenerative system is mainly used for very high temperatures which are not usually required for the heat-treatment or forging of metals. Its installation is relatively expensive, and unremitting attention is called for in the operation of its alternating-mechanism.

The recuperative system is inexpensive in the first place and automatic in the general features of its operation, but the recuperators used with it have been deficient in some respects. They were usually built in the form of flues for exhaust gas and for air in alternating layers separated by fireproof partitions or cast-iron plates, the gases traveling from the furnace downward—imparting their heat to the partition walls, and the air rising from below and receiving heat from the opposite sides of the same walls. The trouble experienced with this construction was that the partitions were liable to leak at the joints and the resulting mixing of the exhaust gas and the air currents led to considerable irregularities in the draft and the heat generation. Moreover, repairs could not be made while the furnace was in operation and involved considerable work.

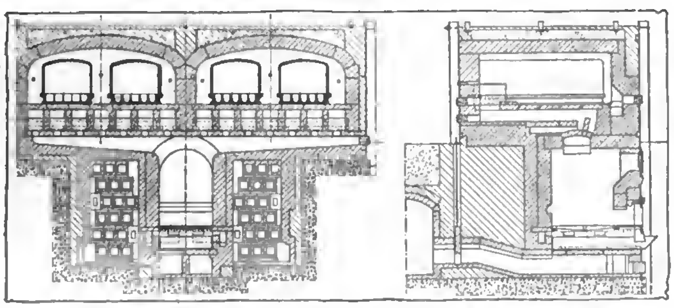

Fig. 1—Recuperating gas ovens, Hermansen system

Important progress in this respect is now effected by building recuperators according to the Hermansen patent. The novelty of the construction lies mainly in the form of the bricks used in building them. They are hollow fireclay bricks with transverse grooves on the upper and lower surfaces. The square hollow spaces in the bricks form the exhaust gas channels, while the grooves come together with corresponding grooves in bricks above and below to form the air channels. The ends of each brick are tenoned to engage the adjoining one, and the bricks are so laid that the gases follow a zig-zag course from top to bottom and longitudinally of the furnace, while the air rises from one layer of transverse channels to the next higher one. To this end, the bricks of each layer are offset transversely one-half brick with relation to the layers above and below, so that riser-spaces one-half brick wide are created alternately to the left and right of the structure between the recuperator tubes and the furnace walls. As the joints of the bricks are also staggered longitudinally, all mingling of air and gas is excluded.

Another important advantage attained by this construction lies in the easy access to the flues for purposes of inspection and cleaning. The front wall and, if the generator gas is pre-heated, also the side walls of the recuperator are built of similar precisely-shaped bricks, so that there is an end-opening for each flue, and this is closed with a fireclay stopper which is perforated and provided with a window.

As a recuperator of this design demands but very little room, the oven, the generator and the recuperator can readily be built as one unit, and the open or muffle ovens used with this equipment need not differ in arrangement from those usually employed with direct coal or coke firing or with mixed direct and gas firing.

The author, Engineer L. Kentnowski, describes and illustrates a number of installations in which the Hermansen design is incorporated and in all of which the gas generator is built into the plant below the service floor from which the ovens are operated. One of these plants, built for the *Deutsche Waffen und Munitions Fabriken* at Karlsruhe, for the heating of ammunition material, is shown in transverse and longitudinal sections in Fig. 1. It comprises 4 ovens with 16 cast-iron retorts, and each of the ovens is served with fuel gas from a separate generator.

If the gas is taken from public conduits or an isolated generator, as usual in the iron and steel industry, two independent recuperators are built under the ovens, one to pre-heat the air and the other the gas.—From *Metall und Erz*, January 8.

FROM Carbureter to Vaporizer—What is the use of having large inlet valves in a motor for the sake of getting the benefit of its full range of power if there is a throttling action in the Venturi tube or the air admission of the carbureter? Some such question, as well as the relatively new idea in carbureter design of leading air into the jet itself at the high motor speeds for the purpose of reducing the proportion of fuel in the mixture, and atomizing the fuel at the same time, seems to have actuated the makers of the Gobbi carbureter, a newcomer in an apparently crowded field. The features first noted in the construction, are a jet with concentric channels four to five times as large as the conduits in ordinary jets, a mantle coming down over the outer annular channel and, in the float chamber, the absence of the customary weights and levers to regulate the admission of the fuel. The dimensions of the jet are in reality considerably larger than the drawing, Fig. 2, shows. Continued inspection brings it to one's attention that the mouth 2 of the jet is unusually close to the throttle valve, whose under-surface, by the way, is of a special formation determined by experiments, and that the outer annular channel is not really a channel at all, so as to constitute a second jet communicating directly with the gasoline supply from the float chamber, but is merely a sort of elongated cup receiving overflow from the central jet through the perforations 3 and 4 and communicating with the atmosphere under the mantle P. The level of gasoline before the starting of the motor is of course identical with the float level in the cup as well as in the jet.

When the start is made, the suction draws air from around the mantle P and gasoline from the mouth 2 together with some air bubbles through perforation 4. These bubbles help to vaporize the first charges. If the motor is allowed to speed up, the increasing suction in the jet soon exhausts the gasoline supply in the cup, because the atmospheric depression is communicated through the perforations 3 and 4 and air is sucked in under the mantle. That the mantle acts in this manner is a matter of experimental demonstration. The more rapid the suction from the motor, the more air finds its way not only around the mantle but also under it and into the cup, and at a certain motor speed it begins to penetrate at perforation 3 and to mingle with the ascending column of gasoline in the jet, holding the flow of the fuel down to the proper proportionality of 1 to 18 weight parts of gasoline and air respectively. [While 1 to 9 weight parts is the proportion theoretically required for perfect combustion, 1 to 18 is the proportion found most suitable in actual motor practice at high speed—tending toward 1 to 16 at low speeds—owing to the short time available for effecting a completely gasified mixture and to the amount of oxygen needed for the unavoidable combustion of lubricating oil. The possible effects of special lubricating systems, such as admixture of graphite with the oil, to modify the desirable proportions between fuel and air, have not, so far as known, been ascertained.—Ed.]

The construction thus involves no other variation of the air channels than that which is caused by the operation of the butterfly throttle valve. The position of the latter alone determines whether the charges drawn into the cylinders at a given motor speed shall be small or large, in proportion to the load of the vehicle, the same as with other carbureters, while the vaporizing jet alone takes care of the mixture by causing more or less air to be mixed with the ascending column of gasoline, according to the speed of the motor. It is not stated how this construction is adapted to different types and sizes of motors.

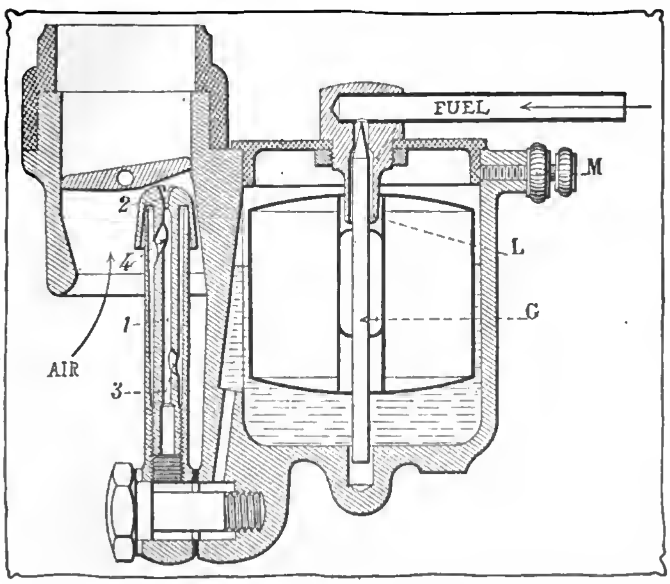

Fig. 2—Gobbi carbureter, atomizing the fuel in the jet

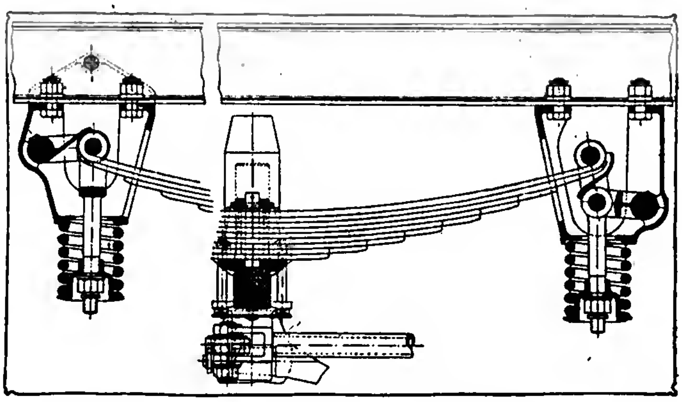

Fig. 3—Front spring construction in the Büssing heavy truck

In the mechanical construction it is noted that the needle valve G is fitted tightly in the axis of the float, so that the level can be changed by pushing it up or down, and that the tube L, in which the gasoline arrives by top feed, is extended so as to telescope into the bore of the float and is supposed to regulate the feed as effectively as this may be done by the leverage system generally employed, while also guarding especially against the tendency to overfeeding to which the top-feed system is said to be liable.—From *La Vie Automobile*, January 18.

—

NOTES from the German Industry—From a review of the automobile situation in Germany with reference to construction and commerce it is noticed that the universal aim is mass-manufacture by the most economical methods but that the home market is scarcely sufficiently large to permit the realization of the intention. The popular demand runs now mostly to cars of less than 10 horsepowers, as the taxation becomes considerably higher when this power is exceeded and the speed regulations in the cities render higher power useless under most circumstances. The formula applied for determining the tax gives a low rating, however. Every manufacturer has given special attention to this type of car in his schedule of production for 1913, and most of the new models are designed in the semblance of the larger cars whose vogue is passing—though they are still preferred by all who can indulge in grand touring—and, while smaller and lighter, are equipped in the same style, mechanically and otherwise.

For light trucks, delivery wagons and omnibuses the chassis are usually the same that are used for pleasure cars of the same power, this being the result of attempting series-manufacture for a limited market.

The production of heavy trucks, on the other hand, is assuming large dimensions, by reason of the state-subsidy system. Nearly 20 manufacturers are turning out this class of vehicles, practically all of them conforming to the rules for loads and dimensions which have been laid down by the army authorities as conditioning the payment of the subsidy. The new rules call for a lighter type than was formerly specified, and the trials made with the new vehicles last October have justified the change, which was occasioned by road difficulties arising from heavy loads.

While the great majority of three-wheeled vehicles are used for merchandise delivery, an increasing number of the three-wheel chassis are now fitted with open or even closed carriage bodies with more than two seats and are finding favor for use in the cities.

In the general industry the enhancement of motor efficiency and silence is the principal achievement of the past year, the sleeve-valve motor having exerted a strong influence to this effect. Practically all other conspicuous changes, in Germany as elsewhere, relate to the equipment. Motor starters and electric lighting of cars by means of generators run by the motor are engaging widespread attention.

The 1913 models give evidence of great care in the improvement of the spring suspension for all classes of vehicles, the trucks included. Broader and longer leaf springs are the rule as compared with 1912. Shock-absorbers are widely adopted in a profusion of varieties. Platform springs are no longer uncommon, and here and there semi-elliptic springs are used in pairs, side by side (which gives more freedom for torsion than a single broader spring). The rear springs are in some instances adapted to transmit the traction thrust.

The grouping of all valves on the same side of the motor has become universal, partly by reason of the cheaper manufacture and the reduction of parts secured by this design. The carbureter is nearly always located on the opposite side from the valves and is secured to a simple flange on the monoblock motor casting, the induction pipe being cast into this between the two middle cylinders and terminating in an enlarged chamber from which short conduits lead to the inlet valves. The exhaust pipe, on the other hand, is never cast in the block or inclosed, as experiments in this direction showed very unfavorable results in the way of keeping cylinders hot on one side and causing strong local tensions in the materials.

All the different arrangements of the valves—poppet valves—are represented in the 1913 models, each firm holding on to the style once adopted, more for the sake of preserving the individuality of its product than for strong technical reasons.

The tendency to a long stroke is pronounced and an offset crankshaft is not uncommon. Valves and, in so far as possible, all other moving motor parts are as a rule boxed in to secure silence as well as protection from dust. Cooling by the thermo-siphon system has gained several new adherents, even for large touring cars, the monoblock castings giving an opportunity for the large pipe sections required with this system, while the saving of the pump and the automatic adaptation of the system to varying outside temperatures are appreciated features. The motor lubrication is now in nearly all instances automatic, so that little more is required of the car owner than to keep the reservoir filled.

The suspension of the motor in the frame is now usually effected without the use of a false frame, and it is in act the general tendency to compose the frame of as few parts as possible. As a rule the front portion of the main frame is narrowed so that it can be reached on both sides by the brackets of the crankcasing. Only in a few instances is the upper half of the crankcasing extended bodily to the frame, though this construction affords great convenience for the mounting of magneto, water pump and lighting dynamo as well as for adjustments and repairs, doing away with all chance for having tools dropped into a drip pan through dispensing entirely with the pan itself. In contradistinction to this rigid suspension, three-point suspension is numerously represented, for the gear box as well as for the motor. In heavy trucks the false frame is still used, but it is suspended from the main frame by very substantial lubricated joints.

The cone clutch is more than holding its own against the multiple disk clutch. The Hele-Shaw clutch is seldom seen in the German cars. The cone clutch is, however, considerably improved. Its inertia is reduced by using sheet steel for its manufacture or by using two oppositely inclined cones of reduced diameter and in which of course all end-thrusts are absorbed. Special small brakes to take up the rotary inertia of the clutch and gears have been taken up again, after a rest of a few years, but they still do not seem to work to entire satisfaction.

The unit construction, by which motor, clutch and gear box are built into one casing, is making very slow progress, though it has been employed successfully for several years by one of the leading German manufacturers.

Hydraulic transmissions are still in the embryonic stage. Their weight and the chance of leakage at th ebearings is against them, and it is understood that they do not respond well when unusual demands are made upon the power. Their low cost does not yet, in the general opinion, compensate for these disadvantages. [Only one type of hydraulic transmission is in operation in German cars.—Ed.]

Though silence is sought, silent chains are not meeting with much favor, mostly because their use involves additional cost of production and larger, and therefore heavier, casings than are required for gears. Great efforts, on the other hand, are made to render gears silent by painstaking milling of the teeth.

Horizontal division of the gear box is being avoided more and more. A casing cast in one piece with a large top-opening is preferred, giving lighter construction with fewer bolts and nuts, and offers no difficulties to the assembling of the gears. This is especially the case now, since ball bearings are becoming universally used in the gear box and necessitate large end-openings in the casings. The really oil-tight gear box is, however, still an exception.—From *Allgemeine Automobil-Zeitung*, January 10 and 17.

The care given to spring suspensions, as referred to in the foregoing, is exemplified in the double front springs used for the heavy Büssing motor truck. The construction, which is shown plainly in Fig. 3, affords a progressive spring resistance and permits the front axle to work in practically straight up and down movements in such manner that the relation of the steering rod to the wheel is affected very little by road shocks; a provision which makes the steering easy and secure and reduces tire wear. The illustration is taken from *Der Motorwagen*, of January 10.

Larger Middle Transverses.—Among the changes in the construction of frames, it is notable that the middle cross-member is everywhere increased in depth and robustness and is opened centrally to pass the transmission.

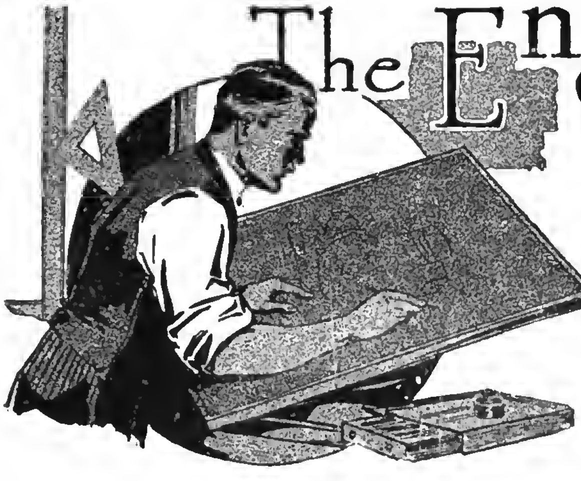
[It is also in some cases, for example in the Mercedes-Knight, developed as an elongated X, giving a much increased rigidity in the transverse plane midway between the wheel axles while localizing torsion of materials in the middle lognitudinal plane.—Ed.]

The large transverse offers a rational support for thrust and torsion rods as well as far the attachment of the drip pan if one is used.—From show review in *Omnia*, January 4.

Testing Aluminum Solder.—Among the many aluminum solders in the market there are several which disintegrate after a relatively short exposure to the weather. Otto Nicolai of Bonn, Germany, mentions a simple method for determining whether any given aluminum solder will prove durable or not. A sample of soldered work is placed under water, and, if within 48 hours small bubbles—which are hydrogen bubbles—appear either on the sample or upon the surface of the water, the solder will disintegrate in two weeks under water and in a few months by mere exposure to the atmosphere. Nicolai markets an aluminum solder himself, but the method is considered reliable. —From *Metall-Technik*, January 11.

Voiding of French Patents.—With reference to the danger of having French patents forfeited in case patents on the same subject are forfeited in any other country (see The Automobile of January 9, page 162) it has been brought to notice that Germany and Austria-Hungary joined the Convention of December 14, 1900, at a later date and that therefore patents taken out by subjects of these two countries enjoy the same immunity from the danger referred to as patents taken out by Americans or other citizens of a country participating in the convention.—From a communication to *Le Génie Civil*, January 11.

The Engineers' Forum



Exhaust Gas Analysis

Engineers Discuss Value of Analyzing Exhaust Gases To Determine Engine and Carbureter Efficiency

E. R. Hewitt Favors Analysis and Gives Results of Years of Tests

Part I

Note—These discussions by leading engineers are from stenographic notes taken during the recent session of the Society of Automobile Engineers in New York City, when this pertinent subject proved one of the most interesting of the meeting.

NEW YORK CITY—I began work on exhaust analysis about 1898, I think, and I have been following it through pretty thoroughly ever since, and in addition to the ordinary work in the laboratory on test matters I had an exhaust gas apparatus rigged up, and when running my car I have been able to take samples under all the different conditions of road running using the ordinary Orsat apparatus. I hang it up with rubber, so it does not get too dirty in running the car, and have one man drive the car and the other man draws in a sample by drawing in five or six volumes of about 50 cubic centimeters each through the apparatus, then shutting off, so you get a good average sample, I should think, under the ordinary running of the motor. While drawing in 50 cubic centimeters you would probably have 100 or 200 cylinder explosions, so you get a good sample.

I noticed while driving merely at 20 miles an hour on the road the car would run 300 or 400 yards in drawing the 50 cubic centimeters, and in comparing these analyses in running I had very curious things develop. It was 2 or 3 years before I could understand what they meant. Now I have had to repeat those experiments on the road. The result was not the same as you would get if you had the motor set under load to produce 13 1-2 per cent. CO_2 and 1 to 2 CO and a trifle of free oxygen. You take it out on the road and you will not get those same conditions at all. I took a car and blocked it up on the back axle and put the brake against the rear brake drums and got the road conditions and made a note of the whole range and then took it out on the road without altering the carbureter and tested the thing up thoroughly **and the road conditions were not the same as the practical conditions in the shop. The reason for that seems to be that the jar of the motor affects the level in the carbureter considerably and that affects the mixture somewhat.** The difference in temperature inside the bonnet under different conditions affects the carburetion very much more than is generally understood. Carburetion is affected to the extent of about 15 per cent., as near as I can make it, by 100 degrees variation Fahrenheit. Now those variations occur every 100 degrees quite often, running over the road various times during the same ride. For instance, I ran with a thermometer in the radiator cap when I tried this experiment and got the temperature of the circulating water; and if the circulating water is, say, 120 to 130 degrees running on a level and you start to climb a steep hill, your circulating water will climb up to 160, 180 or even 200, and your exhaust gas analysis will change very materially without altering the carbureter at all. It will immediately become very much richer. It is leaner when it is cold and it is richer when it is hot, and it varies materially. **That is, if one were to give any opinion, your motor heats up when it climbs a hill and your temperature rises in your bonnet and the mixture becomes richer and you get a little more power.** You want a trace of CO in it, and I will explain to you in a moment why that is so; and you want a trace of free oxygen. You will evidently get in running on the road both free oxygen and CO, provided the CO does not exceed .5 per cent. In fact, you can have—under road conditions I frequently had as much as 1.5 and 2 per cent. CO and as much as 2 per cent. or 4 per cent. of free oxygen at the same time; and naturally I thought my apparatus was wrong and devoted a good deal of time to finding out where the trouble was. I spent the whole season fooling with that and could not discover where the trouble was.

The next season, when I got more time to spare with it, I went over it, and found there was no trouble with the apparatus whatever, and still continued to get free oxygen and free hydrogen at the same time. Then I tried some experiments in the shop, where we could observe the exhaust carefully, and I noticed by getting up close to the exhaust pipe and watching the engine when it was running slowly under very heavy loads, and putting a piece of colored glass so I could get right close to the exhaust flame, I noticed that where the flame came out over the port **you would notice a blue flame inside the valve, when you looked up inside. When it passed over the port you would notice it changed to yellow; and you would always notice a difference in color where the gas turned the corner around the valve.** That was noticed particularly where the mixture was imperfect, small globules remained in the air entering the engine.

Now what occurs is that you get your explosion in the cylinder; each individual globule of gasoline in the engine is burned up by the little molecules of oxygen around it as far as they can get at it. They burn off the outside shell of this thing and there is not time enough for them to burn that up. These other molecules of oxygen cannot get inside there and therefore they leave the core of gasoline in there, which is more or less broken up by the heat. The intense heat generated around this gasoline then practically mixes up all the free oxygen and hydrogen and when it explodes over the valve side all these things are stirred up tremendously with the high velocity over here, and then this core gets burned up by the excess of oxygen which is inside.

It first comes through the valve, it gets below the burning point outside the valve, and those things are carried outside through the valve and form free oxygen and free hydrogen and the other compounds. So when you get a very queer analysis like that yon may make up your mind that the gasoline is entering in the form of globules and not in the mixture.

Now it can enter the engine in two ways. Suppose your mixture is either rich or badly mixed inside the carbureter. What occurs is this: the gas rises from the carbureter and is thrown against the outside wall of the intake pipe on the first curve, and after it is condensed against the wall of the intake pipe it falls right along it. Now if you have a four-cylinder engine and an intake pipe of that type you will invariably find that is the solution. But I am sure that the solution of that is because of the uneven mixture in these various solutions. Now if you tap off the explosion gases from these different solutions you will find a difference in the analysis of it. And this will not solve the queer analysis, it will not solve the normal analysis of more or less complete combustion; but they will vary very much. You can get tremendous variation between two solutions run on the same mixture, and it is entirely dne to the centrifugal effect in the intake pipe. As you cannot get an intake pipe without curves you have got a complete mixture at the carbureter. The problem of getting that was one I worked on a good while. The first thing was to bring up hot air, and where you can get hot enough air yon vaporize the thing. So I ran the air up to 1,150 degrees Fahrenheit, tying an electric heater to it to get it practically up to the combustion point of the gasoline. When I mix that hot air in the venturi tnbe, as the air exceeds 800 degrees Fahrenheit, I can get practically a complete mixture, so there would be no story of queer analysis, but the analysis would remain normal; but the amount of oxygen was so much increased by having that air at that temperature that you would have too much air in your intake pipe and it would spread materially and fill your cylinder full, because the friction would increase greatly, so you would cut down your maximum power very greatly. That made it impossible to work that system out, although I tried it and had it in operation for a considerable time.

Then I experimented to get the maximum velocity inside the venturi tube, and got velocities as high as 1,700 or 1,800 feet a minute and ran them singly and in tandem; but the intake pipe turns were very narrow and they could not get aronnd with the intake mixture and made it impossible to work it out. Then there remained to use a combination of both. **You want hot air and a good mixing chamber at the same time to get the proper gas analysis.**

I made glass Venturi tubes and glass intake pipes so I could find out exactly what was going on inside the engine, and I found that with any form of carbureter, I don't care what it is—I don't believe anybody can make a form of carbureter in which when the velocity in the intake tube goes below 5,000 feet a minute you will not get a condensation in here. I have been unable to find any one that would not do it. I do not mean in the intake, I mean in the carbureter itself. You cannot drop below 5,000. To get the best results you should have about 15,000. **The object of the whole problem is to design a carbureter to give you a high velocity in there and at the same time do it with the least expenditure of power, and that has been done in several commercial forms. There are several of them that are pretty good.**

Now the object I had was to find out what was theoretically possible in the engine. In the first place, how little gasoline can you run with, how many cubic inches of cylinder capacity can you make per pound? That is the question under the very best possible conditions that are obtainable. I worked it out with light conditions, the engine running idle and on the road and found there was very little difference. I found the engine would make very little difference, and use the same amount running idle as under 10 per cent. load. You can run down to the same point, run the oxygen up and then run it down to a certain point in decreasing the volume in the cylinder. I found that you could run down to one-fourth cylinder volume; and when I got below full cylinder, to one-fourth cylinder full, then I would begin to get a mixture that is too lean, and on running your oxygen up to 6 per cent. and your CO np to 8 per cent. you can get a maximum lean mixture that you can run on, but yon would not run as well as you would with the oxygen around 12 and the CO around 2. Then by running the volume down so that it will take in as little of the stuff as possible you get the very best that was obtainable.

Then taking these conditions out on the road I used them as a standard for what is obtainable on the oxygen. For instance, I figured out the gearing, the number of cubic inches of cylinder capacity per mile; then I know theoretically what it ought to take to run that car, and then I find out what the car is really doing under ordinary road conditions, and in that way you can tell whether the carbureter is really any good or not. And, as far as I know, that is the only way to tell; and until I got those facts I could not really test the carbureter and could not tell what I got. I would get 10 miles on one and 15 miles on another, and I know that when I got 15 I did not know whether I was getting all it was giving or not, and whether I could get more yet; and having those facts in mind I do not think that you can get any more running an engine under load on the road than yon can get running it idle, **but you can run a car at 20 miles an hour on the level, on a macadam road, with exactly the same amount of gasoline per cubic inch of cylinder capacity that you can run it idle.** For instance, the car I have now, the theoretical amount it should take is 15.2 miles to the gallon, running straightaway, and I operated it last summer in Europe at 14 miles during the whole season, and very often operated it for a whole day's run as high as 15 miles; and if I ran long grades and coasted down high grades, for instance, around Central Park, I can drive around Central Park, New York, within the theoretical amount; that is, I can drive around Central Park with less gasoline than I can run the engine idle, but that is upgrade, long grades and shutting off the motor.

Now, what are the best mixtures? I found them afterwards; that would be approximately the mixture and maximum efficiency of power.

For greatest power efficiency on the road the following analysis is desirable:

CO_2	13.5 per cent.
O	.1 per cent.
CO	.2 to .3 per cent.

The maximum efficiency mixture gives an exhaust analysis as follows:

CO_2	12.5 per cent.
O	2. per cent.
CO	0.

In the best power mixture, sometimes, CO can run even a little higher than that given. The reason that you have CO is because you cannot get a perfect mixture in your intake pipe and carbureter, and if you do get a perfect mixture and the motor is throttled down a little you have an explosion here after it passes the throttle, and you have a suction on the intake pipe. If you have a suction in the mixture in the carbureter it need not be in the intake pipe, and that will increase the temperature. And if it was right when it passed that carbureter you would have a vacuum caused there by the suction. For instance, I have a suction on the intake pipe and it operates on the road about 15 inches of mercury suction running at 20 miles an hour, and running idle it runs from 3 to 4 inches of mercury suction, and when it is pulling, say, a 5 per cent. grade, with full load of passengers at high speed, it will run probably 10 inches of mercury, and when I cut down the full power of the motor, driving, say, 10 miles an hour, at full engine power, the suction will drop to 2 inches.

I tried a very long series of experiments on the subject to find out what the effect of the suction on the intake pipe was, both in gas analysis and on the power, and I found, roughly, about 1 inch of mercury suction would affect the car 10 per cent. That is approximately the loss; that is about 3 inches of mercury suction. So if you could cut it down to nothing you would increase your power by 30 per cent. That is on three or four different engines, and I suppose they are engines that would vary on account of friction in the pipe. If you do not have a high suction you do not have high speed. You do not have 5,000 feet there unless you have a mercury suction to draw it through, and that comes from the centrifugal blower. And I think in that way that you can increase your power over 30 per cent. for any commercial vehicle to-day; but then your heat would go so high on your cylinders that it would not work. In my tests I used two cars, a four-cylinder that averaged 21 to 24 miles per gallon and a six that averaged 14.5 to 15. You cannot make a carbureter which will start the engine cold and be running satisfactorily when the engine is running hot. That is, there is a difference of 15 per cent. in gasoline mixtures between cold and hot air. You have got to compensate that in some way, and the way the ordinary man compensates for it is by setting the thing so it runs too rich all the time.

Regarding the relative merits of rough and smooth intake passages I found at my works I gained three-quarters of a mile sometimes when I made the thing rough. In other words, I get a better mixture of the gasoline thrown against the walls of the rough surface than with the smooth, and the exhaust gas analysis showed up much better with the rough intake manifold. As far as I am concerned, I want them just as rough as I can get them, but not with sharp corners, without any interruptions to the flow of the gases. But the rougher the surface is the better you are off, the better mixture you get, the better exhaust analysis you get.

The best method for breaking up the globules in an intake manifold is a series of plates, perforated with holes, five or six or seven of them. The gasoline will drop over the top of the plate and drop through the holes, and the draft pouring up through the holes tears the gas all to pieces on the edge of the holes. That is much better than by suction and with the screen. It breaks it up better and offers much less resistance. It is better than anything on the market with screw propellers and so on.

The question of properly filling the combustion chamber is an important one in carburetion. I had a truck engine which was operating very satisfactorily. The crank over the compression was exactly 78 pounds. In the revising of the same engine I changed the valves, changed the lift and the position of the cams, altered the intake pipe and carbureter resistance and left the compression and speed the same. When I first put the engine on the blocks it knocked very badly at about 700 or 800 revolutions, carrying the full load, and after working with it a few days I found out that the compression was too high. So I lowered the compression and had 72 pounds crank over and the knocks disappeared. In other words, the old engine did not fill the cylinders full. The design was such that it did not get the full 78 pounds running. After I got at it I went over it and tested it and I found only two points it knocked, one was 66 and the other was 76. When it was 76 it was knocking and when I got down to 72 it would not knock. In other words, about 72 pounds is about all you can safely carry.

But the advantage of putting gas in under compression would be only at high speed. You can design an engine up to 1,000 revolutions, which will practically fill itself full. But if you design one up to 12,000 your friction on the intake pipe is going to increase by the square of the speed and decrease with the square of the volume. If you have one of 72 pounds up to 2,000 revolutions, if you get up to 1,600 you would probably be down to 60 pounds on your volumetric efficiency.

Edward R. Hewitt.

Discussing Three-Point Suspension

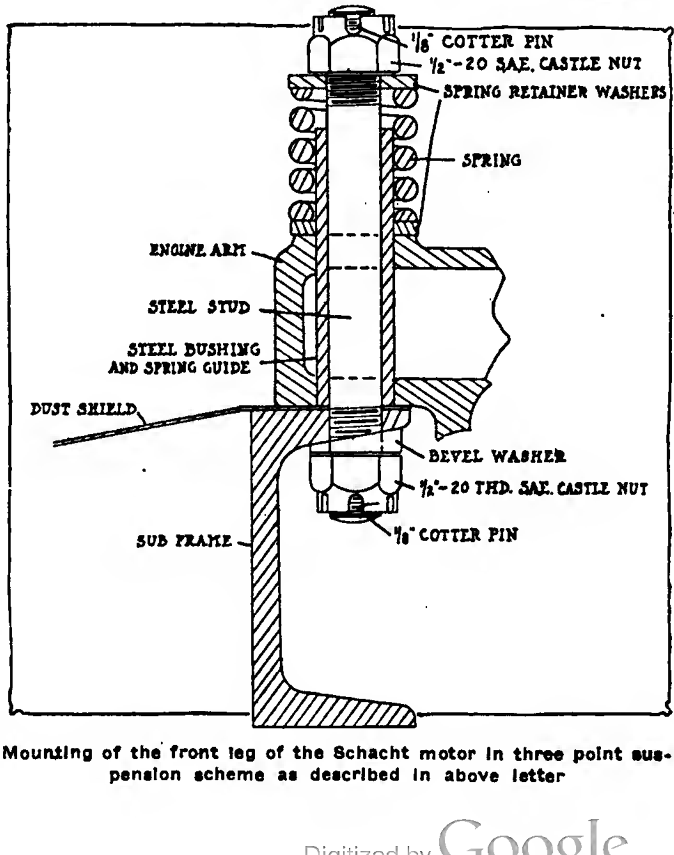
Boston, Mass.—Editor The Automobile:—In regard to the three-point vs. four-point suspension controversy which I have noted from time to time in your Engineer's Forum columns, I would like to say that I believe many of the so-called three-point suspensions are in reality four-point suspensions. The reason for that is the fact that the single member has often two points of support which though close together are still wide enough apart to form four members. This construction cannot by any stretch of the imagination be called a three-point suspension and is bad from a standpoint of rigidity as well as flexibility. I am a firm believer in the three-point suspension when it is really such and not a misnamed four-point affair. I sincerely trust discussion on this subject will go on as I believe there still remains a great amount to be said and as far as I have seen I do not believe the heart of the matter has as yet been reached.

A. P. Stein.

New York City—Editor The Automobile:—With further reference to the article in issue of December 19, 1912, Automobile, page 1277, "3-point vs. 4-point," etc., would advise that we have had quite a little success in tests of the spring under the engine stud nut.

It has occurred to the writer that it might be of interest to the readers as to how this construction was arranged and we are enclosing a sketch, which is reproduced in the illustration shown at the bottom of this page. We are placing this at the two front legs of engine only and the action is wonderful. It certainly relieves the motor and frame of heavy twists and strains and we feel quite certain that we are to reap some benefits from this type of construction.

A. Schimpff



Mounting of the front leg of the Schacht motor in three point suspension scheme as described in above letter

Electric Cranking and Lighting

Part IV.

Telling the Story of the Storage Battery Required for the Electric System of a Car and Outlining Its Care and Construction—Calculating Candlepower and Correct Wiring

Subject Digest

¶ The lighting battery is not capable of taking care of the sudden load imposed by the cranking motor. The ignition battery is incapable of handling lighting or starting, therefore the batteries must be redesigned when a cranking system is fitted.

¶ The principal difference between batteries designed to give a slow discharge and those intended for a sudden and rapid current flow is in the plates. For slow discharge a few thick plates are used, for sudden discharge many thin plates.

¶ The electric cranking motor is generally more efficient in higher voltages, but the weight of a 6-volt storage battery is less for a given capacity than any other. With an increase in battery weight, there is an increase in cost.

¶ One of the first duties of a user of a storage battery is to see that it is kept filled with water. This means attention at least once a month. The batteries for this reason must be mounted accessibly.

STORAGE batteries used for lighting, igniting and starting while they resemble one another externally are quite different in their internal construction. This particularly applies to batteries which have to be used in conjunction with an electric cranking motor on an automobile.

The lighting battery which has been extensively used during the past two seasons is very similar to the one which is now supplied for electric starting. It lacks capacity more than anything else to make it applicable to the latter duty. On the other hand the ignition battery is inapplicable to either lighting or starting duty. Just as the lighting battery lacks capacity for starting purposes so does the one used for ignition purposes only that the latter is lacking in a greater degree than the former.

For example just compare the capacity of three batteries, one for starting, one for lighting and one for igniting purposes. If we make the comparison with 6-volt batteries the capacity will then depend only on the number of amperes discharged continuously. A starting battery is rated at 100-ampere-hour capacity when it will discharge at the rate of 5 amperes for 20 hours continuously. A lighting battery with a rating of 80 ampere-hours capacity will give 5 amperes for 16 hours continuously. The ignition battery rated at 40 ampere-hour capacity will give only 0.5 ampere but will deliver this for 80 hours continuously. For lighting, a battery should always be able to deliver at least 5 amperes continuously for 10 hours. This would easily be accomplished by the lighting and starting battery but would be impossible with the ignition battery. The latter is not designed to give such a high rate of discharge.

There is little difference in the construction of lighting and and starting batteries. The greatest difference in these is the capacity. Capacity in this case only means a greater factor of safety. Therefore, it may be said, that the construction of the ignition battery prohibits its use for starting purposes but that a large lighting battery may be used for starting because it is of the same general construction as that generally used with electric cranking motors.

Difference in Battery Construction

The principal difference between batteries designed to give a slow discharge and a quick discharge is found in the plates, the ignition type of battery having a few thick plates while the lighting and cranking battery has many thin plates.

The essential requirement for rapid discharging is large plate area per ampere discharged. This is just what is accomplished by the use of thin plates, for when two plates replace one the effective area is doubled.

In practice this doubling of area is accompanied by the reduction in thickness of plate in order to keep the size of the battery about the same as before. It also has an important bearing on the discharge rate which may be obtained from a battery and also the capacity or length of time that the battery will give this discharge. The gain is due to the shortening of the distance which the electrolyte has to travel to reach the center of the plate.

The difficulty which accompanies the thin plate is to prevent the active material from falling out of the grids during rapid charging. This in the past has been one of the weaknesses of this construction. It has been largely overcome in the latest batteries of the thin plate type. But less fear need be had of such difficulties in the average electric lighting and starting system as applied to automobiles because the rate at which the batteries are usually charged is far under that which would be likely to cause disintegration of the active material and the grids. Hence, the automobile user enjoys the advantages of high discharge rates, inherent in the thin plate battery and at the same time is insured against short battery life whih comes from too rapid charging, a common occurrence in power house work.

A brief examination of the battery construction will explain why the thin plate is so much more efficient when a high discharge rate is desired. The battery plate or grid pasted with active material can be compared to a sponge. In order that the electrical discharge may take place it is necessary to have the sulphuric acid solution, H_2SO_4, or the electrolyte throughout the plate just as the water fills the pores of the sponge. As the electrical discharge takes place the sulphuric acid in the interstices of the plate becomes changed to water and hence diluted. With this dilution of the electrolyte the output of the battery will fall off. If the discharge is stopped for a short time the acid will penetrate into the plate and bring up the specific gravity again to normal and the same high rate of discharge may be continued until the renewed solution is diluted.

What this has to do with thin plates will now be considered. Note the section of the two plates, A and B, in Fig. 2. The distance from the center of the plate to the outside in the case of B is twice the distance of that in B, that is, the distance, L, is twice the distance, D. The time that it takes the acid to penetrate to the center of the plate A will probably be twice as long as is the case with B. In short the replacement of the electrolyte is about twice as fast in B as in the A and so that a much higher rate of discharge can be taken from B without the dilution of the electrolyte affecting it. This is the secret of the starting battery now used.

For a short time or until the electrolyte is diluted so as to bring down the output, a very high discharge can be obtained from almost any battery. To illustrate this a very interesting experiment was performed many times a day at the booth of the Electric Storage Battery Company, during the New York shows. The apparatus is shown in Fig. 4. It consisted of a single cell taken from a 3-cell, 6-volt starting and lighting battery. It therefore, gave 2 volts approximately. This was connected up across a shunt so that the amperes used could be measured with an ammeter. A switch was also placed in the circuit and very large wires were used everywhere in order to reduce the loss of voltage and current. Across two binding posts in the circuit was clamped an ordinary eight penny wire nail. This was about 1-8 inch in diameter. When the switch was closed and the circuit completed, through the wire nail the latter began to heat up immediately. To do this about 1,000 amperes were demanded from the battery, as the ammeter faithfully recorded. That so heavy a discharge could be obtained from so small a battery was surprising to many people. It proved that the ability of any electric cranking system depends on the size of the cranking motor, the gear ratio employed and the gauge of the wire connecting the motor, the gear ratio employed and the gauge of the wire connecting the motor and battery. It also proved that the only limit to the discharge rate in any system is the resistance of the outside circuit and the voltage of the battery.

Capacity of Storage Batteries

The rate at which a battery may be discharged is almost without limit as shown by the preceding illustration. The length of time which a battery will keep this discharge rate up is another question. This depends upon two factors: first, the number of plates in the battery and also upon the temperature of the battery. The capacity is also dependent upon the rate at which the battery is discharged.

The effect of the temperature upon the capacity of the battery is quite important. To better show the effect of a curve, Fig. 8 has been given. From this it will be seen that the increase in temperature above 80 degrees Fahrenheit has little effect upon the battery. On the contrary, when the temperature falls below 70 degrees the capacity of the battery steadily falls off. This decrease in efficiency of the battery is in direct proportion to the drop in the mercury. At 20 degrees below zero it will be noted that the per cent. of rated capacity is about 33 or the battery has only about one-third its normal capacity.

The next consideration of importance is the rate at which a battery is discharged. The number of ampere-hours which may be obtained from any battery varies directly as the number of hours taken to discharge that battery. In other words the slower we take the electricity from the battery the longer we can continue to take it. Also the number of ampere hours will be greater.

Take some specific examples to illustrate this point: first, note the curve, Fig. 11, which gives the Percentage of Rated Capacity, for any number of Hours Discharge Rate. This shows how rapidly the capacity of the battery falls off as the time in which it is fully discharged, is reduced. Also that if a battery is discharged at a rate slower than that at which it is rated, the capacity of that battery is much increased.

In Fig. 1 a comparison is made between the capacity of various batteries and the time each will burn under varying loads. A 6-volt battery is used in each case: one, of 80 ampere-hour capacity; another of 100 ampere-hour capacity and a third of 120 ampere-hour capacity. The lighting system is representative of that found on many small electrically lighted and cranked cars. The tail light gives 2 candlepower, the sides, 3 candlepower each and the headlights 21 candlepower each. This gives a total of 8 candlepower when the sides and tail are burning. With only the head and tail lights burning 44 candlepower is obtained and with all lamps lighted 50 candlepower is produced. The current required in each case is respectively, 1.68, 7.42 and 8.68 amperes.

With these lamp loads the 80 ampere-hour battery will keep

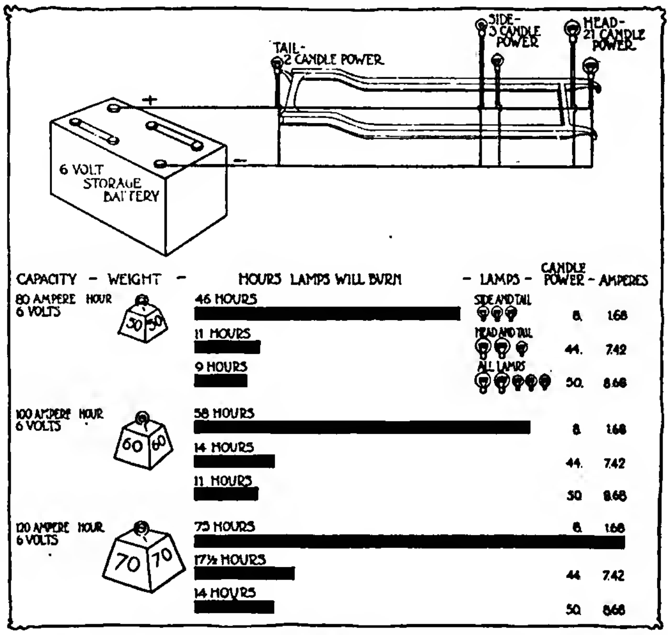


Fig. 1—Showing how long the lamps will burn with batteries of 80, 100 and 120 ampere-hours capacity

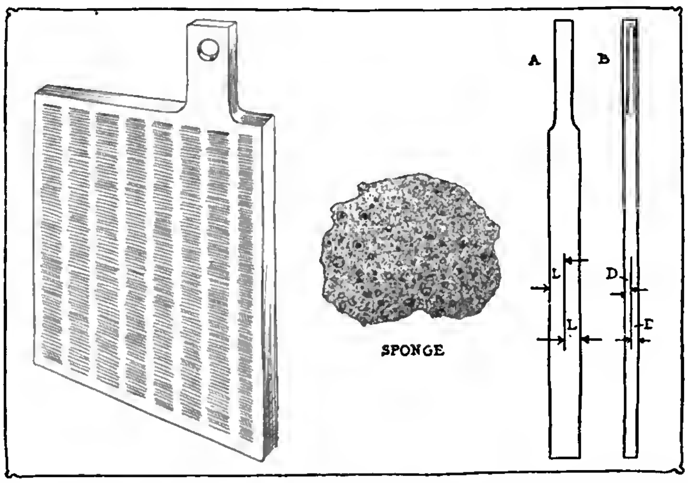

Fig. 2—Comparison of grid and a sponge, thick and thin plates

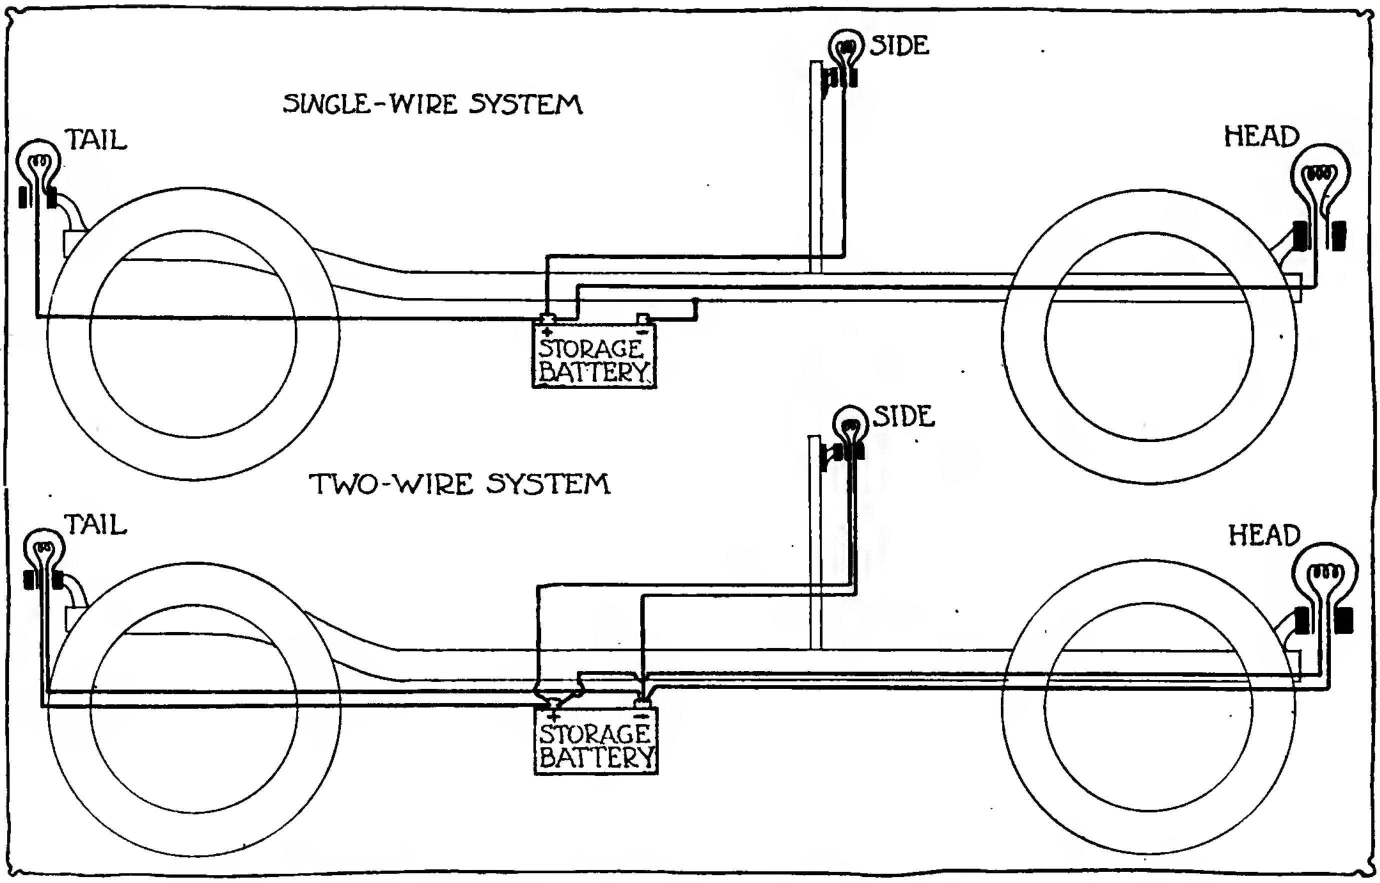

Fig. 3—Diagrammatic layout of the single-wire system as compared with the two-wire system of lighting

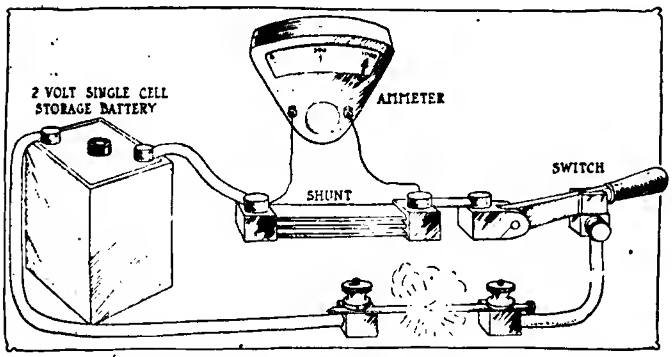

Fig. 4—Apparatus for rapid exhaustion of a cell

the lamps burning continuously for the following periods of time respectively; 46 hours, 11 hours and 9 hours. In short, the battery will keep the side and tail lamps lit five times as long as it will furnish current for all the lamps. This is very important to note because it means that the turning off of the head lamps when you stop the car will greatly increase the life of the battery and reduce the work it will have to do.

For comparison peruse the table below which gives the number of hours which each battery will burn the lamps.

Voltage	Battery Capacity	Hours Lamps will Burn Continuously	Lamps	Amperes Drawn
6	80	46	Side and tail	1.68
		11	Head and tail	7.42
		9	All lamps	8.68
6	100	58	Side and tail	
		14	Head and tail	
		11	All lamps	
6	120	75	Side and tail	
		17.5	Head and tail	
		14	All lamps	

Comparative Weights of Batteries

There is serious consideration of the question of voltage in lighting and cranking batteries. That which is most commonly used has 6 volts, although batteries which deliver, 12, 16 and 18 volts are also used to some extent. The 24-volt system is not mentioned here because it applies to the starting operation of two or three systems only and does not affect the lighting system at all. The lighting system in all 24-volt starting systems will be found to be only 6 volts. Where the higher voltage is used it is determined not by the lighting conditions but by the electric cranking motor which is usually more efficient under higher voltage. Higher voltage also means less loss of power or voltage head in transmitting the electricity from the battery to the electric motor. This brief digression is only to explain why a higher voltage than 6 is frequently used.

The weight of a 6-volt battery is less for a given capacity than any other. This is clearly shown in the curves which are plotted in Fig. 7. These curves were obtained from data on the weights of batteries furnished by one of the largest producers of lead plate batteries used for electric lighting and cranking. The solid curves show the weight of batteries in each of the four voltage systems, 6, 12, 16 and 18. The capacity being given with the weight in each case. The dotted curves, A, B and C give the direct comparison of the different size of batteries with the 6-volt ones. The curves, A, B and C being respectively for 12, 16 and 18-volt batteries. From this we can make a direct comparison. Take the 160 ampere-hour capacity. The weights will be as follows:

Voltage	Weight	Percentage Greater Weight. 6-Volt Battery Assumed as 100 Per Cent.
6	80	0
12	95	18.75
16	103	28.75
18	122	52.50

With the increase in weight there is a corresponding increase in cost of the battery. Hence both from the standpoint of cost and extra weight the higher voltage battery it seems would be less likely to be standard. As it is the 6-volt battery is used more widely than any other and the above comparison is really an explanation of this trend.

The method of obtaining the curves A, B and C should be stated. It was assumed that the energy from a 12-volt battery was the same as from a 6-volt battery. If so, a 12-volt battery of 35 ampere-hour capacity is equivalent to a 6-volt battery of 70 ampere-hour capacity. In other words divide the voltage by 6 and multiply the ampere-hour rating by the quotient so obtained. This was done in each case.

Battery Under Operating Conditions

In order to illustrate the conditions of battery operation when starting the curves, Fig. 10. are given. These were taken from a 6-cylinder 4.5 by 5.5 inch motor. They show the load amperes required to turn this large motor over for 34 minutes continuously. They show in addition how the voltage of the battery is affected, how the temperature of the battery rises, how the specific gravity of the electrolyte falls off and the sudden drop in the revolutions per minute at the latter part of the run.

How closely the speed of the cranking motor and also that of the gasoline engine depends upon the voltage of the system can be very clearly noticed. The voltage curve and the revolution per minute curves are almost parallel to one another.

As a battery is discharged the electrolyte is gradually diluted and the specific gravity drops steadily. This is very nicely shown by the specific gravity curve in Fig. 10.

The temperature of any battery is raised quite a little during any continuous discharge of this character. This it is stated by different authorities will help to pull up the efficiency of a battery in cold weather if that is found necessary. But as was proven by the experiment wherein 1,000 amperes were drawn from a 2-volt cell, little difficulty will be found in getting enough amperes into the electric motor even under the worst temperature conditions. In connection with this it should be mentioned that the average 6-volt starting motor if locked so that it cannot start up will seldom draw more than 400 to 500 amperes. This is the condition in practice where the motor is frozen and can not be turned. This is enough to prove that other conditions rather than lack of current are going to prevent an electric cranker from operating in cold weather.

Standard Electric Lamp Sizes

The size of the lamps used in the systems now prevailing does not vary greatly. The 6, 8, and 12-volt lamps being interchangeable in the sockets provided, but a 6-volt lamp cannot be put in a 12-volt circuit. Four styles of lamps are furnished, these being shown full size in Fig. 6. The lamps all have the same size of Ediswan socket. The diameter of the bulb varying in each case. Another point which is not generally known is that the size of the bulb is no criterion of the candlepower of the lamps within a certain range. For example the 2.0625-inch lamp may be 24, 21, 18 or 15 candlepower, the only difference being in the size of the filament. In buying lamps the maker's stamp would be on the outside and the purchaser should carefully see that this is correct.

Two difficulties arise from not using the right size of lamp: first, you do not have uniform lighting due to the fact that the new lamp is of higher or lower candlepower than the one it replaces and second it may take more current than the old lamp,

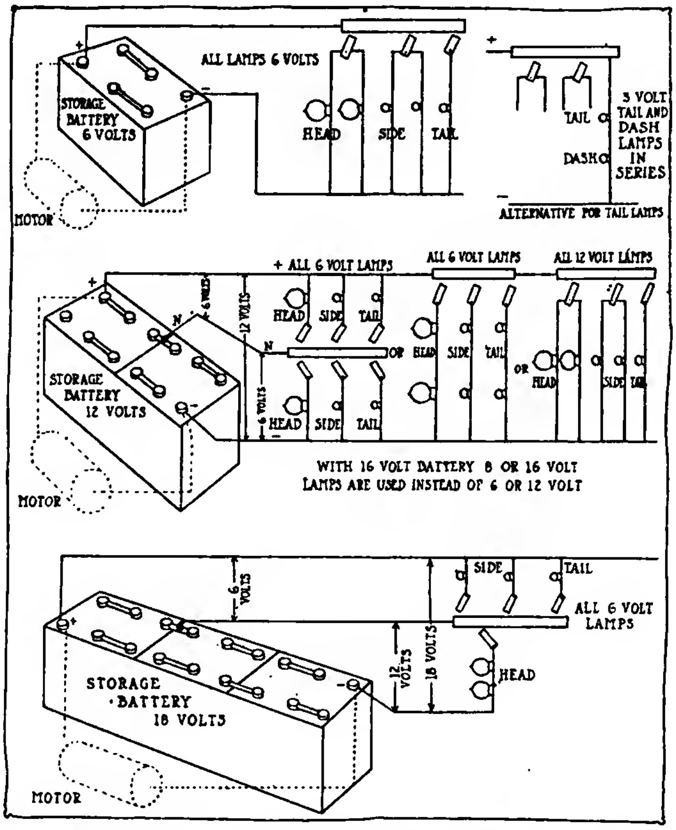

Fig. 5—Method of wiring lamps and motor on a 6, 12 and 18-volt storage battery

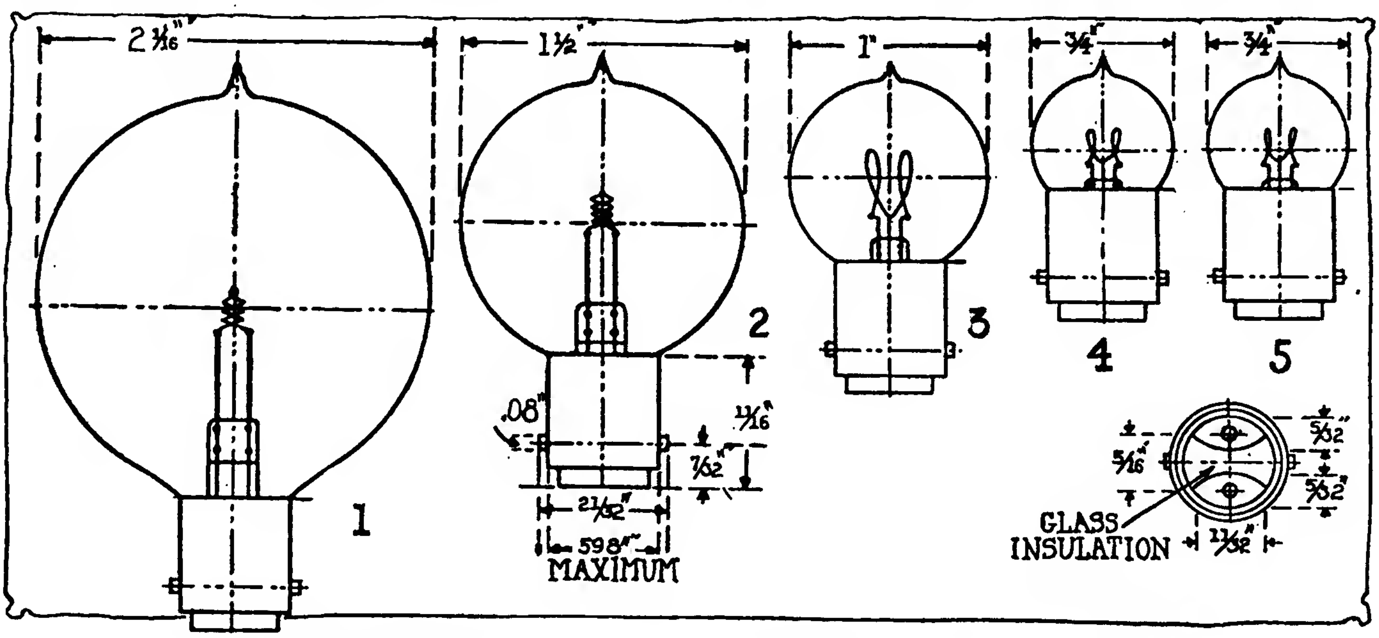

Fig. 6—Actual size of lamps now in use, showing the full size dimensions of the bulb and sockets

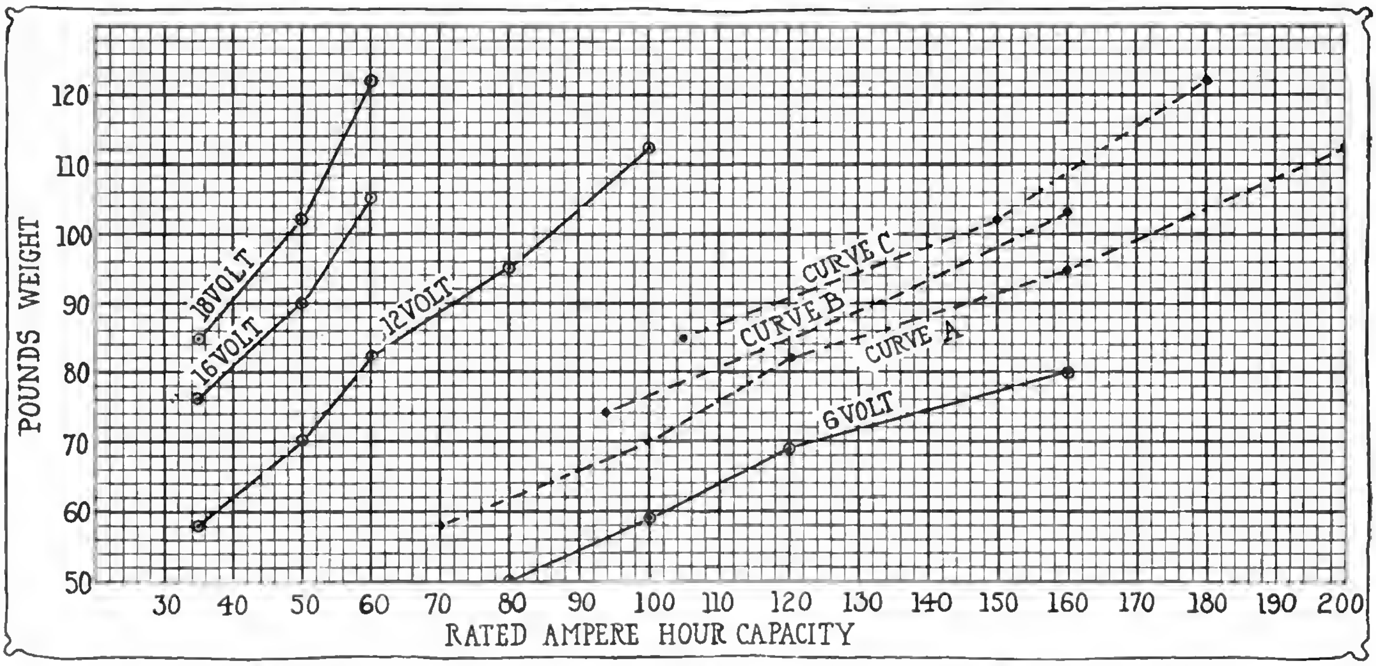

Fig. 7—Capacity against weight, showing the number of ampere hours capacity in 6, 12, 16 and 18-volt batteries per pound

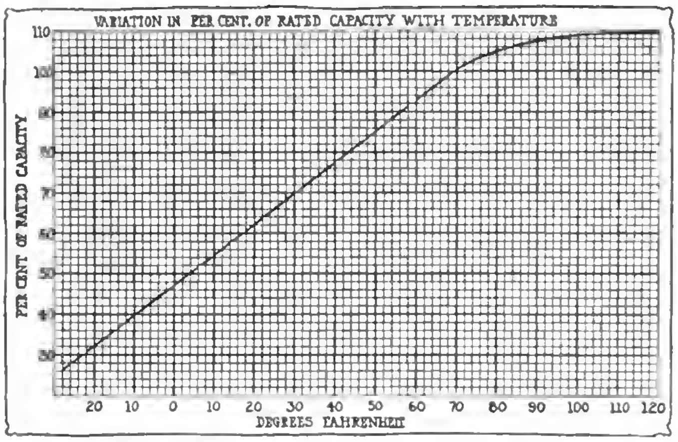

Fig. 8—Percentage of rated capacity secured at different temperatures

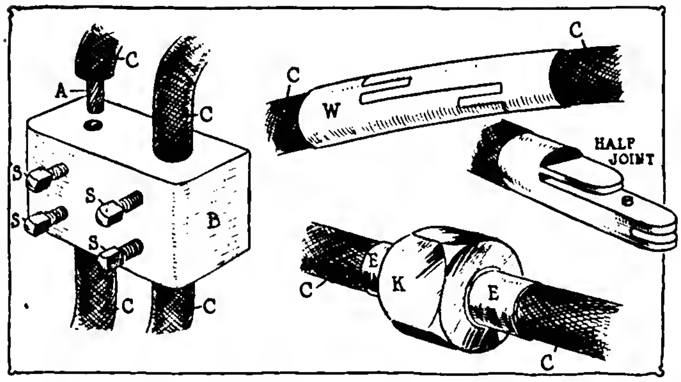

Fig. 9—Types of connections and joints used on heavy wires

provided it is of higher candlepower, in which case it may take more current than that for which the manufacturer designed the system. In the latter case the drain on both the battery and the over demand on the generator may ruin your battery through no fault in the design of the system.

Figuring Candle Power of Lamps

A very simple rule for figuring out the amperes taken by the lamps is as follows: Divide the candlepower by the voltage of the system. This only applies to the lamps giving more than 9 candlepower. For example take a 21-candlepower bulb. This will take 21 divided by 6, giving the result of 3.5 amperes.

Conversely you can judge very closely the candlepower of a new lamp after purchasing it if you will measure the amperes which it takes to burn it. The table which is given here will assist you in finding out. The easiest way is to turn off all lamps except the one which you want to test. Do not have the motor running. The ammeter with which your system is probably supplied will then register several amperes on the discharge side. This reading is the amperes which the lamp takes. To turn the other lamps off you only need to unfasten them in their sockets. A test like this is not difficult and is frequently very valuable as it prevents your using too large bulbs in your system.

Methods of Wiring Lights

Three methods of wiring are most in practice. In these it will be noted that the systems, whatever their voltage for charging may be, try to so arrange their wiring that 6-volt lamps may be used by the customer. This is due probably to the fact that 6-volt battery lighting systems have been used for some time and that 6-volt lamps can be obtained so much more easily than any others. Other reasons for the 6-volt system were given in connection with batteries. Fig. 5 has been prepared to compare these systems graphically and as simply as possible. Note that the 6-24-volt system used by some manufacturers is not shown here because in that system the lighting is all 6-volt and comes under the condition shown first in Fig. 5.

Treating each system briefly we find the following novelty in the 6-volt system. The standard wiring is shown in the first part of the cut. All the lamps are in parallel or across the line. One switch throws both headlights on, likewise only one switch is used for the side lamps. This is common practice on most cars although some provide a separate switch for each side lamp. By so doing the operator is permitted to leave the car standing at the curb with only one of the side lamps and the tail burning. This permits a slight economy in electricity.

The novelty in the straight 6-volt system is in connecting up the dash or speedometer light in series with the tail lamp. By so doing the operator is warned instantly by the extinguishing of the dash lamp if the tail lamp burns out. This also works vice versa and might force the operator to drive home without either tail or dash lamp. Where the tail lamp is independent and it burns out another bulb taken anywhere in the car may be put in place of the extinct bulb. This is not true of the two-lamp system mentioned first. In that the lamps are in series across a 6-volt circuit so that it is necessary to use 3-volt lamps. If one of these burns out a 6-volt lamp will not replace it very well. It, however, only means that a 3-volt lamp must always be carried in reserve with this system.

The 12 and 16-volt systems are similar in all respects to one another except in the voltage and the number of cells possessed by each, the 16-volt battery having 8 instead of 6 cells. There are three possible ways of connecting up this system to the lamps: By the three-wire system with all lamps in parallel and using 6 volts; second, by putting 6-volt lamps in series across the line or by using 12-volt lamps. Note that in the above discussion 8 may be substituted for 6 and 16 for 12 volts. The only difficulty with the series connection of the lamps is that if one of the two burn out the other one goes also. With the parallel wiring each lamp is independent of the other and the burning out of one has no effect whatever on the other.

The 18-volt battery is used on only one lighting and cranking system. The connections are very simple. The small lamps are in multiple across one-third of the battery and operate at 6 volts. The headlights are on the other two-thirds of the battery which gives 12 volts, but as the lamps are connected in series they are ordinary 6-volt bulbs.

When the battery is divided as in the case of the 18-volt system or as in the first example of the 12-volt system it is very important that the current drawn from both sides of the battery be equal. For example, the 12-battery has one headlight burning on one-half the battery and the head on the other half. This gives perfect balance but it should be observed that if either one of these lamps is burned out and is not replaced for a considerable period, the battery will be rather unbalanced. For this reason in any system where lights are connected to the battery in this fashion it is especially important to replace a burned out bulb as soon as possible. This of course, holds true in any system, but more especially to this particular combination.

Single vs. Two-Wire System

A greatly mooted question at the present time is whether to use the two- or single-wire wiring system. Both have their champions and their points of superiority. The greatest point in favor of the single-wire system is the saving which it effects in the wire. The connectors used are not those which are shown in the cut of the bulbs, Fig. 6. In the lamps used in the single-wire system one side of the filament is grounded to the base of the lamp and the other electrode is in the center of the plug. The idea of the two systems is diagrammatically represented in Fig. 3.

The two-wire system is the most used one today and for that reason is most standard. However, one cannot overlook the single-wire system because it has decided merits and only needs support from the lamp and connector manufacturers to become more popular.

Couplings for Motor Leads

The wires from the battery to the electric cranking motor have to be very large especially in the 6-volt system in order to keep down the resistance. On this account there is some difficulty in making connections with them. As the current carried is very high, often reaching 300 amperes, it is important that these terminals be burned onto the battery and sweated into the switches, or other connecting points. In Fig. 11 some characteristic connectors used for this purpose are shown. Binding post connectors cannot be used because the wire used is too big. Take No. 00, very commonly used, and it will be found that it measures 0.4 inches in diameter over the copper strands, not over the insulation.

One method of connecting this is to remove the insulation from the wire. Clean and tin the ends thus uncovered and dip the end into molten solder. When this end is put into the hole of a junction box, B, and the set screw, S, brought down against it, perfect contact will obtain. This joint is far superior to one obtained by a solid copper wire in a junction box of this kind because the set screw squeezes into the soft soldered strands of the copper and will hardly work loose under any conditions.

The Westinghouse joint, W, is another one which is very neat and clean as well as serviceable. When it is connected it is protected by slipping a rubber tube over it and taping the ends down to prevent moisture working inside. The joint is exactly like an air brake hose coupling and because of the angle through which it is necessary to bend it in unfastening some difficulty may be experienced in installing it on some cars.

Every factory making automobiles has pipe couplings for their gasoline, oil lines, etc. These can very easily be used to good advantage as connectors for the main feed wires. They are very easy to handle in a small space. In Fig. 11 one of these is shown at K. The two halves of the coupling, B and E, have the ends of the wires, C and C, sweated into them. This coupling on account of the edges presented coupling must be well protected, otherwise it will soon chafe the insulation off and cause a short circuit.

Some Battery Box Pointers

The battery boxes for housing the battery of the lighting and cranking system must be so placed that it can be easily reached. This is important because one of the first duties of the user of storage batteries is to see that they are filled up with water. This should be looked after monthly. Two locations are now utilized for the battery, one under the tonneau floor between the frame and the propeller shaft; the other a location on the runboard.

The battery boxes in either case must be carefully enameled to prevent the fumes from the sulphuric acid from attacking them. The lining which is usually of wood should be thoroughly boiled in paraffine to protect them and increase their life. The box cannot be ventilated too well. It must also be carefully drained in order to get rid of any electrolyte which may be spilled.

Electric Lighting of the Gasoline Car

Electricity now the Predominant Method of Car Illumination—Two Methods of Control in Use, Mechanical and Electrical—Field Strength Regulated by Differential Windings—One Maker Uses Magnetic Shunt

THE widespread adoption of electricity as a means of illumination is one of the noteworthy features of the 1913 cars. With the exception of some of the smaller and cheaper models practically all the cars on view at this year's shows were fitted with electric lighting systems, a clear indication that the present-day motorist is demanding the advantages offered by electricity in this connection. Electricity is an absolutely safe method. By adopting it all danger of exposed flame and lighted match, associated with the older lighting systems is avoided. Its extreme cleanliness and the fact that the lamps can be lighted without making it necessary that the driver leave his seat are also highly important points in its favor.

The chief essential of a satisfactory electric lighting system is that it can provide a uniform current at all times irrespective of the speed of the car, without the need of attention on the part of the user, and the variety of means by which this automatic regulation of current is effected forms an interesting basis of study. Broadly these methods may be divided into two classes: those in which the control is accomplished by mechanical means, i.e., by regulating the speed of the dynamo, and those where the current is maintained at a constant voltage through the electrical control of the generating power of the dynamo.

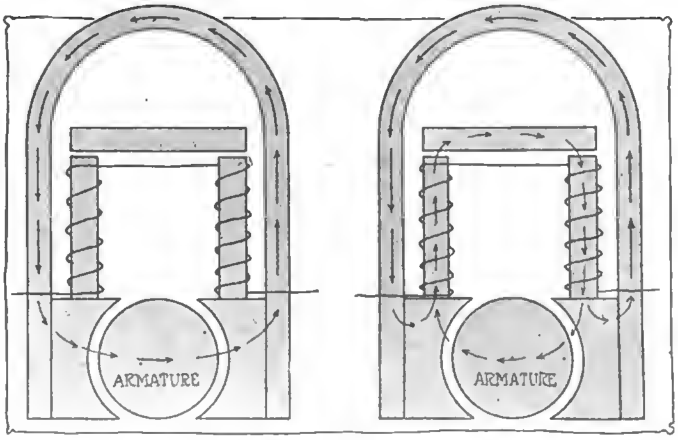

Fig. 1—Magnetic flux diagram of Splitdorf lighting generator

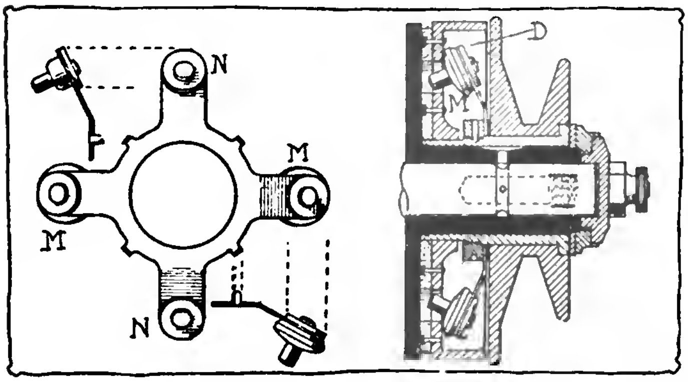

Fig. 2—Centrifugal clutch in Dynalux generator

In the first class some form of centrifugal clutch is the means employed. In the latter class the method generally adopted is that of varying the strength of the field magnets, by the use of a differential coil. This is a field winding so connected as to oppose the main energizing coil, and only comes into action when the generator is running at such a speed that the current developed would have an injurious effect on the lamps and battery. When running slowly the machine can furnish its full output by reason of the unimpeded power of its main field winding.

Dynalux—Controls by Speed

One of the simplest electric lighting systems is that manufactured by the Dean Electric Company, and called the Dynalux System. In this the generator has only two outside terminals from which wires extend directly to the battery without any intervening switches or regulators, all regulation being effected by devices contained within the generator casing.

The generator itself is of the cylindrical type with two poles, but differs from ordinary practice in that the magnet casing is built up from steel stampings clamped between two end rings. The poles form part of the stampings, and these are provided with a lip on one side only so as to facilitate the fitting of the wound field coils. Better commutation is also obtained by this one-sided extension of the pole face.

The armature is of the conventional slotted drum type run on ball bearings. A speed governor is fitted to one end of the shaft and an automatic cut-out at the other. Both these devices are mechanical in action, that is, they depend solely on the speed at which the generator is run. The cut-in is shown clearly in Fig. 3, the end cover being removed for the purpose. It consists of a disk D permanently attached to the armature shaft,

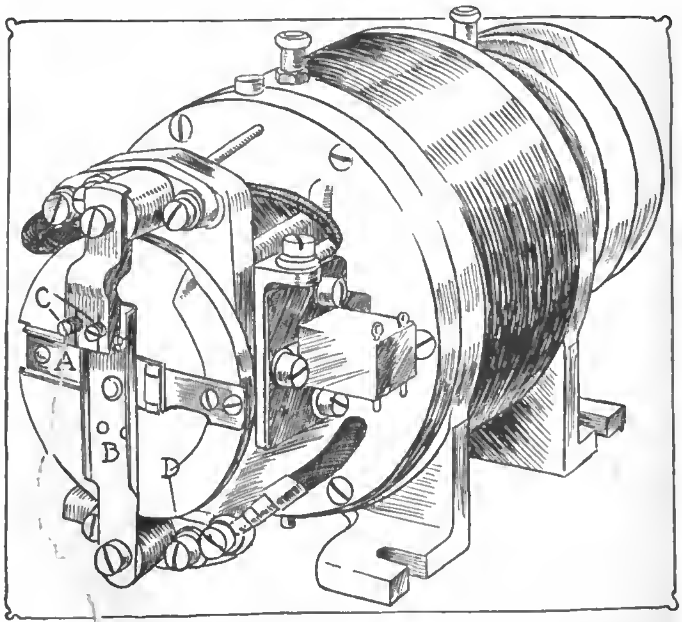

Fig. 3—Dynalux generator with cover removed, showing cut-in

on which is fitted the spring A. This spring is fixed at one end, but is free to move through a short distance at the other, which is provided with a light weight extending backwards in such a way that an increase in the speed of rotation causes the weighted end of the spring to move away from the face of the disk. In doing so the spring A carries with it the vertical spring B by means of an intervening fiber buffer at the center, bringing two tungsten contact pieces at the top in electrical contact with the corresponding screws C. These contacts carry the main current to the battery and lamp circuit, and are arranged to operate at 1,100 revolutions per minute, at which speed the generator is furnishing enough current to overcome the battery voltage, and supply the lamps. When the speed of the car is such that the current generated by the dynamo is greater than required, the centrifugal declutching device, Fig. 2, comes into operation, disconnecting the machine from its driving shaft. It will readily be seen that the same action also disconnects the generator electrically from the battery circuit through the agency of the cut-in just described, so that there is no possibility of the battery discharging through the windings. In the declutching device, four weights are arranged on a spider formed of spring material carried positively by the pulley. Two of these, M M, are slightly heavier than the remaining couple NN. At rest, and on low speeds, all of them force together the clutch faces. When the speed, however, reaches 3,500 the arms M and N let go, the former before the latter, and allow the pulley to run free. The lamps are then supplied from the battery. It should be understood that this only takes place during the short periods when the car is "speeding" above its average rate.

Splitdorf—Has Field Regulation

The Splitdorf "Triplex" generator belongs to that class in which the main field is produced by a combination of permanent and electromagnets. Its general appearance and the arrangement of the coils is shown in Fig. 6. The construction follows the lines of the ordinary magneto with the exception that only two pairs of permanent magnets are placed over the pole pieces F, the third being replaced by an electromagnet E. This magnet has compound energizing coils C consisting of a long shunt winding and a small number of series turns, both being connected so as to augment the existing permanent magnet field. This is a rather important point. They are not differentially wound so that the effect of one coil can be made to neutralize that of the other. Besides the field windings proper there are two coils D wound on short cores bolted to the upper face of the pole pieces. Their function is to reduce the output of the generator at high speeds by causing, or tending to cause a reverse flow of the magnetic lines of the field through the armature. This peculiar action and the ingenious arrangement by which it is obtained without demagnetizing the field magnets will be made clear by reference to the flux diagrams, Fig. 1. The diagram on the left shows the normal state of the magnetic flux, when no current is passing round the coils. The other diagram shows the passage of the flux when the differential coils are energized in a direction to oppose the permanent magnetization. It will be seen that although a reversal has taken place in the direction of the lines passing through the armature, the original flux throughout the main portion of the magnet is unchanged, and therefore the magnets are not being demagnetized.

The regulating principle of the system, as shown in the outline diagram, Fig. 5, is as follows: When starting up, the permanent magnetic field is sufficient to generate a quick supply of current at the brushes, and through the shunt field coil. The main contact A then closes, connecting up the generator to the outer circuit, first passing through the few series turns of the main field. As the speed increases the contacts B are opened by a further pull on the armature G, Fig. 6, cutting out the shunt windings and reducing the main field to such an extent that the generator is virtually running as a permanent magnet machine. Any further increase of the speed of rotation, and the consequent tendency to oversupply is taken care of by the differential windings D, which decrease the field strength as explained above. The nature of the output is given in the curves, Fig. 4. It will be observed that over a speed of 1,500 revolutions per minute there is a surplus of roughly 1.5 amperes over the lamp load, passing into the battery The readings here shown were taken with a full lamp load of 8 amperes and a 100 ampere-hour battery floating on the line as in the diagram of wiring.

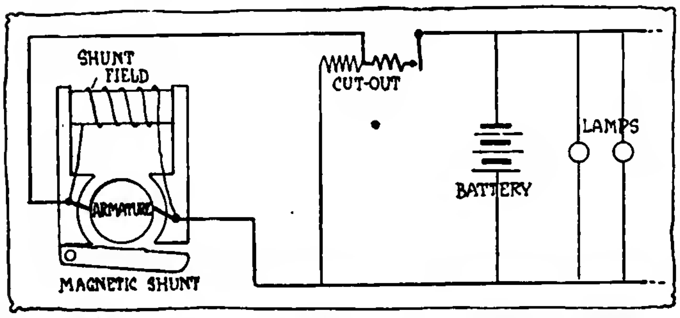

Fig. 8—Diagram of connections of Wells lighting system

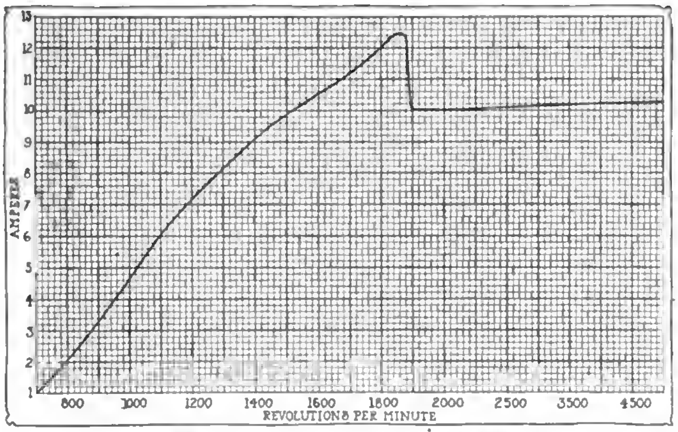

Fig. 9—Output curve of Wells generator

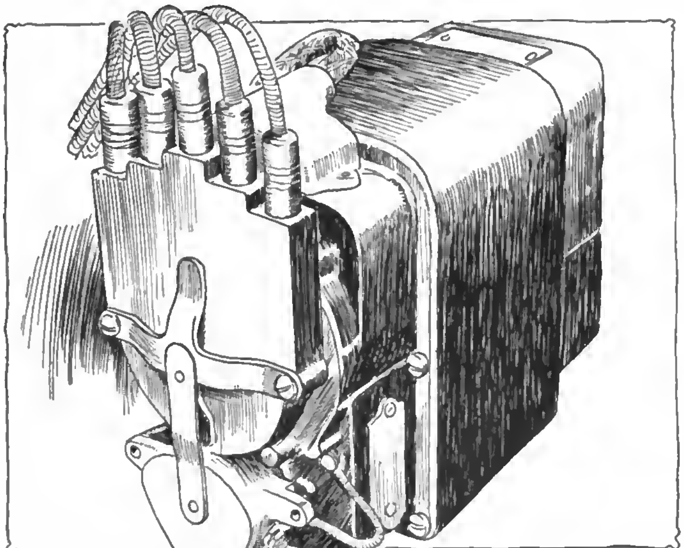

Fig. 10—View of Gould combined lighting and ignition generator

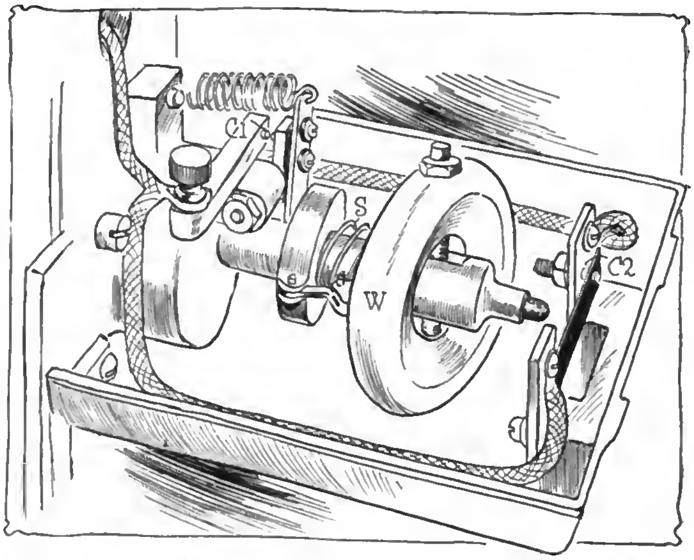

Fig. 11—Automatic cut-out and regulator on Vesta generator

The equipment comprises a fuse box containing a separate fuse for each lighting circuit, so that in the event of a possible short circuit the fuse of the particular line will blow out, eliminating the faulty circuit and preventing injury to the lamps. The fuse panel is designed to take the ordinary enclosed fuses and may be fitted in any convenient place, preferably on the dash under the hood. An ammeter is also included in the system. The dial is calibrated to show the amount of current being utilized for lighting and also the charging rate up to 20 amperes. On the discharge side of the scale readings can be taken up to 10 amperes.

The Splitdorf Company also manufactures a four-pole lighting dynamo of the electromagnetic type, with a cylindrical casing.

Gould—Employs Differential Windings

In the Gould system, current for both ignition and lighting is generated in a single unit, alternating current being delivered at one end of the armature and direct current for lighting at the other. Fig. 10 shows the external appearance of the dual machine, which is designed to run at engine speed. It will be noticed that the ignition end presents the characteristics of the ordinary magneto. The magnets are of the two-pole type in soft steel, but an unusual feature of their construction is that the core on which is mounted the field coils is made from hard steel. This is done so that there is always a sufficient amount of residual magnetism to ensure a prompt generation of current when starting up. It is not, however, enough to give the machine the operating characteristics of a permanent magnet generator.

The magnets are wound differentially, that is, there are two field coils, one being a shunt winding and the other a differential or bucking coil for the purpose of controlling the magnetizing power of the shunt coil. These are mounted on the hard steel core located horizontally above the armature. The pole pieces are made with extending lips in the direction of rotation in order to improve the commutation.

The armature, which runs on ball bearings, is of the drum type and carries two distinct windings, the first being connected to a collector ring from which alternating current is taken for ignition, and the second to a commutator at the other end of the shaft, furnishing direct current for the lighting and battery-charging circuit. Special care is taken to insure perfect insulation of the two windings. In a severe test the makers found that it was even possible to burn out one of the windings without impairing the function of the other.

The regulating devices of the Gould lighting system are contained in the upper half of the rectangular end cover at the commutator end. This half, being easily removable, permits a

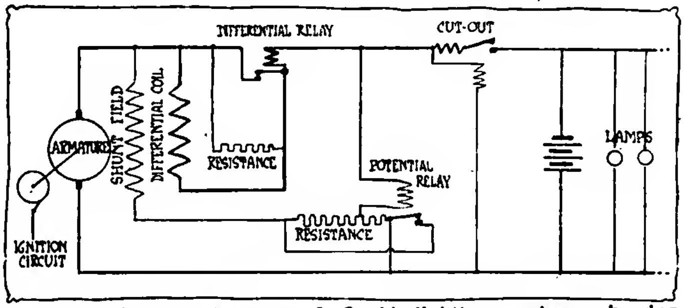

Fig. 15—Wiring diagram of Gould lighting system, showing the differential field winding and the use of a resistance to control the voltage

full inspection of the control parts as well as access to the brush gear. Fig. 16 shows the details of the regulator removed from the generator. Three magnetic control units A, B and C are arranged vertically within the cover. Located above them are two resistances of the enclosed type, D and E, which are used in connection with the regulation of the field coils. Each of the control units has a hinged armature; that of B normally rests in such a position that its contact points are open, while the armatures on A and C normally keep their respective contacts closed. Their action may be followed by referring to the diagram of wiring, Fig. 15, in which A is the differential relay, B the cut-out and C the potential relay. The two resistances represent D and E respectively. The operation of the system is as follows: When starting up from a condition of rest the current delivered at the brushes passes round the shunt field, augmenting the slight existing permanent magnetism of the field magnets. As the speed increases, current is generated at a sufficient voltage to actuate the cut-out through the fine winding shunted across the mains. This takes place at the comparatively low speed of 250 revolutions per minute, when the car is traveling approximately 7 miles an hour. The generator is then acting as a simple shunt machine, delivering current by way of the cut-out to the battery and lamps. At this time the differential field coil is not in circuit, being shorted by the closed contacts of the differential relay. But this device is so wound that when the full output is passing round its coil the armature lifts, opening the contacts and thus including the differential field winding in the main circuit. This weakens the power of the shunt field and holds the current output at a constant figure of 7 amperes on full load, as shown in the curve, Fig. 13, at all speeds above 550 revolutions per minute. The same figure also shows the constant voltage characteristic of the generator. This is accomplished at the higher speeds by alternately inserting and cutting out a resistance in the shunt field circuit, by means of the potential controlling device, as shown in the wiring diagram. In practice this action resolves itself into a constant vibration of the contact arm, but its effect is imperceptible in the lamps.

Wells—Uses Magnetic Shunt

A unique method of regulating the current supply is that incorporated in the Wells lighting generator shown in section, Fig. 7. The main field is produced by a shunt wound two polar magnet furnished with a single coil. Hinged to the base of one of the pole pieces is a magnetic shunt, B which normally is held away from the other pole by a pair of light springs. These springs are so proportioned that when the machine is tending to generate more current than is necessary the magnetic strength of the main field is such as to draw up the iron shunt and so permit a large portion of the magnetic flux to pass through it instead of the armature, thereby weakening the generating

Mixing Kerosene and Ether—Changing From Detachables to Demountables—Cost of Ether—Good Selling Territory—Gasoline Burns Quickly—Using Natural Gas—Speedometer Deranged—Cylinder Design—Beck Motor Criticised

Wants To Use Kerosene and Ether

EDITOR THE AUTOMOBILE:—What proportion of washed ether or any other kind could I use with kerosene oil for fuel purposes?

For starting on cold days I have used fifteen drops of ether to a pint of gasoline. In December last on a day when the temperature was 10 above zero, I started the engine on the second turn, using the above mixture. It was necessary to prime a second time, as the engine became so cold in standing in a shed over night the gasoline would not vaporize until the engine became warmed up. Now, this mixture of gasoline and ether I know will do the work; but what proportion of kerosene and ether will be required?

Is kerosene heavier than gasoline? What air adjustment of a Stromberg carbureter would be necessary? Also, approximate cost of correct mixture, kerosene and ether, should be used to insure satisfactory results?

I can bear out what the correspondent says in your January 16 issue, page 241, under the heading Engineer on Ether, only I used unwashed ether and he used washed ether. His was one-half gas and one-half ether.

Please state the difference between washed and unwashed ether.

Albany, N. Y. FRANK DEWITT BROWN.

—THE AUTOMOBILE has no record of anyone using a mixture of kerosene and ether for running, and it appears that the cost of ether and kerosene combined would be more than the cost of gasoline alone. Therefore, it would hardly pay to operate on a mixed fuel of this nature, as the trouble of mixing, combined with the high price, renders it impracticable.

Kerosene is heavier than gasoline. If you used a fuel of this nature you would probably need a wider jet opening and about the same air opening. Washed ether is the commercial product as distinguished from the chemically pure product. It generally contains a slight amount of water and minor impurities.

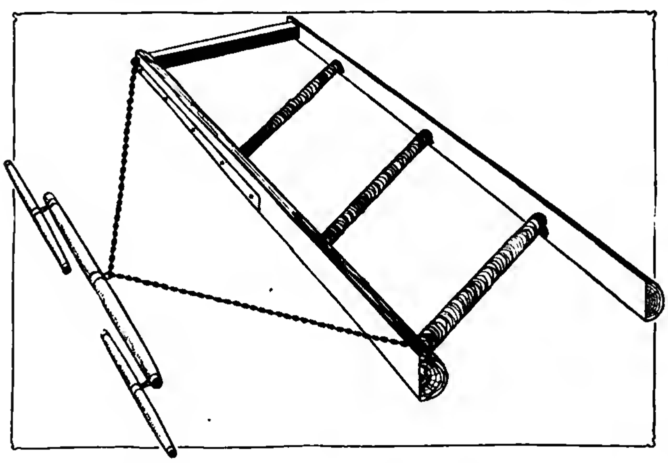

Fig. 1—Diagram of split-log drag, showing construction

Changing Over to Demountables

Editor THE AUTOMOBILE:—There is one subject which I have not noticed in the discussions in the Letters Answered and Discussed, which I think would interest a great many automobilists, and that is the advisability and cost of changing from the Q. D. to demountable rim, say in a 34 by 4-inch size.

What is the best method to use to prevent the sticking between the bead of an automobile tire and the Q. D. rims? It took me about 3 hours to remove two of my tires in preparing the car for its period of hibernation.

New York City, N. Y. T. D. MARTIN.

—There are many automobilists who are having this change made. The advantage, according to the views expressed by these people, is that it is possible to carry an extra tire, already on the rim and pumped to the proper pressure. This considerably lessens the time and trouble of a tire change on the road. The cost of making a change on the size you mention is $15 in the average case. The work required means sawing off the spokes for an inch and putting a new felloe band in place. It takes about 24 hours to get the job done.

If you will paint the rims with graphite paint you will prevent any tendency to stick. This sticking is due to rust, and can be prevented by using the paint, which is an effective rust preventive.

Use of Split Log Drag

Editor THE AUTOMOBILE:—I have before me a story on the split drag which you published some time ago. Would you tell me if the drag is of any use in heavy country?

2—Are there any axles which are composed of all roller or all ball bearings? I am referring to rear axles. Are both a necessity?

Richmond, Va. CHAS. KRUMP.

—The split drag is of practical use. In Fig. 1 is shown the form of the drag and Fig. 2 tells better than words what it can do.

2—The roller bearing axle is often fitted with a ball thrust as in Fig. 5, although the Timken axles use only taper rollers and other axles fitted with roller bearings capable of taking a thrust strain. All ball-bearing axles are common. One of this type is shown in Fig. 6.

Nearly Any Territory Good

Editor THE AUTOMOBILE:—Would you kindly tell me in what part of the country there is a good opening for a garage or sales agency? Also, what priced cars are favorites there, provided you know?

Akron, O. GILBERT E. WELLS.

—A study of the first seven pages of THE AUTOMOBILE for last week will show just where the cars are being used. A good medium-priced car can be sold in nearly any part of the country with success if the car is one that can be backed by a proof of good materials and service on the part of the factory. Any part of the United States where the roads are good and the touring season is open for the major part of the year would promise success if combined with businesslike methods of selling the cars. According to statistics prepared by THE AUTOMOBILE, there is one car for every forty-four people in one state, while in another there is but one car for 700 people. Figuring the other states on this basis, as on page 329 of the issue of January 30, and combining that information with the population of the state and the number of automobiles in use in the state might give you an idea as to where to start an agency.

Does Gasoline Explode?

Editor THE AUTOMOBILE:—As a reader of your magazine, I take the liberty of asking you a question regarding gasoline vapor. Does it explode in the combustion chamber or is it a rapid-burning substance?

Youngstown, O. LEO LINBERGER.

—Gasoline burns very rapidly. It is impossible to draw a line between an explosion and exceedingly rapid combustion. The mixture in the cylinders of an automobile motor may be put in the latter class, however.

Running on Natural Gas

Editor THE AUTOMOBILE:—1—Please state what changes should be made so that an ordinary 4 by 4.5 motor will run on natural gas for fuel. It is a four-cylinder motor fitted with a Shebler carbureter.

2—How many cubic inches of gas would such a motor use per hour under average load?

3—The cubical contents of a steel tank is 9,240 cubic inches. How many cubic inches of gas will this tank hold at 100 pounds pressure per square inch?

—4—Is distillate a practical fuel for automobile motors?

Mondoc, Ind. T. C. KABEL.

—1—No changes will have to be made in the engine. The carbureter should be removed, however, and a mixing valve which can be secured from Lunkenheimer or any other valve manufacturer put on.

2—This would depend on the revolutions per minute. Assuming that the engine has a volumetric efficiency of 100 per cent, the approximate number of cubic inches used per hour would be the number of revolutions per hour multiplied by the piston displacement and divided by 10.

3—About 62,857 cubic inches at atmospheric pressure could be put into the 9,240 cubic inch tank at a pressure of 100 pounds.

4—This has not as yet been determined.

Horsepower of the Hupmobile

Editor THE AUTOMOBILE:—We note that in your January 9 issue you quote the S. A. E. rating horsepower for the Hupmobile 32 as 16.90, while the company's claim is 32 horsepower. Does the 5.50-inch stroke give the engine more horsepower than a 5-inch stroke?

La Feria, Texas. B. H. DUNLAP.

—The S. A. E. rating of the Hupmobile 32 motor is undoubtedly low. The motor should readily develop 32 horsepower on the block. It must be remembered that the stroke factor is not directly considered in the S. A. E. rating. A motor of 5.5-inch stroke would develop more power than one with a 5-inch stroke at the same number of revolutions per minute.

Speedometer Out of Order

Editor THE AUTOMOBILE:—I cannot speed my car, which is a 36 "Special" Maxwell 1912, higher than 35 miles per hour. The compression is good; valves had been recently ground; carbureter works well; there is no skip in the ignition from a foul spark plug, and the engine does not heat up. In fact, the car runs better after I have driven it 20 miles or so. I have taken off the fan belt in order to get the engine hotter. I have a hot air tube from exhaust pipe to carbureter. The car picks up to 30 miles very quickly, but in order to reach the 35-mile-

Fig. 2—Top: A drag in use. The man driving stands on the drag and adds his weight to the weight of the latter to get a better effect

Right: This shows a stretch of the same road after the drag had passed over it. When aided by a good sun this road was hard enough to stand travel for some time without rutting

Left: A stretch of road before dragging. This road was covered with a soft clay mud to the depth of about 5 inches

These three illustrations show actual work on the roads of one of our Southern states. The road in this instance was composed of a soft dirt or clay which made an excellent roadbed in dry weather, but which became a morass almost at the first touch of rain. By the use of the drag the community was able to keep the roads in a fairly good condition even in the rainy season. In winter the ruts which froze solid prevented satisfactory touring through this particular section

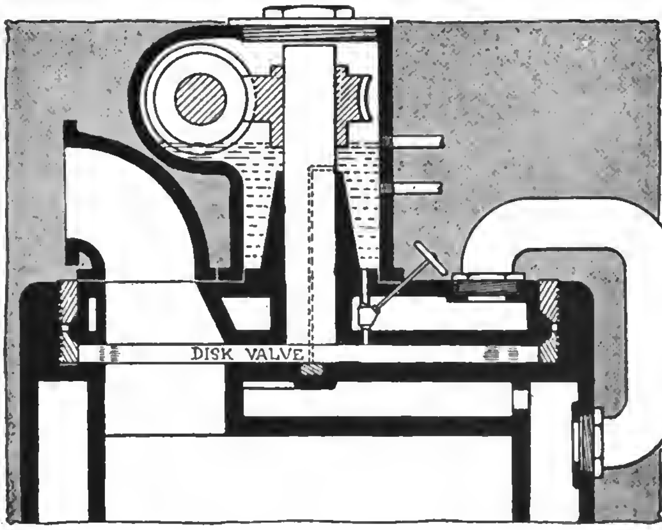

Fig. 3—Section through the disk valve of a Beck motor

an-hour mark the momentum of the car seems to be the greatest factor.

My own idea is that the gasoline which the oil companies are now putting out is inferior or that the gasoline does not vaporize enough. But this cannot be so, as the car works fine on any speed on any gear from 0 up to 30 miles.

It may be the speedometer, which I notice is somewhat worn in the small wheel member meshing with gear attached to wheel. It is rather difficult to tell in driving a car, as I have no chauffeur, whether I am going 30, 40 or 45 miles an hour except by the speedometer.

Albany, N. Y. FRANK DEWITT BROWN.

—You should replace the small gear on the speedometer. These are made softer than the large gear on the wheel so they will wear out first, making the replacement inexpensive. Where you have lost motion in the speedometer gearing it is impossible to tell how fast you are going. With the Maxwell "Special" you should be able to get up to 45 miles an hour without very much trouble. As a matter of fact, after you once start you can run faster on a low-grade fuel than you can on a high grade. There are more heat units in the fuel. Keep the radiator covered in cold weather and see that your carbureter gets plenty of air at high speeds.

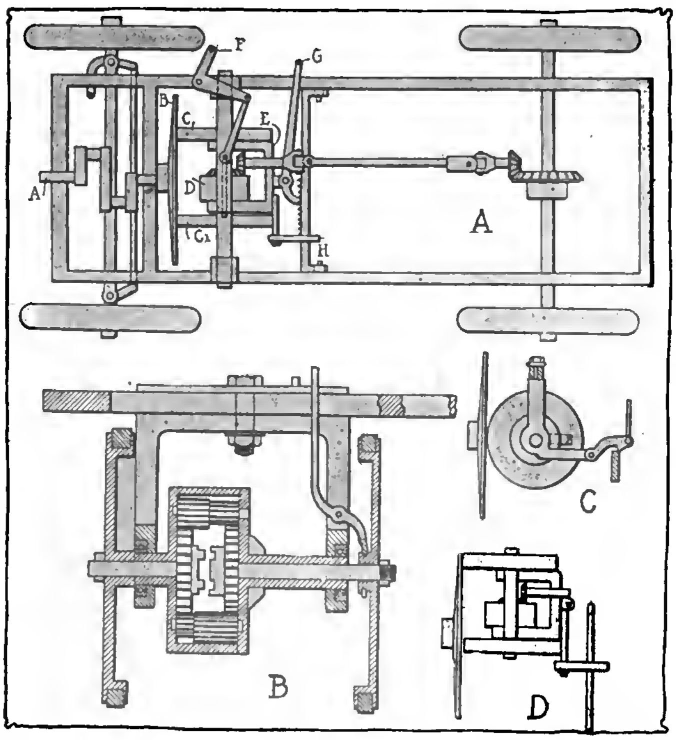

Fig. 4—The Trufant friction drive which has lately been invented

—

Get in Touch with Manufacturers

Editor THE AUTOMOBILE:—We have a Kelly 3-ton truck equipped with Frayer-Miller fan blower air-cooled motor. It is necessary that we change the power plant to water-cooled, and we wish to hear from engine manufacturers who have no doubt already furnished motors, and also from radiator manufacturers who could furnish either the dash type or the front type radiator.

Of course, we realize that we will have to make some changes in the chassis frame-work in front, and it is our idea to extend same sufficiently to carry the motor under a hood instead of under the seat, as at present. The present subframe for the engine is 19 inches in the clear, and, because of the steering gear and gearshift mechanism at the side, it will not be feasible to widen same over a couple of inches at most. Is this plan practical? E. C. JENKINS.

Cleveland, O.

—The scheme is practical, but when you take it up with the motor manufacturers you will no doubt find that it is expensive.

Questions of Cylinder Design

Editor THE AUTOMOBILE:—I am making drawings for an engine, bore 4.5 inches, stroke 8 inches, compression about 110 or 115 pounds. I would like to know if a .25-inch wall is thick enough to withstand the pressure. The casting being made of finest iron obtainable. I would also like to know if steel could not be used as well as iron for cylinders. Are there any advantages contained in iron which are absent in steel? What is considered the best angle for valve seats on a high speed gas engine?

New York City. F. A. KUPER.

A formula which applies in practice for the thickness of small bore cylinders is as follows:

$$t = D \div 30 + .125 \text{ inch.}$$

—In this formula t, is the thickness; D, the cylinder diameter, and .125 inch is added to make the cylinders thick enough for good shop practice. This would make the cylinder you are designing work out as follows:

$$t = 4.5 \div 30 + .125 \text{ inch} = .15 + .125 \text{ inch} = .275 \text{ inch.}$$

A thickness of .275 inch would be plenty, and .25 inch would probably suffice.

Steel castings are not successful in motor cylinders. Steel cut from solid blocks would be too expensive. Therefore steel is not used. The nearest to steel is semi-steel or vanadium iron.

A seat angle of 45 degrees is the most common for poppet valves.

Interested in Beck Motor

Editor THE AUTOMOBILE:—Being a reader of your paper and very much interested in your article on non-poppet valve engines, I would like to ask a few questions on the Beck motor.

In your article you state that the pressure is somewhat removed. Taking for granted that the disk is, say, .001 or .002 smaller than the ported faces, will not the pressure between the faces equal that of the cylinder? Or is it that the speed of a gas engine is so fast as not to allow the pressure to get in such a small space in such a short time?

Taking for granted again that the gases do get there, would they not ignite? Then if they ignite, would that cause a carbon deposit between the ported faces?

New York City. S. E. FAMSON.

—Referring to Fig. 3, which is a reproduction of that given in the issue of December 19, it will be seen that the pressure is only exposed to a small area and therefore the total pressure on the disk is relatively small. The amount of effort required to turn the disk is not at present known, as the motors are now in a more or less experimental stage.

Even if such an explosion occurred it would probably do no harm. The gases probably ignite at the point you mention, but as far as a carbon deposit is concerned it is doubtful if trouble will develop in that direction.

Has Invented Friction Drive

Editor THE AUTOMOBILE:—Not being familiar with any type of friction transmission as used on automobiles, excepting the Cartercar, Lambert, Metz and Patiel, will you kindly describe any other types there may be on the market? The reason I am asking is that I have a model of my own invention in which friction is applied differently and with more efficiency than the above-named.

Windsor, Mo. GEORGE P. JAMES.

—THE AUTOMOBILE has no further list of friction drives. There was one described in the issue of April 25, 1912. It is the invention of W. E. Trufant, who stated in part:

"It is well known that in the usual type of friction drive for automobiles there is difficulty in starting and in running at very slow speed because the velocity of the contacting friction surfaces is so slow. To overcome this, great pressure must be applied and the wear and strain are excessive. When the roll is in the high-speed position and the operator carelessly applies the same pressure as was necessary on low speed the strain, wear and loss of power are very great.

"To overcome all this and get almost unlimited power on the slowest speeds with little strain or wear of the parts two rolls are employed mounted on a yoke one on each side of the center of the disk with a differential gear between them and a bevel gear on the differential case to transmit power to the jackshaft or rear axle. In this construction, when the rolls are an equal distance from the center of the disk there will be a high velocity of the friction surfaces, but no movement transmitted to the differential case as the gears in case are idle because one roll rotates in one direction at the same speed that the other rotates in the opposite direction. Now if the yoke and rolls are moved a little to the right so that one roll will be farther from the center of the disk than the other, you will still have a high velocity of the friction surfaces and a forward movement will be transmitted to the differential case at a speed equal to one-half the difference in the speed of the rolls. When one roll is at the edge of the disk and the other near the center the speed will be nearly one-half the speed of the fastest running roll.

"The reverse is obtained by moving the yoke so that the roll at the left rotates faster than the other and so controls the direction of rotation of the differential case.

"To insure equal pressure on each roll the pressure is applied to the yoke at a point between the rolls, and the yoke is hung on a pivot.

"To get a higher speed forward than the differential motion will allow the differential is locked and one roll held out of contact with the disk.

"On account of the great power at low speeds this drive is particularly adapted to motor trucks.

"In Fig. 4 A is the engine shaft; B the friction disk; C and C1 the rolls; D the differential case, and E is the yoke which carries the rolls; F the lever to move the yoke and rolls along the face of the disk; G the lever to press the rolls against the disk, and H a latch to hold the left-hand roll away from the disk when the differential is locked.

"More of the details showing how simple the construction is are given in Figs B, C and D. As will be noticed in these figures all that is necessary to lock the differential is to move one of the rolls and its shaft axially until the differential gears, engage each other."

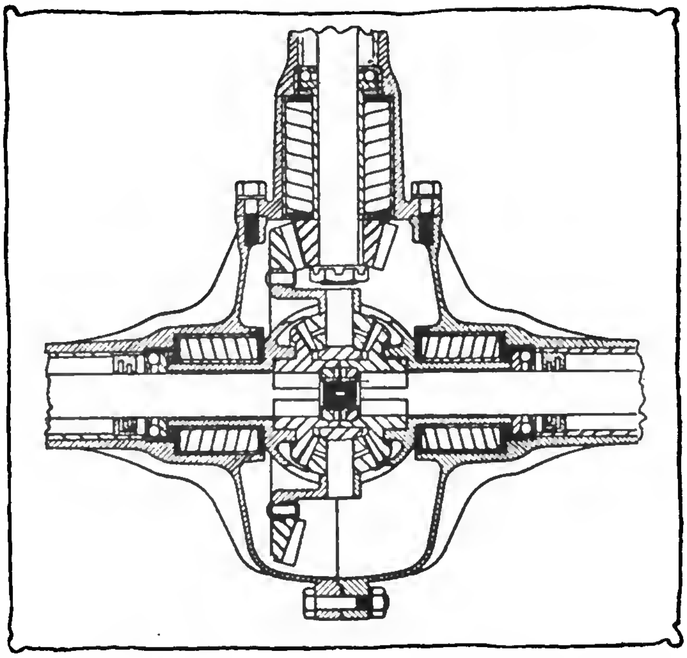

Fig. 5—Rear axle, using nothing but roller bearings with ball thrust

The Editor of this department is holding numerous letters signed Reader, Subscriber and by various initials which cannot be answered until the name of the sender be known. Owing to the large number of inquiries received many letters are answered by mail instead of through these columns; those of general interest being selected for the latter purpose. Anyone may receive a direct reply by mail by stating their desire and enclosing postage.

Cleaning Out Old Oil

Editor THE AUTOMOBILE:—I have a splash system for oiling my car. I have drained all oil from crankcase and desire to clean it thoroughly. Some oil will remain in bottom of crankcase where the over supply of oil goes. How can I clean with kerosene without removing lower half of crankcase, and how can I remove all the kerosene.

Anderson, Ind. W. W. ROGERS.

—You do not mention the name of the car you are using so no specific information can be given. Pour 3 quarts of kerosene through the breather pipe. Run motor for 15 seconds. Let stand 24 hours. Open drains in bottom of crankcase and pour in new lubricating oil.

Entering Wedges

TO the automobile manufacturer the New York shows of 2 weeks ago and the Chicago shows running this week have had a far-reaching value in that the maker has had an opportunity of gauging the public pulse on many of the innovations incorporated in 1913 models, whether these innovations are found in his own car or in those of his rivals. In a word, the maker knows better today where he stands than he did 3 weeks ago. This is a valuable asset. It is imperative to know where you stand, so that if on the right road you can push ahead and if on the wrong road you can retrace and start anew.

To be on the right road does not always mean to be most in accord with the imagined whims of the public, but rather to be on the road along which the saner public demands may be found. This is particularly apparent at the present show. To be explicit: In the matter of cranking motors there are several makers with certain types of cranking motors. which types are hopelessly in the minority so far as public inquiry is concerned. but who believe they are right and are convincing the public that their apparatus is as successful as the more popular types and has certain advantages in spite of some disadvantages. It is always a good balance wheel when some manufacturers have minds of their own and set out valiantly to set their principles graphically and sensibly before the public. More of this individual concern stamina is needed.

The desires of the buyers at Chicago are practically the same as those in New York. Years ago there was an apparent difference between the requirements of the two national shows. In those days the motor-buggy was a Chicago characteristic, the makers of these vehicles imagining that Western roads and Western people demanded such, but the end of them was quicker than the rise, and since those days the cars of Chicago are the same as those of the East, excepting for the larger following of foreign machines in the Eastern metropolis. Three years ago there were over a score of Central West manufacturers who did not show in New York, but presented their wares first at Chicago. Now this is largely changed so that less than a dozen concerns miss the New York show and make their annual bow at the Chicago exposition. On the other hand, there are only about the same number seen at New York who are not exhibiting this week in Chicago. This new order of things is but one more example of the nation-wide influence of the car, which has attained such enormous proportions during the past years, so that today, **whether a car is built in Iowa or Pennsylvania, it is known alike from coast to coast.** This holds true with the exception of half a dozen concerns who operate quite locally and confine themselves largely to special order work. During the last year there has been a steady elimination of those companies that have been entirely local in their operation.

From the general inquiries of the public at the metropolitan shows to date, interest centers around a score of car features. **Everybody wants electric lighting.** So general is the demand that where it is not stock the inquirer not infrequently walks away, a fact which is also true with respect to cranking motors. When cranking motors are inquired about the first questions are for the electric type, but if the concern makes a pneumatic or other type it is generally reported not to be a difficult problem to convince the prospect that the air or mechanical type gives entire satisfaction and generally the salesman does not fail to point out the disadvantages of the rival systems. **The general public generally fails to recognize the differences between the various types of electrics and in scores of cases seem to be as satisfied with one make as with another.** There has not been sufficient educational work on the pros and cons of electric starters.

Salesmen Need Education

It is imperative that foolhardy performances be avoided with electric starters, and in this respect those dealers who are showing how many hours their starter will run the motor continuously and how far the cranking motor will propel the car along the streets with a load of passengers, are working a great injury to the cranking motor business. They are themselves setting a bad example, an example which will be taken up by prospects and made imperative some months hence as a demonstration feature. **Nothing could be more absurd and unnecessary that these foolish performances and equally foolish arguments which the poorly-informed salesmen are putting forth.**

The cranking motor demands educated salesmen and unfortunately at New York City as well as at Chicago many of the salesmen were entirely ignorant of the real features of their equipments. About all they knew was how to operate the cranking motor and they generally were able to say how long it would keep the motor turning over and at what speeds, but they were absolutely inadequate to give that commonsense advice on the use of a cranking motor which the buying public is in such need of today. Cranking motors are here to stay and makers should prepare their salesmen to make the early operation of them as successful and cheap as possible. Unless rational caution is used there will be much battery trouble with many owners, because of the large initial current draw by the cranking motor.

Left Control Is Coming

There are more than a score of other entering wedges in addition to cranking motors and electric lighting: Left-hand location of steering wheels is one, yet it is quite an unsettled question with several makers to date. One of the leading Western distributors handling cars with right-hand wheels claims few if any inquiries for the left-hand wheel, whereas his rival with a right-hand wheel openly announces that he has lost several sales because of not having cars for sale fitted with the left-hand wheel. Like all other new questions there are two sides to it, and while it seems certain that the left-hand wheel is slowly on the gain it will be some time before several concerns adopt it. There are many arguments being cited pro and con on the wheel position and naturally drivers who have been used to the right-side wheel are strongly in favor of it. For city driving there is a more general demand for the left-side wheel, chiefly in large cities where the huge motor truck with its high body is coming into more general use and also where the closed type of passenger car is so general for winter use. Where chauffeurs drive cars the question of right or left-side wheel is not of so much importance.

Wire wheels are going to be a most important 1914 factor. They cannot come in numbers before that date because the makers cannot supply the demand. The old arguments that the public would not take to their appearance have been exploded as have also those of washing, etc.; and now the wise maker is putting forward those important arguments of greater tire wear, increased motor flexibility in driving the car and reduced stress on motor bearings.

The precipitation of carbureter interest brought about by the increased prices in gasoline will have a far-reaching effect before the 1914 models are announced. One leading car company getting but 12 miles per gallon at present has, with a new carbureter design, been able to average over 20 miles to the gallon. Similar reports come from many other concerns. Doubling the fuel mileage will not be general next season; this is too much of a jump and if it is apparently so easily obtained it would have been on hand before this. **There will be greater fuel economy next year, because of improved carbureters and more efficient motors.** The car makers must co-operate with the carbureter makers in bringing this about. Carbureter makers are getting away from moving parts, such as auxiliary air valves in several instances; they are also improving starting by the gasoline by-pass from the float chamber to the intake manifold above the throttle, thereby enabling the throttle being closed to start and insuring plenty of fuel through the bypass; and the general use of the hot-air horn, the shutter valve on the air intake and the hot water or air jacketing are most important.

Next year will witness more unit motor and gearbox construction than seen this season. In a few cases this will be at the expense of the unit rear axle and gearbox, because a few concerns with 1914 models at present on the road are contemplating such alterations. With left-hand steering wheel the unit motor and gearbox given ideal arrangements for center levers, a construction which eliminates cross shafts for these levers and keeps them entirely free from the body.

A few concerns, and they are pioneers and leaders, are going to use lighter pistons for 1914. Some are already placing orders for steel pistons and a few are working with magnalium. With steel the weight is cut from 4.5 or 5 pounds to 2.5 or 3 pounds, and this weight reduction shows almost unexpected increases in horsepower, the increases in some dynamometer tests being as high as 45 per cent. Those makers who are planning to use a few of these lighter reciprocating parts are going carefully and have had them under test for several months. The question of clearance is one of the big ones with both steel and magnalium and every caution is needed with either. The more the weight of reciprocating parts can be reduced the better, because vibration is cut down and possible motor speeds increased. **Last year's racing experience aided in showing the increased speeds possible with lighter pistons as well as how it assists in producing a smoother running vehicle.**

Increased Efficiency Now

With motor improvement by way of a more general use of block casting, longer strokes and higher piston speeds in lineal feet and higher crankshaft revolutions with consequent greater motor efficiency, there is a demand for improved lubrication. The adoption of forced feed to the bearings with pressures as high as 40 pounds is exhibiting in leading makes. More oil when needed at the various motor parts is essential because of higher explosive pressures with the higher crankshaft speeds, and not infrequently the reduced waterjacket space between cylinders in block casting makes the demand for more adequate oiling still greater. Foreign makers have discovered that the higher explosive pressures at high speeds call for higher oil pressure to the bearings. Racing has taught them this lesson, in which the oil pressure has been carried to beyond the 200-pound mark with a few makers, and with this really enormous pressure there has been a noticeable loose fitting of the bearings crankshaft, these being so loose as to practically pound on low speeds and idling.

A continuation of several other motor trends is promised in 1914: With six-cylinder motors the use of block and triple castings will increase, the makers already have their plans laid in these respects. Intake manifolds will be abbreviated where either the triple or block casting type is used. The seven-bearing crankshaft is being weighed very carefully by both European and American builders and the feeling is gaining ground that four **bearings of good length hold the oil film better in these high speed motors than seven shorter bearings.** In this same regard the three-bearing crankshaft for four-cylinder motors gives promise of displacing the five-bearing type. Not a few makers of six-cylinder motors with the long aluminum crankcase have noticed the weaving of the case up and down in the center. This weaving is naturally transmitted to the crankshaft and must impose a strain on it. With the shortening of motors this is being avoided, although some have worked against it with the heavier crankshaft. A few use metal other than aluminum for the top of the crankcase and another solution is casting the cylinders with top of the case integrally, a construction possible with block cylinders. When this is done the separate cylinder head receives attention, it having the merit of affording ready removal of carbon and also allowing the machining of the cylinder head in manufacture as well as making the boring and grinding of the cylinders an easier operation. Next season will witness progress in motor design along these various lines.

The movement started in Europe a few years ago for lighter rear axles is growing. Lighter rear axles means reduction in unsprung weight and consequently longer tire life. The moving of the gearbox from the axle to the motor is one means of accomplishing this and other means are by mounting the springs so that their weight is carried on the frame and not on the axle, and also the mounting of the differential on the car frame and using a combination stationary and live rear axle. The axle housings are being lightened by not a few makers, and there is a tendency to eliminate unnecessarily expensive axle constructions and use more standardized forms. The use of die-cast aluminum for differential housings in the axle has not yet made its appearance in America. Close in touch with improved rear axle design is that of underslinging the rear springs. Where either elliptic or three-quarter elliptic springs are used clipping them beneath the axle gives a lower body carriage.

The more general use of pressure feed for gasoline and the consequent mounting of gasoline tanks on the chassis in rear calls for adequate provisions for supporting the gasoline tanks and those concerns who have redesigned the frame side members to meet the new conditions are accomplishing the neatest jobs. The side members are in such cases curved downwards around the end of the tank providing a neat and most adequate support and one which eliminates the necessity of several additional parts. Some improvements must be made in filling arrangements for these tanks because of the growing practice of carrying the spare tires in the rear of the car. Where wire wheels are used this difficulty is increased. The new conditions will call for a change in position of the filler cap.

Death Takes I. A. Mekeel

Prominent Publisher Dies After an Illness of One Week—Was Connected With Several Prominent Trade Papers

Sterling Qualities of Self-Made Man Won the Esteem of All His Associates

I. A. MEKEEL, vice-president and treasurer of the Textile Publishing Co., publishers of the Dry Goods Economist, died at midnight on Sunday of this week at the East Orange, N. J., home of D. R. Caldwell, president of the Wells-Fargo Express Company. Mr. Mekeel had been stricken just a week previously on the afternoon of January 26 with indigestion so acute as to affect the heart, and had continued in such a condition that he could not be removed to his own home at 80 Upper Mountain avenue, Montclair, N. J. Towards the close of last week his condition showed decided improvement, but on Sunday, the 2d inst., he suffered a relapse and at midnight the end came.

Mr. Mekeel was born in Clinton, Ia., September 25, 1870, the son of George M. and Maria Haviland Mekeel. He was educated at the Friends' Academy at Union Springs, N. Y., and at the age of seventeen became a school teacher in the vicinity of that place. Two years later he removed to St. Louis and connected himself with a brother, the owner of *Mekeel's Weekly Stamp News,* a paper published in the interests of philately. He gave proof of the business ability which afterwards became so marked when, at the age of twenty-one, he went to Europe to effect the sale of rare stamps. Subsequently he became the owner of *Mekeel's Weekly,* which is now published in Boston and in which Mr. Mekeel was interested up to the time of his death.

Mr. Mekeel connected himself with the Textile Publishing Co., in 1900, as a solicitor on the Dry Goods Economist in the New York market. In about a year he was appointed one of the special representatives not only for the *Economist,* but also of its allied papers in the Root Newspaper Association. So successful was he in this work that in 1904 he was elected a director and secretary of the Textile Publishing Company and treasurer and general manager of the R. N. A.

His marked executive abilities and his power of constructive work were particularly displayed in his management of the first convention of the business and editorial staffs of the Root Newspaper Association papers, which was held in Cleveland, O., in June, 1906. This is but one of the many evidences of Mr. Mekeel's ability in creating greater co-operation and broader interchange of ideas among all the various R. N. A. interests.

On May 1, 1911, principally through the work of Mr.

Mekeel, there were brought together, under the name of the United Publishers' Corporation, a large number of prominent business papers, including the *Dry Goods Economist* and its allied publications in the Root Newspaper Association, also *The Iron Age, Iron Age-Hardware, The Metal Worker, The Building Age, The Automobile, The Motor Age, The Automobile Blue Book, The Auto Trade Directory* and *The Commercial Vehicle*. Of this parent corporation Mr. Mekeel became vice-president and treasurer.

He was also president of the Boot and Shoe Recorder Publishing Co. and the Atlantic Printing Co., Boston, and of the Mekeel-Severn-Wylie Co. He was vice-president of the David Williams Co. and of the McGraw Realty Co., and first vice-president of the Federal Printing Co. He was treasurer of the Root Securities Co., the Pacific Coast Publishing Co., the Tri-State Realty Co., and also of the Commercial Bulletin Co., Minneapolis and St. Paul He was also a director of the Dry Goods Reporter Co., Chicago, and of the Dixie Printing Co. and the Tradesmen's Publishing Co., St. Louis. He was a member of the Lotus and Engineers Clubs and of the Aldine Club.

Mr. Mekeel married on October 29, 1896, Elizabeth M. Schureman, a member of a prominent St. Louis family. He is survived by Mrs. Mekeel and three young sons, by his aged father and by his two brothers, of whom the younger, G. D. Mekeel is president of the Commercial Bulletin Co., publishers of the *Twin City Commercial Bulletin*.

Mr. Mekeel's sudden death, in the prime of life and when he seemed to be at the zenith of his powers, is sincerely mourned by a great number of business and social friends. He was well known in many centers other than New York and St. Louis, among these being Boston, Chicago, Minneapolis and St. Paul, and wherever known he was both admired and respected. Of splendid physique, highly attractive personality and apparently unbounded vigor and energy, he at once won all with whom he came into contact. His shrewd business sense, though always at his command, never warped nor unduly influenced his mental breadth or lessened his sterling qualities, derived from a Quaker ancestry. He was a magnificent example of the highest American type of the present day—full of life, of humor, of comradeship, and yet ever intent on the interests of the great business to which he had dedicated his career and in behalf of which he spent himself with all too great devotion and utmost self-sacrifice.

To his immediate associates his death is a shock whose force cannot be put into words, all the more so because hope of his recovery was high and until near the end there seemed no ground for serious alarm. His activity, his optimism, his sound yet prompt judgment, his invariable good humor and the dynamic force with which he put through important matters will be sadly missed. He was a twentieth-century man in every sense of the word. Had he been spared it is hard to say what heights of efficiency he would not have scaled.

But he was more than all this; he was honest, clean-minded, upright; he took no unfair advantage.

To all of his immediate business associates he was more than a fellow-worker. To have known him, to have worked with him, but to have had him as a friend is more. And it is as a friend, a loved and valued friend, that his associates most deeply mourn him.

Albany Legislature Busy

At Meeting of Club Representatives and Owners Opposition to Rigid Laws Shown—Need for Innovations

General Licensing of Automobile Operators Proposed and Opposed by Clubs

ALBANY, N. Y., Feb. 5—(*Special Telegram*)—At a meeting called in by the Secretary of State Mitchell May, to which automobile owners and representatives of clubs and associations were invited, a fairly general opposition to the changes proposed for the safety of the pedestrian public was expressed.

Secretary May, impressed by the insufficient protection given by the apparently effective Callan law, had called in the meeting to discuss the questions of general licensing of automobile operators, including owners and their family members, after an examination demonstrating that the individuals in question were fit to drive an automobile. This sane proposal, however, which has been successfully introduced in a number of European countries, was opposed by most of the automobilists present. While several owners remarked that it would be just to license owners and their sons, to forbid the driving of cars by people less than 21 years of age and such whose eyesight were bad, other owners were emphatic in stating that the present laws, not only of New York state, but also of other states were more than adequate.

A letter, addressed to Secretary May by the New York City Coroner, George P. Le Brun, which brings out some very interesting facts, follows, in extract:

There were 234 fatal accidents in New York City during 1912, being an increase of 40 per cent. over 1911. This increase indicates necessity amendments to the present law governing the operation of automobiles.

Of the 234 fatal cases, forty-three were caused by automobile trucks; five by taxicabs; three by hospital motor ambulances, leaving 182 by pleasure cars. As far as could be learned about twenty-five of these cars were operated by owners, and the balance, 157, by licensed chauffeurs.

Investigation into the cause of these accidents made by the Coroner's office revealed that 75 per cent. occurred at or near street corners, that the cars were going at from the rate of 25 to 50 miles an hour, and operated by experienced chauffeurs. Therefore, in my opinion, excessive speed in operating automobiles in the City of New York is the cause of the majority of accidents, and the fact that there seems to be no punishment for running over pedestrians; as of the 234 fatal cases, I am not aware of an operator being sent to jail, fined or punished in any way. This is well known among operators of cars, as in the majority of cases they are not even arrested. The records last year show but 30 per cent. of arrests in fatal cases. Naturally they become careless and disregard the rights of pedestrians. I believe the revocation of the license would be the means of making the operator of a car more careful, and the suspension of the car license for a stated period when it was operated by the owner, or when he was in the car with the chauffeur at the time the law was violated.

I would suggest another means to avoid accident and that is an ordinance prohibiting pedestrians from crossing busy streets other than at crossings.

All operators of cars should be licensed and no license issued without the applicant being examined as to his fitness to operate a car.

In every runover the police should notify the Secretary of State, who should have the power to suspend operators' licenses pending an investigation, and if after an investigation it is shown that the operator violated the law by excessive speeding or otherwise in causing the accident, the license should be forfeited.

As to speed limit in the City of New York, it should not exceed fifteen miles an hour.

The coroner's office has been vigorously opposed to the lax automobile law and the apparent inefficiency of previous legislation. The letter was provocative of much comment.

Blackman with Commercial Vehicle

Charles W. Blackman, who has been identified for several years with manufacturing enterprises of the automobile industry, has become connected with the *Commercial Vehicle*, and has accepted the post of general manager of that publication, which had formerly been held by Robert Wolfers. Besides the experience gained in the practical field of manufacture, Mr. Blackman has accumulated such as his long previous connection with automobile publication could bring him. Besides attending to the general management of the publication named above, Mr. Blackman will supervise the policy of the paper.

Four New Manufacturers at Detroit Exhibition

Forty-Two Makes of Pleasure Cars Totaling 300 Exhibits on View—Good Attendance

Philadelphia Closes Successful Pleasure Car Show—Will Now Show Trucks—56,000 See Buffalo Show

DETROIT, MICH., Feb. 3—Detroit's twelfth annual automobile show closed its doors on February 1, after having submitted to the people of Michigan a representative array of makes of pleasure cars, electric and commercial vehicles. In addition to the Wayne pavilion the large number of exhibitors made necessary the use of the Annex this year. This will probably remain one of the city's show buildings. It is 173 by 124 feet across Front street from the main building and gave the exhibit 10,000 more feet of floor space than could be boasted of in 1912.

Forty-two makes of pleasure cars were exhibited, each manufacturer showing several models, thus bringing the total number of show cars to something like 300. The show marks the entry of Detroit into the national show circuit, which now, in addition to Detroit, comprises eleven large cities. For this reason many of the exhbits were brought direct from the New York exhibition.

Four new cars made their first bow at the Detroit show. These were the Traveler pleasure car and the Hercules, Standard and Star commercials.

The Traveler is the product of the Traveler Motor Car Company, Detroit. It is an assembling proposition and features the Traveler-Detroit 36 at $1,080, fully equipped. The specifications include left-hand drive, center control; wheelbase, 120 inches; Beaver motor, 3 3-4 x 5; unit power plant; cylinders cast in pairs; multiple disk clutch; chrome nickel gears, selective sliding gear transmission; semi-elliptic springs, front and three-quarters elliptic rear; Timken axles, full floating rear axle; 34 x 4 Goodyear tires, non-skid all around; Bosch dual ignition; Gray & Davis lighting system; 18-gallon gasoline tank, and full electric equipment.

The Star truck is made by the Star Motor Car Company, of Ann Arbor, Mich., which has succeeded the Huron River Manufacturing Company, of Ann Arbor. Standard parts are used, the body being built at the factory on orders from the purchaser. This new Star line is made in two types, model A being a 1-ton proposition, while model B has a rated capacity of 1,500 pounds. Continental motors are used, the model A having a bore of 4 1-8 inches and a stroke of 5 1-4 inches. The other model has a motor of dimensions of 3 3-4 by 5 1-4 inches. The cylinders of the latter are cast in pairs while those of the former are monoblock-cast. For the type A chassis with 130 inches wheelbase, $1,800 is asked, while type B is priced at $1,200. The wheelbase of this model is 110 inches. The two machines are conventional in most respects and reflect standard practice as it applies to commercial car construction.

The Standard truck, made by the Standard Motor Truck Company, of Detroit, is in four lengths of wheelbase, twelve lengths of frame back of seat for loading space. Eight different gear ratios are available between motor and rear wheel, permitting gearing the truck to suit the services to which it is to be used. The chassis is a complete unit, including seat, to which any type of body may be attached. The short chassis has 10 feet wheelbase, the standard has 12 feet wheelbase, the long 14 feet, and the extra long 16 feet. The Standard chassis is $2,750 and the others $50 additional. The car has a four-cylinder Continental motor, L-head type, 4 1-2-inch bore, 5 1-2-inch stroke, and has 40 horsepower. It has a capacity of 3 tons and sells for $2,750.

The Hercules 1-ton truck, manufactured by the Alma Manufacturing Company, of Alma, Mich., is made in two types, one with engine under hood and the other with engine under seat. Following are some of the specifications for engine-under-hood type:

Loading capacity, 2,000 pounds; speed, maximum 15 miles per hour; Continental 30-horsepower motor, four-cylinder, L-head type; 3 3-4-inch bore, 5 1-4-inch stroke; carbureter, Schebler model L; ignition, Bosch magneto, set spark.

The price of this Hercules, including standard equipment and stake or express body, is $1.775.

Quakers Saw 80 Motor Trucks

PHILADELPHIA, PA., Jan. 31—Philadelphia's twelfth annual automobile show, conducted under the auspices of the Philadelphia Automobile Trade Association, came to a close tonight. Staged in the new mammoth garage of the Automobile Club of Philadelphia, Twenty-third and Market streets, the exhibition of gasoline and electric pleasure cars and commercial vehicles was the most successful, financially and socially, ever held in this city.

All told, some 300 cars were shown during the first week, which was devoted solely to pleasure cars, consisting of sixty-nine different makes. Part II, or the commercial vehicle section, which wound up the show tonight, consisted of about eighty motor trucks, the product of thirty-five manufacturers, the exhibits ranging in size from 500 pounds' capacity to 10 tons, and showing bodies adaptable to every conceivable form of transportation. Some were entire strangers to Philadelphians, notably the Velie, Blair and Smith-Milwaukee, which were not installed until Tuesday.

The commercial vehicle exhibit this week, together with the hold-over accessories dealers, occupied two floors. Although a representative display was presented when Part II opened on Monday, it was not until Tuesday that the show got under way and was filled with spectators.

Buffalo Show Successful

BUFFALO, N. Y., Feb. 4—With an average daily attendance of 8,000 people, Buffalo's eleventh annual motor show came to a close Saturday night. In point of sales and attendance the exhibition just closed proved the greatest in local automobile history. In fact local motorists say it would be hard to duplicate. Thursday night broke the record for attendance during the week. The night was "Society" night, and fully 12,000 people were present. The lowest attendance of the week was registered on the closing day when 5,000 were present. The door prize, an Empire touring car, was won by A. G. Mead.

Metropolitan Engineers Discuss Motor Testing

Various Types of Brake Testing Mechanism and Manograph Work Discussed Informally

Hugo Gibson Presents Paper on Manograph and Dwells on Its Operation—Montreal Show Closes

TWO papers were on the schedule for the January meeting of the metropolitan section of the Society of Automobile Engineers, held last Thursday evening. The first of these papers was by Herbert Chase, of the testing laboratory of the Automobile Club of America, entitled Motor and Carbureter Testing. The second was by Hugo Gibson on the Manograph. Both papers were illustrated by lantern slides and the discussion was taken by dictaphone.

A running discussion was carried on while Herbert Chase showed his slides on the various kinds of apparatus used in testing work. Slide 1 depicted the Brony brake and the rope form of brake. The principles of resistance upon which all brakes work was discussed. The rope brake was criticised owing to the fact that it had a marked tendency to seize and also because of the difficulty in regulating the load. The fan dynamometer was also shown on this slide and various methods of changing the load suggested. It was brought out, however, that owing to the difficulty in correctly calibrating for all conditions, inaccuracies were bound to creep in.

Slides 2 and 3 showed further particulars of the rope brake and water brake. The small size required for the absorption of a given amount of power is one of the advantages of the latter type of brake. The fourth slide showed the Garland brake, which has recently come into prominence for automobile motor testing. Briefly, this device works upon the principle of an increased load through the means of an increased electric field resistance due to the cutting of magnetic flux by copper. The brake is cooled by water without the use of any piping connections. At 3.5 amperes a load of 100 horsepower is held at 2,000 revolutions per minute.

The fifth slide showed the electric cradle type of brake. This was stated by Mr. Chase to be expensive but ideal. It is small for the amount of power consumed, it is accurate and can be used for the measurement of power of fractional loss.

The next series of curves touched upon the results secured by exhaust gas analysis. Mr. Chase stated that it was evident if both CO (carbon monoxide) and free oxygen were present in the exhaust gas that combustion had not been complete and that a percentage of the fuel was being thrown away in the exhaust instead of being of use for propelling the vehicle. The correct proportion of air to gas for forming a mixture which showed the best results as far as combustion went was stated to be in the neighborhood of 12.5 parts of air by weight to one of gasoline. The results in this case gave no carbon monoxide and a maximum of CO_2 (carbon dioxide). This meant that all the carbon on the charge had been burnt and the highest possible efficiency secured from the fuel.

The losses of heat in exhaust temperature and through the cooling water, it was stated, were unavoidable. It was shown that the losses through the cooling water on an average motor were about 30 per cent. of the total power in the fuel put into the motor. This could not be cut down with our present methods of cooling, Mr. Chase stated, and was to be expected.

Some typical manograph cards were thrown upon the screen. The effect of late and early ignition was noted. Some discussion regarding the waves often found in the expansion line ensued. It was the theory of some of the members that this was due to stratification of the charge. Others stated that they had noted the fluctuations in the curve whenever the motor was operated with too rich a mixture. Following the discussion on the manograph cards a description of the testing apparatus at the Automobile Club of America was given.

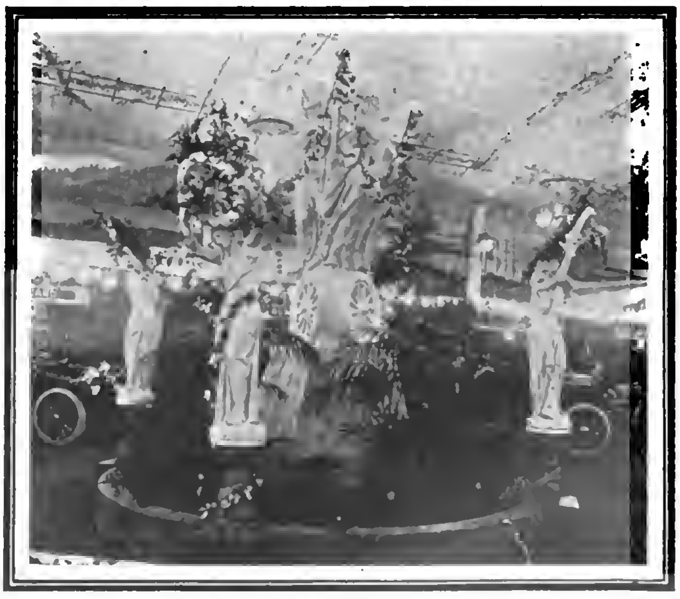
After a short recess Hugo Gibson's paper on the manograph was given. He spoke on the rapidity at which the beam of reflected light crossed over the ground glass. He spoke of the light weight of the moving parts in the manograph and the fact that there was no lag to the beam of light which was large enough to be appreciable. The total weight of the moving parts in the manograph as he used it measured 3.5 grams.

A discussion on the diaphragm showed that it generally lost some of its resiliency after it had been in use for some time. This necessitated a recalibration of the instrument in order to take care of the change in the diagram due to the change in resiliency of the diaphragm. It was brought out, however, that the change in the resiliency was so slight that the recalibration showed very little change over the former readings.

The necessity of using a pressure pipe at all was regretted by Mr. Gibson. He stated that a certain loss resulted which would not be the case if the diaphragm could be part of the cylinder wall. This was found to be impossible owing to heat and other conditions under which the diaphragm would be compelled to work. He also stated that the same manograph should be used for each cylinder where the diagrams were taken of a six-cylinder motor. If different manographs were used for each cylinder the curves would be on a different basis and would be hard to compare. For this reason he used a series of water-cooled cocks which could be employed to connect each cylinder with the manograph in turn. It was shown also in Mr. Gibson's discussion of the manograph that the arc light is a necessity; for, as he stated, the time of each exposure is only .000,004 second and the acetylene light is not powerful enough for this work.

Montreal Has 178 Exhibitors

MONTREAL, Feb. 2—The second automobile show was successfully brought to a close February 1. There were 178 automobiles and trucks in the exhibition. Of these, 124 were touring cars, and 51 delivery trucks. The total sales and prospective sales were much greater than ever before. Undoubtedly the show was a monster success from every point of view.



Part of the elaborate decorations of Detroit's Twelfth Annual Automobile Show

(*Continued from page 403.*)

cups with long tubes attached so that the cup can be accessibly mounted, the tube leading the grease or oil to the part to be lubricated. These improvements are generally on the higher-priced machines, those driven by chauffeurs, so that those driven by owners, are poorly provided for in this respect.

During the opening evening of the show one salesman in conversation with a group of prospectives was heard to remark, "We cannot get our owners to even fill the grease cups and we have to inspect many of our cars periodically to insure that they are cared for." A hurried glance at the chassis, which this salesman was representing, showed that not a solitary one of the rear axle grease cups could be reached without getting under the car and lying on your back on the ground. Is there any wonder that with such lack of accessibility that owners do not give attention to such parts? There is more injury done by failure to fill grease cups and give the parts supposed to be protected by them proper attention than there is by such parts wearing out.

At the exhibit space of another concern, which makes a speciality of having accessible grease cups, it was learned that grease cups on universal joints had to be taken off and new types of joints fitted, because the destruction of the joints was due to lack of attention rather than to normal wear. These are actual conditions, and although many salesmen remark, "They only have to be screwed down every 500 miles," yet the engineer says that they should receive attention after every century of running.

The difficulty of caring for rear axle grease cups has increased with the placing of gasoline tanks under the rear of the chassis, and still more so by carrying tire and demountable wheels on the rear, but in spite of these changes there has not, in scores of cases, been any attempt to add to the accessibility of these important parts of the car.

The use of flexible tubing in connection with grease cups is gaining more prominence, and by its use grease cups can be brought out to some accessible position. Much more can be done in this respect, and there is great need for it.

Several examples of accessibility of lubrication measures are seen and any cited herewith are cited merely as examples, and others could be cited as fulfilling the same requirements. The Haynes motor carries a large filler pipe with a funnel ending, which funnel is carried high up and well out, leaving it entirely accessible and yet not interfering with any of the other motor appurtenances. On the Packard the brake rocker shaft, carried in front of the rear axle, is lubricated by a grease cup carried back of the axle and fitted with a long tubular stem reaching to the rocker shaft bearing. On the Stevens-Duryea six a long vertical pipe is fitted to one of the rear axle brake oilers, solely to bring the oiler head to a position where it can be filled with entire ease. On the Peerless chassis is a similar provision. The Premier chassis uses a very large grease cup at the forward end of the torque tube and this grease cup inclines forward so as to be reached when the floor boards are raised. On the Cadillac the grease cup for the forward end of each rear spring is a long stem allowing the grease cup to hang much lower than the spring eye and so make it accessible from underneath the fender. On the White motors exceptionally large filler caps are used on the motor oil reservoirs so as to make filling easy. The fan and water pump shafts also carry large grease cups. On the Locomobile chassis the differential portion of the axle is entirely free from grease cups, which gets away entirely from the inaccessible feature.

An improvement that can be imitated to advantage is that of fitting leather boots for the steering connections between the cross tie rod and the steering knuckle parts and having the grease cups extend through these boots so that the screwing down or filling of these is not molested and is the same whether the boot is in place or not.

One of the most inaccessible grease cups is that on the clutch cone, and yet it is one that merits every attention. From factory representatives it was generally learned that it is frequently neglected, yet it is on a rapidly rotating part and should receive the major share of attention. The clutch thrust collar can be lubricated by a grease cup located on the outside of the chassis frame and connecting with the collar through a flexible tubing. This construction could be well imitated by not a few makers.

One of the most inaccessible grease cups is that on the forward end of the torque rod or torque tube, as the case may be. This location generally comes underneath the front seat, a point inaccessible when the forward floor boards are raised and nearly as inaccessible when the tonneau floor is raised. There is not any reason why a long flexible tube could not be connected to this grease cup and the cup placed to be reached from under the forward floor boards.

As soon as designers have decided on what type of generator they will use for electric lighting and what form of cranking motor will be used, it will be imperative for them to set about arranging the various motor appurtenances such as magneto, carbureter, water pump, electric generator, tire pump and cranking motor with some form of symmetry, and so get away from the mussed up appearances that so many carry today. Since the New York show the new Mitchell chassis has been cleaned up considerably in this respect, in that now the lighting generator is located at the right side of the gear-box and the cranking motor at the left side, both specially accessible by raising the floor boards. This arrangement, coupled with the use of a transverse shaft at the forward end of the motor driving the magneto at one end and the water pump at the other, gives one of the cleanest and most accessible outfits seen. It leaves both sides of the motor clean, the carbureter occupying one side and the other side having but the exhaust manifold.

The coming of wire wheels for this season and next will necessitate some changes in fender design, because the conventional falt-top fender, so well suitaed for the straight spoke artillery wood wheel, is not best suited for the wire wheel, when appearances are considered. The convex top lends itself more to the irregular shape of the wire wheel, particularly the coned appearance caused by the radiating spokes meeting the hub end.

Taft Opens Washington Show

WASHINGTON, D. C., Feb. 4—President Taft last night officially opened the Washington, D. C., automobile show by pressing a button at the White House that turned on lights in Convention Hall and unfurled a big flag. This is the first time in history a President of the United States has opened an automobile show. There are forty six exhibitors.

French Grand Prix May Be a Two-Day Event

On July 12 Will Be the Big Car Race Under the Fuel Limitation Rules of 14.1 Miles to the Gallon

Motorcycles and Cyclecars Will Feature the Second Day's Races With the Course Shortened to 12 Miles

PARIS, Jan. 24—It has been practically decided that the Grand Prix race at Amiens next July will be a 2-day event. On Saturday, July 12, there will be the big car race under the fuel limitation rules calling for 14.1 miles to the gallon, and on the following day a race will be held for motorcycles and cyclecars (machines with a cylinder capacity of not more than 67 cubic inches and a maximum weight of 672 pounds). For the small cars the course will be shortened to about 12 miles instead of 19, thus avoiding two of the right-angle turns which must necessarily be cut up after the passage of the high-speed racers. The same grandstands and pits will be used for both events and the cement surfaced hairpin turn in front of the grandstands will also be used by the motorcycles and sidecars.

Several of the French Grand Prix racers will go on the road next month. Delage has already completed the bench tests of his motors, the dimensions of which are 4 by 7 inches bore and stroke. These two cars will be driven by Bablot, the winner of the 3-liter race for Delage in 1910, and by Albert Guyot, who is scheduled to drive the record breaking six-cylinder Sunbeam at Indianapolis next May. Guyot has made arrangements by which he can drive in the American classics on the English car and get home in time to handle the French car on the Amiens course. Peugeot will have Boillot, Goux and Zuccarelli as their drivers. The new racing motors are well advanced, but all particulars of them are being kept secret. It is believed that their bore and stroke will approximate 4 by 7. Sunbeam is at present making experiments with two different types of motors, one set being of small size and running at a high speed, and the second set having a big cylinder area and running comparatively slowly. The Sunbeam drivers will be Victor Rigal, the winner in the 3-liter class at Dieppe last year; Darius Resta, Gustave Caillois, and W. Lee-Guinness, brother of the owner of the famous 200-horsepower Darracq of Florida fame. Christiaens will handle a six-cylinder Excelsior in the French race, this doubtless being the only six-cylinder car taking part. Champoiseau will be one of the Schneider drivers. No other drivers have yet been appointed. As several of the French cracks, among them Duray, Wagner and Hemery, are still without engagements, it is probable that they will be secured for the foreign cars entered in the race.

Seek to Offer Trophies at Indianapolis

INDIANAPOLIS, IND., Feb. 3—The management of the Indianapolis Motor Speedway is trying to arrange to offer the Remy Brassard, the Prest-O-Lite trophy and the Wheeler and Schebler cup in connection with the 500-mile race to be given at the local speedway, May 30. These would be given in addition to the cash prizes aggregating $50,000 which are to be hung up.

It is proposed that the Remy Brassard, which carries with it a weekly salary of $75 a week shall go to the driver making the best time for the first 100 miles; the Prest-O-Lite trophy, which is a brick of silver valued at $1,500 to the driver making the best time for the first 200 miles and that the $10,000 Wheeler and Schebler cup shall be given to the driver making the best time for 300 miles.

It is thought that the offering of these trophies might have the effect of forcing the National and Marmon companies into the race. The Prest-O-Lite trophy was won by Howard Wilcox driving a National and the Wheeler and Schebler cup by Ray Harroun, driving a Marmon. An effort is being made to find a suitable trophy to be hung up for the driver making the best time for 400 miles. Bob Burman has held the Remy Brassard most of the time since it was first offered, and he has already entered the coming race.

The management expects an excellent list of entries, many prominent firms stating that they will enter.

Chandler Motor Car Company Its Name

CHICAGO, Feb. 4—The Chandler six makes its debut during the Chicago show. It was not in the show proper but is being displayed in a private garage to agents who are looking into its merits. The Chandler six is the product of the newly formed Chandler Motor Car Company, which is made up of former officials of the Lozier company. During the New York show it was reported that the concern was to be known as the Emise Motor Car Company, and that it would build the Emise six. Instead of that, it is named in honor of F. C. Chandler, former vice-president and general manager of the Lozier Motor Company, now president of the Chandler company.

Other officials include C. A. Emise, former sales manager of the Lozier, as vice-president and sales manager; Samuel Regar, former Lozier treasurer, as treasurer; W. S. M. Mead, secretary; J. V. Whitbeck, engineer and J. R. Hall, superintendent. The company is capitalized at $250,000 and incorporated under the laws of Ohio. A definite location has not yet been secured but a Cleveland proposition is being considered.

Mr. Emise's resignation from the Lozier company has just gone into effect, and Mr. Chandler and Mr. Regar state they retired several months ago.

It is planned to turn out 2,000 cars the first year. The new model is to list under $2,000 and its specifications include a six-cylinder motor, 3 3-8 by 5 inches, of the L-head type and cast in two blocks. The camshaft, pump and magneto are driven by inclosed silent chains and the valves are inclosed. A Bosch high-tension magneto is used and the cooling is by centrifugal pump, a square-tube radiator being fitted. A Westinghouse electric self-starter and lighting system are used. The clutch is a multiple disk and the gearset three-speed selective in unit with the motor and clutch. There is a floating rear axle, double internal expanding brakes, three-quarter elliptic rear springs, 34 by 4-inch wheels, left side drive and center control, while the car is fully equipped.

A view towards northeast corner of Coliseum

Floating Types Dominate Axle Field

Few Alterations of Any Consequence Made in the Rear Axles Offered to the Car Builder This Year—Quest for Silent-Running Gears

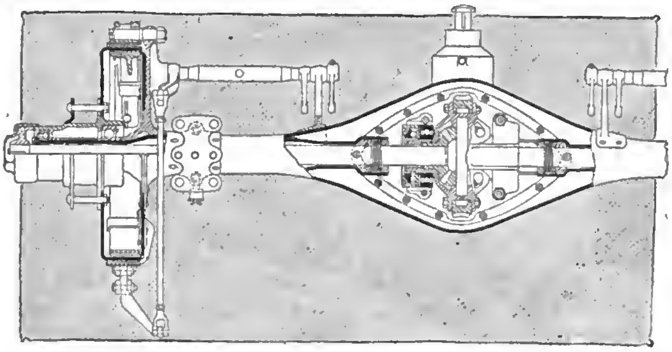

Fig. 1—Showing the general construction of the American worm-drive axle. In the design here shown the worm is carried below the wheel

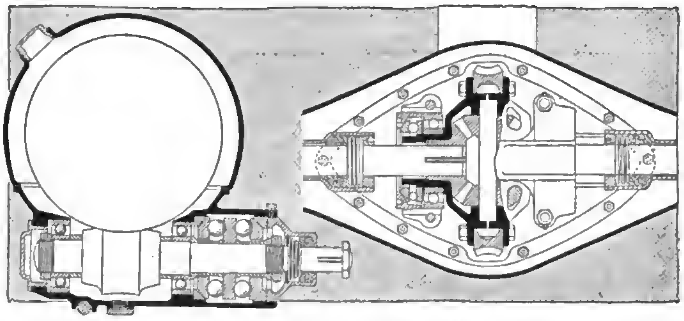

Fig. 2—Details of the mounting of the gears and differential of American Ball Bearing Company's underneath worm-drive axle

AXLE design and construction has been developed to such a degree that this part of the automobile now admits of but very little variation from year to year. Accordingly, in looking over the profusion of designs offered to the motor car manufacturer this year, we see but slight changes, if any at all, from that practice which is now regarded as standard. Nor should we look for radical alterations in products such as this which have gone through such a long process of evolution.

Here and there a manufacturer has added another size or two or another type to fill up gaps in his line, while several others have brought out worm-driven types in anticipation of a demand for them in the near future. Not a few of these makers believe that the public will soon demand worm drives just as it has dictated other changes.

Axle makers as a whole have sought to produce silent running gears, and methods of gear manufacture have necessarily been improved therefor. Pressed steel housings are well nigh universal now in pleasure car axles, these housings being made strong enough so that truss rods have been quite generally discarded. Changes if any have been in the nature of minor refinements, generally not coming to light except on close inspection. Oil packing rings tending to prevent oil leaking, adjustment features, and so on, have in some instances been slightly modified. Metals used for the manufacture of certain parts have in some instances been altered in composition. In other cases entirely different metals are now used for some of the parts.

Floating types are in evidence in nearly every pleasure car axle maker's list, although the semi-floating designs still hold their own for small car installations. Strictly speaking, the majority of floating axles really involve a feature of the semi-floating class in that their driving shafts bolt directly to the wheels through flanges or plates which are integral with the axle shafts.

American—Besides its bevel gear rear axles, which are of the floating type, the American Ball Bearing Company is manufacturing a floating worm-driven rear axle for gasoline pleasure cars, commercial cars and electric vehicles. This axle embodies the Lanchester-Daimler type of worm gear mechanism, the worm being of the hourglass type and partially embracing the circumference of the worm wheel. Considerable difference of opinion exists among automobile engineers as to the relative advantages of mounting the worm above or below the axle and for this reason the American company constructs these axles with the worm in either position.

Drawings showing the construction of this axle for pleasure car work with the worm below are reproduced in Figs. 1 and 2, the details of the mounting of the gears and of the differential are shown in Fig. 2. The housing is of pressed steel, 3-16 inch thick, while the entire driving mechanism, including the worm and worm wheel, together with the differential and all necessary bearings, is mounted on the gear carrier and inserted in the axle as a unit. This construction is also true of the bevel gear axles of this make. The drive shafts and the differential are carried on large annular ball bearings, while ample provision is made for end thrust through the use of thrust bearings at either side of the differential cage. The worm is carried on two annular ball bearings and it is also provided with a double thrust bearing. Provision for oiling is made through the tap hole at the top of the housing. To prevent oil leakage out of the housing, packing rings are fitted. These are held tight against the shoulders of the housing by springs, the tension in which may be adjusted by the nuts shown. The hubs, which are mounted on annulars, are driven through plates on the axle shafts.

Double internal, or external and internal, brakes are supplied. The axle tubes are riveted into the ends of the housing, and like the differential bevel gears are constructed of 3½ percent nickel steel. Drive and axle shafts are made of chrome vanadium steel. Hubs are cast steel, while brake drums and flanges are sheet steel.

Driggs-Seabury—The Driggs-Seabury Ordinance Corporation makes two designs of floating pleasure car rear axles in addition to its front axles. These rear axles consist of a type for cars weighing from 2500 to 3500 pounds and another for vehicles between the weights of 2700 and 3400 pounds. The first is constructed with driving flanges integral with the axle shafts. The housing of the differential gears and bevels is integral with the tubes which inclose the axle shafts, it being made of hydraulically pressed steel. A strong construction is obtained by the re-enforcing of the ends of the axle tubes by wrought steel members which carry the spring seats and the load. The differential unit and its cage are assembled within the housing through a suitable opening at the front, it then being securely fastened in place. At the rear there is a similar opening through which the differential mechanism and driving gears, together with bearings, may be removed without the dismounting of the rear wheels, the axle shafts being the only other portion of the axle which must be disturbed. With this type of axle, a torsion tube is provided which houses the propeller shaft. Throughout the axle suitable annular ball bearings and ball thrust bearings are used. The 2700 to 3400 pound design differs somewhat from the type mentioned above. The jaw clutches on the ends of the axle shafts are not secured to the hub flanges, while double row ball bearings carry the wheels. Throughout this design, double row annulars are used in place of the single row construction of the other type.

All brake operating rods and levers are located within the overall length of the axle, so that brake connections may all be made within the chassis frame. The operative parts of the brakes can be arranged along their shafts in practically any desired positions to meet the demands of any particular car design.

Hess—The Hess Spring and Axle Company's standard bevel gear drive rear axles are constructed in two sizes, a heavy type and one of lighter design. These are of the floating variety, the axle tubes being integrally constructed with the housings which inclose the differential and driving units. The wheel carriers of model 211 are constructed of nickel steel. Housings are strongly constructed of pressed steel, and the design is such that no truss rod is necessary for cars up to 4500 pounds empty weight. An opening at the rear permits of easy access to all internal mechanism. In this plate there is a tapped hole through which grease may be put into the gearing and bearings. In assembling the axle, the power transmitting unit containing the differential carrier and the pinion is put in through a suitable opening at the front of the housing. The entire driving unit, which is completely assembled before being put in the housing, is carried in hangers, which are integral with the front plate covering the front opening. The light type model 112 axle is especially adapted to electrics and to cars weighing empty up to 2750 pounds. The same general design characteristics hold for this axle as for model 211, except that the axle shafts have integral flanges which bolt to the hubs and that the wheel carriers and housing are pressed out integrally.

Fig. 3 gives an idea of the details of the worm-driven axle which is being produced by the Hess concern in addition to its bevel gear types. This is of the overhead worm design, and a notable feature is the construction of the pressed steel housing, which is so made that a liberal quantity of oil can be carried within it without any escaping. The worm used is of the straight type, better known as the David-Brown type, produced for the Hess Company by Brown & Sharpe. The housing will carry cars up to 4000 pounds empty weight without truss rods. The same general features are embodied in these worm axles as are used in the bevel types, and they are furnished with gear ratios ranging from 3 to 5 to 1.

Lewis—The Lewis Spring & Axle Company is on the market with a floating type of rear axle which is constructed of rolled steel in two halves, which are welded together. The axle tubes are an integral part of the differential housing. Like several other designs, the Lewis axle has its differential gears, bevel pinion and driving mechanism, together with bearings carrying these parts, mounted on a carrier on which all adjustments are provided. Thus if necessary to remove the entire assembly, the adjustments need not be disturbed. The gear carrier is made of cast steel, while the shafts and gears are constructed of heat treated 3 1-2 per cent. nickel steel. The tubes carrying the wheels are separate from the main housing and are carried back to within an inch of the differential cage. These reinforcing tubes are carried on plates and welded to the main housing so that the complete construction is practically a one-piece design.

McCue—The McCue Company offers a complete line of rear axles to meet the requirements of all weights of cars. There are six types of these McCues, one of which, model 7XW, is shown in Fig. 5. This particular type is equipped for wire wheels, the McCue company making a specialty of wire wheel constructions. In addition to the design here shown, the list includes models 6X, 9X, 29X, 17X and 19X, all of which are of the floating type, bevel geared. The axle housings are made of steel in one-piece construction, the metal tapering in thickness from 3-16 inch at the center to 5-16 inch at the ends. The shape of the housing is such that it is a truss within itself, no rods being employed. The wheel bearings are of ample sized annular type, mounted in the center of the wheel hub so as to be in direct line of the force. Driving flanges are fastened to the hubs by six 9-16 inch bolts each. Brakes are both expanding as shown in the figure. The drum diameters of this 7XW type are 10 inches for the emergency and 14 inches for the service brake. Spring seats are made adjustable from 35 to 42 inches center to center. Driving gears and differential mechanism are carried in a unit, bolting to the housing through flange at the forward end. Any of these McCue models is furnished to take either wire or wood wheels.

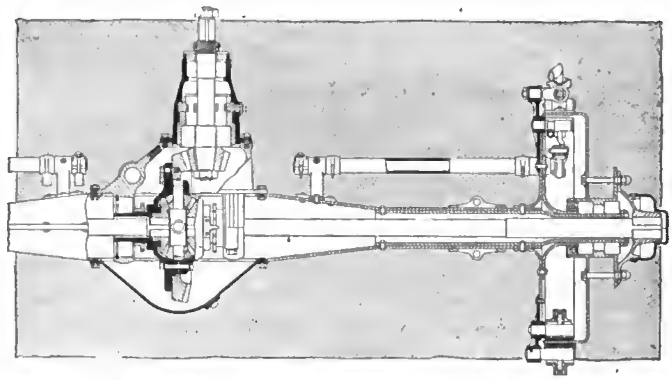

Fig. 4—The Metal Products Company's style 18 bevel-gear rear axle. The housing is made in two halves, riveted together along truss flanges

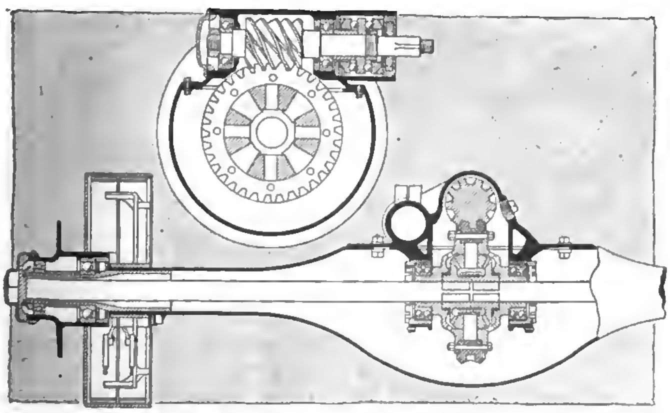

Fig. 3—Hess overhead worm-drive axle, showing the details of the worm and gear mounting on annular and thrust ball bearings

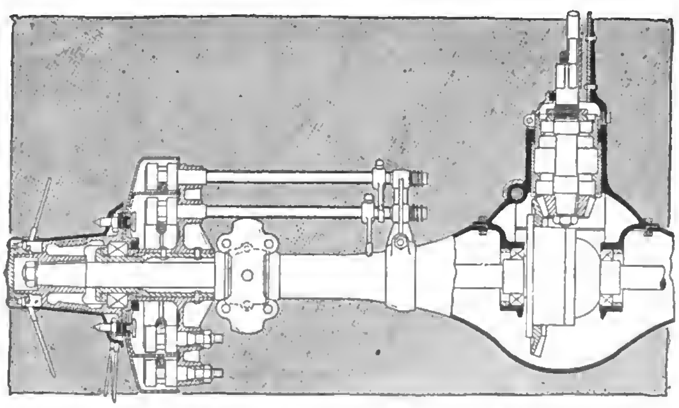

Fig. 5—The McCue Company's model 7XW rear axle of the floating type. This design is shown fitted for wire wheels of the McCue make

Metal Products—The Metal Products Company manufactures two sizes of rear axles of the floating type. These have pressed steel housings, and one of them, style 18, is shown in Fig. 4. The designs of the two are similar, the difference being principally in the load carrying capacity. The lighter type is designed for cars weighing from 2,800 to 3,100 pounds, while the heavier carries vehicles weighing from 3,500 to 3,800 pounds. The housing which integrally inclosed the driving axles as well as the differential and driving gear mechanism is constructed longitudinally in two halves which are riveted together along their edges, forming webs which act as strengthening elements. The usual mounting of driving gears and differential in a hanger removable from the front is present, while an opening at the rear is also provided. The Hudson, Chalmers & Woods electric concerns receive practically the entire output of this plant.

Merchant and Evans—The Evans transmission jackshaft for commercials is manufactured in two sizes, the medium design for vehicles equipped with engines up to 40 horsepower, four-cylinder, 4 3-4 inch bore, and the large type for cars carrying power plants up to 60 horsepower, four-cylinder, 5 1-2 inch bore. The design of the two sizes is practically the same. The differential and driving gear mechanism are made accessible from the top, a cover plate bolting in place and forming a portion of the upper half of the housing. Wheel bearings are double row annulars, while suitable annular ball and thrust ball bearings carry the various shafts throughout. There are three forward speeds provided with this assembly. Second and third speeds are direct.

Muncie—The Muncie Gear Works standard types of jackshafts for commercial cars range in size from the small model for light delivery wagons to carry from 500 to 1,500 pounds to the type for trucks to carry 2,000 to 2,500 pounds with a 30 to 35 horsepower motor. These jackshafts also vary in that some of them are designed to carry gear boxes bolted to them while others do not provide for the unit attachment of the gearset. Fig. 6 shows a model 503 outfit with unit transmission on gearset, giving an idea of the method of bolting the latter to the axle housing through flanges. This design is intended for trucks carrying from 1,000 to 1,500 pounds and equipped with power plants ranging in horsepower from 15 to 20. Annular ball bearings and thrust bearings are used for the differential and driving mechanism, while the sprocket ends of the driving shafts are mounted on Hyatt roller bearings, which are a spiral type, as shown. The jackshaft is geared 3.2 to 1. Gears have a pitch of 5, while the differential gears have 8 to 10 pitch. The frame hangers are adjustable as to distance from center to center within the range of 30 to 36 inches. The transmission provided two forward speeds and reverse, the high speed being direct. This jackshaft is typical of Muncie design.

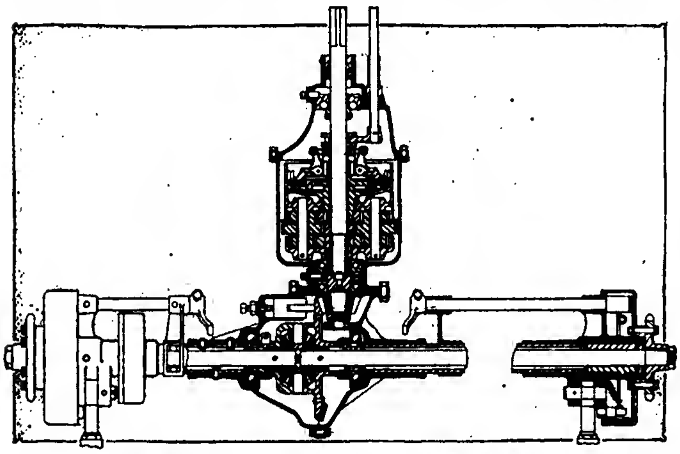

Fig. 6—The Muncie Gear Works' unit gearset and jackshaft for trucks of from 1.000 to 1,500 pounds. The axle shafts are carried on roller bearings

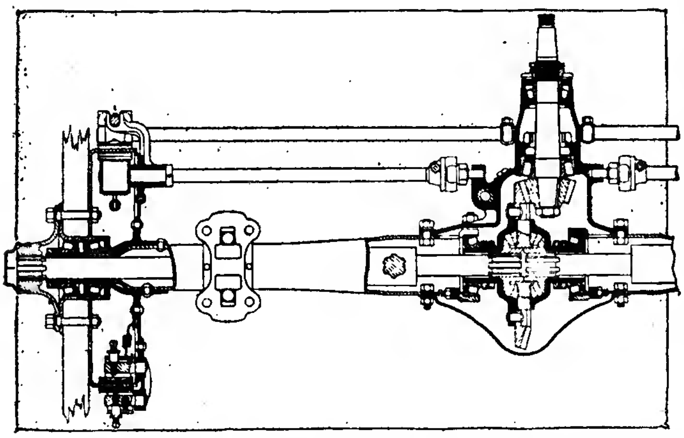

Fig. 7—A Timken-Detroit type of floating rear axle for cars of approximately 2,700 pounds total weight. Note the double roller bearings carrying wheels

Sheldon—In addition to its truck axle equipments, consisting of jackshafts with and without the gear boxes in unit and dead rear axles, the Sheldon Axle Company makes pleasure front and rear axles. With the latter we are specially interested here. A typical Sheldon rear pleasure car construction is the type 201-D, which is a three-quarter floating variety, with torque tube inclosing the propeller shaft and fastening to the differential housing at its front end. This model is for cars weighing not over 2,700 pounds empty. The axle shafts are constructed of nickel steel and have the driving flanges fixed to their ends, which flanges bolt to the wheels. The propeller shaft is also of nickel steel and is mounted on annular ball bearings at its forward end and at the pinion end. The differential is carried on Hyatt roller bearings in combination with straight ball thrust bearings on either side. The differential is so mounted as to be adjustable. The driving pinion, ring gear and pinions are all made of heat-treated nickel steel. The differential unit complete may be removed by taking off four nuts holding the differential bearing caps and taking out the axle shafts. The axle tubes are not internally constructed with the differential housing but are separate pieces which rivet to the housing. This may also be said of the propeller shaft tube. Brake drums are of pressed steel 14 inches in diameter. Brake levers may be optionally located at the drums or inside the frame.

A notable feature of Sheldon construction this year is that the hubs of all axles are made so as to take any make of standard annular bearings interchangeably, or any standard roller bearings in annular series.

The Sheldon company has also brought out a new worm driven axle employing an imported worm of the overhead type. The details of this new axle are not forthcoming at this time.

A. O. Smith—Besides producing pressed steel frames, clutches, steel stampings and various forgings for motor cars and trucks, the A. O. Smith company also makes axles front and rear, for pleasure cars and trucks. The pleasure car types are made in three sizes, model 4 for cars weighing up to 3,000 pounds, model 5 for those up to 4,000 pounds, and model 6 for heavy types having a maximum weight of 5,000 pounds. The rear designs are built on the unit principle, embodying simplicity and ease of adjustment. The housing used is of pressed steel of the integral truss type, the truss webs extending along the top and bottom. The ends are re-enforced by long swaged tubes, the outer ends of which form the bearing sleeves. These in turn are bridged across by the brake supports. These axles are equipped throughout with Whitney roller bearings, which are now manufactured by the Smith concern. There is the usual opening at the rear for inspection and adjustment of the gearing. The spring centers are variable within limits. External and internal brakes are supplied, and for model 4, the drum diameter is 14 inches. The other two models have 16 inch drums.

Salisbury—The Salisbury Wheel and Manufacturing Company manufactures floating rear axles which have pressed steel housings, the axle tubes being integrally formed with the housing for the gears and driving mechanism. The usual construction having the differential driving pinion, together with the necessary bearings in one unit, obtain in this construction, the entire unit bolting to the front of the housing through an integral flange, the extension of which forms the bearings for the differential and its parts. The driving shafts drive the wheels through clutches. Annular ball bearings are used throughout the construction, one single-row annular being mounted directly under the vertical center line of the spokes of each wheel, while suitable annulars carry the differential on either side. Ball thrust bearings take care of the end thrust. The brakes are in two sets, service and emergency, both internal expanding, and they are concentric. In connection with this axle a triangular torque rod is used, the mounting for the rear end of this being integral with the outer flange of the differential carrier.

Stutz—The Stutz Auto Parts Company is the maker of a transmission and rear system which consists of a rear axle, gearset, propeller shaft and torque tube in unit. The transmission gearset housing is of cast aluminum, while the greater part of the driving and differential housing is made in a single unit. New Departure ball bearings are used throughout the construction of the gearset and the driving gear unit, while the propeller shaft is mounted on Hyatt roller bearings. These unit systems are constructed in two sizes, the smaller for cars under 25 horsepower, and the larger for those ranging from 25 to 40 horsepower. The gears are of the bevel type.

Timken—The Timken-Detroit Axle Company's line is most complete for all types of vehicles, both pleasure and commercial. It includes both front and rear types. A typical pleasure car design is that shown in Fig. 7. This is a floating type for cars weighing completely equipped, less passengers, approximately 2,700 pounds. Special features embody a continuous pressed steel housing, with its ends swaged and ground for the bearings. The oil retainer tubes are welded into position and extend in close to the differential. The carrier embodies the complete power plant with all gears, bearings and differential integral. The drive shafts are of nickel chrome steel, both ends being six-splined to received the end flanges which bolt to the wheels. Timken adjustable roller bearings, which are combination thrust and annular types, are used throughout the construction. Each wheel is carried on two bearings, while one is placed on either side of the differential mechanism, one just back of the driving pinion and another at the end of the pinion shaft, where it connects to the propeller shaft proper. The rear cover plate is of pressed steel and provided with filling and oil level plugs. The brake drums are of pressed steel, 14 inches in diameter on the No. 5220 shown in Fig. 7. All operating parts of the brakes are provided with anti-rattling devices, while both brake levers are brought in to the center with standard construction. Option of levers at drums may be had. All gears are drop-forged. hardened and ground with the idea of making them as silent as possible. Gear ratios are from 2 13-21 to 1 to 3 13-14 to 1.

Torbensen—The Torbensen Gear and Axle Company manufactures internal gear drive truck axles, the design of which is radically different from that of conventional American rear axle practice. No changes in the product have been made within the past year, the line consisting of three models, viz., model R for vehicles of about 3-4 ton capacity, model R-1 for those of 1 ton capacity and model S for cars of from 1 1-2 to 2 tons capacity. These capacities refer to the loads. In the Torbensen design there are really two axles, one a solid continuous member of the dead type for carrying the load, and the other, placed just behind it, a driving member of the live type, which turns the wheels through pinions and internal spur gears Fig. 8 gives an idea of the design of the type S. The wheels are mounted on the ends of the dead member, which also carries the wheel gears. The spurs connecting with these gears are mounted on the supplementary axle, in which is also incorporated the differential mechanism. The main speed reduction takes place directly at the hubs of the wheels, hence the rotative speed of the engine is reduced but little until it reaches these wheels. The Torbensen concern is now prepared to furnish its axles with

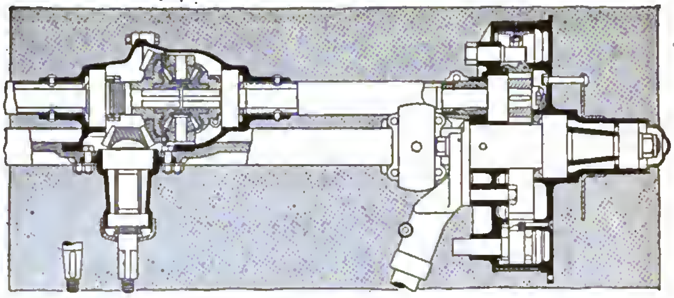

Fig. 8—The Torbensen type S rear axle for trucks which is of the internal gear type. The driving member is back of the dead-load member

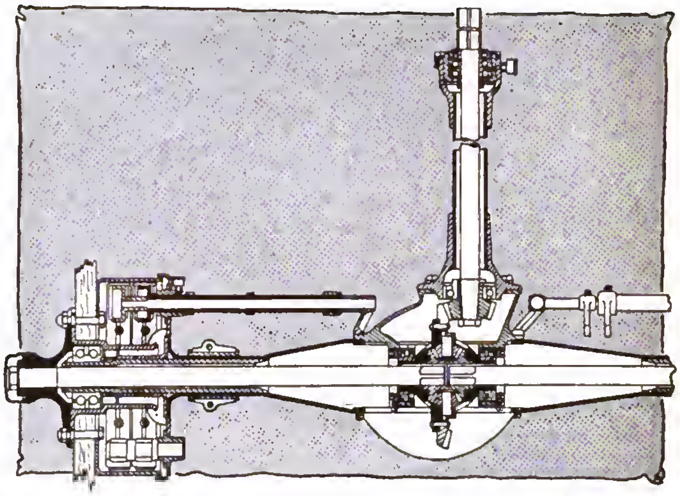

Fig. 9—An example of Weston-Mott construction. Model 950-L floating axle for cars weighing from 2,800 to 3,100 pounds. The housing is externally webbed

any bearings, domestic or imported, which may be specified. The dead member is now furnished in any desired alloy steel.

Warner-Toledo—The Warner Manufacturing Company includes in its product of various automobile parts, heavy duty truck and light delivery car jackshafts, which incorporate with the differential and axle driving members, the Warner gearsets, which are selective, sliding-gear types. The gears are accessible through cover plates, which inclose the upper part of the driving mechanism and differential gearing. For delivery wagons with capacities up to 1,500 pounds, the jackshaft is furnished with either a three-speed selective gearset or a planetary type. The brakes with this construction are 10 inch expanding.

Weston-Mott—The Weston-Mott Company is in the field with a complete line of bevel-gear rear axles, the models being fifteen in number and covering all maximum car weights from 1,500 pounds to 5,000 pounds. These are of three general types, namely, fixed hub, semi-floating; single-bearing floating, and double-bearing floating designs. The first of these is the simpler and in it the hubs are usually keyed or fixed to the outer ends of the shafts, the inner ends of which float in the differential. The single bearing floating types are constructed either with a roller bearing or a ball bearing placed durectly under the spokes of the wheels. The double bearing type carries two ball bearings in each hub, a large one to carry load and end thrust and a small one for load only. The shafts are made with integral driving clutches. A typical example of the latter class is the model 950-L, which is adapted to cars weighing from 2,800 to 3,100 pounds. It is shown in Fig. 9. It has a pressed steel housing of the externally flanged or webbed type.

In general all Weston-Mott axles have bevel rings and pinions cut with corrected teeth, which adds to the silence. High carbon or nickel steel is used in the driving shafts, while the bearings are either Hyatt rollers or New Departure ball bearings. Ball thrust bearings are of special Weston-Mott design.

Retainers Improved in Special Bearings

Although Conservative to the Highest Degree, the Makers of Bearings Have Made Minor Improvements—Some Other Interesting Accessories

CONSERVATISM is about the most marked quality in the bearing field for this year. Where the ball and roller bearing representatives were approached at the show it seemed to be the case that where a thing had only been on the market for 2 or 3 years it was regarded as new. The introduction of the automobile has presented but few added problems to the bearing manufacturer. Where changes have been made they have come but slowly and only after long periods of experiment. The big point in ball and roller practice seems to be to get a good retainer. With these few facts in mind, a brief survey of the field as represented at the New York show may be given.

Hess-Bright

No departures from standard design have been made by the Hess-Bright Manufacturing Company in the line of bearings brought forward for the consideration of the car manufacturer. The experimental laboratories of Wittenau, Germany, and the smaller one of Philadelphia, are constantly engaged in making detailed improvements and one of the most recent developments brought out by this concern is a retainer which is especially suitable for automobile installations. In order to keep manufacturers in touch with the latest improvements, the Hess-Bright company supplies data sheets in loose-leaf form. These are added to from time to time and are kept up to date.

J. S. Bretz

These imported bearings, made by Fichtel & Sachs, Schweinfurt a-M., Germany, and imported by J. S. Bretz, New York City, are made in every type of installation for automobiles. They are used by more than fifty American automobile manufacturers. The distinguishing feature of the F. & S. ball bearings is that by the use of a patent cage, 95 per cent. of the ball race is filled with balls and at the same time there is no inter-ball contact, each ball being guided separately and independently. The radial bearings are made principally in three series, A, B and C, the lightest being A and the heaviest C. A special magneto series under the name of type F is also made.

R. I. V.

The R. I. V. is an imported ball bearing made in all sizes and adopted on many of the standard American makes of automobiles. The series includes light, medium and heavy-weight models of radial and thrust types. A special line is made for ball bearing-equipped axles, for commercial or other heavy service. The latter is especially interesting in that a bronze auxiliary bearing is so fitted that it will not be in play under ordinary circumstances or service, but will come into effective use in case of extreme overload or other emergency. This extra bearing takes the form of a bronze bushing supported by two collars which withstand the lateral pressures used by making a steep turn out of a rut or around a corner at high speed. Special steering gear with combination rear axle and gearset installation are also specialized.

New Departure

The New Departure Manufacturing Company specializes on three distinct types of bearing, the double row, single row and Radax. The latter bearing is named from the fact that it is designed to withstand a combination of radial and axial load in one direction. The Radax bearing is made in the international standard metric sizes the same as the single-row bearing. In many respects this bearing is equivalent and the same as one-half of the double-row bearing. This is true especially of the radial load. In the axial or thrust load, however, it is the equivalent of the double row. A steel separator is used with this bearing.

American

Front and rear axles and the ball bearings used in their installation are made by the American Ball Bearing Company. This concern, which has had a steady growth since its organization in 1885, has started the manufacture of axles in 1900. Since then axles have been specialized. All the parts for the axles are assembled in the American Ball Bearing Company's assembly rooms and are shipped complete. The finishing of the ball-bearing cups and cones was done in the American plant by small abrading wheels and no water cooling is used. This is known as the dry grinding process. The wet grinding work is used on the larger material, such as axle parts, etc.

Rhineland

Rhineland is an imported ball bearing brought to this side by the Rhineland Machine Works and made at the home factory in Düsseldorf. Both tradial and thrust bearings are made and all the latter except those for light loads have a ball-shaped, stationary ring, which is designed to afford an equal distribution of load on all balls. The balls on all the thrust bearings are held in place by brass cages. The radial type will take 25 per cent. end load, but not more than 10 per cent. in the heavy series. Double-row bearings and others especially adapted to serve radial or combined radial and thrust loads are also manufactured by this company.

Atlas

The Atlas Company is an American concern making alloy steel balls guaranteed to be round and true within .0001 inch. The steel used in these balls is a chrome alloy manufactured abroad in the Girod electric furnace process. They are hot forged in specially constructed furnaces so designed that no direct flame can ever strike the field while they are being heated. The balls are forged in strings and then cut apart. After this they are annealed and allowed to rest before being rough ground. After thorough grinding they are sent through a smooth grinding process, which brings them within a few thousandths of 1 inch above the proper size. The heat treatment is then given the balls and they are hardened clear through. This is an advantage as compared with case hardening.

S K F

S K F radial bearings are made in a type which is especially designed to take care of misalignment of the shafting. The bearing is so designed that the balls can run out of line in any direction. They are held in place by a single-piece retainer without rivets of screws, with floats between the ball races and is practically frictionless. The bearing may rotate so much out of line that it produces the same effect as a ball and socket joint capable of adjusting itself automatically to any deflection in the shaft upon which it is mounted. No binding strains are introduced on the balls when the shaft is traveling out of line. In the case of the double row, the load is automatically distributed on both rows of balls. The steel used is what is known as a Swedish crucible alloy steel, the iron being taken from the Swedish mines. The S K F thrust bearings are made in single and double type and possess the same self-aligning features as the radial type.

Bantam

The Bantam Anti-Friction Company is one of the few that make both ball and roller bearings. These are made for all installations either of the thrust or radial type. The collars in the thrust ball bearings are made of tool steel and the cages of bronze. Thrust bearings with grooved collars are made with inside brass thimbles. Radial bearings of the all-ball type are also manufactured. Cup and cone bearings in all sizes can be furnished by this concern, while in the roller department an equally wide range of choice is offered.

S. R. O.

The S. R. O. is a bearing which is made in Switzerland by one of the largest European factories. The balls are cut from solid steel as compared to the tubular stock. Many of the foreign manufacturers are users of this bearing. The ball races in the S. R. O. bearing are specially featured. The notches for the balls are shallow and do not reach the bottom of the race This eliminates a common cause of trouble and makes for a minimum of wear. Al sizes of annular and thrust types are manufactured by this concern. All are fitted with a cage made from pressed-steel stamping riveted together.

Imperial

A full line of annular and thrust bearings is manufactured by this concern. The feature which is most prominent in Imperial design is the cage or ball retainer. This retainer has been designed to allow of as many balls as possible in the space provided, without permitting the inter-ball contact, which is highly detrimental. The Imperial retainer consists of a one-piece body with a closing ring. The Imperial balls are made in England and are guaranteed to .0001 inch. The bearings are made in light. intermediate and heavy series.

Schafer

Schafer ball bearings are imported by Barthel & Daley, of New York City. They are used on sixteen different makes of American cars. This line is the same as for the past year except that a new retainer has been brought out which tends to make the bearing more silent. The balls with this retainer are only in contact with the separator when the bearing is under heavy load. Both the radial and axial bearings are made by this concern as well as combination of annular and thrust. The latter bearing has a two-point contact as against the four-point contact of the cup and cone bearing.

Norma

The ball bearings of the Norma Company of America, New York City, have attained a very high reputation both in America and abroad. Two exclusive features distinguish the Norma ball bearing: the ball cage and the ball races. The former affords an elastic polar guiding of the balls, with minimum speed at point of contact, and the minimum of noise and internal friction. The inner race is ground to a circular ball seat with a radius slightly larger than that of the ball. The outer raec has a ball seat of similar radius, but at the normal contact line between balls and race, the curved race surface meets a tangent cylindrical surface. This makes the Norma an open-type bearing of unequaled accessibility. And the design of Norma cage and races permits the use of more balls, and larger balls, than any other construction having substantial uninterrupted race shoulders.

Outside of the line of ball bearings described for the Norma concern a full line of roller bearings is carried. These are distinguished by a crown outer race. The rollers themselves are cylindrical and run in free guide. The roller has a full bearing on the surface of the inner race, because this is also cylindrical. On a light load the bearing of the roller on the outer race is only at the point of crown on the outer race. Under heavy load the outer race flattens to the form of a true cylinder and gives a full bearing on this race also.

Timken

The Timken line of roller bearings is complete. Timken uses the tapered roller in long and short series. The short series is suitable for an annular replacement, should such be desired. It is made in the same sizes as ball bearings and is interchangeable with any of the standard makes. The Timken cages are of flat steel. Owing to the tapered form of the bearing it is not necessary to use a ball thrust with the roller bearing. The slope of the rollers is sufficient to render the bearing capable of withstanding a heavy thrust or axial load. The Timken axle line, fitted with bearings of the same make, is continued in all sizes for trucks and pleasure cars.

Standard

A new series of interchangeable bearings designed to be of the same size as the standard makes of ball bearings have been brought out by the Standard Roller Bearing Co. This type of roller bearing has cylindrical rollers with grooved centers. These bearings run on ribbed races, the rib running through the groove in the roller. Cup and cone roller bearings and straight roller types are made by this concern, while in the ball bearing field they manufacture a series of closed type in all sizes.

American

The American Roller Bearing is of the annular non-adjustable type. The rollers are cylindrical in shape and run between cylindrical races. Alternate rollers are smaller in size and all rollers bear upon each other. The smaller rollers act in the nature of a separator, while the large rollers carry the load. As the friction between the separating rollers and the load carrying rollers is independent of the load, it is very small. Ball and thrust and dust washers are fitted to these bearings, which are made in all sizes.

Bower

The Bower roller bearings are of two types, one in which a wedge shape enlargement takes the end thrust, and the other, which carries the end thrust on a groove cut in the roller. The rollers are cylindrical but carry, as explained above, both radial and thrust loads. When the thrust is carried on the wedge shaped enlargement, the roller runs in guide rings at each end with small diameter spindles. The other type of roller is carried by a thrust shoulder on the outer race. The guide ring in this case is in the form of a single slotted ring.

Gillette

The Gillette roller bearing is of the tapered cup-and-cone type. No cages are used, but a retaining ring is fitted to hold the rollers on the cone when the cup is removed. A thrust flange is fitted on the back of the cone to take up end play. A snap retaining ring on the small end of the bearing holds the cup in place. When the ring is removed the cup and rollers can be taken out.

Spark Plugs Not Yet Discussed

Below are given the descriptions of several prominent makes of spark-plugs which did not find space in the issue of January 30. They include the products of important companies in which the automobile public needs must be interested.

Oakes & Dow Company—The two types of spark-plug made by this Boston concern are well known as sootless mica plugs. None but pure Indian mica is used in these plugs. The

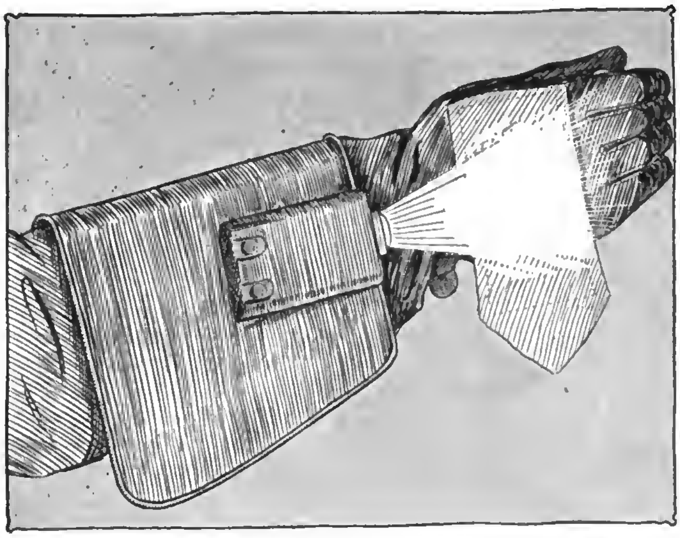

Fig. 1—Flashlight glove designed by Baroness Van Haeften-Hatch

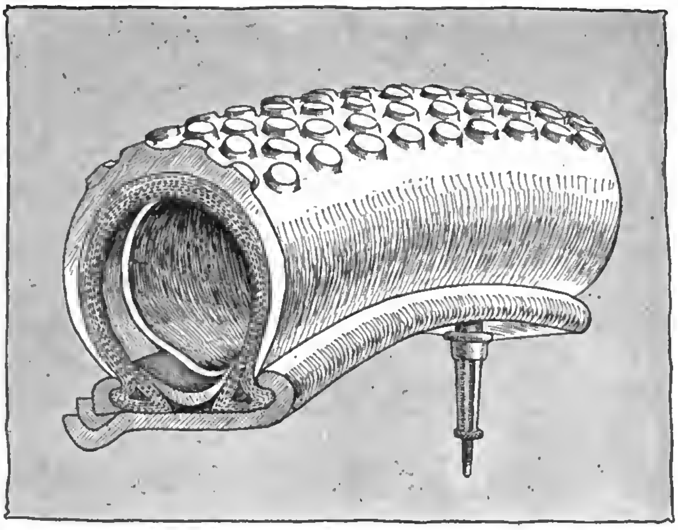

Fig. 2—Walpole tire with Bailey tread

positive electrode, in the manufacture of this accessory, is wrapped with sheet mica and driven into the plug shell with a blow of the hammer. Mica rings are threaded over the wrapping and fixed by a locking ring. The mica is then turned in a lathe and polished.

Rex Ignition Company—The Rex Spark plug made in New York City consists principally of three pieces, namely, the porcelain, the shell and the bushing against which the porcelain is packed by two rings. The electrode is of imported wire and claimed to be proof against burning out and the whole plug to be sootproof.

Ideal Switch Company, Incorporated—Five types of spark plugs are manufactured by this company at Plainville, Conn. The high tension and adjustable gap designs are said to be rust, soot and heatproof. The first type is or ordinary appearance with a straight positive electrode and a bent wire as negative point. The adjustable gap type is distinguished by the use of a special gland or bushing fitting between the shell and the porcelain and working in a thread of the latter, so that the porcelain may be raised or lowered. The central electrode in this case is bent toward the periphery of the shell. The porcelain and the shell are marked with one vertical arrow each and if these arrows are in alignment the shortest spark gap is obtained. The Ideal company also makes a conical type plug which has its name from the shape of the porcelain, a closed end case design with a contracted shell opening and a mica core plug.

Charles D. Shain—The Shain spark plug is distinguished by the shape of the positive electrode which is formed as a ball fitted with a peculiarly shaped head. The latter as the form of a downwardly diverging cone made of a special metal sheet into which deep corrugations have been cut to give the effect of an inverted crown. The points of the crown act as sparking points.

Accessories of Unusual Interest

Rose Manufacturing Company—This company, of Philadelphia, Pa., continues its line of lamp brackets and radiator heaters from last year. The first series of products comprises brackets which support both the tail light and the rear license number; besides, the well-known radiator license bracket is being made by this company. The radiator heater is made in two styles, both of which have the effect of keeping the cooling water at a temperature preventing its freezing. One style of the heater is adapted for illuminating gas and the other for oil; but the gas type may be also used with acetylene.

Walpole Tire & Rubber Company—The Boston company of this name manufactures both inner tubes and casings. The inner tubes are of red rubber, constructed heavily and claimed to contain the highest grade of up-river Para rubber. The casings of this company include clincher as well as Q. D. designs, and plain treads may be obtained as well as non-skid types. The non-skid treads are of the Bailey class and consist of rubber vulcanized to the ordinary degree on which truncated-cone projections are formed, there being alternate rows of three and four projections each. This construction provides a variable-width contact between the tire and the ground, making sidewise sliding very difficult.

Flashlight Signal Glove—The latest idea in accessories is the signal glove designed by Baroness Van Haeften-Hatch, of Newport, R. I. The purpose of this device, which is illustrated in Fig. 1, is to provide a clear signal to the driver of the following car whenever it is desired to stop or to turn a corner. The thick traffic of the city streets is not limited to daylight and many of the accidents which have evidenced themselves very clearly in the marked rise in automobile insurance rates have occurred after nightfall has rendered it impossible for the drivers to observe the signals made from surrounding cars. The glove is of best grade leather with stiff cuff. It is built along the regular gauntlet lines with a strap to fasten it securely to the hand. A lamp is mounted on the back of the wrist portion of the glove and a piece of heavy white kid on the back of the hand. The light is controlled by two brass contact points mounted one on the thumb and the other on the index finger of the glove. When these two points are pressed together a light is immediately flashed on the white cloth.

Peck Wheel Company—The Peck wheel is manufactured for both pleasure and light commercial cars. It consists of a solid outer rim which carries the solid rubber tire and to which are fastened twelve plungers or pistons equally spaced around the rim's inner circumference. Each plunger fits within one of the twelve cylinders which are attached at their lower ends to the wheel hub so as to have radial play. Thus the pistons and their mating cylinders form the spokes of the wheel when the parts are assembled. Interposed between each piston head and its cylinder head is a coiled spring which acts to force the piston out to its normal position when sufficient load force is not exerted to overcome the spring resistance. Thus the weight which the wheel must carry is carried by the upper arc of the wheel. In addition to the coil springs, there is an air cushion under each piston which adds to the resiliency when pistons are forced in. The free radial movement of the pistons and cylinders makes for flexibility of drive.

Sewell Cushion Wheel Company—Sewell cushion wheels are designed for gasoline and electric trucks, motor 'buses and motor-driven fire apparatus. The Sewell construction embodies a complete wooden inner wheel and an extra wooden felloe outside of this. The felloe carries any standard solid tire. Between the wooden wheel and the outer felloe is interposed a rubber cushion which appears in three forms, namely, a flat cushion for heavy trucks, rubber rolls for light commercials and zig-zag cushions for medium trucks. The two wheel parts are held together by side rubber flanges which thus preserve the resilient feature.

Ideal Steel Wheel Company—The Ideal wheel replaces the spokes of the ordinary wheel by ten elliptical steel springs, each of which is made of two strips of thin spring steel sprung between hub and rim to the proper tension. These strips fasten to both the rim and hub. When assembled the spring strips bear radially against one another, thus bracing and counterbracing. When assembled the springs are designed to give both lateral and radial support. In action, each spring carries a portion of the load.

Seaton Wheel Company—In the Seaton wheel there is an inner and an outer portion. Interconnecting these two is a series of tension coil springs, the supports for which are alternately connected to the inner and outer wheels. The springs are mounted horizontally between the segments. When a load is placed on the axle, the inner wheel sinks with relation to the outer, the center lines of the coil springs then being out of their horizontal position. This movement is provided for by the swivel mountings of the springs in the alternate segments, one of which is attached to the inner portion of the wheel and the other or mating segment to the outer on the opposite side.

Favary Wheel Company—The Favary construction is really a mechanical tire in which resilience is obtained by the flex action of a combintion embodying pliable bands under tension. There are three bands to each tire, and between each a series of aluminum blocks is interposed, these blocks being riveted to the fabric the layers of blocks being in staggard relation so that when one set of blocks is pressed inward it sinks between the blocks on the next lower layer, giving the resilient effect.

Schermack Wheel Company—The Schermack spring wheel is an all-steel type and consists of a hub section or inner wheel and an outer wheel carrying a standard solid tire. The two sections are provided circumferentially with aligned projecting flat steel springs or brackets fastened together in pairs by cross bolts. When assembled, the flat springs, one of each pair being fastened to the inner portion and the other to the outer part on the opposite side, are under tension, the resilient action being permitted by the ball and socket connections of the flat springs and the cross steel bars which are normally horizontal, but deflected under load.

Rajah Auto-Supply Company will continue the manufacture of their familiar line of Rajah spark plugs and terminals for the coming season, with the addition of the new Rajah starter and Rajah giant plugs that have recently been introduced to the trade. The Rajah starter plug is simple, easily adjusted, efficient and well designed for the purpose for which it is intended. The Rajah giant plug is a big, strong plug of extreme simplicity and durability.

(*Continued from page 425*)

power of the dynamo. This form of construction does away with the necessity of including any electrical controlling device other than the usual voltage and reverse current cut-out, as shown in the wiring diagram, Fig. 8. This device, in this particular case, is arranged alongside the magnet inside the cover. The armature is of the ordinary slotted drum type run on ball bearings. Carbon brushes are used and these are easily accessible by simply unscrewing a pair of caps on the side of the bearing end cover. The output curve, Fig. 9, shows clearly how the current increases with the speed until 12 amperes is reached, when it is cut down by the action of the magnetic shunt to an almost constant level of 10 amperes, irrespective of increase of speed.

Holtzer-Cabot—Uses Centrifugal Cut-in

The most notable feature of the Holtzer-Cabot lighting system is that regulation of the current at high speeds is obtained inherently by the special construction of the generator. A single centrifugal switch which cuts in the generator at the correct speed is the only controlling device with moving parts.

The generator is a two-pole machine with a cylindrical magnet casing of laminated iron. The pole pieces are of special design, having long extended tips, which so controls the action of current generation as to choke down the higher speed currents, owing to the self-induction set up in the armature.

An ingenious form of cut-out is employed, acting on the centrifugal principle. Its construction is shown diagrammatically in the plan of wiring, Fig. 17. The outer ring R is made up of three parts electrically insulated from each other, as in commutator construction. The large inner segments is in electrical connection with one of these parts. Two contact weights or segments W attached to springs extending from the large segment, are so arranged that when the device is rotating at a certain predetermined speed, they fly out due to centrifugal force and make contact with the adjacent parts of the outer ring. All three sections of the ring are then electrically connected. Two carbon brushes bearing on the outer surface of the ring at diametrically opposite points are wired to the generator and battery line respectively. It will be seen how this arrangement makes it impossible for current to flow until the segments W are in contact with the outer ring.

The generator is shunt wound and is connected up with the battery floating on the line as in most systems.

Vesta—Controls by Resistance

In the Vesta lighting system reliance is placed on the simple permanent-magnet generator, without any field adjustment of any kind. The output regulation is effected by the insertion at high speeds of a single step resistance in the main circuit. This method is a development, or rather a simplification of the Vesta generator of last year in which a small rheostatic resistance was used for the same purpose. It has been found that a single step affords ample control and at the same time avoids complication.

An external view of the generator is given in Fig. 12. The magnets are of the usual type, mounted in pairs as in magneto practice, and made to slip over the pole pieces. End covers are fitted rendering the machine dust-proof. One of these has a small rectangular extension which surrounds the commutator and supports the two brush-holders; the other forms a housing for a centrifugal governor shown in detail in Fig. 11. This device alone controls the output. A wheel W is mounted on an extension of the armature shaft in such a manner that while stationary it occupies a skew position owing to the action of a spring S, which exerts a pull on one side through a short connecting link attached to a collar on the shaft. The balance wheel and spring are so proportioned that when an armature speed of 200 revolutions per minute is reached the centrifugal action of the wheel withdraws the collar and permits the two contact points C1 to come together.

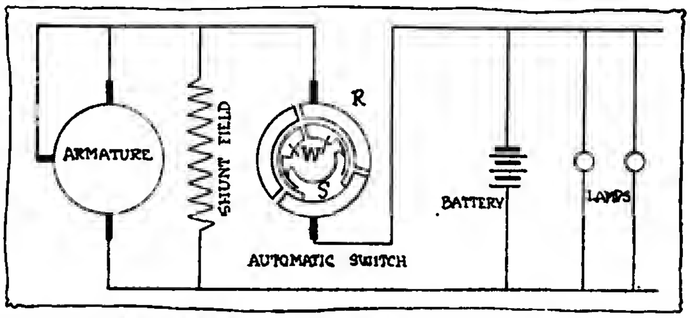

Fig. 17—Wiring diagram of Holtzer-Cabot lighting system, showing automatic switch

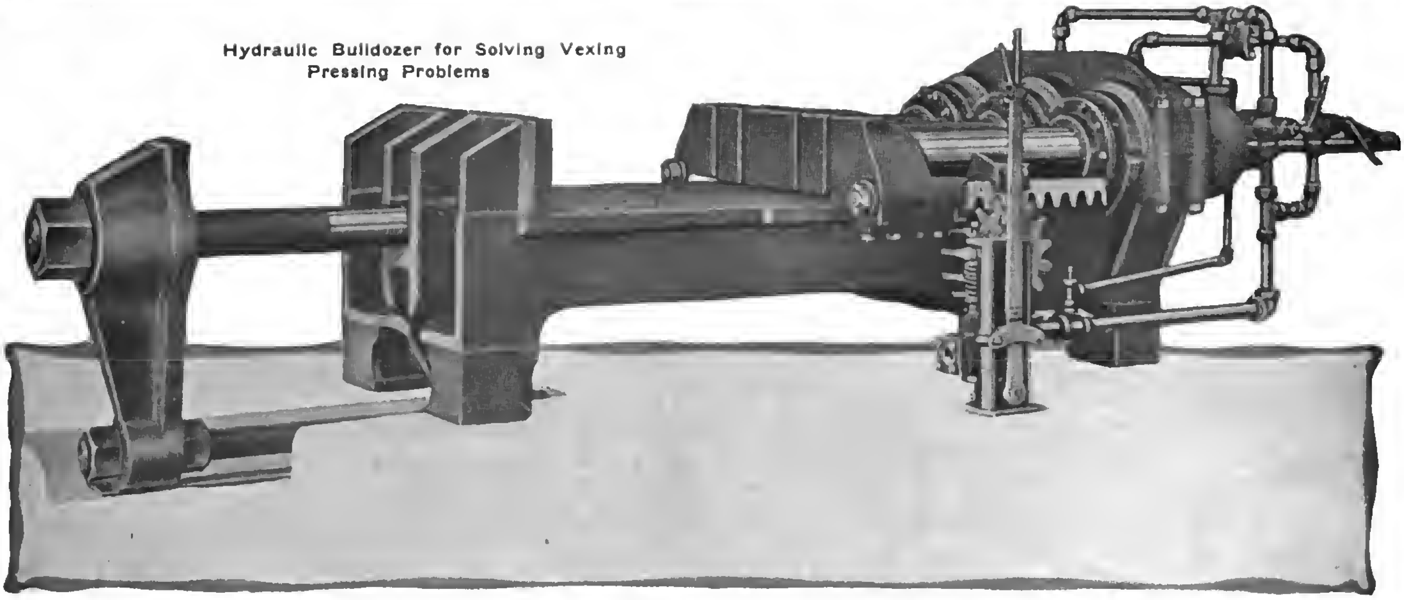
Factory Miscellany



Hydraulic Bulldozer for Solving Vexing Pressing Problems

The above illustration depicts an instrument known as a bulldozer. This is a heavy slow moving die which shapes large parts such as axles. The machine depicted was designed by the Watson Stillman Company of New York for manufacturers of heavy axles for automobile trucks. The bar which is to be upset, split or shaped is placed on the flat table or bed plate with the opposite end to that which has to be worked upon placed against the heavy upright beam shown at the extreme left. The bulldozer shown here is operated by hydraulic pressure.

The width of the bed plate is 44 inches; maximum opening between moving cross beam and rigid cross beam 48 inches; maximum opening between moving cross beam and adjustable stop, 90 inches; length of moving cross beam, 48 inches; diameter of rams, 11 inches; stroke, 15 inches; maximum liquid pressure per square inch, 1500 pounds; diameter of horizontal extension bolt, 6 inches. The weight of the complete machine is 20,000 pounds.

A notable feature of this machine is the arrangement of its three rams, all connected to the one head to permit the use of only one, of two, or of all three rams, depending on the pressure necessary. With one ram—the middle one—the capacity of the bull-dozer is 56 tons; with the two outside rams, 127 tons, and with the three cylinders in use simultaneously the capacity becomes 200 tons.

EASTERN Rubber's Factory—The Eastern Rubber Company, recently organized in Toronto, Ont., to manufacture automobile tires, etc., has secured a site of four acres. Two manufacturing buildings will be built—one three stories high, about 250 feet by 72 feet, and another 200 feet by 72 feet, one story. In addition there will be suitable warehouses and a power plant. The capacity of the company's plant, without any increase to the initial machinery equipment, will be approximately $2,225,000 per annum, and it expects that the business during the first year will amount to about $1,000,000.

Mayer Carbureter Builds—The Mayer Carbureter Company, Buffalo, N. Y., is planning the erection of a factory at Detroit, Mich.

Perkins, of Washington, Builds—W. A. Perkins, Seattle, Wash., will construct a $250,000 plant in Centralia, Wash., for the manufacture of automobiles and parts.

Canadian Firm Planning Factory—The Canada Standard Automobile & Tractor Engine Company, Moose Jaw, Sask., is having plans prepared for the construction of a new factory.

Pioneer Tire Equips Plant—The Pioneer Steel Block Tire Company, St. Louis, Mo., recently capitalized with a capital of $25,000, will in the near future equip a plant for the manufacture of a patented tire for use on automobile trucks.

Working Day and Night—The Speedwell Motor Car Company, Dayton, O., is now working both night and day shifts and the prospects for future business make it extremely likely that this condition will exist for several months to come.

Albion Establishes Factory Garage—The Albion Motor Car Company, Ltd., of Glasgow, Scotland, a large manufacturer of motor trucks, has arranged to establish a factory garage for assembling cars in Montreal, Que., and proposes in the near future to manufacture in Canada.

Doubles Space—The Oakes Fan Company, Indianapolis, Ind., recently doubled the floor space of its factory, increasing its force of men as well as its equipment of machinery. It has bought all the machinery and tools owned by the Enders Tool & Machine Company.

Fire in Buick Plant—The brass and aluminum foundry of the Buick Motor Car Company, Flint, Mich., was destroyed recently by fire with a loss of $40,000. The burned structure was only the frame building in the plant, and so it will be rebuilt. The drop forge department was saved.

Swinehart to Enlarge Factory—With the advent of commercial cars the solid tire business of the Swinehart Rubber Company, Akron, O., has increased until the capacity of its plant is taxed to its utmost and the company is now increasing its plant to add several million tires a year to its output.

Maroney Goodyear Manager—J. A. Maroney succeeds E. H. Parsons as manager of the St. Louis, Mo., branch house of the Goodyear Tire & Rubber Company. Mr. Parsons has been promoted to manager of the St. Louis district, which takes in cities in Missouri, Oklahoma and Texas. This transfer takes place at once.

Royal Factory in England—The Royal Motor Car Company, London, Eng., which was recently organized with a capitalization of $500,000, has concluded to erect its factory in Strathroy, this decision having been arrived at following negotiations with the Strathroy Council. The town makes a loan of $50,000, gives a free site and other inducements. It is the intention of the firm to start work as soon as possible on a factory 400 feet by 200 feet and two stories high.

Kenen Building Light Trucks—The Kenen Motor Company, Los Angeles, Cal., will in the near future produce light trucks. To fulfill this the company is at present enlarging its plant, which, when completed, will give a structure measuring 200 feet by 325 feet. A factory output of 30 trucks a month is expected when the addition is completed. Fixtures, jigs and machinery for the new factory are in process of construction in Detroit, Mich., and will arrive in Los Angeles by the time the addition is ready to receive them.

The Automobile Calendar

Shows, Conventions, Etc.

Jan. 27-Feb. 13....Troy, N. Y., Annual Show, State Armory, Troy Automobile Club.
Feb. 1-8...........Chicago, Ill., Annual Automobile Show, Coliseum and 7th Regiment Armory.
Feb. 3-8...........Washington, D. C., Annual Show.
Feb. 8-15..........Hartford, Conn., Annual Show, State Armory, Hartford Automobile Dealers' Association.
Feb. 8-15..........Minneapolis, Minn., Annual Automobile Show.
Feb. 10-15.........Chicago, Ill., Truck Show.
Feb. 10-15.........Winnipeg, Man., Show, A. C. Emmett.
Feb. 10-15.........Ottawa, Ont., Ottawa Motor Show, Howick Hall, Louis Blumenstein.
Feb. 11-15.........Binghamton, N. Y., Annual Show, State Armory, Dealers' Association, R. W. Whipple.
Feb. 15-22.........Albany, N. Y., Annual Show, State Armory, Dealers' Association.
Feb. 15-22.........Newark, N. J., Annual Automobile Show, First Regiment Armory, New Jersey Automobile Exhibition Company.
Feb. 16-23.........Richmond, Va., Annual Show.
Feb. 17-22.........Kansas City, Kan., Annual Automobile Show.
Feb. 18-19.........Madison, Wis., Annual Show, City Market Building, Dealers' Association.
Feb. 18-21.........Grand Forks, N. D., Annual Show, Auditorium, Dealers' Association.
Feb. 18-22.........Baltimore, Md., Annual Show, B. A. D. A.
Feb. 19-22.........Bloomington, Ill., Annual Show, Coliseum, McLean County Automobile Club.
Feb. 19-22.........Geneva, N. Y., Automobile Show, Armory, Louis Blumensteiu.
Feb. 19-22.........Kalamazoo, Mich., Annual Show.
Feb. 19-23.........New Orleans, La., Annual Show.
Feb. 19-27.........Topeka, Kan., Annnal Show.
Feb. 20-22.........Canandaigua, N. Y.. Automobile Show, Louis Blnmenstein.
Feb. 22-Mar. 1....Brooklyn, N. Y., Annual Show, 23rd Regiment Armory.
Feb. 24-27.........Kansas City, Mo., Truck Show.
Feb. 24-Mar. 1....St. Louis, Mo., Annual Show.
Feb. 24-Mar. 1....Memphis, Tenn., Annual Show.
Feb. 24-Mar. 1....Omaha, Neb., Annual Automobile Show.
Feb. 24-Mar. 1....Paterson, N. J., Annual Show, Paterson Automobile Trade Association.
Feb. 24-Mar. 5....Cincinnati, O., Annual Show, Music Hall, Cincinnati Automobile Dealers' Association.
Feb. 25-28.........Eau Claire, Wis., Annual Show, Armory, Dealers' Association.
Feb. 25-Mar. 1....Syracuse, N. Y., Annnal Show, Syracuse A. D. A.
Feb. 26-Mar. 1....Fort Dodge, Ia., Annual Show.
Feb. 26-Mar. 1....Glens Falls, N. Y., Antomobile Show, Louis Blumenstein, Manager.
Feb. 27-Mar. 1....Toronto, Ont., Annual Show, Toronto Automobile Trade Association.
March 3-8.........Bridgeport, Conn., Show, Park City Rink, B. B. Steiber.
March 3-8.........Denver, Col., Annual Show, Municipal Auditorium.
March 3-8.........Pittsburgh, Pa., Annual Antomobile Show.
March 3-8.........Springfield, Mass., Automobile Show, New Auditorium Building, United Amusement Compauy.
March 3-18........Des Moines, Ia., Annual Show, Pleasure Car Section, Coliseum, Dealers' Association.
March 5-8.........Tiffin, O., Annual Show, Tiffin *Daily Advertiser.*
March 5-8.........Louisville, Ky., Annual Show, Dealers' Association.
Mar. 5-8..........London, Ont., Annual Show, Drill Hall, Louis Blnmenstein.
March 8-15........Boston, Mass., Annual Automobile Show.
Mar. 8-15.........Columbus, O., Annual Show, Billy Sunday Tabernacle, Automobile Club and Trades' Association.
March 12-15.......Ogdensburg, N. Y., Automobile Show, Lonis Blumenstein, Manager.
March 19-26.......Boston, Mass., Annual Truck Show.
March 20-24.......New Orleans, La., Aunual Show, N. O. A. D. A.
March 24-29.......Indianapolis, Ind., Annual Automobile Show.
March.............Nashville, Tenn., Annual Show, Nashville Automobile Dealers' Association.

Race Meets, Runs, Hill Climbs, Etc.

May 30............Indianapolis, Ind., 500-Mile Race, Speedway.

Foreign

March.............France, Scaled Bonnet, 3000-Mile Run.
March 31..........Montevidio, Uruguay, International Competitiou of Agricultural Motor Vehicles.
April.............Barcelona, Spain, International Exhibition.
May...............St. Petersburg, Russia, International Automobile Exposition, building of Michael Maneze, Imperial Automobile Club of Russia.

Truck Factory for Nevada—An automobile truck factory will be built on a Nevada, Ia., site by the Nevada Manufacturing Company. Temporary quarters will be built at once on land recently leased.

Toledo Electric Company Builds—The Electric Auto Lite Company, Toledo, O., is building on addition to its plant on Michigan street, providing for 40,000 square feet of floor space. The company manufactures a new combined electric lighting and starting system for automobile equipment.

Diehl Adds New Building—The Diehl Manufacturing Company, Elizabethport, N. J., has taken title to 12 1-2 acres of property fronting on Newark avenue. The greater portion of this property lies in the city of Elizabeth, although there is a 16-foot frontage in the city of Newark. The frontage on Newark avenue measures 832 feet with a depth of 630 feet to the Pennsylvania Railroad.

Lewman's Tire Factory—H. L. Lewman, of the Fall City Construction Company, Louisville, Ky., is at the head of a company, which is being organized to establish a tire factory in that city. The exact location of the plant has not yet been determined, but construction details will be forthcoming shortly.

Floods Oakland Plant—Works Manager Humphries, of the Oakland Motor Car Company, Pontiac, Mich., says the company suffered a damage of $12,000 because of the recent flood which filled the basement of plant number 1 and caused a temporary shutdown of that building. Flood conditions have been overcome and the plant has resumed its manufacturing operations.

Tate Electric to Build—The Tate Electric, Ltd., organized by Montreal and Toronto, Ont., capitalists to build electric pleasure and commercial cars, will erect a plant at Walkerville, Ont. A site has been secured on St. Luke's Road, and a two-story building, covering 42,000 square feet of brick and steel construction, will be erected. Albert Kaltschmire is manager.

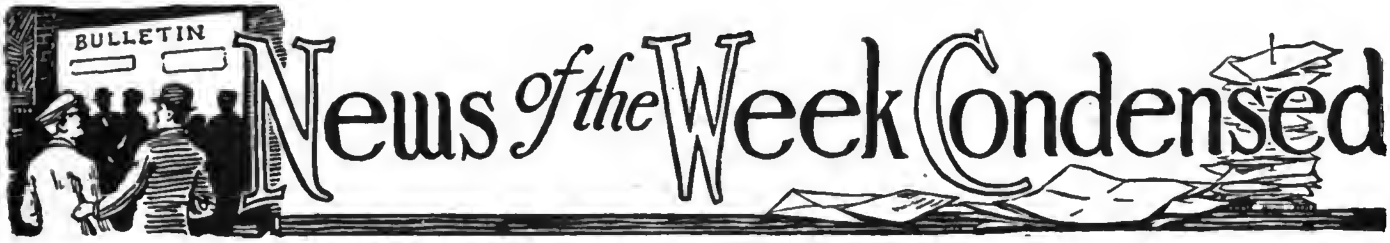
Lord Baltimore's Production 1,000—The Lord Baltimore Motor Car Company, Baltimore, Md., manufacturer of the Lord Baltimore commercial car, announces that it will produce this year 1,000 1,000-pound delivery wagons, 100 one-ton trucks, 100 one and a half-ton trucks and 100 two-ton trucks. The firm will erect a large factory so as to market and produce this quota of cars.

Spoerers Build Truck—The Carl Spoerers Sons Company, Baltimore, Md., has entered the commercial field and will market 1,500-pound light delivery wagons by May 1. The company expects to turn out fifty of these trucks this year. They will be of 30 horsepower, four cylinders and will have four speeds forward and reverse. The frame will be of pressed steel and the same materials as in all the Spoerer pleasure cars will be used. The wheelbase of this truck will be 150 inches.

Buicks Assembled in New Orleans—After February 1, all Buicks shipped to Central and South America and the West Indies will be assembled in New Orleans, La., specially crated for export and delivered on board by employees of the company, who will see that the machine is so placed in the cargo as to undergo the minimum chance of being damaged. A considerable saving in freight rates also is made as the cars are knocked down, as they reach there from the factory, and take a much lower rate.

Sanford Expands—The Sanford Motor Truck Company, Syracuse, N. Y., has purchased from the Syracuse Savings Bany a three-story brick building for purposes of expansion of its motor truck manufacture, and a force of fifty men will in consequence be increased to 300 before the end of the year. At least 300 trucks will be made this year, doubling the output. For three years the company has been making trucks at a small leased plant on Park street. The new plant will be equipped to turn out 1,000 trucks annually.

Adds 40,000 Square Feet—The Garford Company, Elyria, O., is adding nearly 40,000 square feet of floor space to its plant at that city, for the manufacture of its products. The new buildings consist of a warehouse, 60 feet by 300 feet, of reinforced concrete; a rear axle assembly shop, one-story high, 56 feet by 280 feet, also of reinforced concrete, and an addition to the main building, 45 feet by 45 feet and four stories high. The latter will be of steel and concrete construction, to conform with the style of the present main building of the plant. The improvements will allow for increased manufacturing facilities in the plant, removing several departments which now find themselves in cramped quarters. The stock and tool rooms, now housed in the main building, will be moved to the new assembly plant, allowing for the installation of a great deal of new machinery the company has had on hand for some time but has been unable to place.



Banquet of the New York Garage Association, recently held, at which the high cost of gasoline was discussed by the speakers

WESTERN Electric Salesmen Meet—The Western Electric Company, New York, recently held a conference of salesmen throughout the country in Chicago, Ill. The week was an extremely busy one, with a wide variety of entertainment, together with numerous talks by members of the manufacturing staff in explanation of the process and inspection methods pursued.

Maxwell Commercial Manager—C. A. Forster has been appointed commercial manager by the Maxwell Motor Company, Inc., Detroit, Mich.

Vancouver's Trucks Number 232—The number of trucks and delivery wagons in Vancouver, B. C., is 232. Of this number 107 are heavy trucks.

Kalish Resigns—D. F. Kalish, general manager of the Hartford Auto Parts Company, Hartford, Conn., has resigned to enter a new field of business.

Brooklyn Federal Moves—The Oriental Rubber and Supply Company, Brooklyn, N. Y., distributor of Federal automobile tires, has moved to 1166 Bedford Avenue.

Bourne Stearns Manager—The F. B. Stearns Company, Cleveland, O., announces the appointment of S. N. Bourne as resident manager of its Philadelphia, Pa., branch.

Shaw Heads American Tire—Adam Duncan has resigned from the presidency of the American Tire & Rubber Company, Akron, O., and has been succeeded by James Shaw.

Bosch to Exhibit—The Bosch Magneto Company, New York City, will exhibit its products at the motorcycle show in Chicago, Ill., during the week of February 3 at space 4.

Hoyme Philadelphia Alco Manager—C. R. Hoyme, formerly sales manager of the International Motor Company, was recently appointed Philadelphia, Pa., manager of the Alco.

Los Angeles Chalmers Moves—The Western Motor Car Company, Los Angeles, Cal., distributors of Chalmers cars, has moved into a four-story building at Tenth and Hope streets, that city.

Kline's Rochester Service Station—The Kline Motor Car Company, Rochester, N. Y., distributors for the Klinekars in that territory, recently opened up a new salesroom and service station in that city.

Beedon Goes to Keeton—Bert Beedon has resigned from the traveling force of the Olds Motor Works, Lansing, Mich., to become affiliated with the selling staff of the Keeton Motor Company, Detroit, Mich.

Two Hendersons in Tour—Two Henderson cars have been entered in the Indiana Automobile Manufacturers' Association's tour to the Pacific Coast, July 1, by the Henderson Motor Car Company, Indianapolis, Ind.

Shadel Kline Sales Manager—The Kline Motor Car Corporation, Richmond, Va., has appointed R. E. Shadel district sales manager for New York State and New England, excepting Connecticut, with headquarters at Rochester, N. Y.

Akron Rubber in Houston—The Akron Rubber Company has established a house in Houston, Tex., for dealing exclusively in automobile accessories. Mr. Fouse is manager. The company will represent the Swinehart Tire and Rubber Company, Akron, O.

Big G. V. Truck Order—The American Express Company in Boston, Mass., recently placed an order for twenty-five 2-ton General Vehicle trucks of the 1913 model. The delivery of these trucks commences in March, and approximately ten vehicles a week will be placed in operation.

Shaffer Invents Gasoline Economizer—W. A. Shaffer, of Waco, Tex., has been granted a patent on a contrivance for use on gasoline engines for automobiles. Mr. Shaffer claims that his invention reduces the consumption of gasoline to practically one-half, the motor being of the two-cycle type.

Lewis to Manage New Company—R. C. Lewis, general manager of the Beaver Manufacturing Company, Milwaukee, Wis., has resigned to assume management of the Lewis Motor and Engineering Company, recently formed to manufacture a line of monobloc motors. The new products will include several European features.

Vancouver Club's Road Doings—One important matter which the Vancouver Automobile Club, Vancouver, B. C., has taken, and which will be carried through to completion early in the spring, is the placing of a log drag on the main highways adjacent to the city. A fund is now being subscribed which will be used exclusively for this work.

Constructs New Furnace—The Milwaukee Gas Light Company, Milwaukee, Wis., has just completed the construction of a new type of furnace for the preparation of automobile springs for the oil tempering process for the W. R. Sherin Company, of that city. The furnace is heated by means of Solvay process gas and the idea is regarded as a real triumph.

Cadillac in New Quarters—The Cadillac agency in Birmingham, Ala., is soon to occupy a new building at the corner of Avenue D and Twentieth street.

New Baltimore Quarters—The Franklin Motor Company, Baltimore, Md., representing the Franklin car, has opened new headquarters on Charles street near North avenue.

Large White Truck Order—The Atlanta Ice & Coal Corporation, Atlanta, Ga., recently ordered 15 White trucks, six of them being 1.5-ton capacity, seven 3-ton and two 5-ton.

Harris with Firestone—R. G. Harris has accepted a position of assistant advertising manager, with headquarters in Akron, O., with the Firestone Tire and Rubber Company, that city.

Opens New Showroom—The French-Schutz Company has opened a showroom on North avenue and Calvert street, Baltimore, Md., where it is handling the Pratt car and Empire tire and Holley carburetor.

Bergstrom Establishes Garage—George H. Bergstrom of Depere, Wis., has established a garage in the McGeehan building, which will be formally opened on March 1. He has not yet selected all of his agency lines.

Join White Sales Force—Frank M. Olmstead, former branch manager in Baltimore, Md., for the Goodyear Rubber and Tire Company, and R. Bruce Hamilton have joined the sales force of the White Motor Company.

Dayton Leaves Columbia—F. E. Dayton has resigned as sales manager of the Columbia Motor Car division of the United States Motor Company, Hartford, Conn., to become general manager of a New York incinerating company.

Appointed Wells Lighting Distributor—The Auto Supply Company, Milwaukee, Wis., has been appointed state distributor for the Wells electric lighting system, manufactured by the R. C. Wells Manufacturing Company, Fond du Lac, Wis.

Bailey Appointed Manager—Henry C. Bailey has been appointed manager of the Hartford, Conn., Auto Parts Company to succeed David Kalish. The new manager was formerly superintendent of the Corbin Motor Vehicle Corporation.

Atwater Sales Manager Patterson—G. S. Atwater has resigned his position as eastern sales representative of the Hayes Manufacturing Company, Detroit, Mich., and has accepted the position of sales manager of the Patterson Rubber Company, Lowell, Mass.

Atlanta Club Elects—At the annual meeting of the Atlanta, Ga., Automobile and Accessory Association, held recently, the following officers were named: George W. Hanson, president; C. H. Johnson, first vice-president; Wylie West, second vice-president, and E. H. Elleby, secretary.

Missourians Meet—A number of members of the different automobile organizations of Missouri recently journeyed to Jefferson City, where a monster meeting was held. Good roads and other things of great interest to the automobilist were placed before the legislature, which was in session.

Brings Suit Against Petrel—County Judge J. M. Becker, of Monroe, Wis., has brought suit in the circuit court at Milwaukee, Wis., against the Petrel Motor Car Company of Milwaukee to recover the purchase price of a Petrel car, $775. and the sum of $197.80, which he declares he spent in bills.

Laxity in Registration—Only 7500 of the 25,000 motor cars in Wisconsin had been registered and licensed for 1913 at the close of business on January 31. While this number is larger than for the corresponding period a year ago it is known that there are hundreds of cars in use which still employ the 1912 license plates.

Abbott Treasurer Universal—M. J. Abbott has become treasurer of the recently organized Universal Farm Tractor Company, which is establishing a factory for the manufacture of motor-driven corn cultivators at Newcastle, Ind. Mr. Abbott was formerly assistant manager of the Newcastle plant of the Maxwell-Briscoe Motor Company.

Golder Appointed Trustee—C. E. Golder of Milwaukee, Wis., has been appointed trustee of the bankrupt estate of the Bates-Odenbrett Automobile Company, which recently failed with small assets. Officers of the concern were examined by the trustee on February 3. Trustee Golder formerly was president of the Curtis Auto Company of Milwaukee.

Two Indiana Bills Passed—Two more bills affecting auto interests have been passed by the lower House of the Indiana legislature. One forbids testing automobiles or motorcycles on any public highway or street, and the second provides where the highway is not visible for 100 feet in advance of a vehicle, frequent signals must be given by horn, bell or whistle.

Van Vliet Business Bought—The Central Iowa Motors Company, Des Moines, Ia., has purchased the business of the Van Vliet-Bradt Motor Company, agent for the Moon car. Mr. Van Vliet has retired from the automobile business, although he will manage the Des Moines show. Mr. Bradt is in charge of the accessories department of the Herring Motor Company, that city.

Middletown Equipping Fire Department—The fire department and council of Middletown, Pa., are considering the purchase of three automobile hose trucks for equipping their fire department. A special meeting was held recently, at which time a number of truck manufacturers were present who were asked to submit their bids before the next meeting of council, February 10.

Large Weaver Deal Closed—The consummating of a deal is reported between the Weaver Manufacturing Company, of Springfield, Ill., and Messrs. W. L. Owen and R. S. Rollman, by which the above-mentioned parties are given the exclusive sales right for Weaver automobile twin-jacks in Chicago, Ill., and northern Illinois, and also the entire state of New York, including New York City.

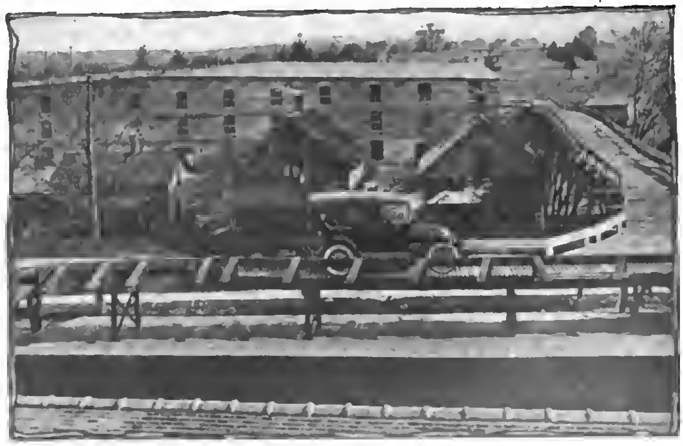
Milwaukee to Green Bay Road—An improved highway from Milwaukee, Wis., to Green Bay along the western shore of Lake Michigan, via Port Washington, Sheboygan, Manitowoc, Two Rivers and Denmark, is contemplated by a campaign put under way recently by Secretary L. E. Meyer of the Milwaukee Automobile Club and Secretary Arthur F. Raab of the Sheybogan Automobile Club.

Want Light Bill Passed—An effort will be made to secure the enactment of a law compelling the display of lights on all vehicles in Connecticut. A bill to this effect has been presented in the legislature by Mr. Pons of Roxbury. For several years motorists have tried to bring about such a law, but were nnsuccessful. It is said about the Capitol that there is more sentiment in favor of the bill this season than formerly.

Wolverine Club Elections—All of the old officers of the Wolverine Automobile Club, Detroit, Mich., retired from office recently with the exception of A. R. Miller. Directors were elected as follows: Leonard Davis, J. H. Armstrong, Len Mathews, C. A. Woodruff, F. N. Randall, A. J. Kinnucan and Edward Hines. A smoker was held in the banquet hall of the Tuller Hotel in the way of a grand opening of the new quarters.

Michigan Wisconsin Road Plans—One of the most extensive highway projects ever undertaken in Wisconsin and one which involves $350,000 is the proposed joint plant under consideration by the county boards of Marinette, Wis., and Menominee, Mich., whereby almost every roadway in the two counties will be permanently improved within five years. Marinette county proposed to issue bonds in the sum of $200,000 for the work on the Wisconsin side and Menominee will issue $150,000 for the Michigan side.

Six Months and $500 Fine—Heavy fine and a long term imprisonment will face automobile speeders if a bill drawn by a city solicitor, Schrieber, of Toledo, O., and which he will have introduced in the legislature becomes a law. A fine of not more than $500 or not more than 6 months in the workhouse is provided for the first offence. A fine of $500 and six months' imprisonment is the penalty for any subsequent offence. The new law would make the owner and operator of any automobile violating the provisions of the act jointly liable in damages for any injuries inflicted.



How cars are sent from the assembling plant to the shipping department at the Reo plant. This overhead runway connects the two departments and the cars are driven over into the shipping department under their own power

Opens Broadway Branch—The Twentieth Century Automobile Company, New York City, dealer in automobiles, has opened a branch at 1690 Broadway.

Securities on Chicago Exchange—At a meeting in New York City recently, directors of the B. F. Goodrich Company, Akron, O., decided to list the securities of the corporation on the Chicago, Ill., Stock Exchange.

Goodyear Outlook Excellent—The Goodyear Rubber and Tire Company, Akron, O., is expected to have a gross sale of $40,000,000 this year, as compared with about $25,000,000 for the fiscal year which closed November 1.

Franklin Conference in Chicago—A conference of Franklin dealers of central and middle western states was held at the show rooms of the Franklin Automobile Company, 1450 Michigan Avenue, Chicago, Ill., on Saturday, February 1.

Celina Automobile Company Elects—The board of directors of the Celina Automobile Company, Celina, O., recently organized by electing the following officers: President, Walter Mersman; vice-president, Ira Wagner; secretary and treasurer, Edmund Brandt.

New Speed Bill Introduced—Representative Thomas, of Waterbury, Conn., has introduced a bill setting speed limit for all vehicles, including electric cars, 30 miles an hour, and within the confines of a city or borough 12 miles an hour. Any occupant of the vehicle is subject to the same fine as the driver who violates the provisions—fine of $500, imprisonment for six months, or both.

Peerless Automobile Stock Taken—Announcement is made that all the stock offered to the shareholders of the Peerless Motor Car Company, Cleveland, O., under the plan for an exchange of one-half of common stock holdings for an equal amount of the newly authorized preferred stock has been taken, with the result that the company has now about $2,100,000 preferred stock, $2,100,000 common stock and $1,000,000 bonds outstanding.

State Road Maintenance Fund Advocated—A State road maintenance fund is being strongly advocated by the Tri-City Ocean-to-Ocean Official Highway Association and an effort will be made to have the Iowa State Legislature pass such a bill drafted on the same lines as the New York maintenance bill. Scott County has more miles of macadam road, outside of town and village limits, than any other Iowa county, totaling approximately 100 miles. These roads have cost at the low figure of $5,000 per mile.

Automobile Incorporations

AUTOMOBILES AND PARTS

ALLIANCE, O.—Alliance Motor Car Company; capital, $50,000; to manufacture automobiles. Incorporators: M. W. Geiger, G. K. Pritchard, R. M. Scranton, J. O. Ellis, C. G. Kline, E. P. Kinney.

BALTIMORE, MD.—Hall Seeley Motor Corporation; capital, $1,00,000; to manufacture motors. Incorporators: M. W. Hall, C. F. Seeley, L. S. Myers.

BOSTON, MASS.—Donovan Motor Car Company; capital, $50,000; to deal in automobiles. Incorporators: F. S. Donovan, A. D. Adams.

BOSTON, MASS.—Universal Truck Company of New York; capital, $25,000; to deal in motor trucks. Incorporators: M. Meyers, M. E. Crable, F. L. Hewitt.

BOWLING GREEN, KY.—Monroe Motor Company; capital, $2,590; to deal in automobiles. Incorporators: I. B. Monroe, H. G. Monroe, G. W. Monroe.

BROOKLYN, N. Y.—Royal Garage and Machine Works, Inc.; capital, $3,000; to manufacture automobile parts. Incorporators: William Schwenn, Louisa A. Schwenn.

CAMDEN, N. J.—The United States Tire Filler Company; capital, $125,000; to manufacture automobile tires and automobiles, etc. Incorporators: R. B. Patton, H. E. Patton, H. R. Gotman.

CLEVELAND, O.—Chandler Motor Car Company; capital, $20,000; to deal in automobiles. Incorporators: Isidor Grossman, Cland W. Shimen, Harry C. Cobn, E. L. Frazer, H. B. Howells.

CLEVELAND, O.—C. H. Tyler Motor Company; capital, $10,000; to deal in automobiles. Incorporator: C. H. Tyler.

COLUMBUS, GA.—Ingram-Joerg Company; capital, $3,000; to deal in automobiles. Incorporators: J. C. Ingram, Robert Joerg, Jr., C. E. Lawrence, R. F. Joerg.

CONNERSVILLE, IND.—Central Car Company; capital, $100,000; to manufacture automobiles. Incorporator: J. W. Burk.

ELMWOOD PLACE, O.—Highland Body Manufacturing Company; capital, $81,900; to manufacture automobiles. Incorporators: William Morrison, J. M. Morrison, R. E. Simons, Jr., George P. Stimson, J. Wilby.

MERCEDES, TEX.—Sterling Automobile Company; capital, $10,000; to deal in automobiles. Incorporators: A. G. Crawford, W. D. Chadwick, G. E. Simpson.

NEW YORK CITY—Brown Car Corporation; capital, $30,000; to manufacture automobiles. Incorporators: W. P. Fargo, H. W. Torney, E. E. Beyer.

NEW YORK CITY—Cortelyou Starter Company, Ind.; capital, $25,000; to manufacture starters for automobiles. Incorporators: J. H. Miller, I. B. Parker, Otto F. Ochs.

NEW YORK CITY—Gas Saver Sales Company; capital, $25,000; to deal in automobiles. Incorporators: C. Fisher, J. H. Miller, E. Cable.

NEW YORK CITY—Gildale Motor Corporation; capital, $30,000; to deal in automobiles. Incorporators: F. W. Strauch, T. P. Gilman, E. S. Peck.

NEW YORK CITY—Harvester Truck Company, Inc.; capital, $1,000; to deal in automobiles. Incorporators: H. B. Danziger, L. K. Schwartz, J. R. Rubin.

NEW YORK CITY—Manhattan Automobile Club, Inc.; capital, $100,000; to carry on an automobile club. Incorporators: F. D. Dorman, A. B. Cordner, E. E. Schwarzkopf.

NEW YORK CITY—Maxim Tricar Manufacturing Corporation; capital, $100,000; to deal in and manufacture automobiles. Incorporators: O. Kuhnenman, C. F. Novotny, A. A. Mesebutt.

SOMERVILLE, N. J.—Atlantic Motor & Supply Company; capital, $25,000; to deal in automobiles. Incorporators: A. G. Sleeper, F. A. Sleeper, H. B. Clements.

TARRYTOWN, N. Y.—Maxwell Motor Company; capital $10,000; to deal in automobiles. Incorporators: J. D. Maxwell, J. P. McManus, L. F. Sniffen.

TOLEDO, O.—General Motor Truck Company; capital, $50,000; to establish a system of heavy tonnage transportation via motor trucks by contract. Incorporators: G. R. Grandy, C. O. Morton, F. M. Morton.

TOLEDO, O.—Maumee Motor Car Co.; capital, $10,000. Incorporators: Richard D. Logan and others.

TRENTON, N. J.—Fitzgibbon & Crisp; capital, $100,000; to manufacture automobiles. Incorporator: L. L. Woodward.

WASHINGTON, D. C.—Express Spark Plug Company; capital, $200,000; to manufacture spark plugs. Incorporators: C. H. Duffy, John Loughran, Fred Plugge, John Keane.

GARAGES AND ACCESSORIES

BIRMINGHAM, ALA.—Drennen Motor Car Company; capital, $50,000; to carry on a garage business.

BUFFALO, N. Y.—Rub-On Manufacturing Company, Inc.; capital, $5,000; to manufacture automobile specialties. Incorporators: Otis Bower, W. A. Faxon, W. H. Faxon.

PERU, IND.—Peru Castings and Machine Company; capital, $25,000; to manufacture castings. Incorporators: R. M. Carter, C. E. McCampbell, I. H. Barbee.

PHILADELPHIA, PA.—Tension Tire Company; capital, $100,000; to manufacture and sell and deal in and with automobile tires and all accessories thereto. Incorporators: Robert G. Gregg, Howard F. Spellhouse, Geo. L. Townsend.

NEW YORK CITY—Morot Cycle Tire Company; capital, $10,000; to manufacture motor-cycle tires. Incorporators: H. W. Torney, E. E. Beyer, J. E. Beyer.

NEW YORK CITY—United Garage Company; capital, $14,000; to carry on a general garage business. Incorporators: K. Mynter, E. B. Smith, Samuel Ecker.

ONEIDA, N. Y.—Federation Supply Company; capital, $150,000; to deal in automobile supplies. Incorporators: H. D. Crim, Timothy Curtin, A. J. Seaton.

SPRINGFIELD, ILL.—White Garage Company; capital, $12,000; to carry on a garage business. Incorporators: G. W. Taylor, C. W. Luttrell, H. G. Colson.

ST. LOUIS, MO.—Pioneer Steel Block Tire Company; capital, $25,000; to manufacture a new steel motor tire, the invention of Fred W. Karches. Incorporators: W. D. Becker, J. G. Ganahl, Nicholas Le Brun, F. A. Gerber, F. W. Karches.

WASHINGTON, D. C.—District Automobile Service Company; capital, $50,000; to carry on a garage business. Incorporators: G. R. Cowle, L. Bert Nye.

CHANGES OF CAPITAL AND NAME

GREENSBORO, N. C.—Ford Garage Company changed name to McGlamery-Markham Auto Company.

GREENSBORO, N. C.—Ford Garage Company increased capital to $30,000.

WASHINGTON, D. C.—Peerless Motor Transfer Company; change of name to C. B. B. Motor Company.

The AUTOMOBILE

Commercial Section of 1913 Chicago Show Breaks All Previous Records

Seventy-Six Truck Makers Exhibit Their Product on Vast Floors of Coliseum, Armory and Wilson Building

CHICAGO, ILL., Feb. 10—The commercial vehicle section of the Thirteenth Annual Chicago Automobile Show was thrown open to members of the trade at 10 o'clock this morning and to the general public at 2 o'clock this afternoon. By the time the crowd had begun to press through the doors of the Coliseum and the Armory practically every exhibit was in place. There are seventy-six makes of commercial vehicles exhibited and 141 accessory booths. The trucks fill the main floor of the Coliseum, the Annex and the Wilson building as well as that of the First Regiment Armory. In the Coliseum thirty-six different makes of vehicles may be seen, in the Annex there are nine, in the Armory twenty, and in the Wilson building eleven. The accessories are shown in the gallery of the Coliseum, on the second floor of the Annex, and in the gallery of the Armory. The basement of the Coliseum, which was used for both cars and accessories during the pleasure car show, has been abandoned this week, the floor space occupied by the truck section being only 135,615 square feet as compared with 147,990 square feet required for the passenger vehicles. Sixty-seven of the commercial vehicles on display are of the gasoline type the other eight being electrics. At the recent New York show there were six makes of electrics shown but only fifty-nine makes of gasoline machines. The value of the truck and accessory exhibits is estimated at $1,000,000.

There are nineteen makes which did not appear at the New York exhibition. These are: Adams, Avery, Buffalo, Clark, Commerce, Diamond T, Four-Wheel Drive, Harder, Harwood-Barley, Harvey, Ideal, Mercury, Mogul, Natco, Old Reliable, Poyer, Rambler, United States and Urban. Naturally a considerable number of makers who had space in New York are not represented in Chicago. A few of the Chicago exhibitors are showing parts as well as chassis and complete trucks. Among these are International and Mais.

The decorative scheme used during the pleasure car week is continued throughout the commercial car section the only change being in the names of the various exhibitors and the arrangement of the spaces.

Quick action characterized the transformation of the pleasure car section into the commercial vehicle section. Promptly at closing time on Saturday night the pleasure cars and such accessories as did not exhibit during the second

Impressions at the Chicago Show

¶ *An offspring of the passenger car business, the commercial vehicle industry, has shown itself exceedingly precocious. In its early days no one paid much attention to its increasing stature and trucks were included in the passenger car exhibitions in a sort of tolerant way, almost as accessories.*

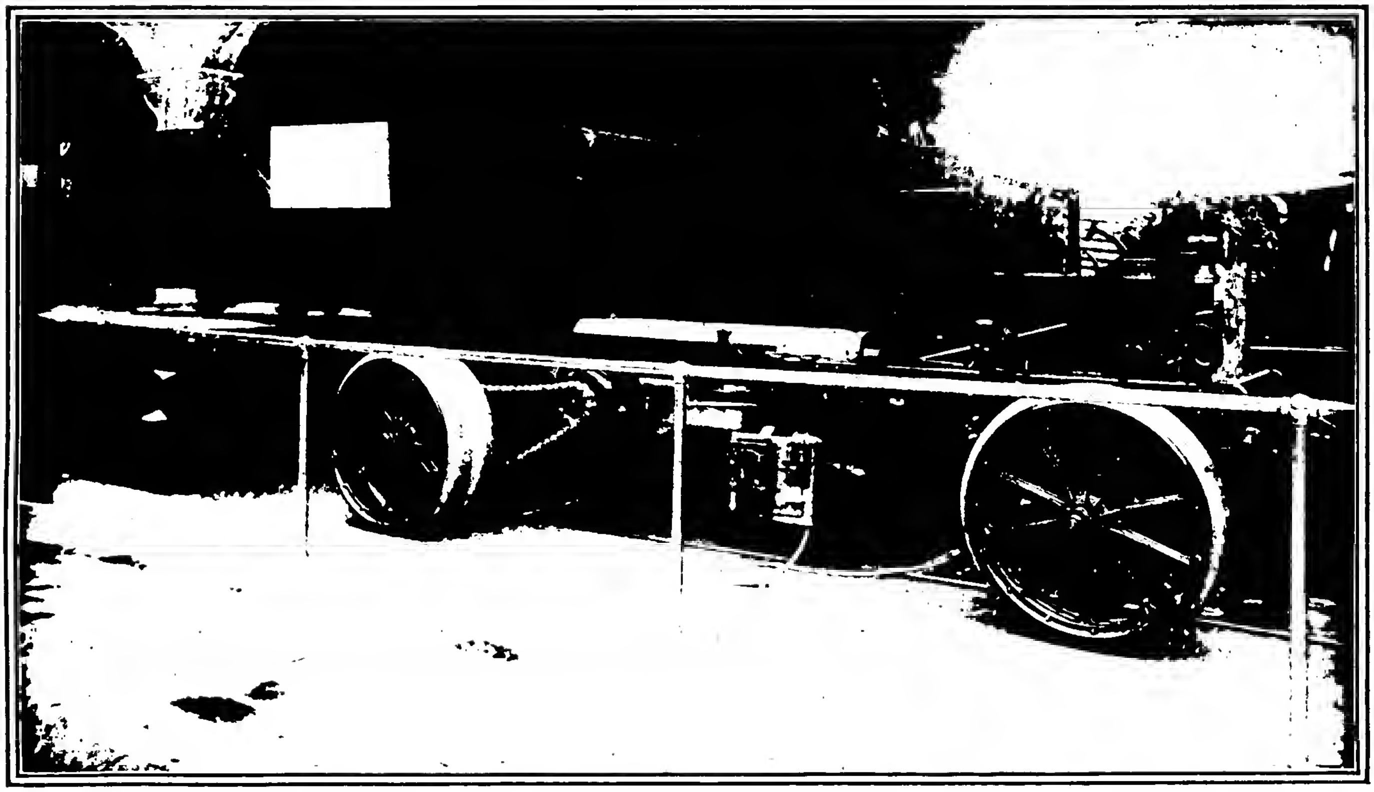
¶ *All this has been changed and changed very radically. For several years commercial vehicles have been recognized as products of an independent industry big enough and strong enough to take care of itself as such. Truck shows are held in conjunction with the passenger car exhibitions instead as a part of them.*

¶ *The show now in progress at Chicago typifies in its exhibits the common sense ideas which are coming into control in the motor truck field. The freak constructions are being eliminated, standardization is being broadened in scope and the result is a more highly finished and efficient product.*

¶ *One of the salient features of the present Chicago truck show is its wide scope. Here may be seen trucks of all sizes, from the little 500-pound delivery wagons to the tremendous 7 and 7.5-ton vehicles, massive and powerful as the mammoth or the mastodon, but infinitely more useful. The favorite sizes, however, judging from the exhibits, are the 2, 3 and 1-ton vehicles in the order named.*

Many men of many minds may well be suited in the selection of a type of body adapted to each particular line of work for there is a great variety on exhibition. There are dumping bodies of varying sizes to suit varied requirements, power or manually operated, as the buyer wills. There are all sorts of transfer bodies for all kinds of delivery service. In fact, the prospective truck buyer will be hard to suit who cannot find what he wants at the Chicago show.

Center of the Coliseum, showing the arrangement of trucks on the floor of the exhibition hall, with ample space between them to allow of inspection by visitors to the show



The 5-ton Locomobile automatic dumping body is actuated by an endless screw, and rollers tilt the body to the proper angle, holding it against the rear edge of the chassis

Two Dumping Bodies at the Chicago Show

The new White power dump body is operated by a nut traveling on a long endless screw extending along the center of the chassis from the back of the seat to above the jackshaft. To the traveling nut is attached two stout chains which pass over respective pulleys and attach to a V-shaped framework fastened to the underside of the body floor. As the traveling nut is carried forward on the endless screw the body is raised and traveling towards the rear allows the body to lower onto the frame. Automatic means are provided to cut out the power and stop the endless screw when the body reaches either the raised or lowered positions.

The Mack dumping body is operated by power of the motor. The mechanism consists of two vertical chains passing over upper and lower sprockets in rear of the driver's seat. Attached to a link of each chain is a link which also connects with two arc-shaped feet on the under side of the body. Driving the chains in one direction raises, and in the opposite direction lowers the body.

week were hurried into shape for removal from the buildings. Electric wagons were used for hauling the cars out of the building, the action thus being continuous, one electric going out at about the same time the other came back for another car. By 8 o'clock in the morning practically every vestige of the pleasure car show had been removed and the electrics began to move the trucks in. They were busy at this task until Sunday afternoon when most of the exhibits were in place. A few spaceholders were late in sending in their exhibits but these were practically all in place by opening time today.

The largest exhibits at the show were those of the Packard, White and G. M. C., each of which comprised eight vehicles. The Alco showed seven trucks and a trailer, and the International also showed seven machines. There were six exhibitors represented by one truck or chassis. The greatest number, however, exhibited three vehicles, although nearly as many exhibited two. Four machines were shown by a few more exhibitors than showed five.

The preponderant class at the show were of 2-ton capacity, although the 3-tonners ran them a close race followed by the 1-ton vehicles. The range varied from 500-pound capacity vehicles to 7.5-ton trucks.

One of the distinguishing features of truck design as exemplified in the vehicles exhibited at the Chicago show seems to be that of making the vehicle suitable to the work to be done rather than trying to make the work accommodate itself to the vehicle. This, of course, is shown more in body design and special fittings than in the chassis proper.

Special bodies for special services are coming to be the rule rather than the exception as they were formerly.

All are not like this, however: On a mercury wagon the driver occupies a single folding seat, the width of which is not more than one-third that of the body. He sits on the right side with the side door immediately in front of him. There are rear doors which are kept locked when delivering and are only used for loading. At the left of the single seat is an open space giving free access to the entire packages carried.

The Willys utility wagon, an express type with canopy top, is made to afford every facility for loading and unloading. It has a hinged side door at the right immediately back of the driver's seat. The tailboard is hinged and provided with chains to hold it at a practically horizontal position.

With small capacity vehicles for light package delivery work it is expected that the use of compartment for carrying fragile packages would be resorted to; and also that shelving hinged to the sides would come into more general use. Little is shown in this respect, one of the few examples, however, being the Menominee with shelving which practically increases the carrying capacity 100 per cent.

Open express wagons are perhaps shown in greater numbers than in any other type of vehicle as they are suited for so many lines of work such as grocery, express, produce, etc. There are a number of furniture models of the van type but they are practically standard in construction. They all use the padded rail to protect the furniture, one or two are made without side pillars between the wheels so that the load can be taken off from the right. This is most important for use in large cities with narrow streets, where there would not be sufficient street widths to back the truck up to the curb as is necessary for rear unloading.

The Clark delivery wagon is similarly designed for lumber trade, and has a flat framework extending forward at either end of the seat and at either side of the motor forward to the radiator. This allows of carrying practically any length of timber at either side with shorter lengths back of the seat. The flat framework extending forward alongside of the motor, serves as a fender for the front wheel, and beneath this framework and between the wheels is space for a large box for carrying tools, etc.

Another combination wagon which offers a wide field for usefulness, is the White combination farm wagon. It is an express type of body with canopy top. Two removable cross seats are shown in place in rear of the driver's seat. These are removable when produce or freight is to be carried. The vehicle is fitted with pneumatic tires.

As usual there is a big exhibit of dumping bodies suitable for all coal, sand, and gravel work. The use of the engine power for dumping these is becoming general, whereas a year ago, but few used such. The Pierce-Arrow and Kissel show hydraulic dump types; on the Locomobile an endless horizontal screw with traveling nut is used for the dump body and also for the removable body which is supposed to be placed on a standing platform. The Mack shows its motor-driven, chain-type dump and the Packard and Universal also show dumping types.

The types of bodies suitable for building construction trade are in greater numbers than ever before, a fact which demonstrates the interest this class of buyer is now taking in the motor vehicle. The Locomobile shows a quick-unloading lumber body. On the Mogul use is made of transverse steel rollers on which either a body or heavy building timbers can be rolled on or off.

There are not so many tank wagons for the oil trade as have been seen in other years due largely to the fact that oil concerns have adopted their standard body types and their business is largely repeat orders. The Avery company shows a large tank type with a commendable four-compartment cabinet at the rear end with hinged doors. These compartments contain the faucets in the lower part, and spaces for the cans and other necessaries in the upper. Along either side of the tank is a platform with iron railing, not unlike that along either side of a locomotive boiler for railroad work.

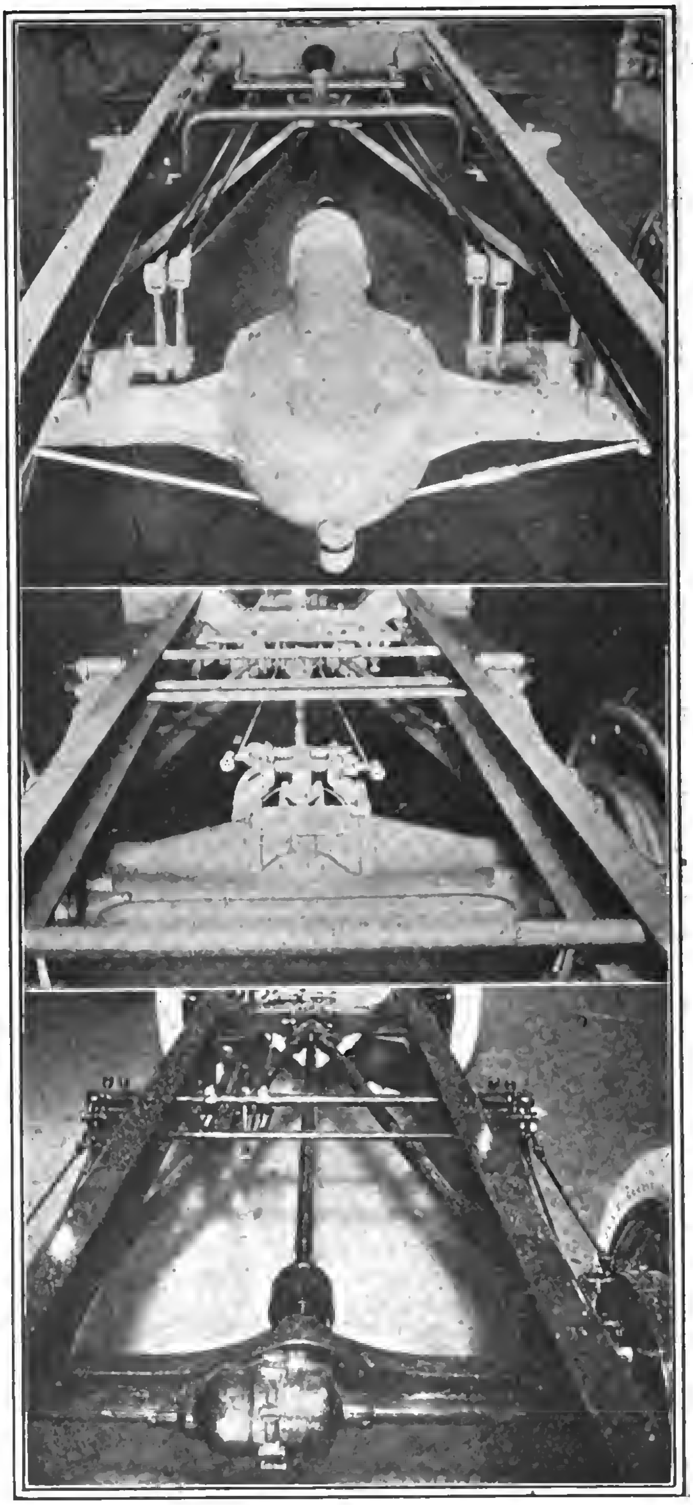
The fact that concerns are insisting upon standard body styles for their industry no matter what make of truck they may use is well shown in the three body types of the Schultz Bread Company. These are on three different chassis, a White, Walker electric and General Vehicle electric. The body designs are alike and are characterized by zinc flooring for cleanliness, and by a side door immediately in rear of the driver's seat, and on the right side of the vehicle. There are large rear doors but they are only used for loading purposes.

Another example of special body for the service is that of a florist wagon used for a 5-mile haul with a stop at each end. Rear doors only are used and the body is of a size to accommodate the packages most used by the concern.

There are fewer fire department vehicles than seen at any previous Chicago motor truck show. Not a few of the concerns prefer standard transportation trade to the fire department field which is so largely special order work to specifications drafted by the various municipalities. If sales of fire department vehicles are general on tender and are supposed to go to the lowest bidder, a fact which causes many makers to prefer confining their efforts to standard types of trucks for industrial fields. The fire department vehicles shown are manufactured by the White, Federal, KisselKar and Pope-Hartford companies.

The use of the trailer is well evidenced by the Knox company, which shows the Martin-Knox tractor pulling a large tank for oil purposes, and on another tractor is mounted the forward end of a body suited for the ice industry. This concern is now supplying the three-wheel tractor for practically all industries. The new Garford tractor is a four-wheel type which carries a horizontal fifth wheel on which the forward end of the trailer body rests.

The Chicago is well represented in the light delivery wagon field, but in all of the bodies shown there is a deplorable lack of versatility of interior arrangement. Some of these designs are open to every criticism in that not a solitary effort has been made to save time by facilitating the arrangement of packages or securing them by the driver or jumper boy when making house-to-house deliveries. There are several of them in which the driver's seat extends across the entire front of the body with a partition from the top of the seat to the roof so that it is necessary to walk to the rear doors in order to get any package, no matter if the package is lying immediately in rear of the driver's seat.



Three New Axles Seen at the Chicago Show

Worm-driven axle on new 1-ton Universal truck. The worm and worm wheel are assembled as a unit in the cover part of the axle housing to facilitate ready removal.

Combined live and stationary axle on new Studebaker trucks. The stationary axle is an I-beam piece, in front of which is carried the jackshaft portion. The ends of the jackshaft carry spur pinions which mesh with enclosed spur gears on the road wheels. It is possible to get any desired gear reduction between these pinions and gears so that the bevel gears in the center of the jackshaft construction are nearly the same size, giving a reduction of approximately 1.25 to 1. Note the radius rods which converge at their forward ends and attach to a frame member.

The small Brown delivery vehicle uses a combination stationary and live rear axle with the stationary portion in front. The live axle portion, or jackshaft portion, carries a spur pinion at each end for meshing with a spur gear on the road wheel.

Red Tail Light Menace to Railroad Employees

Alco Company Denies Reports of Segregation Into Parts—Cleveland Wants Better Tax Law

Creditors of the Columbus Buggy Company To Preserve Assets—Sparks-Withington Will Protect Customers

BOSTON, MASS., Feb. 8—The red light as a signal on the rear of motor cars to prevent rear end collisions on the road may be legislated out of existence within the next few years because of their being really dangerous to the operation of railroad trains.

That these lights have already caused trouble has just been brought out as a result of a committee representing the locomotive engineers operating trains in New England having sought some remedy through the Massachusetts Highway Commission.

The members of the committee made a plea that the red light on motor cars be changed to white or some other color not used in railroading and when Col. W. D. Sohier, chairman of the commission, heard what they had to say, he realized that it was an important matter.

Col. Sohier was told that there are many places in the Bay State, and in fact throughout New England, where the highway and the railroad tracks run parallel. And at some places, for example up near Andover and Gloucester, the tracks make a curve so that the highway runs within a few feet of the railroad roadbed.

On more than one occasion, it was stated, an engineer coming around a curve has seen a red light ahead, and jammed on his emergency brakes bringing the train to a quick stop, jolting the passengers of course, only to see the red light moving away, being the tail light of a motor car instead of a danger signal on the railroad tracks.

This has happened to some of the important trains, it was stated. Of course to an engineer the red light coming upon him suddenly out of the darkness and in close proximity left no alternative but to take precaution and after this happened a few times it got talked about among the engineers. So it seems that the matter was not one to be laughed about, but a real serious menace viewed by these men.

President Speare realized the fairness of the engineers' point of view, more so because motor cars are becoming far more numerous now and owners are making longer tours and are not afraid of using the highways at night. Colonel Sohier suggested that perhaps the Massachusetts State A. A. might introduce a bill in the legislature to change the color of the light to white, or anything but red or green.

Ohio Legislature Busy

COLUMBUS, O., Feb. 10—A bill introduced in the Ohio General Assembly to compel motormen of interurban cars, while passing motorists, to screen their glaring headlights was defeated recently after it had been reported out by the committee favorably. The Columbus Automobile Club fathered the measure and the members were much disappointed at the defeat.

Senator Lloyd, of Franklin County, has introduced a bill in the Ohio Legislature providing that motorists after running over or colliding with an individual must apply the brake at once and go to the aid of the injured. Failure to comply with the law is punishable by a fine of from $200 to $500 and imprisonment of 30 days to 6 months.

Senator William A. Weggandt, of the Ohio Legislature, is drafting a bill to have the state sell the abandoned canal lands and to have the money received from the sale of the lands applied towards the improvement of the highways of the state. The matter has been taken to Governor Cox for his approval. It is believed that at least $20,000,000 would be realized from the sale of the abandoned canal lands.

Alco Not To Split Into Parts

In a statement relating to the future of the automobile business of the American Locomotive Company, President W. H. Marshall, of the company, denied the reports which have been circulated recently with regard to this subject. These reports hinted that the automobile departments were to be incorporated as a separate company from the locomotive manufacturing concern, with separate officers, etc. According to Mr. Marshall, these reports are entirely unfounded. The automobile department will be continued as heretofore, as part of the principal organization, and under the special supervision of Leigh Best, vice-president of the company, who will take over this work in addition to his other duties.

J. W. Du B. Gould, whose arrangements with the company have been announced in last week's issue of THE AUTOMOBILE, is going to increase the operating efficiency of the company's automobile factory, applying the principles of scientific management to this end of the business. No sweeping changes of any nature are being looked toward, at least for the present.

Try To Preserve Columbus Assets

COLUMBUS, O., Feb. 7—A meeting of the creditors of the Columbus Buggy Company, of Columbus, O., which has been in the hands of Daniel McLarin as receiver for several weeks, was held Friday, February 7, at the office of Attorneys Sater, Seymour & Pease. The object of the meeting was to discuss ways and means to preserve the assets of the company. Many of the holders of the preferred stock of the company attended the meeting.

Cleveland Protests Against Tax

FINDLAY, O., Feb. 8—Complaints from the larger cities of the state are being made to Governor Cox relative to the proposed increase in the state license fee for automobiles. A committee of Clevelanders visited the governor a few days ago to protest against any change in the law unless there would be some compensatory changes that would interest the auto owners of the large cities. It is said that Cleveland pays one-fifth of the state auto license tax, and the county gets back but one-eighty-eighth of the fund. Under the increased fee proposed the total license fees from Cleveland would be about $180,000, while the county would have returned to it for road improvement about $10,000. If the proposed fee is imposed they want it pro rated to the counties on the basis of payments.

Sparks-Withington To Shield Clients

The Sparks-Withington Company, Jackson, Mich., who recently was sued by the Lovell-McConnell Manufacturing Company, Newark, N. J., for alleged infringement on the Klaxon patents, has announced that it proposes "to protect all our customers against any suits that may be brought against them to frighten on account of using Sparton horns."

Cannot Sell Perry Chains

CHICAGO, Feb. 6—The Parsons Non-Skid Company, Ltd., and the Weed Chain Grip Manufacturing Company yesterday secured a temporary injunction in the United States District Court against Emil J. Crimske, individual members of the E.Z On Chain Tire Protector Company, and Hartley Manufacturing Company, Manufacturers' Auto Tire Company and the Whitaker

Manufacturing Company restraining them from disposing of the stock of chains made by the Perry Chain Manufacturing Company, of Lansing, Mich., which they have in their possession. It is claimed that the Perry chain infringes the Parsons patents with the exception of a wire spring, which, it is said, is so frail as to be easily broken off; whicb, it is alleged, makes a Weed chain out of the Perry device that closely resembles the Weed.

Indiana Kills Hughes Bill

INDIANAPOLIS, IND., Feb. 10—Hope of obtaining good roads legislation at the present biennial session of the Indiana legislature has vanished. The House, by a vote of 79 to 13, has killed the Hughes good roads' bill, which was drafted by the Indiana Good Roads Association and indorsed by numerous organizations. It was also the administration good roads measure. The bill provided for the creation of a state highway commission and would have prevented farmers from working out their road taxes. It was the sentiment among the farmers against the bill that killed it.

One Mill Tax for Minnesota

W. H. Campbell, of New York, member of the good roads board of the Associated Motor clubs, is in St. Paul and Minneapolis pushing the good roads propaganda. The 1-mill tax amendment to the constitution was passed at the last election and the legislature is about to take up the consideration of how much of the tax will be ordered into effect. The mill is tbe maximum and the legislature may decide upon the limit of assessment for the next 2 years up to that amount. This full tax can produce about $1,000,000 a year. The bill for which the good roads people are working now has been introduced by R. C. Dunn, promoter of the mill tax, to centralize supervision policy, set aside a percentage for maintenance, and to build roads that will last. The bill divides state aid into four classes based on assessed valuations of counties. The counties with the lowest valuations are to be allowed 80 per cent. aid. The minimum is 50 per cent.

Indianapolis After Jay Walkers

INDIANAPOLIS, IND., Feb. 9—A rigid enforcement of the city traffic ordinance has been started in Indianapolis by the police. Although the ordinance has been in effect 2 years it has not heretofore been enforced against pedestrians. Under the present enforcement, pedestrians are permitted to cross the street only at right angles, and not diagonally.

Paul Smith Now with Lozier

DETROIT, MICH., Feb. 10—Paul Smith, formerly with the Flanders Motor Car Company, bas become connected with the Lozier Motor Company, of this city, in the capacity of manager. He will co-operate with Harry M. Jewett, president of the company, in evolving a big, efficient distribution campaign for the product of the Lozier works.

Roth-Murphy in Trouble

INDIANAPOLIS, IND., Feb. 10—Maynard E. Zepp, an employee, has brought suit in the circuit court asking that a receiver be appointed for the Roth-Murphy Engine Starter Company of this city. Zepp says the company is indebted to him for work, that he owns several shares of stock and that the company has $32,000 worth of capital stock outstanding.

Norwalk Declares Good Dividend

MARTINSBURG, W. VA., Feb. 10—The directors of the Norwalk Motor Car Company, Martinsburg, W. Va., have declared a dividend of 7 per cent. which is payable now.

Pennsylvania Road Report Now Ready

Bull Purchases Grabowsky Plant—Randolph Assets Exceed Liabilities—Midland Increases Capitalization

Delaware Laws Proposed to Inforce All Vehicles to Carry Lights—Fractional Year Law Also Provided

YORK, PA., Feb. 8—E. M. Bigelow, Pennsylvania state highway commissioner, submitted to the House of Representatives last Wednesday a statement of the work of his department, during tbe session of the legislature now convening at Harrisburg.

The report shows an expenditure of $4,401,413.24 from June 1, 1911, to January 1, 1913. The department has a balance of $1,221,667.82 on hand.

Of the general state highway appropriation of $3,000,000, $2,943,982.22 was expended for repairs, construction, surveys, maintenance, etc., leaving a balance of $56,017.78. In addition to this there is in the state treasury, $1,845,780.31, representing the receipts from automobile licenses.

For state-aid roads for which the legislature of 1911 appropriated $1,000,000 tbe department has expended $151,562.57, leaving a balance of $884,437.43. Under the state-aid acts of 1907 and 1909 the department has had available during the period of this report, $660,642.28 remaining from former appropriations and $345,438.78 returned by counties and townships, a total of $1,006,081.06, of which $906,233.02 has been expended, leaving a balance of $99,848.04.

The appropriation for the National or Cumberland road, amounting to $300,000 has been expended to the extent of $173,748.22, the balance on hand being $126,251.78. Of an experiment fund of $50,000, $24,276.95 was used, $25,723.05 remaining. The traveling expense fund of $88,000 was all used except $4,202.38. Out of the contingent fund of $79,000 the department expended $2,759.31, leaving a balance of $50,240.69. The appropriation to the automobile division was $100,000 and the expenditures $89,053.33, the remainder being $10,946.67.

Randolph Bankruptcy Not Justified

CHICAGO, Feb. 8—Affairs of the Randolph Motor Car Company were aired before Federal Judge Landis today when E. Goldman, president of the concern, took the stand and accused two former employees with wrecking the concern by taking action in bankruptcy when they had no just claims. The two salesmen claimed $1,300 was due them in commissions. Tbe assets of the company are placed at $100,000 by the concern's attorney while the liabilities are said to be $65,000.

Take Grabowsky Plant to Detroit

DETROIT, MICH., Feb. 8—The Edward G. Budd Manufacturing Company, of Philadelphia, is the real purchaser of the Grabowsky plant and will remove here with its entire office and manufacturing forces. The Budd company is a manufacturer of pressed steel bodies and when it locates here it will increase the capacity of the Grabowsky plant by 300 per cent.

Midland Increases Capital

MOLINE, ILL., Feb. 9—Stockholders of Midland Motor Company met last week and authorized advance in capital stock from $100,000 to $300,000. The increase is made necessary to permit carrying out a policy of expansion, aim of the company being to turn out 1,000 cars during 1913. All of the $200,000 additional stock has been subscribed.

Delaware Laws More Strict

WILMINGTON, DEL., Feb. 10—Two bills are pending in the Delaware Legislature which are of interest to motorists. One requires all vehicles on the roads and streets to carry lights at night and the other proposes the issuance of fractional licenses where persons buy cars during the latter part of a year.

States Give Good Roads Much Needed Attention

Canada Wants Good Roads—Connecticut Passes Improvement Bill

Automobile Laws in Various States Revamped—Minnesota and Connecticut Make Changes

HARRISBURG, PA., Feb. 10—Among the measures introduced at the session of the Legislature at Harrisburg this week is a bill to amend the state highway law. It provides that in the case of the highway commissioner deciding to take over a toll road he can do so before the damages have been fixed by the process of law. Under this bill the state can go ahead and make improvements and remove the toll gates before the courts have determined the damages the owners shall have. Another gives cities and boroughs the power to improve roads less than 1 mile beyond municipal limits, and the other levying a 1-mill tax for highway construction and maintenance in townships, the money to be distributed by the state highway commissioner.

May Change Minnesota Law

MINNEAPOLIS, MINN., Feb. 9—Prospects are good for a change in the automobile license law of Minnesota which now calls for a tax of $1.50 a car for 3 years' running. A horsepower tax bill was introduced, but met the opposition that it might be unconstitutional as taxation in Minnesota must be on an equal basis for all classes of property. The tax was to be in lieu of all assessments. Automobiles are now placed on the personal property tax lists. With the $10 tax the machines will be still subject to personal property tax. The license fees would be applied to roads. On the horsepower tax it is estimated $750,000 a year would be raised. The $10 tax would net about $500,000.

Want Iowa Highway Commission

DES MOINES, IA., Feb. 10—The sub-joint committee of the Iowa House of Representatives which is to present a good roads bill for adoption by the present Legislature has about decided on its program, and it is thought the bill will be presented to the House by February 15. As outlined now the bill will provide:

Establishment of a state highway commission of three members, with ample authority, these commissioners to select a highway engineer.

County engineers for every county in the state, to be employed by supervisors.

Classification of all highways into county and township roads.

All money expended on county roads to be in line of permanent work. No money to be spent except on approval of engineer.

Two mill levy to be placed in compulsory drag fund to be paid out only by superintendent of township roads.

A separate feature of the bill will provide for a 1 mill levy for state aid to be raised from all taxable property in the state, including all property in cities, but this money is to be used only on country roads for permanent highways.

Changes in Connecticut Law

HARTFORD, CONN., Feb. 8—Albert Philips, recently elected secretary of state has spent much of his time since assumption of the office in a revision of the Connecticut automobile law passed by the legislature 2 years ago. Automobilists do not care to see this law set aside for something else, but the secretary has some ideas of his own on the subject expressed in the revised law which has been brought to the attention of the Senate by Senator Johnson, of the Twentieth District.

An important change made by the secretary of state is the taking away from the town assessors the right to tax automobiles. The new bill provides that the owner shall pay at the time his vehicle is registered for the year, 10 mills on the value of the car at 75 per cent. list price for the first year, 55 per cent. of the list price for the second year, 35 per cent. for the third year and for the fourth and each succeeding year, 20 per cent. is to be charged.

Another change proposed affects commercial cars registered in other states. During the past 2 or 3 years much freighting has been done in Connecticut by New York and Massachusetts registered trucks. New York City cars are frequently seen in Hartford.

At present a foreign or outside registered motor truck is not compelled to bear a Connecticut license. The new secretary's bill provides that trucks operated more than 10 days in a year in this state shall be registered. This little piece of legislation is aimed at moving vans and the like.

Prevent Misuse of Dealers' License

DES MOINES, IOWA—In a bill in the House of Representatives it is provided that automobile dealers shall report sales and contracts for sales to the secretary of state. This is designed to prevent automobile owners from operating machines 3 to 6 months after purchase without taking a license. The author of the bill says hundreds of new owners run their cars for months under dealers' license. If the new bill is made a law the secretary of state will be able to collect the tax at once. Another bill provides that every dealer have a license number for each car which he is operating outside his place of business, instead of a general license number. A third bill provides that a car purchaser may get a license from the secretary of state for the unexpired time in the year, for half price. The present law requires payment of full amount no matter how much time remains.

Improving Connecticut Roads

Passage of a bill introduced in the state legislature will provide for a bond issue of $5,000,000 for the improvement of trunk line highways in Connecticut.

Connecticut Registrations High

HARTFORD, CONN., Feb. 8—Twenty-seven per cent. more cars were used in Connecticut in 1912 than the year previous, or 17,900 were registered as against 14,000 in 1911. Revenue from motor vehicle registration in Connecticut during the past season amounted to $255,124, or an increase of about 11 per cent. over the year previous. The receipts for 1912 represent in addition to private owners 10 manufacturers, 389 dealers, 25 motorcycle dealers, 486 livery cars, and 26,241 operators.

Comparison of cost of operation of the registry departments of the states of New York, Massachusetts and Connecticut is interesting. It cost New York state 16.2 per cent., Massachusetts 14.7 per cent., and Connecticut 5 per cent. of receipts to collect fees. These figures represent net office expenses exclusive of cost of markers or license plates.

Approximately $255,000 was expended in 1912 for Connecticut road improvement.

According to the above figures emanting from the secretary of state's office motorists in Connecticut contributed more than a quarter of a million dollars to operate their cars.

Canada Wants Good Roads

ST. JOHN, N. B., Feb. 10—At an enthusiastic convention of delegates from all over the province here last night, a Provincial Good Roads Association was formed, and resolutions were passed strongly urging the government to take the roads out of politics and to provide for three trunk lines stretching across the province from the Maine border; to abolish statute labor, and to provide for a patrol system; also to appoint a competent engineer under whom all road work would be carried on.

New Indianapolis Race Entries of Last Week

Root Succeeds Wagner as Starter—Several Additional Entries Assured

Albert Guyot with a Sunbeam Racing Car Has Sent His Entry In—Third Stutz Entered

INDIANAPOLIS, IND., Feb. 10—There have been important developments in the last week in the plans for the 500-mile race to be held at the Indianapolis Motor Speedway, May 30. Charles P. Root has been named as official starter and assurance has been given of several additional immediate entries.

Root will succeed Fred Wagner, who has been official starter of the local speedway since it was established. Wagner is more or less in disfavor with the speedway officials at the present time. Root had warm support from Chicago and Detroit friends for the appointment.

A cablegram has been received from Albert Guyot, a prominent French driver, that an entry for an English Sunbeam racing car has been forwarded by mail. The car will be driven by Guyot. He won the light car class in the French Grand Prix of 1908 and finished fourth in the three liter race at Boulogne in 1909. The Sunbeam is a six-cylinder car with 3.5-inch bore and 6.3-inch stroke.

The Ideal Motor Car Company has entered its third Stutz car in the event, nominating Don Herr as driver. It is reported that the company is negotiating with Joe Dawson, who won last year's 500-mile race, to drive in the coming event.

European Cars for Indianapolis

PARIS, Feb. 1—(*Special Cable*)—Indianapolis will obtain the finest racing cars Europe can provide for the 500-mile race to be run on the speedway on Decoration day. In addition to the six-cylinder Sunbeam now being fitted out in England for the French driver Albert Guyot, tbe Peugeot Company, has decided to send two of its 1912 racing cars across the Atlantic in charge of Jules Goux and L. Zuccarelli. One of the cars is the big racer which was driven into first place at Dieppe with Georges Boillot at the wheel; the other is an identical car with which Goux secured first place in the fall race at Le Mans. These cars are looked upon as the fastest road racers ever built. Boillot's Peugeot showed an average speed of 68.5 miles an hour over a distance of 956 miles in the two-day Dieppe race last year; the same car clipped nearly one second off the Mont Ventoux hill climb record which had been held for 4 years by a big Brasier; at the Boulogne meeting it secured all the prizes, covering 7 kilometers flying start over give and take roads at 101.5 miles an hour; the flying kilometer at 77.6 miles an hour and the 3-kilometers standing at 86.9 miles an hour.

The motors at present have a bore and stroke of 4.3 by 7.8 inches, which gives a cylinder area of slightly more than the 450 cubic inches allowed under the Indianapolis rules. Arrangements have already been made, however, to fit a new set of cylinders with a slightly smaller bore so as to bring the cars within the limits. All other features, comprising the special type of direct operating camshaft will be retained. During the past season no attempt was made to gain speed by decreasing head resistance, even the short distance races being run without wind cutters. With wind cutting bodies and a few detail improvements it is possible to make the cars 2 or 3 miles an hour faster than at present.

The Peugeot drivers, Goux and Zuccarelli have never driven in America. Jules Goux has had his entire racing experience with the Peugeot Company. After riding motorcycles he handled the firm's long-stroke single-cylinder racers, then their light cars, and finally the 175 horsepower racer built last year. At Dieppe he had to retire, like the late David Bruce Brown, for taking gasoline away from the official station. At Le Mans he got his chance and brought his big Peugeot in first.

Eight Entries for Chicago Non-Stop

CHICAGO, Feb. 10—Eight entries for the Chicago Automobile Club's day-and-night non-motor stop reliability to Boston were secured at the show last week—something remarkable when it is considered that the contest will not take place until the latter part of June. The first was a Packard six nominated by E. C. Patterson, a private owner, while the others are two Abbott-Detroits, two Stavers and three Imperials. In addition several other good prospects were discovered and it is thought that entries will be forthcoming from the Edwards-Knight, Speedwell, Lozier, Chevrolet, Case, Alco, De Dion, Cutting, Haynes, Mercer, KlineKar, Moline, Studebaker and Havers.

The sanction of the American Automobile Association has been secured by the club, following which the entry blanks were issued. Supplementary rules approved by the A. A. A. contest board are somewhat radical in that the contest is made a free-for-all without price classification; that no time will be added for tire trouble and that the affair will run continuously day and night.

Endurance Run for Sicily

PARIS, Feb. 1—Announcement is made by Chevalier Florio, the organizer and donator of the Targo Florio race that this event will take the form of an endurance contest round the Island of Sicily on May 11 and 12. Last year this was a non-stop run, the cars traveling day and night. Owing to the danger of sending high speed cars over the mountain roads at night time, it has been decided to make the race a 2-day event, the first day's run being from Palermo to Girgenti, and the second day's event the continuation of the run from Girgenti to Palermo. The race will be run under the rules of the Automobile Club of Italy. Last year the Targa Florio was won by an Englishman, Cecil Snipe, driving a Scat car.

Joscelyn Proposes Increased Garage Rates

Louis J. Joscelyn, the proprietor of the New York garage bearing his name and president of the New York Garage Owners' Association, has suggested in a letter to the garage trade that the storage rates on all automobiles be raised $5 per month. He maintains that at the present storage rate it is well nigh impossible to profit on the garage business proper, so that the owners are forced to make a relatively high profit on the gasoline sold by the garages. The proposed remedy, according to Captain Joscelyn, would enable the garage owners to make a sufficient profit on the cars storage and would work out to the advantage of owner and garage man alike in the long run.

A. C. A. Keeps Laboratory

At a meeting of the board of governors held last Thursday it was decided that in view of the fact that one of the objects of the club is to encourage research work, the laboratory of the Automobile Club of America will be continued. The laboratory will be run on a more economical scale. A large deficit caused by the laboratory being idle for a part of the time will be avoided in future and more effort will be put into commercial work. It had practically been decided that the laboratory was to be abandoned and turned over to the S. A. E. or some other institution —perhaps a university.

Chicago Show Half Over —Increase in Attendance

N. A. A. M. Decides Upon Holding 1914 Exhibition in That City

Also Discussed Merger with the Automobile Board of Trade, But No Action Was Taken

CHICAGO, Feb. 10—The first half of the Chicago Show, that devoted to the pleasure cars, came to a close Saturday night and it now is stated that the attendance showed an increase of something like 10 per cent. over the same week last year. The first two nights of the show brought out a smaller attendance than usual, just as it did at New York, but every night after that showed an increase over last year. The attendance of dealers was the remarkable part of it all, there being 3,800 agents registered, 800 more than last night, of these, fifteen or twenty came from as far away as New Zealand, Vancouver and Berlin.

The Chicago show will be held in 1914, although some makers have been against it. That has been officially decided upon by the executive committee of the national association of automobile manufacturers, which held a meeting last Wednesday and formally listed next year's event. This action was not precipitated by the letter sent out by Colonel Pope to the motor industry and that letter did not come before the meeting in a formal manner, although it was informally discussed. Colonel Popes' epistle was devoted to arguing against showing as being too expensive, the claim being made that shows in this country have outlived their usefulness.

The N. A. A. M. also discussed the merger with the automobile board of trade but no action was taken.

It looks as if the deal would go through and the Automobile Chamber of Commerce be the result. At the present time signatures of members are being secured. More than 70 out of 103 have been landed. The association appointed W. L. Day, of the General Motors, on the Commercial Vehicle Committee, and also made him its vice-chairman.

Edwards Gets Findlay Plant

FINDLAY, O., Feb. 8—Because J. G. Cleary, of Milwaukee, Wis., who bid in the plant at receiver's sale at $50,000, could not furnish the court's stipulations, the Findlay Motor Company plant has been transferred to W. W. Edwards, of Leipsic.

Rubber Market Continues Quiet

There was an absence of new developments of importance in the crude rubber situation yesterday either at home or abroad. The markets on both sides of the water were quiet. On the eve of the fortnightly auction of plantation rubber which opens in London February 12, consumers were generally holding aloof from the markets, while there was apparently little trading of a speculative character in progress. In London prices moved in a narrow groove. The ruling tone was fairly steady, the lack of any demand of importance being offset by an absence of pressure to sell. In New York City, the market was quiet, with the dealings apparently confined to a few small parcels. Fine upriver Para sold at $.99 1-2 a pound, and coarse at $.76.

New Car for Canada

ST. JOHN, N. B., Feb. 10—The Maritime Six has made its appearance. It has been specially designed to negotiate road conditions in Canada. The Maritime Motor Car Company, Ltd., plans on turning out between 200 and 300 of these cars this year. At first their factory will only be used to assemble and put together the parts of the car, which will be manufactured elsewhere, but it is intended as business develops to arrange for the manufacture of different parts until the whole car represents the product of the factory. The company's factory, covering 2 acres of ground, is the largest in Canada, and in its arrangements is one of the most up-to-date on the continent. It has a capacity of 1,000 cars per year. The management expects to have 100 men employed in the factory this year.

Twenty-Seven Makes at Madison

MADISON, WIS.—Twenty-seven different makes of cars will be on display at the third annual Madison motor show, which will be given by the Madison Automobile Dealers' Association in the New City Market building on February 18 and 19. This is the largest number of exhibits ever made here. Madison dealers are searching for a larger exhibition hall, but at present there is none in sight.

Denver Show Committee Busy

DENVER, COL., Feb. 10—Preparations for the twelfth annual Denver Automobile Show, which is scheduled for March 3-8, in the Municipal Auditorium, have reached a point where the success of the exhibition, both artistically and financially, is practically assured. Already the representatives of more than half of the cars handled in the Denver territory have signed for space on the main floor.

Manager N. H. Van Sicklen, Jr., who is now in Chicago attending the National Automobile Show, wires that several of the pleasure car exhibits now on display there will be transferred entire to Denver for the week of the show.

Automobile Securities Quotations

Among the principal developments of the week was the new advance of Miller Rubber, which rose 40 points. Consolidated preferred gained 28, closing at 106, while its common stock, like Firestone common rose 2 points. Swinehart fell off likewise, and the same applies to the price asked for U. S. Motor common and second preferred while the first preferred rose 30 points with no bid.

Show Doings at Various Cities Throughout States

Many of the Smaller Shows Have Announced Their Opening Dates

Committee Decides Chicago 1914 Show Dates Will Be About Same As This Year

HARTFORD, CONN., Feb. 9—The sixth annual car show of the Hartford Automobile Dealers' Association, conducted under the auspices of the First Infantry, C. N. G., was officially opened at the State armory, Saturday evening by Mayor Cheney. Present indications are that the show will be larger and better than previously. There is more of a business aspect about this year's show than formerly. Thirty-five makes of gasoline pleasure cars are shown, nine of which are new comers, six different makes of pleasure electrics are displayed, three of these are new arrivals. Thirteen different makes of gasoline commercial cars are shown, several of these were never before shown in this city. The showing of electric trucks covering two different makes is most complete and one make of industrial electric truck is displayed.

Brooklyn Show to Be Splendid

The Brooklyn, N. Y., show, under the management of the Brooklyn Motor Vehicle Dealers' Association, will surpass in magnitude and splendor all previous exhibitions held in that city, unless indications cannot be trusted. The show will open on the evening of Washington's Birthday at the Twenty-third Regiment Armory, and so far seventy companies have leased spaces on which they will show a total of about 250 cars. The remaining spaces will probably be filled by the opening day, and it is expected that more cars will be seen than were at the Manhattan shows.

A unique decorative scheme will be used, the interior of the Armory being decorated as a Californian landscape, sunset effect, the entire building to be illuminated by concealed lights. The lobby will be lighted by tungsten lamps contained in transparent columns.

Ready for Richmond Show

RICHMOND, VA., Feb. 9—On Monday, February 17, the first annual automobile show in Richmond will be held in the Horseshow building and will continue for the entire week. The show will be given under the auspices of the Richmond Automobile Dealers' Show Association and more than 100 cars of all kinds and sizes will be on exhibition.

Spaces Alloted for Syracuse Show

SYRACUSE, N. Y., Feb. 8—The Syracuse Automobile Dealers' Association held a meeting Monday night to decide space allotments for the annual motor car show at the Armory late in the present month. There were 100 spaces to be sold, 75 per cent. of which had been applied for by exhibitors in this city and other parts of the state. However, manufacturers throughout the country will be represented in the exhibits. It has been decided to require all exhibitors desiring guest tickets to pay for them in advance and the money for all those not used will be refunded after the show.

Same Dates for 1914 Shows

CHICAGO, Feb. 7—At the regular monthly meeting of the executive committee of the National Association of Automobile Manufacturers, Inc., held at the First Regiment Armory, the members voted unanimously to hold the 1914 show on dates corresponding with those of the present season. The drawing takes place early in October.

The members of the committee present were:

Wm. E. Metzger, Metzger Motor Car Co.
S. T. Davis, Jr., Locomobile Co. of America.
H. H. Rice, Waverly Co.
H. O. Smith, Premier Motor Mfg. Co.
Charles Clifton, Pierce-Arrow Motor Car Co.
Hugh Chalmers, Chalmers Motor Co.
L. H. Kittredge, Peerless Motor Car Co.
W. C. Leland, Cadillac Motor Car Co.
S. A. Miles, General Manager, N. A. A. M.
J. S. Marvin, General Traffic Mgr., N. A. A. M.

W. L. Day, General Motors Company, was appointed a member of the commercial vehicle committee, and made its vice-chairman.

The association has undertaken to ascertain what manufacturers intend to exhibit at the Panama-Pacific Exposition in a separate building to be known as the Automobile Palace. It was reported at the meeting that a large number of members had already made favorable responses.

Harrisburg Show in March

HARRISBURG, PA., Feb. 8—Plans are in progress for the annual automobile show of the Harrisburg Dealers' Association, Harrisburg, to be held in the Rex garage and Arena theater, Third and Delaware streets, March 15 to 22. Prospects look bright for a good show and space has already been signed for nine different makes of car. The two spacious halls will provide 17,000 square feet of floor space for the various automobile and accessory exhibits. A feature of the show will be a truck exhibit, which will be held in the Rex garage building.

Market Changes for the Week

Tin was stronger in tone and again higher at London and sympathetically stronger in the local market. In the open market trading was light and spot tin was nominal at $49.63, a gain of $.93 for the week. Both coppers and cottonseed oil experienced changes, the former losses and the latter a gain. Lead remained quiet and easy, calling for $4.30 per hundred pounds. While there was an undercurrent of steadiness on the cottonseed oil market yesterday, it could not be said that the price changes were especially significant, rising $.01, closing at $6.33 per barrel.

Domestic scrap rubber remains in a steady position. Reclaimers are absorbing moderate quantities and fair clearances are noted from the seaboard for various foreign countries. Automobile tire scrap remained constant throughout the week closing at $.09 7-8. The market for refined petroleum continues strong, influenced by the recent advances in crude oil. The price of crude, Pennsylvania and Kansas wells, is $2.50 and $.88 resp.

Threefold Advantages in Sight by Finishing Motor Vehicle Bodies by Schoop Method Rather Than with Paint and Varnish—New Charging Valve in Two-Cycle Motor—Another Convert to Mixing of Air and Fuel in the Jet—Wheels

SCHOOP'S Metallizing Method For Motor Vehicle Bodies—As automobiles travel farther and faster than ordinary carriages and are bespattered with mud and begrimed with dust in much higher degree, the problem of keeping them looking new and neat is one which presents grave difficulties so long as ordinary coach varnish, or any similar unmechanical substance which is soft and sensitive and can be renewed only in its entirety and by a costly and time-consuming process, is employed for the exterior coating of the vehicle body. In the case of motor trucks and delivery wagons, even ordinary paint is found unsuitable for the purpose, as it becomes shabby very quickly and a good fresh coat of paint cannot be put on over night, nor in patches, and it is expensive and inconvenient to take the vehicle out of commission—so much more expensive, as compared with former conditions, as each motor vehicle takes the place of two, three or four of the vehicles formerly used and also requires repainting three, four or five times as frequently in order to present a similar degree of neatness in appearance.

With these things in view, any new method for finishing the bodies of automobiles and commercial motor vehicles with a smooth and sightly substance, less sensitive to dirt and dust than paint and varnish, seems to command careful investigation of its possibilities, and the Schoop method for metallizing almost any surface by means of a hot metallic blast is prominent in this respect, partly because it has already attracted the widest attention in technical, industrial and financial circles and partly because its further development seems to hold out a promise that it will soon become possible by means of it not only to cover a wooden or metallic surface with a hard, smooth and non-rusting metallic coating, as now can be done with great rapidity, but also to mix coloring matter into such a coating and to obtain any desired color effect without additional labor or skill. Other applications of the method to finishing work and other purposes of interest in the automobile industry will be apparent from the following notes on the subject by Engineer Steinacker in *Elektrochemische Zeitschrift.* He writes in substance:

The idea of producing coatings by a spraying method is not altogether new. Coloring matter and mortar, for plastering, have been sprayed onto a surface by means of suitable apparatus and compressed air for some time past. The air brush device is in this class. The desire to do the same with metals was natural, but its realization met with practical difficulties, and the industrial world had to fall back upon electroplating for this class of work until U. M. Schoop, a well-known electrochemist of Zürich, Switzerland, devised a method which in the main consists in hurling finely comminuted metal against the object to be coated with great force and by means of gases or vapors which are either inert or at least not highly oxidizing. The manner in which the spray of metal is produced is not of importance, so long as it is fine enough and is thrown out with sufficient force. The speed with which the spray leaves the nozzle of his apparatus rises, with a working pressure of 20 atmospheres, to 1,500 meters per second and, as the particles of metal, when they strike the surface to be coated, are not yet fully solidified but remain plastic for a few moments, they are welded into a perfectly homogeneous and adhering film under the high pressure of the stream. It was the casual observation of the fact that a lead bullet when shot against a hard, smooth wall, forms a smooth and adhering film which led Schoop to the working principle of his invention.

Naturally, the easily fusible metals are most readily used with this process, if only because a moderate gas pressure is sufficient in handling them. But the chemical and physical properties of each metal are also to be considered, as well as the thickness of the intended coating and the nature of the surface to be coated. And therefore experiments extending over several years were necessary before the method could be declared industrially ripe.

Many interesting facts were ascertained during these experiments. It was shown that fused metal is cooled to 60 deg. C. or lower when atomized by certain highly compressed gases, and to this fact it is due that even substances which are readily ignitable, such as paper, wood, textiles, celluloid and dynamite can be so metallized. It was also found that the films have the same density as the normal metal and that tin, for example, when sprayed on in this manner, has a hardness of 14.2, by Brinell test, while cast tin has only 9.5. Furthermore, if the surface to be coated is properly prepared, the film adheres so closely that it can be worked as part and parcel of the substance itself.

It follows from these properties that the process is of interest to nearly all branches of industry, affording the means for protecting any finished article against rust, moisture and similar influences or giving it an ornamental coating in one of the art metals and also being particularly adapted for taking impressions for use in the making of matrices and dies. In the electroplating industry it renders it possible to do in a few minutes what has so far taken days.

As it has also recently become possible to produce convenient, simple and portable Schoop apparatus (see THE AUTOMOBILE of Jan. 9, page 163), any industry and any factory is enabled to take up the process.

It is one of its advantages that it renders it possible to apply coatings of aluminum, a metal which so far could not be used in this manner, and it can be used for purposes of soldering or welding, taking the place of autogenous welding in some instances, as in the production of seamless tubing from sheet metal.

The wide scope of the process has been recognized all over the world. The possibility of protecting wood which is to be exposed to the weather or moisture by a single treatment lasting for all time and of saving the paint in the case of bridges and ships has proved very attractive commercially, and large syndicates have been formed, first in France, then in Belgium and very recently in Mexico, which have acquired the inventor's patents for the respective countries and in turn dispose of apparatuses and license to use them within their territories. The license fee is scaled according to the number of apparatuses and their capacity in each instance, so that even concerns which are not vitally interested can make use of the method. Negotiations are already under way in all industrial countries looking to the exploitation of the method on a large scale, and it can therefore not be considered too early for any industry in which the process is needed, or in which it may be applicable in a modified form coming within its possibilities, to investigate these possibilities now.—From *Elektrochemische Zeitschrift*, January.

Elegance of Lines—Even some of our greatest firms might derive some inspiration from studying the graceful lines which characterize the design of mechanical parts in all Italian cars.—From *Omnia*, (Paris).

—

TWO-CYCLE Motors—No design of two-cycle motors has yet been accepted as standard by the industry or by the public, but the mere fact that they belong among valveless motors, in so far as no poppet valves are used in them, has pushed them into the technical limelight in Europe and has drawn attention to the performances in long-distance racing which stand to the credit of two two-cycle motor cars, the Koechlin and the Côte. Their reliability, under racing conditions at least, has been demonstrated, and those who promote sleeve-valve and rotary valve motors point to this among other developments in support of the contention that poppet valves can be dispensed with and that the mechanical resources for simplifying automobile motors have not by any means been exhausted. The great development which has taken place in two-cycle Diesel motors for stationary as well as for marine work has also tended in the same direction. On the other hand, the question of combining the rotary valve or the sleeve valve with the two-cycle mode of operation has come up for consideration and attempts have been made—one of them reported as successful—at applying the two-cycle principle in aviation motors with rotating cylinders. Under these circumstances an improvement recently introduced in the Côte motor and which relates directly to the distribution of the gases and the avoidance of fuel waste, gains timely interest. As drawings showing it incorporated in the motor are not available, this new device is shown separately in Fig. 2, while Fig. 1 shows two sectional views of the Côte motor to which it has now been applied. The operation of the Côte motor is described substantially as follows:

The pistons in this motor are of the two-story variety which has been generally adopted since the practice of first drawing the explosive charge into the crankchamber was abandoned (mainly to avoid leakage at the end-bearings of the shaft and exudation of lubricating oil at the same place), and an annular space between the lower portion of the piston and the wall of the enlarged cylinder serves for storing the gas charge until it can be transferred to the combustion chamber. When the piston descends, it causes a suction from this annular chamber which draws the gas mixture from the carbureter by way of the channel J and through the check valve K and pipe T. At the same time the upper portion of the piston has uncovered the exhaust port O, allowing the burnt gases to escape through pipe Q, and almost at the same moment it has also uncovered the port N which communicates with the reservoir M and the combustion chamber receives from it, while still exhausting through port O, a fresh charge of gas coming from the annular chamber of the other cylinder, in which the piston is just completing its upstroke, so as to drive the contents out of said annular chamber and into said reservoir M. The new charge in the first cylinder is guided toward the top of the combustion chamber by the deflector plate H on top of the piston, and the experience gained in the matter of shaping and dimensioning the deflector and the ports has advanced to such a point that the incoming charge assists in driving the burnt gas out without becoming mixed with it to any great extent at the normal or higher motor speeds. But at much reduced speeds it has never yet been found possible to avoid a loss in efficiency from this cause and a resulting smaller flexibility of the motor under the throttle, as compared with four-cycle motors. In the illustration B is lower portion of the piston surrounded by the annular suction and charging chamber, L and M concentric reservoirs connecting the two co-acting cylinders, R the port of entry for the cooling water, S a breather, *ef* helical gears controlling the magneto F, *d* the spark plug, *h* the return conduit for used lubricating oil.

The improvement by which the economy and flexibility of this motor are to be secured under all conditions of operation takes the form of a shuttle N, Fig. 2, comprising two steel plates *p* and *p'* connected by a rigid tubular bar and adapted to be moved to and fro in the cast cylinder F. This cylinder is closed at its two ends B and B' and is broken by three rows of circular openings O, O' and O'', so spaced apart that only two of them can be between the end-plates of the shuttle at the same time. The diameter of the openings equals the thickness of the plates. The middle row is connected with the carbureter by a circular conduit, while the two others are connected in the same manner with each of the motor pumps (the annular chambers in Fig. 1).

The operation is as follows: Suppose the motor starts from the position shown in Fig. 1, with the shuttle in its middle position and the pump to the right beginning to compress its charge. The shuttle is at once pushed to the left under the pressure of the gas and opens at the same time the channels O and O' so as to connect the pump in the other cylinder, which at that moment works at suction, with the carbureter. It also compresses the gas at M between its front plate and the bottom B of the distributor cylinder, and its motion continues until this compression equals that which drives the shuttle. Now, as soon as the motor piston uncovers the ports in the cylinder walls, the pressure in the corresponding pump falls at once and the air cushion at M expands and drives the shuttle back to its middle position. The work of the pumps is then reversed and the shuttle travels in the opposite direction under the pressure from the pump of the left cylinder.

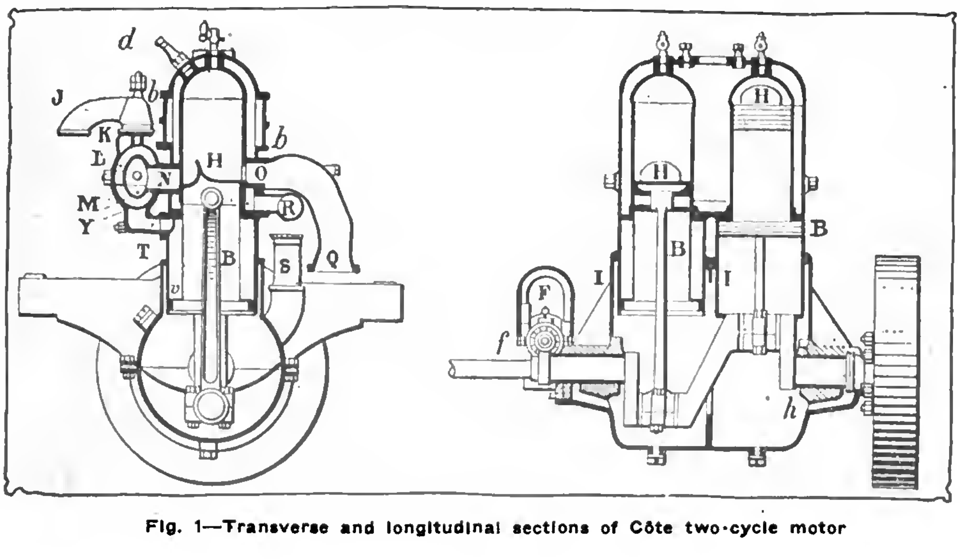

Fig. 1—Transverse and longitudinal sections of Côte two-cycle motor

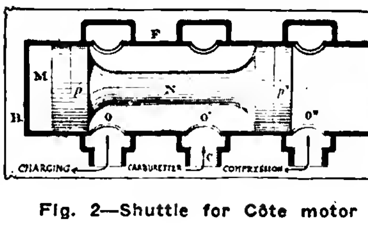

Fig. 2—Shuttle for Côte motor

As the shuttle is always held between two gas cushions there are no shocks or noise. [It is not stated, however, what means are employed for making sure of finding the shuttle in the right position when the motor is to be started.—Ed.]—From *La Vie Automobile*, January 2.

REPRESENTATIVE Carbureters—In a brief review of the progress recorded for the past year in the different construction features of automobiles, there are mentioned several carbureters as exemplifying the trend of progress. Among these the "Jarnac" and the Brewer have been recently described in the columns of The Automobile. One of the Longuemare models and the Langeron are also among them and are illustrated in Figs. 3 and 4. The features of the Longuemare are briefly as follows: The jet is a double concentric one, the outer annular channel G serving for normal motor speeds and

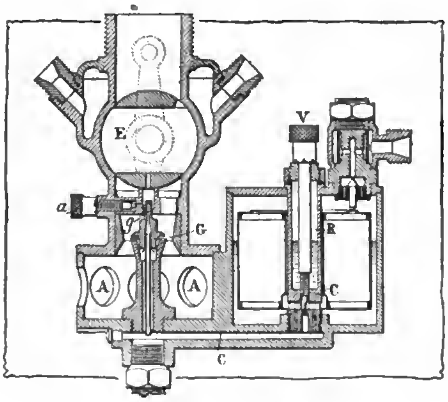

Fig. 3—Longuemare Carbureter

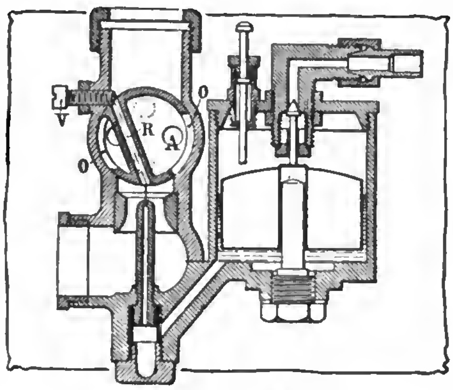

Fig. 4—Langeron Carbureter

the central channel g for keeping the motor running idle at minimum speed when the car is at a standstill. The air feed for the latter is subject to adjustment by the screw *a*. As shown in Fig. 3, it remains in action when the throttle is completely closed. The normal air intakes AA are not varied, but the gasoline feed can be regulated to suit the motor by the screw V. The fuel conduit C is in communication by special small perforations, shown in dotted lines, with a cavity R which is independent of direct regulation by the float action and forms a fuel reserve useful for accelerations and starting. It also has another function. At high motor speeds it is drained by the strong suction without having a chance to fill up from below, and then air is sucked in through the perforations referred to and is mingled with the fuel in the jet G, so as to assist in atomizing it and also holding its proportion to the air down to what it should be. The new Longuemare represents thus another conversion among the old-time makers to the new principle of mixing air with the fuel in the jet. An arrangement for heating the induction pipe from the cooling water or the exhaust gas is noticed above the throttle in the illustration.

The Langeron carbureter, Fig. 4, seems to represent simplicity and economy in design. It has only a single jet, but the throttle drum has a cross-channel R, whose section may be regulated by screw V, and the suction from the cylinders acts through this channel alone when the motor is completely throttled down, the illustration showing the carbureter at this adjustment. When the throttle is opened up and the suction takes effect through openings OO, the apertures AA in the flat side walls of the throttle drum register more and more completely with similar apertures in the carbureter wall.

In the Brewer carbureter, as in the new model Longuemare, the air and gas passages are of constant section and the automatic regulation takes effect on the liquid fuel only.—From *Le Génie Civil*, January 11.

ABOUT Wheels at the Shows.—The metallic wheel dominates but the wood wheel defends itself. The public likes the strength of the former and the form of the latter. This explains the success of the Sankey wheel which combines both features and is seen almost everywhere. The demountable wheels are becoming numerous and are getting better every day. The great specialists in this line, Rudge-Whitworth, Hall, Dunlop, RAF and Riley have accomplished marvels in mechanical construction and their means for locking the wheels in place vie with each other in shrewdness and subtility. On the other hand, certain car builders have equipped their chassis with demountable wheels of their own devising and of enchanting simplicity. In the *Zèbre* car, for example, the wheel is locked simply by means of the hub cap which is screwed upon the end of the axle. To prevent the cap from budging, it is provided with a number of cogs, and the hub is provided with similar cogs but one more of them. If there are five cogs on the cap and six on the hub, for example, a one-thirtieth part of a turn will bring two cogs in line, and the hub carries an elastic split-collar with a pin, and when two cogs are in line this pin is passed through them. It is held by the elasticity of the collar.

The demountable rim battles constantly against the demountable wheel, having in its favor lightness and cheapness. But it is sometimes difficult to operate.

An interesting wheel is shown by Riley, in which wire spokes are inclosed in rigid tubular steel spokes, as shown to the left in Fig. 5. The wires work under tension and the tubes under compression. The rigidity of the wheel as a whole is absolute and its lightness is remarkable. Perhaps it is the wheel of the future. In another Riley wheel a wire spoke is passed through a central bore in each wood spoke, as shown to the right in Fig. 5 and the appearance is that of an ordinary artillery wheel, excepting that the rim is metallic and light.—From *Omnia*, January 4.

Traps in Steel Testing—Careful experiments have shown that the customary tensile tests of steel specimens in themselves affect the steel which is being tested and that the Brinell test does the same. Even tests by scleroscope cannot properly be repeated in the same spot without showing a greater hardness than the untested steel possesses. The error seems to average larger for the elastic limit than for the ultimate strength.

Austria has now imitated Germany in imposing a tax on motor tourists. For an automobile or a motorcycle the owner is to pay 40 cents per day. The automobile can stay for three months before it becomes subject to the ordinary annual taxation but the motorcycle only one month.

Motor Hearses Now Silent—Success in the mechanical campaign for silent automobiles has resulted, among other things, in a boom for the motor hearse in European countries.

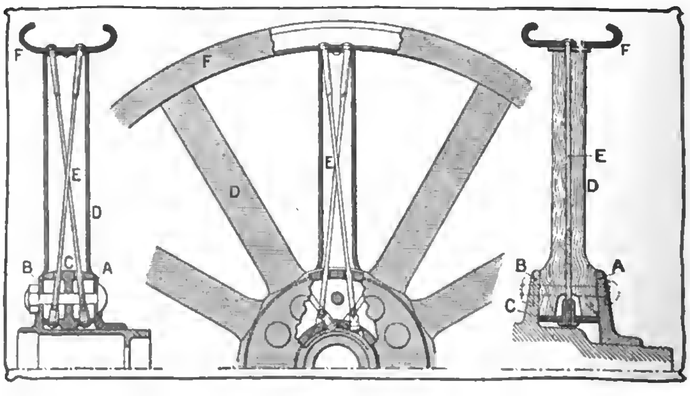

Fig. 5—Riley combined wire and tubular or wood wheel

Communications from The Manufacturer

Metallurgy of Shafts and Rods and Comparative Analyses—Cost of Running an Electric

SPRINGFIELD, O.—Service tests of chrome-vanadium and nickel steel shafts of identical design, and on the same car, conducted by the Kelly-Springfield Motor Truck Company, demonstrated conclusively the greater strength of the chrome-vanadium steel.

As a result of the tests, chrome-vanadium steel was adopted for jackshafts for their different truck chassis, from their 1-ton truck up to the heaviest model.

In making these tests, they equipped a 1-ton truck with a chrome-vanadium steel jackshaft on one side and a nickel steel jackshaft on the other.

The two shafts were identical in design. They were 1.37 inches in diameter and 24, 25, 32 inches long. The chrome-vanadium shaft was manufactured by the Carnegie Steel Company, and was of the steel company's "A Regular" type and heat-treated in accordance with their standard practice.

The method of conducting the tests for the details and results of which we are indebted to the Kelly-Springfield Motor Truck Company was as follows:

A 1-ton truck was rigged up with a 2-ton load, as shown in the accompanying photograph. It was then run continuously night and day for a period of three weeks, during which it was subjected to all possible strains. From the illustration which shows the truck after the completion of the test, it is evident that some "hard going" was experienced.

At the end of the three weeks constant driving, the nickel steel shaft showed a very perceptible twist, while the chrome-vanadium shaft showed no effect whatever from the strains.

All conditions being absolutely identical, the results were directly comparable and furnish indisputable proof of the greater strength of the chrome-vanadium steel.

This shaft was made to the following specifications for chemical composition and physical properties:

CHEMICAL ANALYSIS

Carbon	0.24 to 0.30 per cent.
Manganese	0.35 to 0.65 per cent.
Phosphorus	under 0.04 per eent.
Sulphur	under 0.04 per eent.
Silicon	under 0.20 per eent.
Chromium	0.75 to 1.25 per eent.
Vanadium	0.16 to 0.20 per cent.

PHYSICAL PROPERTIES

Elastic limit, lbs. per sq. in.	120,000
Tensile strength, lbs. per sq. in.	130,000
Elongation in 2 in., per cent	23.8
Reduction of area, per cent	49.4

Because of the superior merits of vanadium steel as shown by these tests, this type of alloy steel has been adopted for a number of the other parts of the truck, which are subjected to the greatest strains. Among these are the propeller shafts and the connecting rods.

In the latter case, vanadium steel was used in order to keep the weight of the reciprocating parts down to a minimum.

By the use of vanadium steel, a rod of lighter section is safely employed than would be deemed advisable if made of carbon steel.

For their 40-horsepower motors, a tapered channeled rod, 14 inches center to center is used. The flanges are .156 inches thick and the web .187 inches thick. At the crank pin end, the section is 1.625 inches deep with 1.125 inches width of flange. From this, it tapers to 1.125 inches depth and .875 inches width of flange at the other end.

In their 30-horsepower motors, the rod is similar in design, but of lighter section and 11 inches long. In this rod the flanges are .635 inch wide and .125 inch thick and the web .187 inch thick. At the crank pin end, the section is 1 13-32 inches deep, tapering to 1 1-32 inch at the opposite end.

The connecting rods are made to the following specifications for physical properties:

Elastic limit, pounds per square inch	100,000 to 110,000
Tensile strength, pounds per square inch	120,000 to 130,000
Elongation in 2 inches, per eent	20 to 22
Reduction of area, per cent	50 to 55

—KELLY-SPRINGFIELD MOTOR TRUCK COMPANY.

Running Expense of Electrics

The Woods Company have seldom published figures covering maintenance cost because none can be given which would be any criterion for the intending purchaser. Many people who use their electric machines a great deal find it costs them less than some of their friends who use their machines very much less. Some owners charge their batteries too often. By this I mean they put their cars on charge when there is sufficient current still in the batteries to give ample mileage for another day's use. This too frequent charging not only adds unnecessarily to the expense of operating, but also shortens the life of the battery needlessly. For these reasons the table of actual expenses which I am giving, while it is fairly typical, is not in any respect a standard upon which to base an estimate of probable cost in any other case. Some owners could show figures very much lower than these, while others, through lack of attention to the simple details of proper charging, etc., have made their expenses much higher than there is any need of.

The following statement sent in by Mr. More, of Sioux City, Iowa, represents the total expense for electric current during the past 2 years:

TWO YEARS' RUNNING EXPENSE

1911		1912	
January	$5.48	January	$2.51
February	1.00	February	3.45
March	1.48	March	2.00
April	3.76	April	3.00
May	7.85	May	2.00
June	8.78	June	3.30
July	7.75	July	4.85
August	6.50	August	3.40
September	3.19	September	3.20
October	8.66	October	4.85
November	4.34	November	2.00
December	3.55	Total for 2 years	96.90

In submitting this statement Mr. More states, in a letter dated December 3, 1912, that Mrs. More uses her Woods Electric on every possible occasion it seems to him, and says further that there was no other expenses for operating the car other than included in the above table.—LOUIS E. BURR, Woods Electric Company.

Care of Spark Plugs

NEW YORK CITY—The following hints and spark-plug don'ts are given to autoists:

Don't fail to wash the plugs with gasoline, using a stiff brush and scour the electrodes lightly with fine emery cloth.

Don't forget to remove all particles of emery before replacing plugs.

Don't forget to carry extra plugs and whenever one is used be sure and replace those used.

Don't throw your old plugs or your extra ones, in the tool box or locker with a lot of old junk, keep them in a wooden box first having greased the threads to prevent rust and then securely wrap each one in cloth. Porcelains are easily cracked and electrodes easily bent by rough handling.

Don't let a bunch of loose heavy wires drag and pull on your plugs, support them or encase in fiber tubing.

Don't treat them like a nut, treat them like a watch.

Don't fail to examine daily for dirt and breaks.

Don't forget to use kerosene on the threads if the plug sticks.

Don't buy cheap unreliable plugs.—EMIL GROSSMAN.

The Engineers' Forum

Exhaust Gas Analysis

Engineers Discuss Value of Analyzing Exhaust Gases To Determine Engine and Carbureter Efficiency

Opinions of Breitenbach, Marshall and Chase—All Experts in This Work

Part II

NOTE—These discussions by leading engineers are from stenographic notes taken during the recent session of the Society of Automobile Engineers in New York City, when this pertinent subject proved one of the most interesting of the meeting.

NEW YORK CITY—I agree with Mr. Hewitt that power loss is due to the globules forming and due to condensation in the manifold. Another reason for power loss is the explosion chambers of our engines are too large. In order to get a proper explosion heat it has to be highly compressed. Now to compress it it requires a smaller chamber. I am sure if you would try the smaller chambers you would see you would have a better gas.

Another cause for poor combustion is due to the valves. Often a valve will not close early enough; and supposing the gas has just exploded in cylinder No. 1, this exploded gas comes out through an inlet manifold and mixes with the gas which is to explode in cylinder No. 3. Now cylinder No. 3 is not getting the same explosive medium as cylinder No. 1, due to having this partly exploded gas mixed in with the unexploded gas. I think that better results could be gotten if the explosive chambers were smaller and we have large exhaust valves.—J. M. Breitenbach.

Best Results Contained No Oxygen

New Haven, Conn.—I have made a good many tests on the exhaust gas analysis, and on different motors of different kinds, running under different road conditions and at different speeds and different speeds of transmission and different speeds on the road, running at different times, and my analyses have followed very closely those of Mr. Hewitt. The best results I got from any car were about 13½ per cent. of CO_2. and practically no oxygen and no CO.

In connection with my experiments I measured the gasoline at the same time to see whether this car was using gasoline in proportion to the amout of CO that appeared in the exhaust. And the worst offender in this case backed up my conclusion that you can make an exhaust gas analysis and find that you have got about 5 or 6 per cent. of exhaust, and you have got a car that is running about 4 or 5 miles to the gallon. If you get an exhaust gas analysis that is in the neighborhood of 12 to 13 per cent. CO_2 and varying amounts of CO, O, that is, all small, and little free oxygen, you have got a car that is running 3 or 4 times as much. That is, the distance it will cover per gallon. I won't say it is in direct proportion, because that is not so, but it bears a close relation to the amount of CO in the exhaust.

The method of making exhaust gas analyses is not so complicated that any one need feel any apprehension about undertaking a gas exhaust analysis. He has got to be able to read the Dorsat and he has got to be able to get his gas into his apparatus without getting any air mixed with it, as I have found that out to my sorrow in one or two cases; and he has got to be sure that his apparatus is in good condition and his cylinders are in good condition.

The method of making exhaust analysis for the purpose of determining whether your mixture is right or not seems to me to be the only way of finding out whether you have a carbureter which gives you good mixture or not. The car that used the most gasoline had the worst percentage of CO, and a very large percentage.

Another point is to take an exhaust gas analysis when the car is standing idle. You will find cars running at garages and chauffeurs will tell you that it does not use any gasoline. You take an analysis of that exhaust and you will find anywhere from 5 to 6 or 7 per cent. of CO. If that is the case that car is probably using just as much gasoline when it is running idle as it would use in the same length of time when it is running on the road. If that is the case the gasoline consumption of that car when it is standing idle will be very much, and due to the fact that it is running without any load on the motor.—Prof. W. C. Marshall, Yale University.

Many Samples Improperly Taken

New York City—I think a great many of the difficulties which have arisen by people using the gas analysis to determine the efficiency of the motor was that the sample was improperly collected. I made a good many mistakes myself that way when I started, and I have been able to overcome that largely by properly collecting the sample. If, as I say, you collect the sample by simply allowing the gas to blow through it you are not at all sure of getting a fair average sample. Dr. Lloyd told me in a talk the other day that he had similar experiences himself when he started to take samples of exhaust gas from the motor. This is very important that you collect the samples properly, in such manner as not to get oxygen from the outside and also so as to get a good, fair average sample. Your results will surely be very confusing if you do not attend to that point.

Another difficulty is that if you attempt to take a sample by letting it flow quickly through the collection tube you are likely to get a sample which is not a regular sample of the whole run. There may be an instance in which the combustion in one cylinder has not been complete, does not show up by missing; there is no evidence of it, and yet probably there has been a little different combustion than you get as a rule with four, and hence as a result you might get less gas in that cylinder here and get a sample which would not be true for a sample. I have adopted the practice of displacing this water in this collection tube, taking enough time to be sure to get an average sample. Of course you can do that as slowly or as rapidly as you wish, according to the length of run.

I make it the practice to take the sample at the top of the exhaust pipe, as close to the motor as possible, in order that there may not be any after-burning in the exhaust pipe. Of course the only effect of combustion is what takes place in the cylinder, and that is what we want to learn something about. I use a waterjacket around this pipe simply for convenience, to keep those connections from getting so hot that it would burn the ordinary rubber hose connection here.

I found very little, practically no hydrogen in any of the samples which I have analyzed from four-cycle motors. In two-cycle motors, where part of the charge flows by without ever being ignited, you of course will get hydrogen, and in that case you should make a test for hydrogen. I have used both Dr. Elliott's apparatus, which is very good, and the Orsat apparatus, which is not so accurate, but which is rather faster to use, and for that reason it serves my purpose better when I am not looking for accuracy greater than 0.1 per cent.

I have found this method of procedure, that is, measuring the air and the gasoline, and then taking the samples of the exhaust gases, a good way of comparing mixing devices, of which there are a good many on the market. If, as is claimed, you really get more power with one of those mixing devices, it should show up in giving you more complete combustion. It is therefore of considerable use in that connection.—Herbert Chase, A. C. A. Laboratory.

New French Power Rating

New York City—Editor The Automobile:—I notice that the horsepower formula which it is proposed to adopt in France for taxation purposes rates a four-cylinder motor 25 per cent. lower than a single-cylinder motor; that is, when the bore, stroke and most efficient motor speed should give the same power for the four-cylinder as for the single-cylinder motor, the rating is changed by varying a numerical coefficient 25 per cent.

In a six-cylinder motor the deduction would on the same principle be about 33 per cent.

I believe this manner of rating corresponds with the variation in fuel efficiency ascribed to motors, according to their number of cylinders.

Now, assuming this to be correct, I would like to have you tell me what share in this loss of efficiency, due to an increased number of cylinders, comes under the head of greater thermic losses—due mostly perhaps to the smaller sizes of the cylinders—and what other share must be ascribed to proportionately greater mechanical friction?

At this juncture, when the question of fuel economy is so prominently before the public, it would seem to be interesting to know through what necessity it is that we so freely consent to waste fuel at the bunghole—the multicylinder construction—while striving assiduously to save it at the spigot—the carbureter.

For example, is it just to avoid the heavy flywheel and the old familiar chug-chug that we put four-cylinder motors in our heavy trucks, or is it possible to demonstrate a reduction of the wear and tear through the use of the four-cylinder type: a reduction compensating for greater first and maintenance cost?—Maurice C. Crosby.

Temperature Excites Unusual Interest

Worcester, Mass.—Editor The Automobile:—Professor Jones in your issue of December 26, 1912, asked "What the temperature of a cylinder is" and for his benefit I will state the following: The temperature of an automobile engine cylinder is a variable quantity, depending upon the particular point in question and the condition of operation. No definite value can be given. It may be illustrated, however, by the accompanying sketch, Fig. 1—D. L. Gallup.

Flame Propagation Considered

New York City—Editor The Automobile:—In The Automobile for December 26, Professor Jones seems to think that it is possible to determine the temperature of the gases in the cylinder at any particular time or period of the stroke. If the specific heat of a gas did not vary when its temperature was raised to the extent as is the case in exploding, it would be of course a simple matter to determine that temperature. Again if the temperature were maintained for any length of time, it would be possible to determine it by simple calorific measurement. As it is such a thing is impossible. Besides the difficulties thrown in the way by the impossibility of determining the specific heat the ever changing wall temperature and the stratification that might possibly exist within the cylinder are also impediments. From our knowledge of flame propogation it must be that different temperatures exist in different parts of the combustion space at the same time. When the charge is first ignited at the spark plug, one particle of gas is fired. This particle ignites its neighbors and we can readily imagine the flame spreading away in the shape of a hollow sphere except where bound by the cylinder walls. The progression of the flame must necessarily mean that as each particle is met it is raised to the igniting temperature and therefore it is impossible to state that any one given temperature exists in the cylinder at any given time. Countless experiments have been made to determine the temperature within the cylinder at different points and the results of these experiments have been anything but uniform. The artificial circumstance of cooling water circulating about the walls and of this water being of different temperature at different points alone would throw out any results that were obtained from a purely theoretical calculation. How much the charge is preheated on entering the cylinder by coming in contact with the heated walls also interferes with the chances of making a successful determination of the temperature value.

All that we can approach with any hope of success is an average value of explosion temperatures for even the mixture varies with every stroke.

I would like to see the views of others in The Automobile as I believe this is a subject of interest to all designers.

Oakland, Cal. J. E. Shepard.

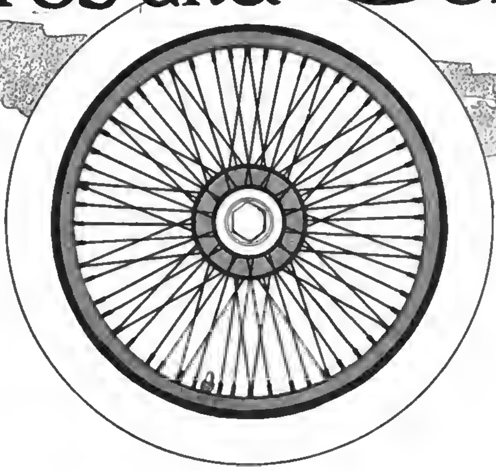
Pros and Cons of Wire Wheels



Engineer Outlines History of Wheel Development—Compares Wood and Wire Constructions

Cites Arguments Why Wire Wheels Ought to Be Introduced

PHILADELPHIA, PA.—Editor THE AUTOMOBILE—The idea seems to exist in the minds of the public and some engineers, too, that the wire wheel of 1913 is just the same, so far as use on automobiles is concerned, as the wire wheel of 1901.

As regards tire-saving qualities and resilience, this is so. That is, in principle, the wheels are the same in the fact that the axle is supported by wires from the top half of the wheel instead of being supported on wooden struts in the lower half of the wheel.

Here the likeness ceases. The wire wheel of today has been evolved by the Rudge-Whitworth company and their licensees in Europe until it is capable of carrying the load imposed by modern automobiles at any speed. The load and speed factors of today are very different from those of 12 years ago.

This firm has been for many years bicycle manufacturers, and now also makes motor cycles and wire wheels. With all its wire wheel experience in connection with bicycles, it did not succeed the first time it tried in making a perfect automobile wire wheel. The troubles were soon cured because of experience, however, and after 6 years' use in Europe the wheel is looked upon as being without a peer.

There are two elements in the modern wheel; one the structural wheel form, that is the rim, spokes and outer hub; the other the means or device to permit demountability and secure locking onto the hub. Both have been through a series of evolutionary steps, and always toward simplicity. The modern wheel is decidedly more simple than any of its predecessors.

As to the spoke construction, two forms are available. What is known as a double-spoke, Fig. 1, and triple-spoke, Fig. 2. With the double form of spoking it is not possible to put the plane of the tread of the wheel as near the center line of the car as with the triple system of spokes. The double-spoke wheel is still in use on such cars as have so modified their design as to permit the tread of the wheel to come where it should. The triple-spoke form permits the plane of the tread to be carried toward the center line of the car almost at will. Incidentally, the triple-spoke wheel is a stronger construction, weight for weight, and is the acknowledged superior.

The means of demountability has caused the greater amount of trouble in the development of the wheel. To arrive at certainty and simplicity did not prove to be easy, although the problem looked simple at the outset. The weight was carried, in the beginning, on the cylindrical member that did the driving. Wear followed, regardless of the character of the driving engagement. The old principle of differential creep was the difficulty. The driving and the load-carrying surfaces were then divorced and in the modern Rudge-Whitworth wheel the load is carried on conical surfaces at the two ends of the hub. These surfaces are at an angle which permits tightness without any tendency to seize.

Many different forms of locking devices are used in Europe where the wire wheel is so much in use. Most of them consist of some form of ratchet and pawl, or series of holes and spring-operated pin, or serrated teeth on a spring-operated nut. They operate well enough but are sometimes injured by slight accidents and give more or less trouble from clogging with dirt.

Discussion has arisen as to why a wire wheel is easier on tires than a wooden wheel. This feature was not anticipated to any such extent as has proven to be a fact in experience. Companies renting cars in England have actually found out that the tire mileage on cars equipped with wire wheels is greater by 50 per cent. or more than similar cars equipped with wooden wheels. These renting companies have looked into this matter carefully because of the saving in car upkeep. Every dollar saved in connection with a car rented is a dollar earned. Racing men have found out by experience that their tires stand up better at high speeds on wire wheels than on wooden wheels, and they have also learned, incidentally, that the tire change is made much quicker by demounting a wheel than by demounting a rim.

It seems to be a well-acknowledged fact in Europe that the wire wheel is more resilient and a tire saver. This being accepted as a fact it becomes interesting to study the causes. They are several: First, weight; second, elasticity; third. heat radiating properties.

On the subject of lightness, it is certain that a car equipped with six wire wheels, two being spare wheels, is 100 pounds or so lighter than a car equipped with six wooden wheels with demountable rims.

More important than this, probably, is the fact that the weight in the wire wheels, immediately in contact with the tire, where it can do most harm, is very much lighter than the weight immediately in contact with a tire mounted upon a demountable rim. It is an acknowledged fact that the demountable rim punishes tires because of the unusual weight continually pounding directly on the tire. It is for this reason that the demountable rim on a wire wheel is seldom seen in Europe.

The demountable rim would subtract from the benefits to be derived from it in several ways: By increasing the weight immediately in contact with the tire, by decreasing the elasticity of the rim, and by decreasing the flow of heat from the tire and also by increasing complication of changing tires.

The light weight at the rim in a wire wheel facilitates starting and stopping, because the flywheel effect is minimized. This the racing man appreciates and some users of wire-wheel equipped automobiles believe that they can tell the difference in the way cars "get away."

The second point is that of elasticity. **In the wire wheel the weight of the car is supported by the spokes in the upper half of the wheel. The axle is suspended in the wheel. When heavily loaded, therefore, the spokes in the lower half of the wheel are relaxed. The result is freedom from stone bruises or bruising injury of any kind in connection with the tires.** The explanation must be that a wire wheel coming in contact with a sharp stone, brick or edge of a pit hole in the road the rim and lower spokes yield more or less and cushion the blow. It is not probable that the lower spokes actually buckle or bend because that would loosen the spokes and crack the enamel. This does not happen in properly constructed wheels; yet there must be sufficient yield in rim and spokes to ease materially the bruising action of the wheel. This point is brought out in Fig. 4, in which the solid lines show the spokes that are in tension, supporting the car load, while the dotted lines represent the spokes that are comparatively relaxed.

Take the wood wheel in contrast, Fig. 3, which may help to make the matter clear. Therein the load is supported upon the spokes in the lower half of the wheel; the upper spokes are idle. And as a wooden post makes an ideal strut to support a load, it follows that the wooden spokes in the lower half of the wheel transmit the blow from the road surface to the hub of the wheel and to the springs and body much more readily and severely than the wire spokes which are manifestly very bad struts and incapable of sustaining compression loads. Inasmuch as the wire wheel is easy on the tire, it is similarly easy on the whole car.

Following this thought, it is common knowledge that solid rubber tires are much harder upon a car than pneumatic tires. The solid tire and its rim will not absorb the road shock at the place where most good is done, that is to say, at the road surface before the shock reaches springs or any other portion of the car. Similarly, the wire wheel is more resilient and elastic than the wood wheel, and consequently the wire wheel is actually easier on the automobile. This superior resilience, therefore, saves tires, the automobile structure and the passengers.

As to strength, the wheel is not only more resilient than wood but it is capable of carrying heavier loads and of resisting side-thrust, as in a skid, to a much greater extent than a wooden wheel. This is true in well-proportioned wheels only. A wood wheel resists only a very slight blow, comparatively, in the direction of the axis of the wheel. This applies particularly to wooden wheels of large diameter.

The third element is that of heat. The relative importance of this element is hard to prove. That it amounts to something is pretty well acknowledged by those who have used the wheels for the last 5 or 6 years. Racing men are particularly certain on this point, and it would seem that they ought to know inasmuch as the heat element in the endurance of their tires is an important consideration. The explanation is not so easy except that it is well known that wood is a bad conductor of heat. **The metal rim of a wooden wheel is largely covered by the wooden felloe and, therefore, pretty well insulated against radiation. The wooden parts do not carry away any of the heat. On the other hand, the whole of a wire wheel is metal and takes away the heat from the rim which is immediately in contact with the tire.**

There is a certain prejudice against carrying spare wheels as compared with carrying demountable rims, but experience in Europe indicates that it is a prejudice without foundation and that it is quite as easy and convenient to carry one or two spare wheels as demountable rims. Suitable devices have been evolved so that there is no complaint at all on that subject among those who have used the wire wheel. As to convenience of demountability in case of tire trouble, there is no question whatever. The one simple nut of the Rudge-Whitworth wheel, for instance, may be removed much easier than any one of the six or eight nuts involved in the popular demountable rim. Moreover, there are no small treads to strip or become crossed or worn out. Many who have tried both methods are greatly in favor of the demountable wheel as compared with demountable rim.

One device which is popular for carrying the spare wheels is an aluminum dummy hub bolted onto the car. Such hubs are made to carry either one or two wheels. The spare wheel is slipped onto the dummy hub and the locknut put into position. This holds it securely, keeps it clean and always ready for service.

In Europe, where the clincher tire with its security bolts (lugs) is still popular, the favored equipment for wire wheels is the soft-beaded clincher tire. In the United States it would seem logical that the popular equipment would be any form of inextensible bead Q-D tire, which means a Q-D rim on the wire wheel. The lightest possible Q-D rim must be used in order to get full advantage in tire saving.

The speed qualities of wire wheels are well brought out in the records made on the racing track at Brooklands, England, up to the end of 1912. All the records between 85 and 98 miles per hour were run on Rudge-Whitworth wheels. The long duration records from 12 to 24 hours were also made on the same type of wheel at sustained speeds in the neighborhood of 66 miles per hour. These performances were shown graphically in the form of a chart published in the January 23 number of THE AUTOMOBILE.

HENRY SOUTHER.

The Automobile invites comment on pertinent wire wheel topics.

Ford Service System

Building and Service Scheme Used for Supplying Metropolitan District with Cars and Repairs

Eight Principal Blanks Used — Factory Is Always Kept Posted on Branch's Business—Details of Stock Room

THE service which the Ford Motor Company, Detroit, Mich., gives to the users of its products in the Metropolitan territory stands upon a relatively simple but effective system, designed to be carried out in the 84,000 square feet service building at Long Island City, N. Y. This building consists today of a basement, ground floor and two stories, each with a floor space of 21,000 square feet. The service building is not only a repair and storehouse for Ford cars, but also contains the offices of the New York branch, there being on Manhattan Island only the showrooms of the company. The Astoria building is divided as follows:

In the basement, chassis frames, motors and dashboards, etc., are kept, all the cars which are sold in the district around New York—between Philadelphia and Cambridge, where the nearest service stations are located—being built here, from parts shipped by the Detroit factory. The basement also holds wheels, rims and tires; furthermore, small parts, bolts, nuts, screws, etc., which are required in the work of assembling.

The ground floor contains the large showroom, the sales offices and a large space serving as a garage for the cars employed by the company and the automobiles brought in to be repaired or ready to go out. Furthermore, the checker's office recording every car which leaves the building, with the time of leaving, is on this floor.

On the second floor, stockroom and main office are located. The stockroom contains and delivers all material needed for repair work or replacement of parts. The stockroom also serves as the order department for outgoing repair parts.

Cars ready for shipment are arranged on the top floor, side by side, with 1 inch clearance between the mudguards. From the elevator on—which is stationed at one end of the building—the floor is divided lengthwise in two parts. On one side of the floor is the repair shop and on the other the complete care are held until freight cars may be procured to send them to the dealers. Close to the end of the line of cars a small space for testing motors is reserved. The end of the floor is taken up by the body storage room at present.

Furthermore, the Ford company occupies a floor in the Galvin building, Long Island City, for finishing chassis equipped with motors, touching up scratched paint on bodies, and mounting the latter on the chassis, etc., until the car is ready to be returned to the main building, whence it is shipped to the dealers.

After describing the locality in short, the system used by the Ford company in its repair and stock departments will now be described. Besides the selling department, these two portions of the branch constitute the principal parts of the establishment.

The main stockroom, the basement stock for assembling work and the car and body stock on the top floor are under the supervision of foremen, and no part or car is permitted to leave its department except on an order signed by the foreman or his representative. Likewise, whatever work is done, is carried out in response to an order made out and sent to the specific department by the office on the ground floor. Only in this way is it possible to account for every minute of every workman's time and for every part which enters the building.

Accounting systems which cover work and material records are best described, in the case of automobile service establishments, by illustrating the way in which repairs are handled; as in this case, both material and labor expenditures and the forms for recording them, are involved. The forms used by the Ford plant include eight principal blanks, namely:

1—The repair order which is made out in triplicate;
2—Shop employee's daily time ticket;
3—Universal stockroom requisition;
4 and 5—Labor-and-material record form on the repair order;
6—Stock cards for parts, bins and stockroom file;
7—Quarterly inventory blank.
8—Unfinished repair work form.

In addition to these forms, which are described and illustrated below, the Ford service plant also uses purchase and credit orders, which, however, are very much like the repair order in design. The same applies to the parts-sale order form.

1—Triplicate Repair Work Order—This form is a blank, 9.63 by 8.13 inches and comes in form of a pad of consecutively numbered leaves. Two copies, orange and green, respectively, are printed on thin paper and the third copy is on light cardboard, Fig. 1, being printed on both sides. The light paper copies are printed on both sides, Figs. 4 and 5; the front, Fig. 4, differs from Fig. 1 but by the printing below the double line, provided to facilitate bookkeeping, while the reverse side, Fig. 5, forms the blank mentioned above under (4 and 5). The cardboard copy, Fig. 1, after the blank has been filled out downstairs, remains in that office for future reference. The orange-colored duplicate, filled out by a carbon with the name of the car owner, the number of the motor and that of the car and repair work instructions—along with the signature of the owner authorizing the repairs—is sent to the office upstairs and held for the bookkeeper until all the work is finished. The green triplicate, filled out, also by a carbon, like the other two copies, goes to the shop, where it is given to the foreman at the same time with the car to be repaired.

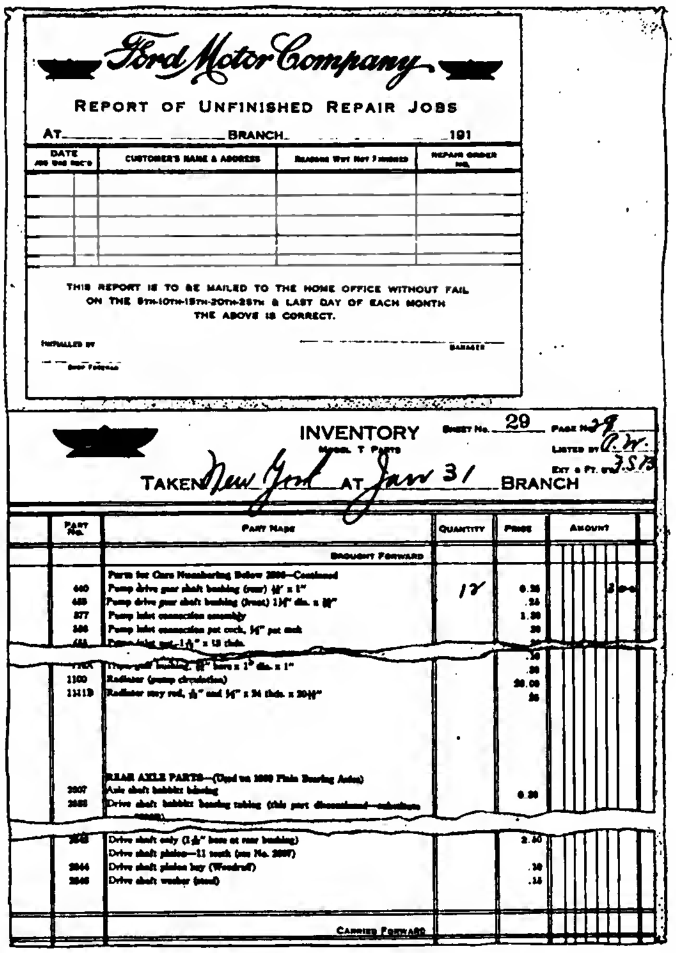
2—Shop Employee's Daily Time Slip—A duplicate blank, printed on thin paper, comprises the working time ticket used by all shop men. Besides this, every employee of the company rings in and out, on a time clock, to record the time spent in the building. The shop time ticket, Fig. 6, is 7.75 by 5 inches, both copies being printed on yellow paper. Every shop employee uses one ticket per day, marking on it his name and number, as well as the date of the day. Under job number the number appearing on the repair order is entered, while in the next columns is described the repair operation done by the man who fills out the ticket. This description indicates whether the whole operation outlined on the order has been done by him, or only part of it, without recording any more details than are necessary. The time used on the job is also recorded, together with the man's rate of payment. Copies of this form are O.K.'d by the foreman who keeps one and sends the other to the office.

3—Requisition for Getting Materials—Whenever a shop worker requires any sort and quantity of materials to do his work, he fills out the requisition, Fig. 7, which is the same size as Fig. 6 and comes in duplicate, both copies being blue paper. Under No. the number of the shop worker requiring the material is filled in, followed by: Please deliver to, where his name is filled in. In the following line, the repair job number and the name of the car owner, on whose machine the material is to be used, are entered. The part number and the quantity needed, as well as the name of the material are now filled in, the model for which they are required being mentioned also. When this requisition is brought to the stockroom, after the shop foreman has signed it, the material is taken from stock by one clerk who adjusts the record on the bin card; another rectifies the file record and signs under Entered stock cards; one of the stockroom clerks O.K.'s the delivery of the parts and signs under Entered repair order; while, finally, the shop man after receiving the material, signs under Received.

4 and 5—Labor-and-Material Record on Repair Order—By the use of Forms, Fig. 6 and 7, records are obtained of the labor and material used on every repair job. The foreman of the shop, after the job has been finished, takes all the records referring to it and appearing on the time tickets and requisitions and transfers the information contained in them to the reverse of his copy of the repair order, Fig. 5, which is then sent to the office, up stairs. The requisitions and time tickets are also sent into this office every evening, and a girl goes over these records and arranges them numerically, by the numbers of repair jobs and employees respectively. When the complete repair order is sent in by the foreman, the girl checks the time and material records against the back of the repair order, after which the bill is made out to the cusotmer. Of course, the work done under the guarantee is taken into consideration when charging for work.

6—Stockroom Bin and File Cards—The stockroom of Ford service plant is especially worthy of comment. It contains a complete stock of all parts of all Ford models ever built, worth at present about $225,000; about $50,000 worth of stock is disposed of through the stockroom in 1 month. The system of handling these large quantities of material is unusually simple, but designed to work with an efficiency of 100 per cent. At the same time, it is so simple that this efficiency seems to be easy to obtain. Only two forms are used in the stockroom. One is the bin record, attached to every bin in the stockroom and giving its exact contents. This card is shown in Fig. 8. It is 4 by 5 inches, printed the same way on both sides and ruled with red lines. On it are entered the number of the part in the bin—the part numbers on the model T start with 2,500—, bin No. 1 corresponding to the lowest part number of the current model. The minimum quantity to be kept in the bin, which, on an average is sufficient to last for 3 months, is also mentioned on this card. The maximum amount of stock is from 40 to 50 per cent. in excess of the minimum. Bin number and part name are also entered on the card. The column balance contains the number of parts in the bin, beginning with the number contained in it when the card is started, which is changed whenever material is drawn from or added to the stock. Under, Entered from, the number of the repair or selling order on which the material is sent out, or the credit or purchasing order with which it is brought in, appears. Fig. 9 is, in a way, a duplicate of Fig. 8, being a card kept in a file which is conducted separately from the bin record system. The file cards are adjusted from the repair and other orders which show what material enters and leaves the stockroom. Two clerks are continually checking bin against file card, and the date of the last check is noted on both cards. This insures correct records, as in case of a discrepancy, the contents of the bin are counted to arrive at a correct knowledge of the state of things. The file card, Fig. 9, is 7.75 by 5 inches, that is, twice the size of the bin card and each side is divided, a file card lasting twice as long as a bin card.

7—Quarterly Inventory Blank—Every 3 months the entire stock contained in the stockroom of the Ford plant is counted, piece for piece. The stock bin and file cards have been rectified, the information is transferred to the inventory sheets,



Ford Motor Company

REPORT OF UNFINISHED REPAIR JOBS

AT ____ BRANCH ____ 191

DATE	CUSTOMER'S NAME & ADDRESS	REASONS WHY NOT FINISHED	REPAIR ORDER NO.

THIS REPORT IS TO BE MAILED TO THE HOME OFFICE WITHOUT FAIL ON THE 5TH-10TH-15TH-20TH-25TH & LAST DAY OF EACH MONTH
THE ABOVE IS CORRECT.

INSTALLED BY ____ SHOP FOREMAN ____ MANAGER

INVENTORY MODEL T PARTS SHEET No. 29 PAGE No. 29 LISTED BY A.W.

TAKEN New York AT Jan 31 BRANCH

PART NO.	PART NAME	QUANTITY	PRICE	AMOUNT
	BROUGHT FORWARD			
1100	Radiator (pump circulation)		20.00	
	REAR AXLE PARTS			
3044	Drive shaft pinion key (Woodruff)		.10	
3046	Drive shaft washer (steel)		.15	
	CARRIED FORWARD			

Fig. 2—Report on unfinished repair jobs sent every 5 days from branch to factory, Fig. 3—Sample blank of quarterly-inventory-book

which form books made up of loose leaves, Fig. 2. Each leaf is 9.25 by 11 inches, light green and punched to fit into a binder. Each set of leaves deals of the parts of one model, so that a small number of books give a complete statement of the stock of all parts. The inventory is made out with a carbon copy, the original going to the file of the branch office, and the duplicate to Detroit. The sheets of every book are, of course, numbered consecutively, and the list price is checked by the foreman of the stockroom, while the total value of all parts of a certain kind is calculated by a stockroom clerk; both signing their names at the top of the sheet. The total value of every sheet is footed, so that it is easy to calculate the total value of the entire stock.

8—Unfinished Repair Work Record—To keep the factory fully posted on the progress of repairs at Long Island, that service plant fills out, on every fifth day, a statement giving the repair jobs which are on hand, explaining how they are progressing and why they are not finished. The shop foreman and the manager of the plant O. K. this statement. By a glance, it is thus possible for the Detroit officers to see which jobs have been under way for too long a time, and must consequently be dispatched.

The system of sending a statement of the unfinished jobs, inventory and general statement of how things stand—a bookkeeper's statement is sent to Detroit regularly—must necessarily prove of great value. The factory is kept posted by this system with regard to the state of the repair, reserve part and new-car departments and if it appears that any changes in the operating system are necessary, it is easy for the factory experts to detect this need.

A few words, regarding the promptness with which repair work is carried out and repair parts are shipped, may not be out of place. All orders are received, as above indicated, at the office on the ground floor. If mail orders for repair parts come in before 3 p. m., the materials are shipped the same day; otherwise on the following morning. In case a telegraphic order is received, it is filled immediately. Any order coming in is recorded in the office and at once forwarded to the stockroom. If a customer arrives with a car to be repaired, the car is at once put into the hands of a tester who determines what work should be done on it. After he has finished his work, the car is sent into the repair shop and the work started without delay.

One of the most interesting departments of the Astoria plant is the stockroom. It has been stated above that it contains complete sets of repair parts for all Ford models ever constructed and this is fully correct. When one considers, however, that this enormous mass of material—which, as stated before, is worth $225,000 at present—is kept in shelves averaging 8 feet in height and covering, including the passages between them, about 10,000 square feet, it becomes obvious that the strictest economy in space must be applied for this end. As a matter of fact, the Ford stockroom is a model in this respect. Wherever it is possible, the parts in each bin have been so arranged as to make the most of the available space. Excepting the cases of irregularly shaped objects, such as carbureters, etc., the parts have been built up in masses which fill 72.4 per cent. of the space on hand. Roughly speaking, it would take from twice to three times the space needed for an orderly array of the parts, if they be thrown or piled into the bins without any rule. The average space efficiency of 72.4 per cent. is utilized in the case of about 80 per cent. of the various kinds of material stored.

Name Part	Number of Parts	Cubic Feet Filled	Pieces per Cubic Foot	Space Efficiency Per cent.
Piston	700	28	25	78.5
Connecting rod	500	10	50	82
Axle housing halves	106	60	17.7	73
Rear axle halves	139	22	15.8	68
Transmission casing	32	25	1.28	80
Propeller shaft	110	15	7.35	66
Front springs	540	55	9.82	87
Rear mudguard	50	34	1.47	90
Front mudguard	20	34	.59	45
Wheel, 30 x 3.5	13	15	.87	48
Rubber mat, 2.5 ft. sq.	72	7	10.3	96
Radiators	18	42	.428	70
Radiator hose, 2 x 2.5 ins.	1,950	12.75	153	98
Transmission clutchband	940	18	52.2	73
Large ball race	2,000	4.5	445	79
Cylinder head gasket	1,324	9	147.2	80
Hub cap	1,250	4.5	278	97
Balls, 5/16	6,430	.4035	15,900	47.64
Balls, 3/8	6,500	.5044	12,900	47.64

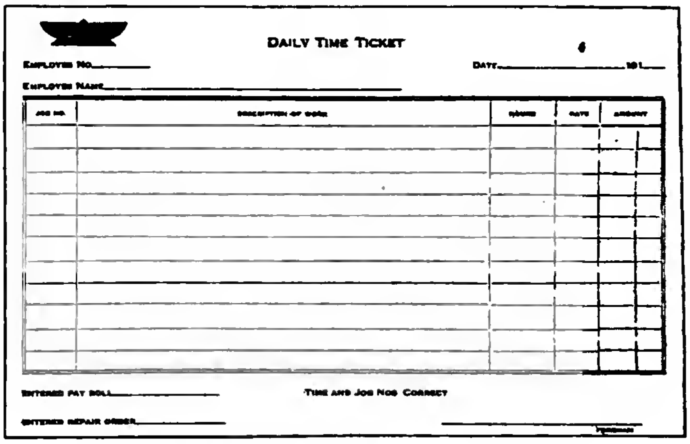


Fig. 6—Time-recording form used at the Astoria branch

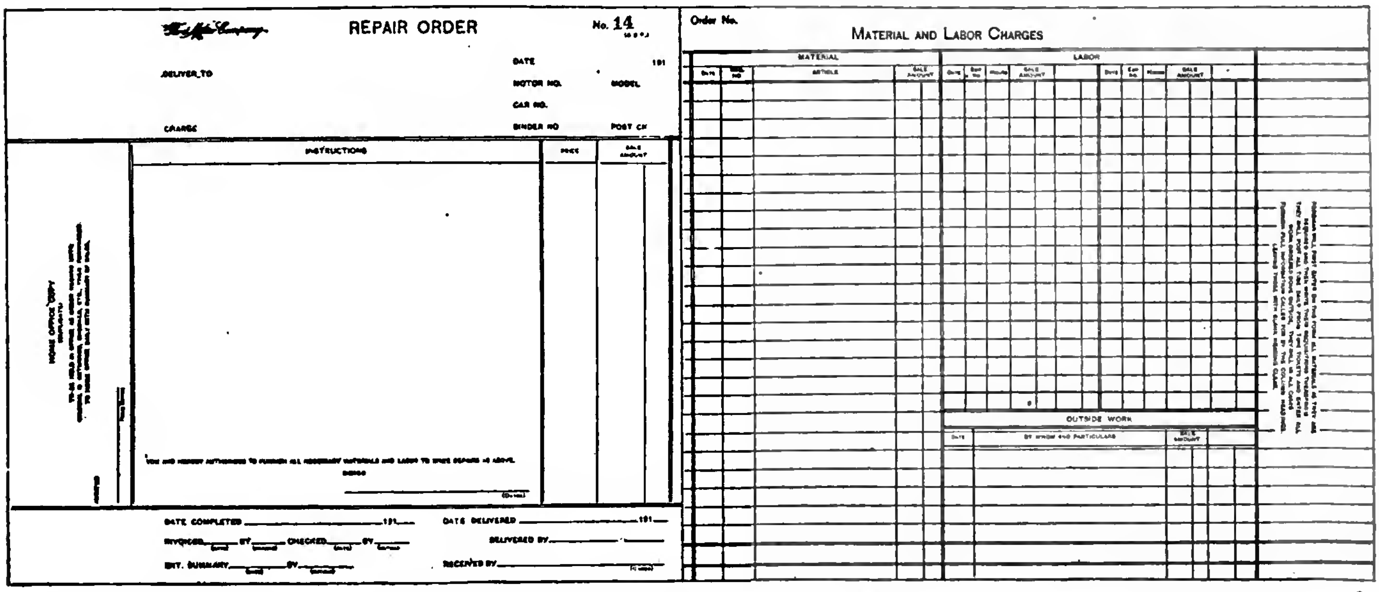

Fig. 4—Repair order blank printed on thin paper. Fig. 5—Reverse side of the thin-paper repair form, designed to take labor, material and outside-work records

On page 472 is a tabulation showing how much space is taken by materials of various nature, the number of pieces which may be stored in a cubic foot on a basis of average calculation, and the efficiency factor; that is, the percentage of the space used which is actually filled by material. All the examples here chosen represent the highest possible efficiency of practice under the circumstances obtaining in a stockroom of this nature. The parts referred to are, with very few exceptions, of the Ford model T.

The economy in space which may be attained by arranging the parts in the most orderly manner possible is easily illustrated by the following example: The 500 connecting-rods, fifty to each cubic foot, are laid in stacks. In each stack all upper and lower ends are arranged in the same direction and between alternate stacks, arranged in the same manner, there is one arranged in the opposite way, with the upper end fitting between the lower ends of the other two rows. This permits of bringing the rows very closely together, so that almost all the space of the bin is utilized. A number of connecting-rods in an adjacent bin were seen by the representative of THE AUTOMOBILE to be not arranged as yet, having been received shortly from the factory. In this case, the same space, that is, a full bin, was required to hold about 250 connecting-rods which were pyramided from the lower front up to the higher back edge of the shelf. It was only in this way that the tangled mass could remain in the shelf and it would have been impossible to fill up the bin completely without arranging the rods. But even if it would have been all filled up, it could not have held more than 400 pieces, necessitating a loss of space of 20 per cent. as compared with the orderly arrangement. Similar instances obtained in the cases of a few other parts just received, which were most effective in proving *ad absurdum* the efficiency of painstaking order.

It should not be forgotten that the advantage of efficient use of space lies in space economy only. As a matter of fact, the saving in time in getting the parts from the bins and preventing material from being destroyed or scratched are also effective in increasing the advantage derived from an orderly arrangement.

It is generally in this department of an automobile service establishment that the efficiency manager has most opportunity to introduce improvements and reforms. The cost of introducing these is almost negligible when compared to the saving effected. Provided that the foreman of the stockroom has brains—without which he should not be made foreman—he can introduce the change either gradually or at one stroke. For instance, when stock is being taken. All that is necessary is to experiment in an empty bin with the various parts before dictating the most suitable arrangement to a boy or clerk. There cannot be laid down any rule for arriving at the most suitable arrangement, but common sense and a sufficient knowledge of stockroom problems must dictate the choice of the finally selected process. The first best method which seems an improvement over the old practice must not be chosen, but experiments should be continued as long as one can think of a new way. After noting the various ways, the best should be selected.

Thus, in the case of connecting-rods, it may be a question of laying the stacks in the bin, pointing from side to side or from front to back. Pistons are probably best arranged in vertical columns as high as the bin. Springs should be laid with the leaf edges in contact with the horizontal supporting surface, so that only two small spaces, one at each end of the bin, remain empty. Hub caps are advantageously kept wrapped in thin paper to them from being scratched and may well be placed within one another, forming horizontal rows which might be stacked upon each other to entirely fill the bin. Depending on the nature of the part, 50, 75 or 95 per cent. of the space may be utilized. In the case of such objects as balls, which automatically—so to speak—arrange themselves in the most economical manner, all that is necessary is to pour them into the bin or keep them in a box. Other small parts, however, such as fittings, are better arranged orderly. It is surprising, for instance, in how small a space one may crowd hundreds or even thousands of washers, nuts, etc., as long as they are kept orderly. The work of developing these improvements invariably pays, and, while it may sometimes take quite a while until a satisfactory arrangement is found, it is work which an able man will enjoy every minute.

A Tip for Tennessee Tourists

EDITOR THE AUTOMOBILE:—I find it very interesting to read about and see pictures of places of interest to tourists. Mammoth Cave, Natural Bridge and others too numerous to mention have all been noted in THE AUTOMOBILE, but I have failed to see any one who has been to or heard of the tourist visiting one of the finest pieces of natural curiosity and beauty and grandeur in this whole country. We have 2.5 miles east of Clarksville, Tenn., on a splendid pike, a cave, not surpassed by the Mammoth Cave of Kentucky. It has a main entrance that you can drive four-horse wagons into, that extends for miles into the earth with the finest scenery one ever saw.

It has a large river, also pools with blind fist, ball room, senate chamber that glistens with diamonds and the grand entrance that has extending rocks which reach over a dancing platform that accommodates easily 250 couples. It has an everlasting cool breeze of about 60 degrees. Just over the bank there is an immense spring of cool water, pure and refreshing. The grove is as fine as you could find in any country. Then just .5 mile south is the famous Idaho Springs with three kinds of sulphurous water, iron water and others. These have been noted for years. There is a fine hotel with every accommodation. It is on the line from Nashville to Hopkinsville, Ky. This is the famous Bunbar cave, none finer in the whole South, none half so cool. Come and see it!

Clarksville, Tenn. ED. C. BATES.

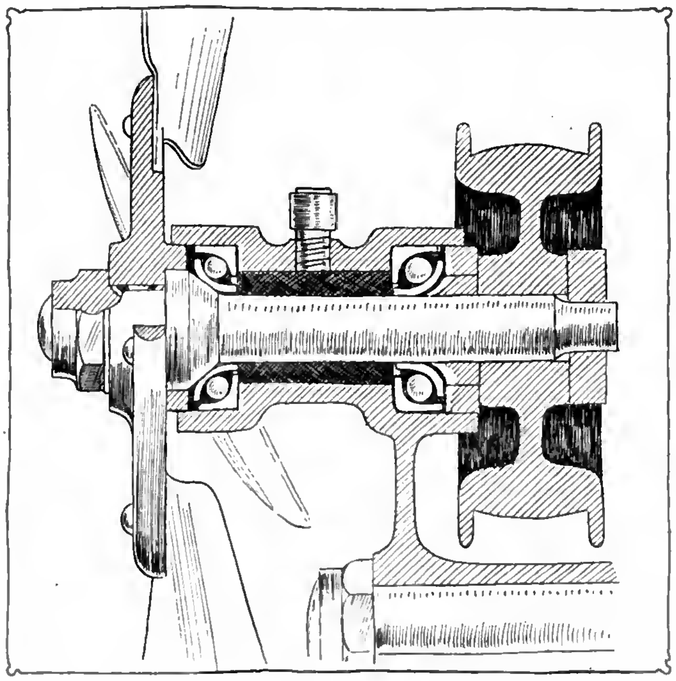

Fig. 1—Balanced fan drive; pulley and fan on opposite sides of bearing

High and Low Tension Magnetos

Editor THE AUTOMOBILE:—Please describe to me the different action of a high-tension and a low-tension magneto.

2—Would a high-tension magneto be advisable on a 30 E.M.F. touring car?

3—Would equal parts of coal oil and gasoline put together be advisable to use on a motor car? If not, what would be the result?

Lodi, O. W. A. BRIGGS.

—1—The high-tension magneto is a low-tension instrument with a high-tension coil added. In other words, it combines two instruments in one. With a low-tension magneto, it is necessary to run the current through a high-tension coil, in order to bring it up to the proper voltage to deliver a spark at the plugs. With the high-tension instrument, there is both a primary and a secondary winding on the armature. In the low-tension instrument there is merely a low-tension or primary winding and the induction or transformation of the current from a low to a high potential is secured through an auxiliary coil unless a make-and-break or other form of low-tension ignition is used. In this case there is no transforming of the current to a sufficient pitch to make it jump a gap.

2—A high-tension magneto would operate to great satisfaction on an E.M.F. car. It would be wise to consult the manufacturers.

3—If you had a carbureter that would handle the mixture it would operate. The difficulty would be in getting started and after starting to vaporize the fuel with sufficient rapidity to meet the requirements of the motor. It is not impossible to use this fuel in motor cars and it would be almost safe to predict that in a short time we will be running on a lower grade fuel than this.

Wants Gas Engine Handbook

Editor THE AUTOMOBILE:—Kindly tell me if I can find a book of reference on automobiles that will give standard practices of the factories: 1—The amount of allowance made per inch of cylinder diameter in turning piston rings; length of pistons, connecting rod proportions, etc.?

2—I wish to know also if model 31 Pope-Hartford selling for $2,250 is equipped with a Bosch dual or other make of magneto?

Houston, Texas. J. V. VAN VORST.

1—Standard practice in the automobile manufacturing business has not entirely reached the point where it can be laid out definitely in a book. The Society of Automobile Engineers which is standardizing work in this country wherever it is possible to do so have published a handbook in loose leaf form which is kept up to date by the society. This no doubt contains the latest information at the disposal of the average person. There are doubtless collections of private data which are unpurchasable. If you will study the car descriptions which appear from time to time in THE AUTOMOBILE, you will notice that although a motor may have the same bore and stroke as another, the piston length, the number and size of the rings and even the dimensions of the bearings will vary to a great extent. For that reason it would be impossible to secure anything which would represent a definite and fixed standard for automobile work. There are many books on the market which give very good empirical formulas. These are no doubt correct as far as they go and may even represent average American practice along certain lines. With the unstable conditions that we now have, however, it would be impossible to state that any given book gave American factory practice unless it was in such shape that it could be appended or amended from time to time.

2—Although not fitted to the first lot of cars that came through the factory, the Bosch dual is now regular equipment on model 31 Pope-Hartford.

Oakland Change of Carbureters

Editor THE AUTOMOBILE:—Kindly answer the following questions regarding a 1910 model 25 Oakland:

1—What make of carbureter is used? Is there any needle-valve adjustment? It seems impossible to throttle down when the motor is idling although the engine works perfectly with the load on. I notice a pipe leading from the exhaust pipe to the carbureter. What is this pipe or does the carbureter take its main air from the exhaust? Do not see any main air inlet elsewhere.

2—What oiling system is used?

3—Could you trace the ignition system for me?

4—There is a sucking sound when the inlet valve of the second cylinder closes. The sound seems to come from the crankcase. What would cause this?

Quincy, Mass. OSCAR WILBUS.

—1—The Brush carbureter made especially for this car was used in 1910. Since that time the Oakland company has taken the Brush carbureter off and are now fitting the Schebler carbureter. According to the Oakland service department in New York City, you would save the price of the carbureter in a short time on account of greater economy, if you would turn your present carbureter over to the Schebler people and add sufficient cash to purchase a new carbureter. The pipe you see leading from the exhaust is an exhaust-pipe heated air inlet.

2—The Oakland car is lubricated by a circulating splash system operated by a piston pump.

3—The ignition of the Oakland 1910 cars is by the Remy type S, a wiring diagram of which is shown in Fig. 4.

4—This is due to a leaky bushing around the valve stem. You can secure one of these from the factory and simply drive it in place yourself.

Has Opinion on Proper Balance

Editor THE AUTOMOBILE:—In reading the engineers' opinions on four and six-cylinder motors in THE AUTOMOBILE of January 23, they claim the four-cylinder type makes more noise and has a great deal of vibration. As many fours are not designed as well as they should be, I think a four-cylinder Knight motor 4.5-inch bore and 7-inch stroke with cylinders offset could be designed and perfected to run smooth and noiseless as any six at 3 miles an hour on high gear and develop 60 to 70 horsepower on the road, if put on a chassis with 136-inch wheelbase with light weight body, would make an ideal touring car using one-third less oil, gasoline and tires, the body could be placed more in front of the rear axle which would give greater comfort in riding without having a long wheelbase that is so hard to turn around in many places.

Alton, N. H. H. O. TIBBETTS.

Ether 35 Cents per Pound

Editor THE AUTOMOBILE:—In THE AUTOMOBILE for November 21, 1912, page 1063, P. C. Avery, Milwaukee, Wis., advises the use of ether in gasoline and suggests it can be obtained at a cost of 18 to 20 cents per pound. I would like to inquire where it can be obtained for about this figure, as the cheapest I have obtained was 35 cents. Can you get a quotation of about 20 cents in New York City, and if so where, and in what quantity?

Westerly, R. I. L. G. WAITE.

—Commercial ether sells for 35 cents a pound in New York City, and it is the opinion of THE AUTOMOBILE that Mr. Avery is low in his cost estimate.

Scraping in Main Bearings

Editor THE AUTOMOBILE:—In scraping in main bearings what precautions are taken in repair shops to maintain the shaft parallel with the bottoms of the cylinders?

2—In starting on the magneto, if the spark should be advanced to the limit, is a back-kick possible?

Boston, Mass. A SUBSCRIBER.

—1—A straight edge, a tightly strung piano wire or any other such means may be used. If the bearings are in a true line it is safe to assume they are correctly lined up with the cylinders and pistons. The wire is struck straight down the line of the top or bottom of the crankshaft and checked at various points along its length. A coating of oil may be given the bearings and a little tire talc sprinkled lightly on this. The shaft is then put in place carefully and lifted out vertically. The line of contact of the shaft may be noted in this manner.

2—It will be almost certain unless the motor is cranked at extremely high speed.

Balancing Belt Fan Drive

Editor THE AUTOMOBILE:—The belt on my fan is always pulling the fan out of line and I would like to know if there is any type of drive by belt that will not permit this to happen. I am using a plain bearing on the fan and I have ruined several bushings.

New York City. H. A. DEWITT.

—Most cars have a balanced drive which takes care of this. In Fig. 1, is shown a balanced drive. It is only necessary to have the bearing surface long or a good space between the bearings. In the drive shown in Fig. 1 the fan is on one side of the bearing and the belt on the other. This is generally the case and it makes for good balance.

Asks Some Splash Questions

Editor THE AUTOMOBILE:—Would you kindly tell me the following:

1—In descriptions of a splash system I have heard of the

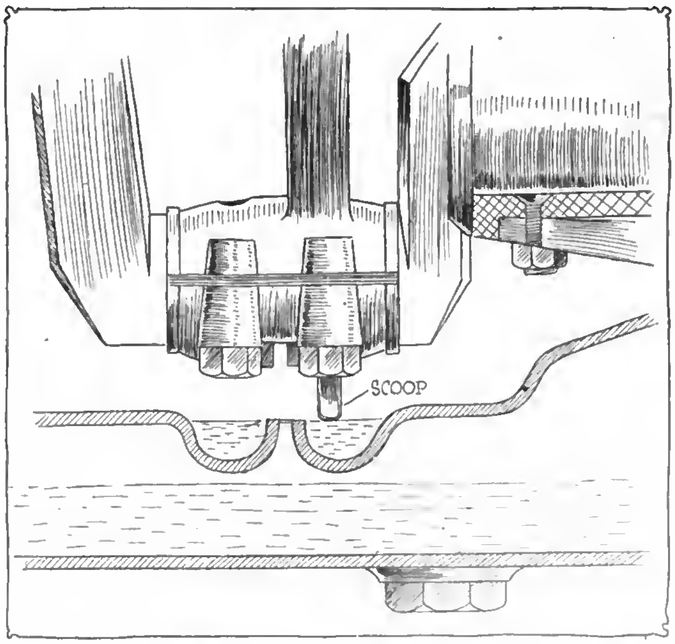

Fig. 2—Oil trough and oil reservoir, the upper small sump where the scoop dips is the trough, the lower part is the reservoir

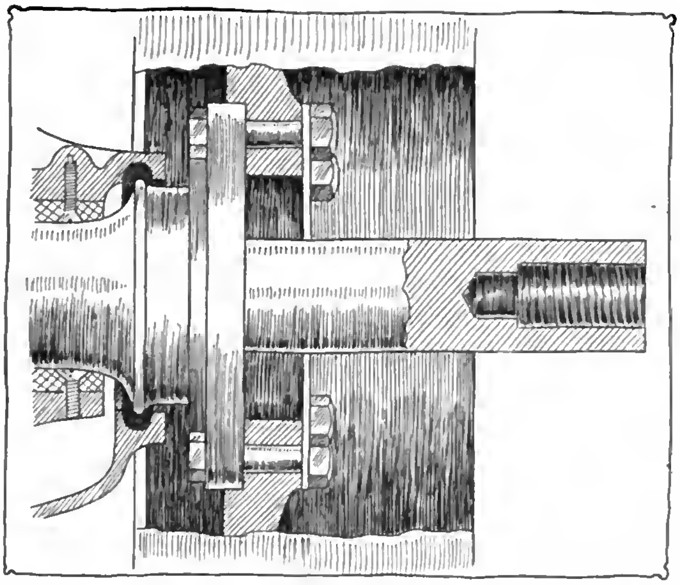

Fig. 3—Connection of flywheel to the end of the crankshaft

oil trough and the oil reservoir. What is the distinction?

2—How are the main bearings oiled in splash systems?

3—How is the flywheel generally fastened to the crankshaft?

Philadelphia, Pa. CHAS. DRUMMOND.

—1—The difference is seen in Fig. 2. The upper is the trough and the lower the reservoir.

2—By a small pocket generally as is shown at A, Fig. 5. The oil collects here and flows by gravity to the bearing.

3—The flywheel connection is generally by six bolts through the flange on the end of the crankshaft. The practice of keying on flywheels is still used to some extent although the bolted-on type is most common. A bolted connection is shown in Fig. 3.

Engine Knocks on Up Grades

Editor THE AUTOMOBILE:—I have a four-cylinder touring car with a 4 by 4-inch motor. It is equipped with a Splitdorf magneto and Maxwell 1912 carbureter. The engine picks up very well on level ground, but when climbing a hill on high gear it does not take hold but dies right down with a knocking sound in the motor which sounds exactly the same as when traveling with a spark that is too far retarded. What is the cause for this and what is the remedy?

Spokane, Wash. TROUBLED.

—There may be several causes for the trouble which you mention. When the motor is on a hill if there is any tendency to knock at all it is there that it will surely develop. The troubles which are commonly the cause of a knock that develops on a hill and which is not perceptible on level ground are as follows: Lean mixture, magneto set too early, valves seat poorly, carbon in cylinders, poor valve adjustment, loose wristpin bushing, loose magneto shaft coupling, sticking valves and piston slap. The cures for these may be taken up in order. They are as follows:

Lean mixture can be cured by opening the needle valve slightly or by closing the air valve. The former is preferable as it is easier to make a correct fuel adjustment than an exact air adjustment. This adjustment should be made on the road. Take the car out on a hill and run it up in the condition that it is at present. Return to the bottom of the hill and make a change in the mixture by turning the fuel adjustment. When this is done run the car up the hill again and note if there is any decrease in the knock. If there is none or the change is only slight it is time to pass to the next cause.

The setting of the Splitdorf magneto is explained in detail in the issue of September 19, and it is only necessary to follow the directions contained therein to secure perfect timing.

Bad seating of the valves may be due to two causes. Carbon or other foreign matter may lodge on the seats and prevent the valves from seating properly, or they may be adjusted too closely so that they are not able to get down to the seats when the motor is hot enough to have caused the valve stems to expand. The latter would be apt to cause a knock on level ground as well as on a hill, however, and thus can be discarded from the list of probable causes. Carbon flakes on the valve seats are common, however, and may be the cause for the whole trouble. They can be removed by dosing the cylinders with kerosene or some other carbon remover and then turning the motor over to work the deposits out from around the valve seats. In case the valves are worn or pitted they will have to be reground.

Carbon in the cylinders is removed as just described. If patent carbon removers are used be sure to follow directions accompanying same.

Loose magneto shaft couplings are readily cured by tightening up the connections. Should an Oldham coupling be used in your car and it is found that considerable play occurs between the driving and driven faces, coat these with solder.

Sticking valves are caused by insufficient lubrication of the stems. A little oil will cure this trouble, which is not probable in your case as it would have been evidenced on level ground as well as on hills. Slapping pistons are due to excessive wear and are of such a nature that the repairs can only be made at the factory.

Electric Resistance of Wire

Editor THE AUTOMOBILE:—The claim has been made to the writer that there is a greater percentage of loss of current from 14-gauge wire than when 10-gauge wire is used for lighting purposes.

Kindly advise me of the percentage of loss in using 16-gauge, 14-gauge, 12-gauge and 10-gauge wire, 12 feet long, connecting a 6-volt storage battery with a 6-volt, 10-candlepower lamp.

New York City, N. Y. L. M. SCHWARTZ.

—There will be a greater potential drop through smaller wire than there will be through large wire. This may be readily made clear to you if you will assume for the moment that your electric current is a quantity of water contained in a cylinder. Imagine two such cylinders, Fig. 6, with an equal amount of water and everything the same in every respect, except that one cylinder has a small orifice and the other a larger one. Suppose it is necessary to empty both the cylinders at the same rate of speed. It would be necessary to put a larger head or weight W_1 on the smaller orifice than W_2 on the larger orifice. It is the same with electricity. If it is desired to empty a battery at a certain rate where a certain pressure of voltage is maintained it is necessary to have at least a certain size wire. Below a certain limit it would be impossible to allow sufficient current to flow over the wire. It happened in the case of some

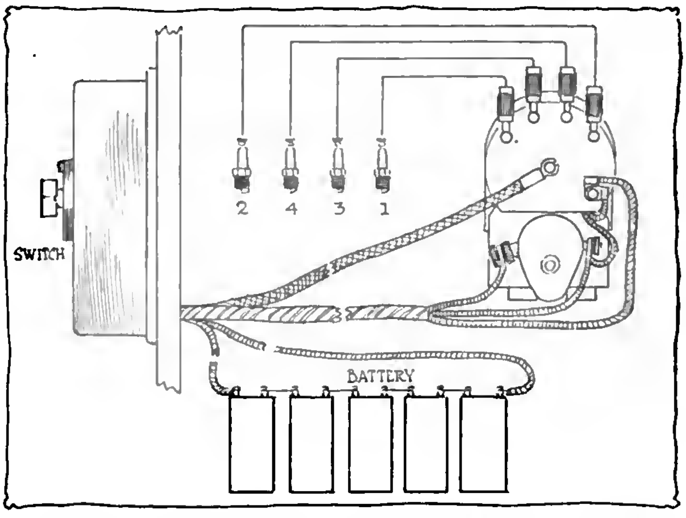

Fig. 4—Wiring diagram of the Remy type S, ignition system

6-volt lighting systems that the designer was not able to get a bright glow at his lamps. After a great amount of trouble it was found that the wire was so small that only 5 volts arrived at the lamp instead of the 5.75 volts required. The following table gives the allowable voltage drop per foot and also the voltage drop per ampere-foot of different gauge wire. In this table is also given the ohms resistance per foot. Knowing the amperes required, which may be secured from an ammeter or from the lamp manufacturer, and taking the ohms resistance from the table herewith, under the head of ohms resistance per foot, the voltage drop per foot can be calculated and compared with the permissible drop The method of calculation is by the following formula:

$$C = \frac{E}{R}$$

In this formula C is the current in amperes drawn by the lamp, R is the resistance in ohms per foot secured from the table and E is the voltage drop per foot. In other words, the voltage drop per foot would be the ohms resistance per foot times the amperes. A glance at the volts drop per foot column will tell if this is in excess of the allowable number as per the Underwriters' requirements.

RESISTANCE OF WIRE

B. & S. gauge	Allowable volts drop per ampere foot	Allowable volts drop per foot	Ohms per.ft. at 20° C=68° F.
14	.00256	.0300	0.002521
12	.0016	.0265	0.001586
10	.00105	.0235	0.0009972
8	.000685	.0206	0.0006271
6	.000400	.0176	0.0003944
5	.000316	.0166	0.0003128
4	.000252	.0158	0.0002480

0	.000100	.0127	0.00009811
00	.000079	.0114	0.00007780
000	.000063	.0108	0.00006170
0000	.000049	.0101	0.00004893

Proper Place to Carry Loads

Editor THE AUTOMOBILE:—Given a motor truck carrying 5 tons of coal. The scales show 63 per cent. of useful load is on rear axle. How far back must body be placed so that rear axle will carry 70 per cent. useful load?

Length of truck overall	220 inches
Wheelbase	138 inches
Rear overhang	39 inches
Loading space back of driver's seat	160 inches
Length of body	160 inches

New York City. F. J. M.

—Assuming that by useful load you mean the weight carried by the truck and not including the truck itself. the center of gravity of the load would be 80 inches forward from the rear of the truck or 41 inches forward of the rear wheels, by subtracting the overhang from 80, 80 being one-half length of loading space. According to your wheelbase, this would mean that the center of the loaded portion is 97 inches back of the front axle and that the weight on the rear axle as compared to the whole load—if the center of the loaded portion is the center of gravity—is as 97 to 138, or 70 per cent. Since you get but 63 per cent., the center of gravity of the load is evidently at present but 87 inches back of the rear axle and the weight will have to be shifted back 10 inches. It would be well to determine if you are correct first, and if so, why the center of gravity falls forward 10 inches when it would seem to be at the center of the load.

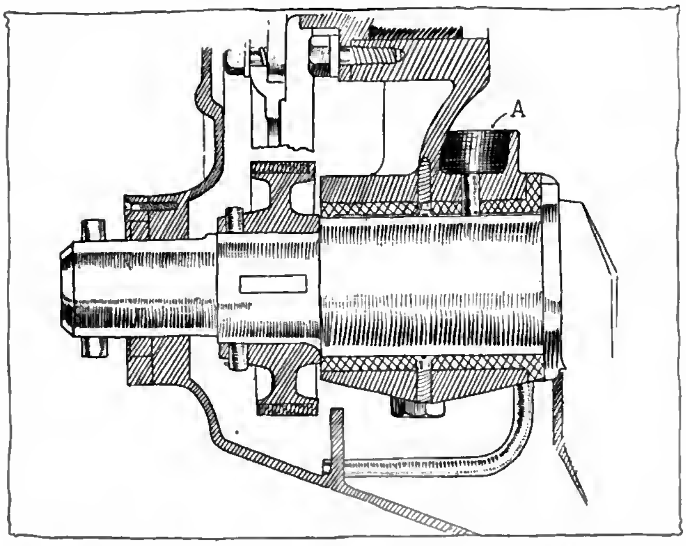

Fig. 5—Oil duct on top of main bearing used with splash system

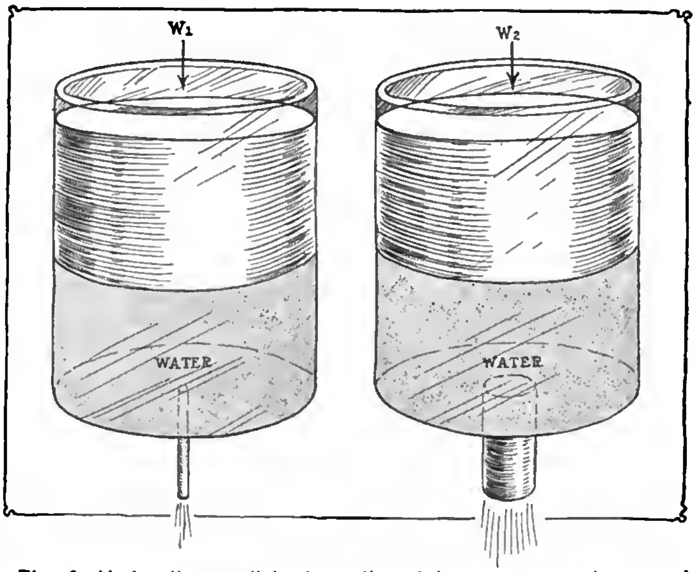

Fig. 6—Hydraulic parallel of small and heavy wire—a large and small orifice

Small Manifold on Intake

Editor THE AUTOMOBILE:—I have a six-cylinder Napier car. The cylinders are 3.5 inches bore by 4.5 inches stroke. Will you be kind enough to advise me in your best judgment what size of intake manifold would work the best on this car. Also, what type of carbureter. There is a foreign carbureter on the car now, and it has a very small intake pipe.

Batavia, N. Y. A SUBSCRIBER.

—You will have to keep the intake on your car that is now used upon it. The valve ports are of a definite area and the intake manifold has been designed to suit that area. The motor has a small bore and stroke and the small intake manifold is only to be expected. The number of cylinders on a motor does not affect the size of the carbureter at all. The reason for this is that the suction strokes of any two cylinders do not overlap. The carbureter that you now have on your car must be of the correct size as the Napier engineering department has a high reputation for its judgment in the design of the motor and its accessories.

Unless the carbureter is deranged to any extent, the best satisfaction will no doubt be secured from its use.

Please Sign Your Inquiries

[THE EDITOR OF THIS DEPARTMENT is in receipt of several letters signed Reader, Subscriber and by initials. No attention will be paid to anonymous or unsigned letters; readers who wish to make use of these columns must sign their letters as an evidence of good faith. No names will be published if the writer of the inquiry or communication does not wish the name to appear. It is only necessary to state this in your letter. Other letters which have not been deemed of sufficient general interest to publish in these columns have arrived without the sender's address so that it is impossible to answer them by mail. We are delighted to have our subscribers use these columns and most cordially invite correspondence, insisting only on the rules just mentioned.—EDITOR.]

Exhaust Gas Analysis

UP to the present little attention has been given to the subject of exhaust gas analysis as a means of determining carbureter efficiency and also motor efficiency, a condition largely due to the fact that fuel economy until the present has been little sought after by the car building companies, the major object being power or speed. It is not long since the custom was to make large cylinders, add to the bore and stroke, to get more power. Little, if any, thought was given to changing valve openings, altering valve timing, redesigning intake manifolds or reducing the internal frictions in order to get more power, because all of these were made unnecessary by the additional cylinder sizes. With the new longer-stroke motors, the increase in price of fuel, and the demand for lighter weight it has become imperative to secure higher motor efficiencies. Increased efficiency has been obtained by improved designs and constructions, but also by improved carburetion. With these demands for improvement has come the necessity for an accurate method of gauging conditions, and, while the various types of testing dynamometers and manographs have come into more general use of late, it is also true that the analyzing of exhaust gas analysis is also becoming more common.

Analysis of exhaust gases is a scientific method of determining if the combustion of the fuel in the explosion chamber is complete. It is a scientific method of determining if gasoline and air are being mixed in the required proportions to give the best combustion. It is also a scientific method of determining questions of cylinder design insofar as the shape of the combustion chamber influences the thorough mixing of the air and gasoline.

Although exhaust gas analysis is receiving considerable attention at the hands of carbureter engineers today it is to be hoped that it will be kept in its proper perspective with relation to the various other methods of testing which are now in vogue. The dynamometer is needed; the manograph is imperative; it is necessary to have other test apparatus to measure the heat losses through the waterjackets; it is necessary to devise methods of measuring the loss due to friction of the internal moving parts of the motor; it is necessary to have methods of checking the condensation in the intake manifolds; and it is necessary to check the mufflers for back pressure; but while any one of these may force itself on the engineer at a particular time, that engineer will obtain the best results, who uses all, each in its proper place, and so has at all times a dependable balance wheel in his testing laboratory.

In order to bring exhaust gas analysis onto a practical basis THE AUTOMOBILE last autumn made a series of road tests with fifteen different makes of automobiles and trucks. These tests were conducted by a leading American university professor who was thoroughly conversant with the work. In all nine samples of exhaust gases were taken from each vehicle tested. The vehicles under test were put over the same road circuit so that it would be possible to make comparisons between different types of motors, cars, etc. The results of these tests will be published in these columns in a few weeks, and they should provide the actual information that the engineer and car owner wants.

This series of tests demonstrated satisfactorily the possibility of making such tests on a fully equipped car on the road. Collector tubes for the exhaust gases were the same as those used in laboratory tests and there was not the slightest difficulty in collecting the samples and analyzing them after the test was over. One leading American carbureter engineer has been conducting road tests of this nature for several years and he claims to obtain as good results as can be had in any laboratory. He even carries his analyzing apparatus with him and makes tests at different times during the same day over the same piece of road. One test is made with a certain carbureter adjustment; a second test is made with a slight variation; and third, fourth and fifth tests can be made after any desired alterations in carbureter setting have been made. Nothing could be more practical.

Greater fuel mileage is being talked of to-day from the Atlantic to the Pacific and the only means by which the engineer actually knows that he is obtaining complete combustion is by exhaust gas analysis. Careful tests will aid him in settling whether the loss in power is due to faulty carburetion or poor features in design. This, as one valuable motor test, should appeal to every engineer because of the accuracy of it and also because of the ease of performing it. There is not any guesswork and the test is made in actual road work, so that all differences between tests made in laboratories and those on the road are eliminated from the considerations. Carbureter makers will benefit greatly from such tests, because of the real facts such tests furnish. They furnish real facts because they are made under running conditions and not in a laboratory.

Executive Efficiency

Aptitude for the Task a Big Feature in the Ultimate Success Of the Boss or Workman

Inability to Calculate Wage Value the Source of Vast Money Losses

MORE than three-quarters of the industrial workers, including executives, do not have natural aptitude for the positions they fill. They are like dogs walking on their hind legs.

It is a simple matter to predetermine both the inherent ordinary and extraordinary capacities of any individual and to place both in positions for which their aptitudes will fit them.

The yearly money loss in direct cost on the average machinist of only 30 per cent. efficiency (not by any means an unusual standing) is nearly $5,000; not counting the loss of profit on output.

This loss from inefficiency increases as the position becomes one of greater importance.

The industrial loss from the ill adjustment of workers to their duties is only a small part of the total loss. Ill-assorted marriages are a phase of bad adjustment, improperly educated children another.

The value of the individual who is competent increases far more rapidly than his market price. Even in rough labor, the kind of man an 8-hour day and 35 cents an hour pay can secure is more economical than the 20 cents an hour man, working 10 hours.

If positions were filled by men fit for them, if the wages were paid necessary to secure men who were fit, difficulties between employer and employee would be inconceivable.

In a long experience we have always found the so-called employer, the executive, at fault. He has filled the positions in his plant with ill-qualified men, because he did not know how to secure competent men, was not able to compute their wage value and was unwilling to pay any advance on the current rate to badly placed men.

The vocational counselor is, like the musician, born with an aptitude which can be cultivated and trained in a scientific manner, resulting in great skill. If either natural gift or scientific training is lacking, the result is mediocre.

A paleontologist can reconstruct, from a single tooth fragment, the animal to which it belongs, including its general disposition. How much easier is it from all the external indications of a living animal to determine its characteristics.

Since man reveals himself in many ways the animal cannot—by his clothes, by his handwriting, by the fatal gift of speech—it is remarkably easy for those who have supplemented natural ability by comparative study to read accurately all the natural aptitudes of any man or woman. For instance, since the brain, spinal cord and whole nervous system are formed from an unfolding of the surface skin, it of necessity follows that the texture of the skin indicates the texture of the brain and nervous system. Therefore in speaking of the character do we use the expressions "thick skinned" and "thin skinned."

As nearly all men lack standards, as many men mistake the effort of incompetence for the achievement of genius, we cannot be guided by any man's estimate of himself. The young are particularly given to taking up with what is distasteful because they enjoy the struggle, the effort.

It is therefore the position that should be given the right man, not the man who should receive the position he wants or likes.

The qualities required for the best administration of every position should be specified.

It is for this reason that some men succeed better in partnership than each did singly. The partners complement each other.

Aptitude is more important than experience. Men with aptitude can be given experience and they learn with extraordinary rapidity. A man with aptitude can learn a trade in a few months. A man without aptitude never becomes a skilled worker.

In giving a man of aptitude experience—that is, educating him—his own peculiar qualities determine the form of education which is therefore adapted to the man, the man not warped to suit the method of education. Some men learn through the eye, others through the ear, others through the muscles. Some learn best under one kind of a man and others under another kind of man. The fitting of man to man is as important as fitting man to position.

As a rule, those who are not identical but also not very far apart in temperament work better than those who are identical or very far apart. A trotting horse does better, not in double harness but with a running mate who is just a little faster. He would not succeed if harnessed either with a donkey or with a fast runner.

Our general plan for industrial employment should be:

1—To establish a thoroughly competent and complete employment department.

2—To employ, assign, transfer, promote and discharge solely through this department.

3—To specify the required qualities for every position.

4—To establish wage classes. The man belongs to the class in which his hourly rate locates him.

5—The rates for certain positions should be determined by the price that has to be paid to secure men of full qualification for the positions. We should vary the rate of pay to secure standard ability. We should not vary the requirements as to ability in order to adhere to standard rates of pay.

6—Full efficiency, full punctuality, full reliability for a specified period entitle a man to advance into the next highest class and corresponding change of work. The only limits to a worker's advance are the limitation of his own ability and the shortage of positions for which he is competent.

7—Failure to attain high efficiency is prima-facie evidence, not of incompetence but of bad placing. Bad placing is very rare if the employment department is competent.

8—The personnel of a man's surroundings are as important as the work. Personal aptitudes count for as much as work aptitudes.

9—The teacher and the teaching should be adapted to the learner.—HARRINGTON EMERSON in *Bulletin of the Efficiency Society.*

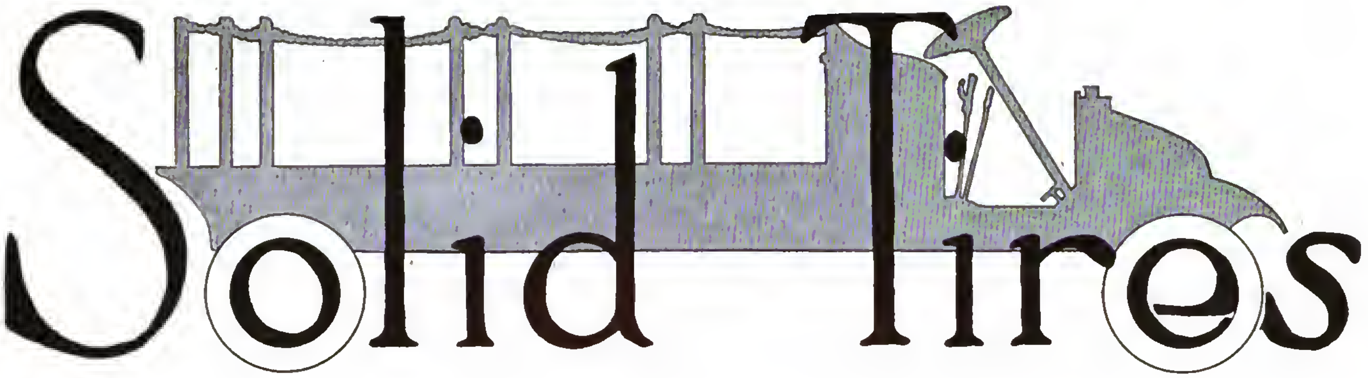
Eighty-Five Gotham Fire Trucks

Fire Commissioner Johnson, of New York City department, has just published his report for the past year. This report brings out the fact that the total number of fire cases increases during 1912, as compared with 1911, while the average damage done by each fire was 32 per cent. less in 1912 than in 1911. In 1911 there were 14,547 fires, with a total loss of $12,470,806, or an average loss of $855. while in 1912 there occurred 15,633 fires, averaging losses of $580, and aggregating a total loss of $9,069,580. The reduction in fire loss during the year 1912 was therefore $3,401,226.

That a great deal of this saving is due to the efficient and speedy service given by motor trucks is illustrated by the fact that Commissioner Johnson has contracted for eighty-five motor-driven pieces of fire-fighting equipment, as follows:

2 hose wagons	$8,326
26 combination chemical and hose wagons	105,170
3 high-pressure hose wagons	13,875
28 second-size steam fire engines	248,920
1 ladder wagon with 85-foot ladder	8,210
8 ladder wagons with 75-foot ladders	63,152
17 ladder wagons with 65-foot ladders	125,716
Total	$573,369

Besides these contracts, the trucks of which will be delivered during the current year, others will be purchased.



Treads Designed for Commercials

A Review of the Heavy Tires Now on the Market for All Weights of Vehicles

WITH the advance that has been made in automobile transportation in the last few years, considerable changes have been heralded from time to time in connection with solid tires. The recent show held in New York clearly demonstrated that tire makers are awake to the keen competition existing at the present time. While several prominent makers still adhere to the pressed-on type of tire as a regular standard, others have added a demountable tire or a block tire to their lines, thereby making the truck owner independent of the power press. With the new types of tires it is possible for the driver to change a tire in a short space of time, without even removing the wheel. There is still a large number of makers who manufacture the side wire or clincher type with cross wires, yet the metal and hard rubber base tire is favored by the majority.

The block tire has gained many adherents in the last year as is instanced by the number of concerns making this type at present. The adoption of the S. A. E. standard rim has been universal and if wheels are fitted with this type, it allows the truck owner to choose the tire he wants, without having to pay for having the wheels altered to suit a particular size of rim.

In order to present to the public the present offering of the solid tire market, a canvass was made at the show and the following is a brief résumé of the types made by the different makers who showed. This article does not deal with any of the mechanical types of tires, but only tires that can be termed solid.

Firestone solid tires, manufactured by the Firestone Tire and Rubber Company, Akron, O., are made in several styles. These include a hard-rubber base channel type; notched tread, con-

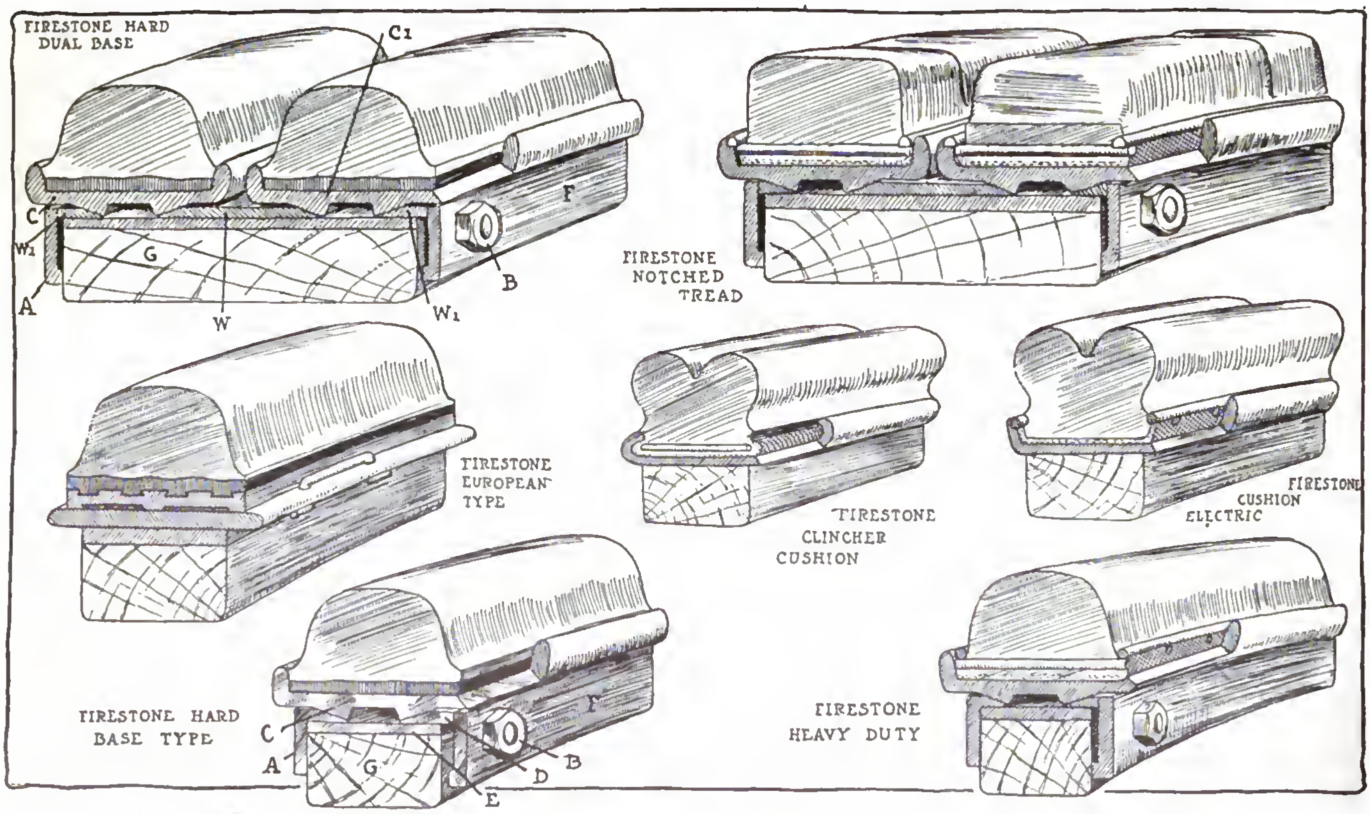


Fig. 1—Firestone solid commercial tires made in all sizes and styles to accommodate every weight of vehicle

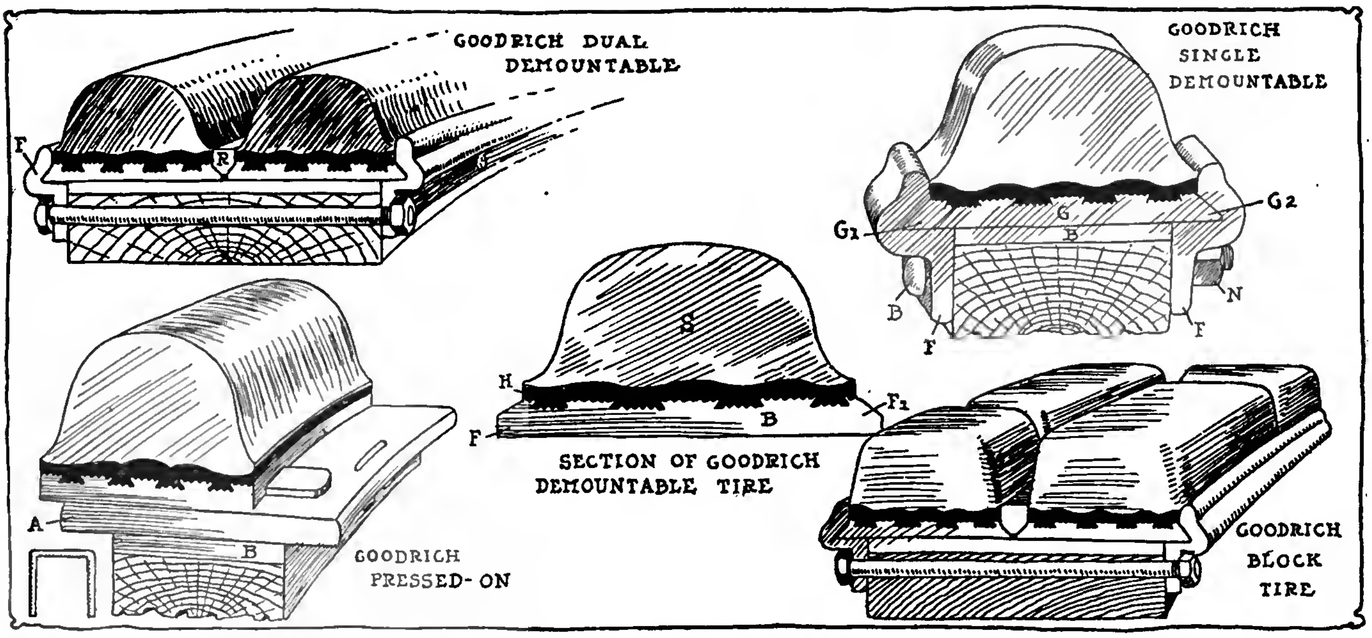

Fig. 2—Showing five styles of Goodrich solid tire for various capacity commercial vehicles

tinuous base, with side and cross wires; European type tire with steel and hard-rubber base, and a heavy-duty, side-wire tire, with plain tread. In addition to the above, the following tires are manufactured, especially for electric vehicles: a clincher cushion tire, a side-wire cushion tire and a special electric side-wire tire.

Dealing first with the hard rubber base channel type tire, Fig. 1, it will be seen that shape of the channel is intended to be used in connection with the Firestone quick removable rim. The inside of the base of the channel is serrated and a layer of hard rubber is interposed between the tire proper and the metal base. The sides of the tire are protected by the lips of the channel, thus preventing abrasion of the rubber through coming into contact with sharp protrusions such as curb stones or ruts. The illustration depicts a single tire as might be used on the front wheels and the quick removable feature of the rim for single tires can be seen. A steel ring E, is shrunk over the wooden felloe G and the flange A is then secured to the felloe by means of through bolts. The rim with tire attached is slid over the steel band E, butting at C against the wedge section of the inner ring A, finding a seat thereon. The steel ring D, having a wedge face, is then placed in position supporting the rim from the opposite side and the wedge is forced home by the flange F and the nuts B.

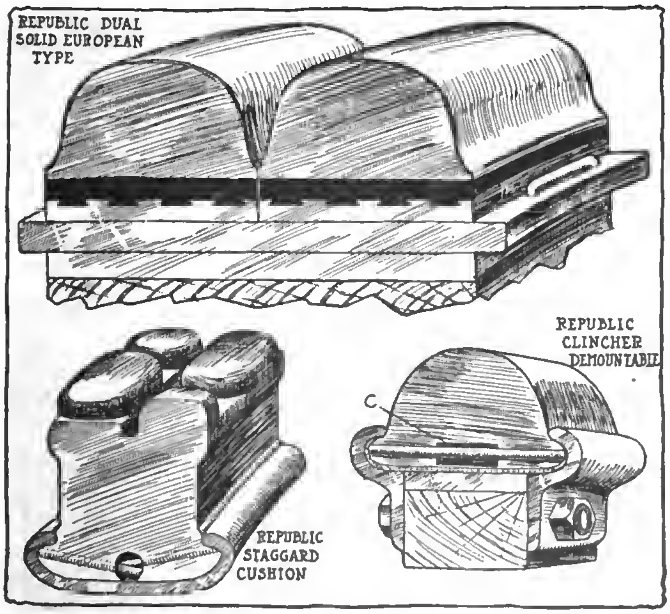

Fig. 3—Three styles of Republic solid tire

A similar principle is employed in the dual removable tires, there being some differences, however, in the execution. In this case, Fig. 1, there are three wedges W, W1 and W2, the wedge W being independent of the flange A. The center wedge W1 is a sliding fit over the steel rim, and when the nuts of the flange bolts are tightened, the outer wedges W and W2 force the rim on to the two sides, wedge W1.

The heavy-duty, side-wire tire of Firestone make is shown at Fig. 1. The tire is moulded on the rim, instead of being made endless and then shrunk over the lips of the channel. Cross wires are employed to assist the rigidity of the mounting. These tires are also fitted to removable rims as shown.

The construction of the Firestone continuous-base, notched-tread tires is shown at Fig. 1. In this instance it is fitted to a dual wheel and the construction is very similar to the heavy-duty tire just described. It is of the side-wire, soft-rubber base type, the base being endless as contrasted with the individual block type.

A cushion type of tire intended especially for electrics is also manufactured with either clincher or side-wire mounting, a section of these types being shown in Fig. 1. The European type of tire with steel and hard rubber base is made; the tire being pressed on to the rim under considerable pressure, held in position by a sunken key, and provided with wire staples to prevent side motion.

Goodrich wireless tire for trucks are manufactured by the B. F. Goodrich Company, Akron, O., in three styles, exclusive of varieties particularly intended for electrics. These are the Goodrich demountable type, block type and the pressed-on type. They are all of the metal and hard-rubber base type.

A sectional view of the demountable type, Fig. 2, shows the construction of the tire. The steel base B has a series of serrations and wedge-shaped protrusions on to which the hard rubber base H is attached. The base B has an undulating surface, the apex of the waves corresponding to the protruding wedges. The shape of the sides of the steel base F and F1 are worthy of notice here, as the method of attaching the tire is combined with this feature. Reference to Fig. 2 will make the reason of the taper clear. Before dealing with the method of attaching the tire, it must be stated tbat the steel base is not endless in the general accepted meaning of the word. It is slotted at three points, located at 90 degrees to each other; while at what would correspond to the fourth position, there is a key which fits into a

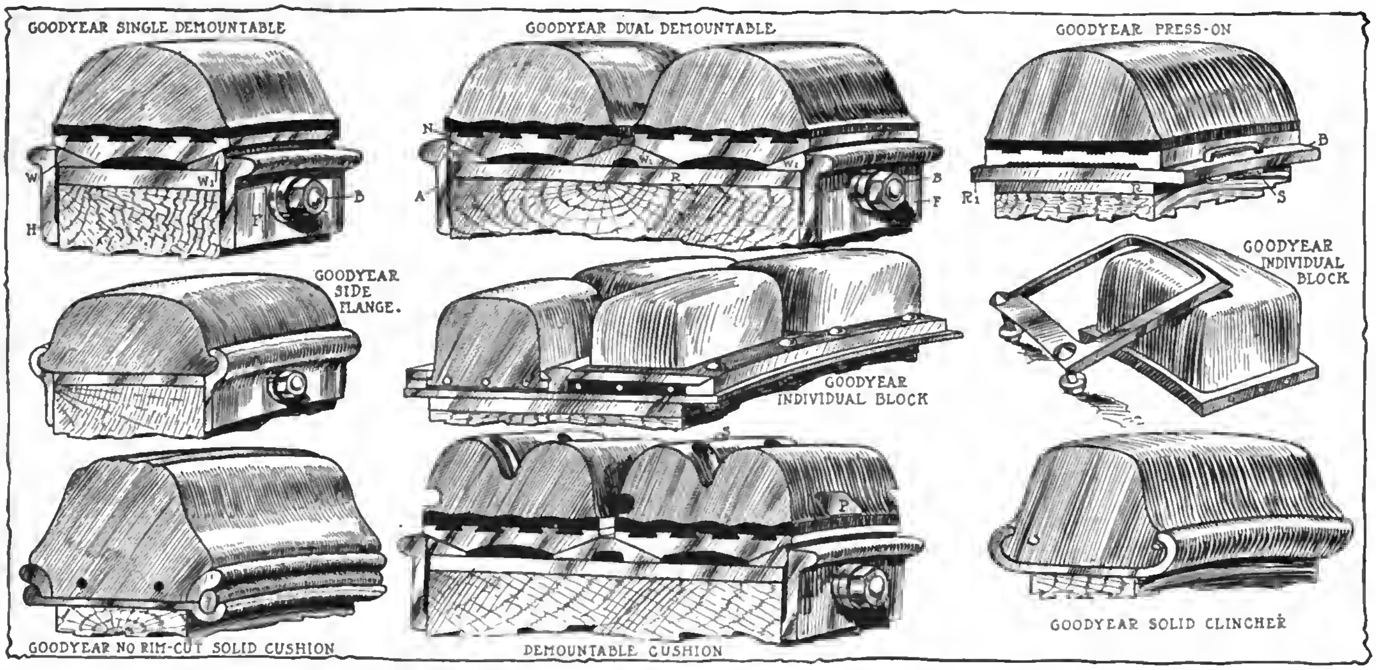

Fig. 4—The Goodyear solid tire output includes the complete line for all types of commercial vehicles

recess in the steel band and prevents the tire from creeping. By slotting the base as above described, it is possible to contract the tire over the band by tightening on the steel base with the rings F and F1. The steel base of the tire fits into the grooves G and G2 and when the nuts N of the through bolts B are tightened the tire is held rigid. It is claimed that the increase and decrease in circumference is so slight as in no way to affect the tire sub-base or tread. Fig. 2 shows the method employed for dual tires. The center ring R is endless. It is unnecessary to remove the wheel or the inner ring F to replace a tire, as everything can be removed after the outer flange has been taken off. A comparison of the block tire, Fig. 2, manufactured by the Goodrich company with their endless tire, Fig. 2, shows the principal differences. Each block has the same integral construction as the endless tire, but the blocks are individual and may be replaced and removed at will. The profile of the tire has been changed, this being necessitated by the construction. The blocks are placed end to end forming a complete tire, and applied direct to the permanent S. A. E. band. One block, known as the Key block, has a key seat which engages with the key on the felloe band. The initial application of the blocks is effected by holding them in position on the rim with a strap or rope while the outside flanges are applied. These tires are interchangeable on the same rims as the endless demountable type.

The method of applying the Goodrich pressed-on type tire is shown in the cross-sectional view Fig. 2. The intermediary rim A may be applied to the permanent S. A. E. band B or may be shrunk on the wood felloe without the use of the permanent band.

In order to provide a tire that will give low current consumption and at the same time give long mileage for electrics, a resilient compound tire has been placed on the market by the Goodrich company. The claim made for this tire is that it is not so soft that it will drag, nor hard enough to affect the batteries through causing excessive vibration.

Seven distinct types of tires are manufactured by the Goodyear Tire & Rubber Company, Akron, O., offering the purchaser a wide variety of choice. The various types are as follows: solid demountable; demountable cushion; solid metal base, pressed-on type; solid side flange; individual block; solid no rim-cut, and clincher truck tire. The solid demountable type, Fig. 4, belongs to the metal and hard-rubber base class. The metal base is undercut at an angle corresponding to the wedges W and W1 which latter rest upon the standard S. A. E. rim R. By applying the flanges A and F and contracting them together by the bolt B the wedges are forced against the rim. To take the tire off the rim, it is only necessary to remove the nuts and the outer rim and afterwards the wedge W1.

The construction of the Dual solid demountable Goodyear tire rim differs only in the center wedge W1, which is chamfered on both sides to accommodate the two tires. The tires intended for single and dual rims are identical, and are interchangeable.

The demountable cushion tire, as the name implies, can be removed from the permanent rim without the aid of a press. The sectional view, Fig. 4, shows that it is similar in base construction to the solid demountable just described, likewise the method of mounting. The tire has a dual tread, there being on the inner sides of the treads, undercuts as shown at S. These allow a displacement of the rubber and the double notches, besides having non-skid properties, offer increased traction. The undercut pockets in the sides provide for the displacement of the rubber, thereby adding resiliency. Fig. 4 shows a tire of the Goodyear cushion make in which the tread slots and base pockets can be seen.

The solid metal base Goodyear press-on tire is shown at Fig. 4. These tires consist of three strata, similar to the demountable types; namely, steel, hard rubber and soft rubber tread, but the shape of the base is different. In addition to the dovetails, the base is serrated to afford better gripping properties to the hard rubber. With the addition of a rim band R1, this tire fits the standard S. A. E. rim R. Side motion of the tire once it has been pressed on is prevented by the staples. It will be noticed that the rim band R1 is slightly bevelled at the sides at B forming a guide for the tire in the pressing-on process.

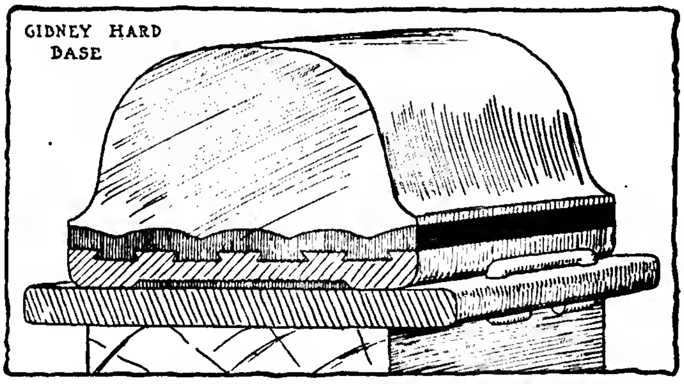

Fig. 5—The Gibney solid hard base truck tire

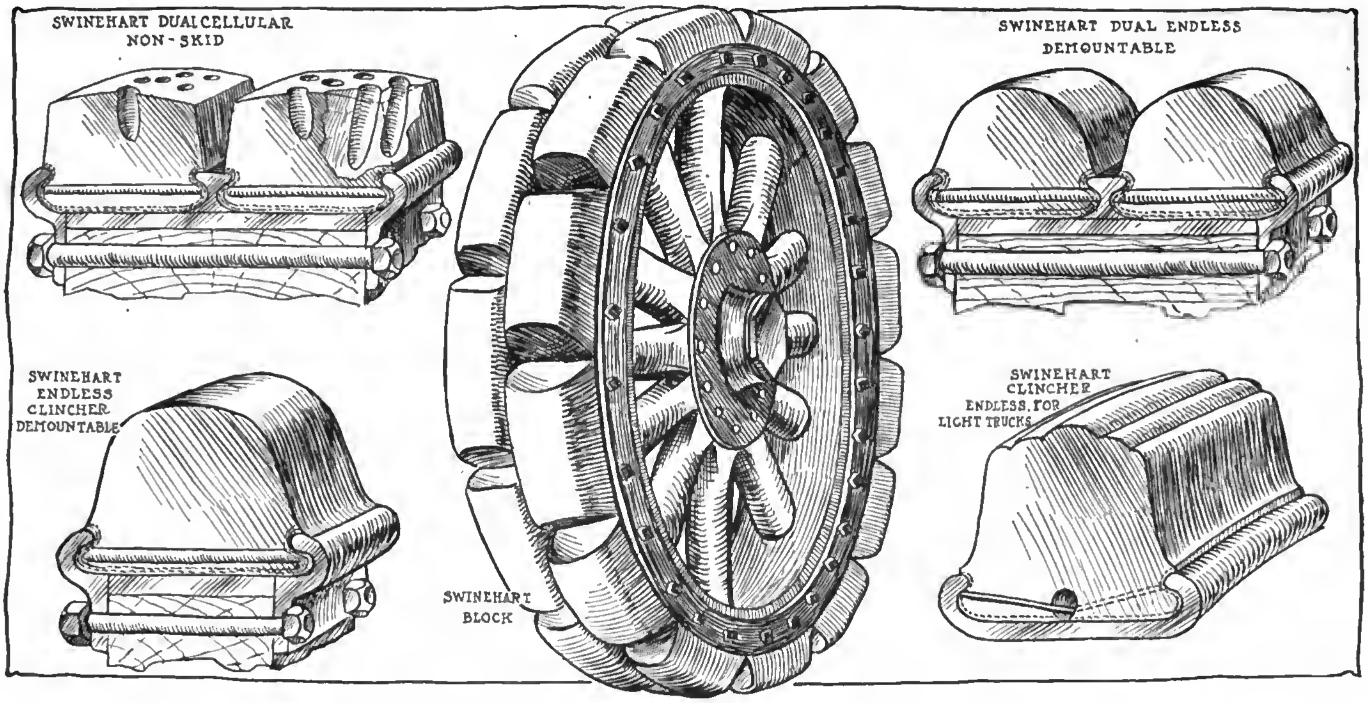

Fig. 6—Four styles of Swinehart solids and the block tread mounted on a wood commercial vehicle wheel

The Goodyear side-flange truck tire is made to the S. A. E. standard rim and side-flange specifications. A section of the tire fitted to a single rim is shown at Fig. 4. The cross wires or pins which are not shown run diagonally in the base of the tire, for which several advantages are claimed; one of which being that it is possible to tighten the side flanges and thereby increase the compression within certain limits, which would be impossible if the wire were placed straight across the tire. This tire, as can be seen from the illustration, has a soft-rubber base.

These tires can be used on dual rims, in which case a floating ring having a double clincher profile is used and placed between the tires. By tightening up the flanges the clincher sides of the tires are compressed into the four clincher grooves.

The Goodyear individual block tire is clearly shown in Fig. 4. Each block has a canvas base foundation, and the portion which is held by the metal clamps has three wires running through it parallel to the rim of the wheel.

Each block is an individual unit and is held in position on the rim by an individual retainer, the shape of block and retainer being seen in Fig. 4. It also shows a section through the tire. The sides of the retainers are bevelled at opposite angles, the inner one dovetailing under a ring placed in the center of the rim. The outside bevel rests upon a steel ring and both retainer and ring are held in position by two bolts for each retainer. In using this type of tire a separate rim is fitted over the standard S. A. E. ring.

The Goodyear no-rim-cut truck tire can be fitted to the standard Goodyear pneumatic rim. The sectional view, Fig. 4, shows that it is a soft-rubber base tire, as opposed to the hard-rubber base type, and there are two endless high-carbon steel wires running through the center of the base. The tire has concave sides. The method of applying the tire is similar to a pneumatic, except that it is necessary to use clamps to force on the inside ring B1 so that the locking ring L can be put in place.

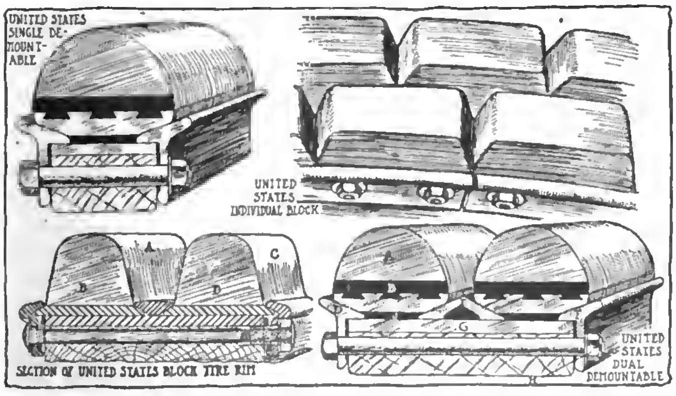

Fig. 7—United States line of some novel treads of great durability

The solid clincher truck tire can also be fitted to standard pneumatic tire rims either of the single-piece or demountable types. The section shows two wires, but these are not side wires. They run diagonally through the base of the tire and, being longer than the width of the rim, firmly wedge the base of the tire. The base is solid rubber and no machinery is needed in applying the tire. This is effected with a small hand tool supplied with the tires.

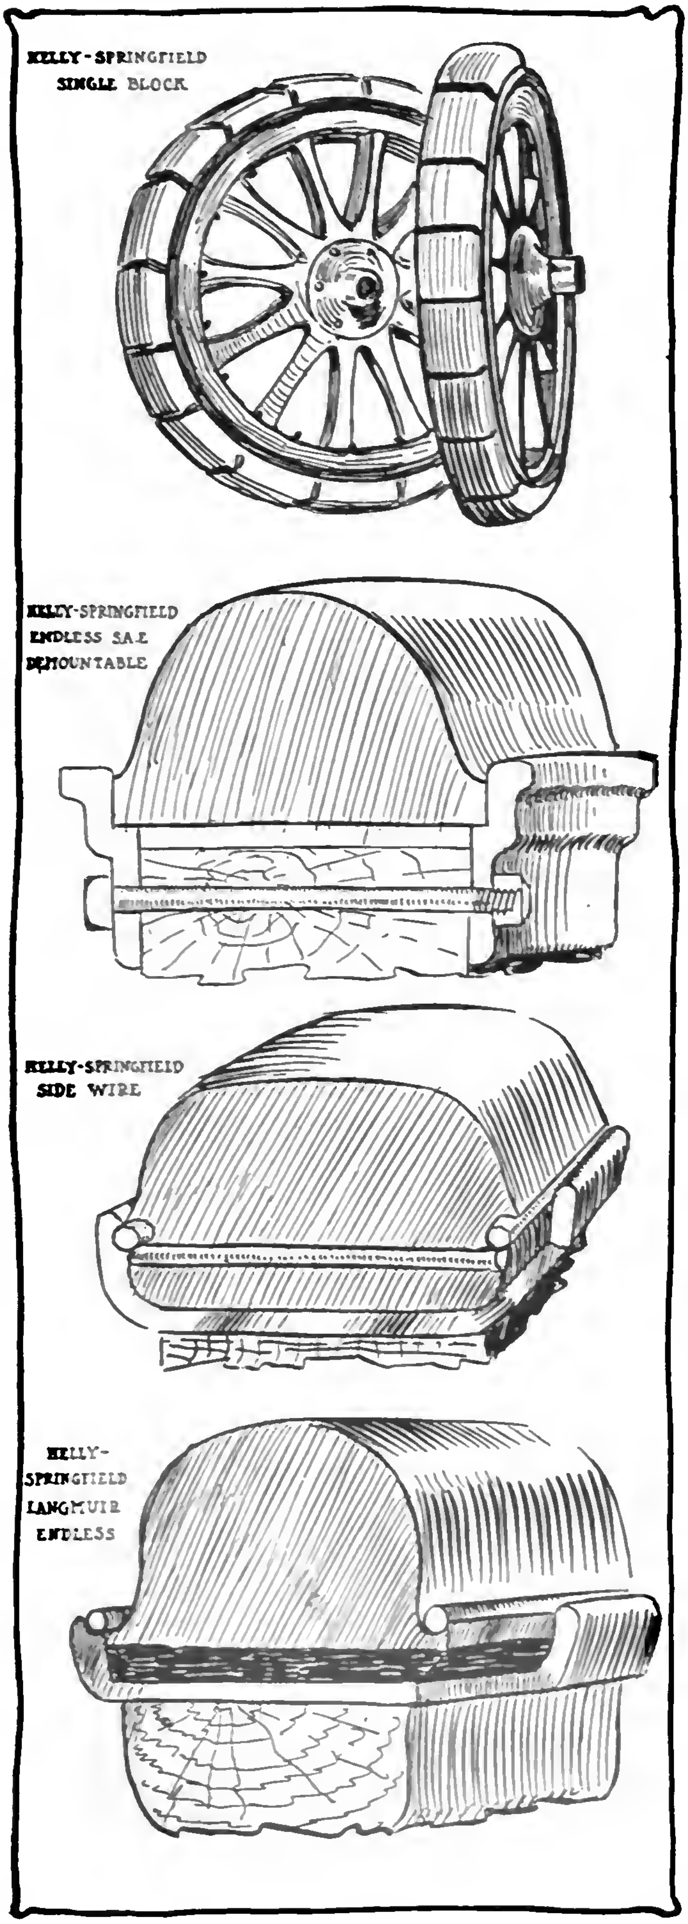
Kelly Springfield solid truck tires are manufactured by the Kelly-Springfield Tire Company, Akron, O., in five types, namely, the dual block or sectional tire; the endless S. A. E., new-type, single-block type; the side-wire type and the Langmuir endless type.

Considerable pioneer work has been done by the Kelly-Springfield company in connection with the block type of tire, having had this type on the market for some time. The rubber blocks are in single sections and have a reinforced base with three strands of wire running through it, Fig. 8. The blocks are held in position by retaining frames. The circumference of the rim is divided into three parts and these are placed over the blocks and held secure to the rim and wooden felloe by means of bolts with round heads.

The single-block tire is a new product of this company, and the method of mounting consists of two outside rings with a series of cross-bars placed between each block. The outside rings are fitted first and the cross-bars have bolts passing through them as well as through the main rim and the wooden felloe. This type of tire is especially adapted for low wheels.

Kelly-Springfield endless tires, a section of one being shown in Fig. 8, are of the soft-rubber base type with three endless wires passing circumferentially through the base. Side flanges hold the tire in position and prevent lateral movement; the wires are canvas covered.

The side-wire type, Fig. 8, differs from the endless type in the method of attachment. The base is formed with several layers of canvas imbedded into the rubber, above which are



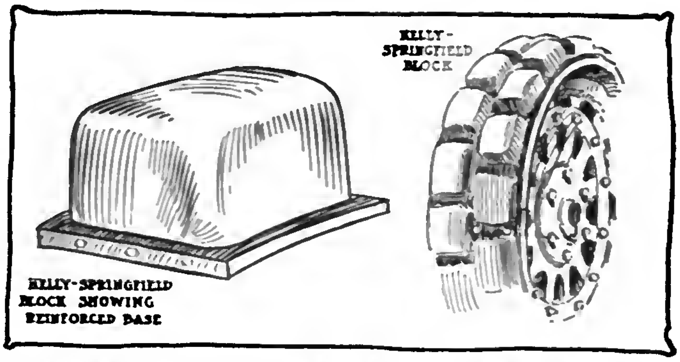


Fig. 8—Showing the Kelly-Springfield assortment of solid tires

cross wires at intervals. The tire fits into a channel rim and the bead is prevented from moving by side wires as can be seen by reference to the illustration. The Langmuir endless tire has a hard rubber and canvas base and is held onto the channel rim by side wires.

Gibney motor truck tires are only manufactured in the pressed-on type and are made by James L. Gibney and Brother, of Philadelphia at their factory at Conshohocken, Pa. These tires are of the metal and hard rubber base type, and a profile view of the tire is shown in Fig. 5. The tire is pressed on the standard S. A. E. rim and all slippage of the tire on the rim is prevented by a sunken key. It will be noticed that the sides of the tire are concave.

Up to the present, Motz cushion tires are made in various sizes, the largest of which is capable of being fitted to a truck having 2 tons capacity. They are made by the Motz Tire & Rubber Company, of Akron, O., which concern also makes a solid tire without the cushion features. The cushion or plain solid Motz tires are intended to be fitted to standard clincher or quick detachable rims as shown in Fig. 9. In the event that they are fitted to the Q. D. rim, a special tool is supplied to impress the rubber to permit the locking ring being removed, in the event that the tire is to be changed.

Excluding special tires manufactured by the Swinehart Tire & Rubber Company, Akron, O., for electric trucks, four distinct types are manufactured for gasoline trucks. These include the single and dual endless, smooth-tread tire, dual cellular non-skid tire, clincher endless tire for light trucks and the latest addition to the line, the continuous base block tire. The formation of the base of the solid endless and the cellular are identical as can be seen by referring to Fig. 6. These tires have cross wires running through the soft rubber base, which is covered below, and at the point of attachment to the side bead with rubber-coated fabric. The tires are intended for use on standard S. A. E. rims without any interliner. The clincher beads are gripped between the removable flanges, which latter are attached to the wooden felloe by a series of through bolts.

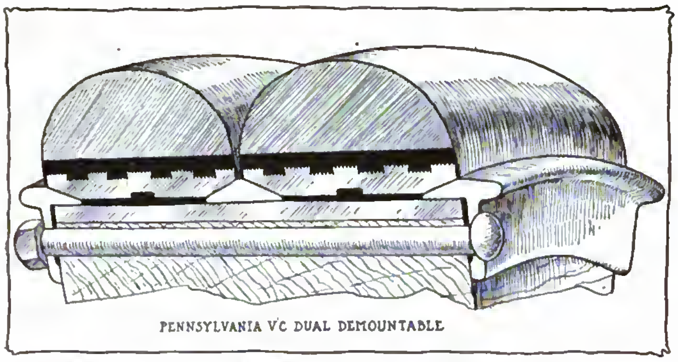
In the case of the dual tire, shown in Fig. 6 a center ring is employed having two clincher grooves. The cross wires pass well under the clincher rims thereby preventing the tire from pulling out.

The cellular tire shown in the dual form in Fig. 6 has a series of holes in the tread which form a suction grip on the road surface, besides allowing space for the displacement of the rubber thereby rendering the tire more resilient.

The new Swinehart block tire is of the continuous base type. It is demountable and is attached by means of side flanges, and fits standard S. A. E. rims without any special drilling of holes.

The Swinehart endless tire for light trucks is shown in Fig. 6. It is fitted to a clincher rim and has a series of cross wires placed at an angle from the lip of the bead to a point near the center of the base. The sectional view of this tire shows the construction clearly.

The Polack Tire Company, who recently has erected a factory at Bridgeport, Conn., is marketing two types of solid tires. These are known as the Polack European section tire and the Polack



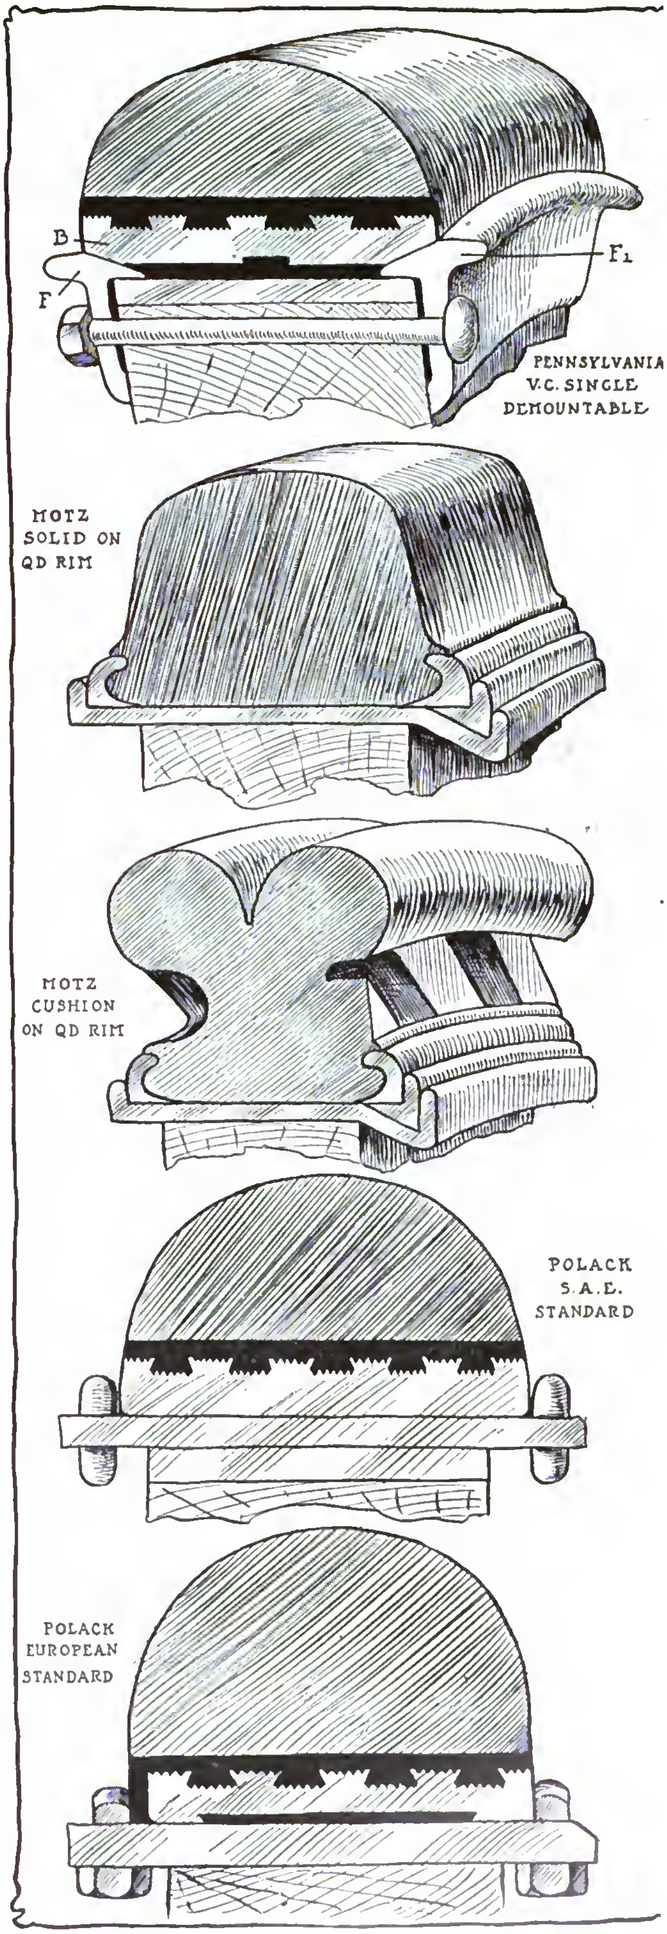


Fig. 9—The Pennsylvania demountable, Motz solids and Polack standard styles

S. A. E. standard tire. The sectional views of these tires in Fig. 9 show the principal difference between the two. The base is of steel and hard rubber in both cases. The European type tire is deeper in section than the S. A. E. standard which has a uniform sectional height of 2.75 inches. In the case of the European section, the hard rubber extends beyond the steel base on one side and all lateral movement of the tire on the rim is prevented by the T bolts shown. In this tire there is also a section of hard rubber beneath the steel, acting as a cushion. The S. A. E. section tire, of Polack make, is fitted to standard S. A. E. rims by interposing a liner between the rim and the steel base. Stout wire staples are used instead of T bolts to prevent lateral movement.

Pennsylvania V. C. motor truck tires are manufactured by the Pennsylvania Rubber Company, Jeannette, Pa., in the demountable form. They are of the hard-rubber and metal-base type. The section of the single tire, Fig. 11, shows the formation of the steel base B. It has a series of corrugations with serrated edges, on to which the hard rubber is moulded. There are also a layer of hard rubber on the under side of the rim that contacts with the permanent felloe rim. The tire is pressed over the rim and the steel B rides on the flange F, and when the second or outer flange is applied and tightened up, the double-wedge action on both sides holds the tire rigid. The flanges F and F1 are wide and project in plain view beyond the edges of the tires thereby protecting them from abrasion. The section of the dual tire, Fig. 10, shows that the same wedge action is employed. In this case, the inner sides of the steels ride on the center floating wedge ring, enabling both tires to be removed without taking off the wheel. The outside width of the tire is exactly the same as the width of the felloe, thus obviating the tendency to spring the flanges outward. The width of the flanges in the dual tire are almost double that used in the single tire.

The line of solid tire manufactured by the Republic Rubber Company, Youngstown, Pa., includes the following types: a single or dual pressed-on type; a block type; single or dual demountable, and an electric cushion tire with a staggard tread. The pressed-on tire is of the conventional form with steel and hard-rubber base. The steel has a series of wedge-shaped corrugations with serrated edges, to which a thick section of hard rubber is moulded. The profile of the soft rubber tread is slightly concave, although not so pronounced as some other tire of this type on the market. The section of the dual pressed-on Republic tire is shown in Fig. 3, in which it will be seen that an intermediary band is used between the S. A. E. rim and the steel base of the tire. Wire staples are fitted to the sides and a sunken key is employed to prevent creeping. The demountable solid tire is of the clincher bead category, with cross wires that fit under the lips of the flanges. The cross section shows the method of manufacture of this tire and the attachment to the wheel. Running through the center of the base of the tire there is a hard-rubber core through which the cross wires pass. The base of the tire is covered with a series of layers of rubber-

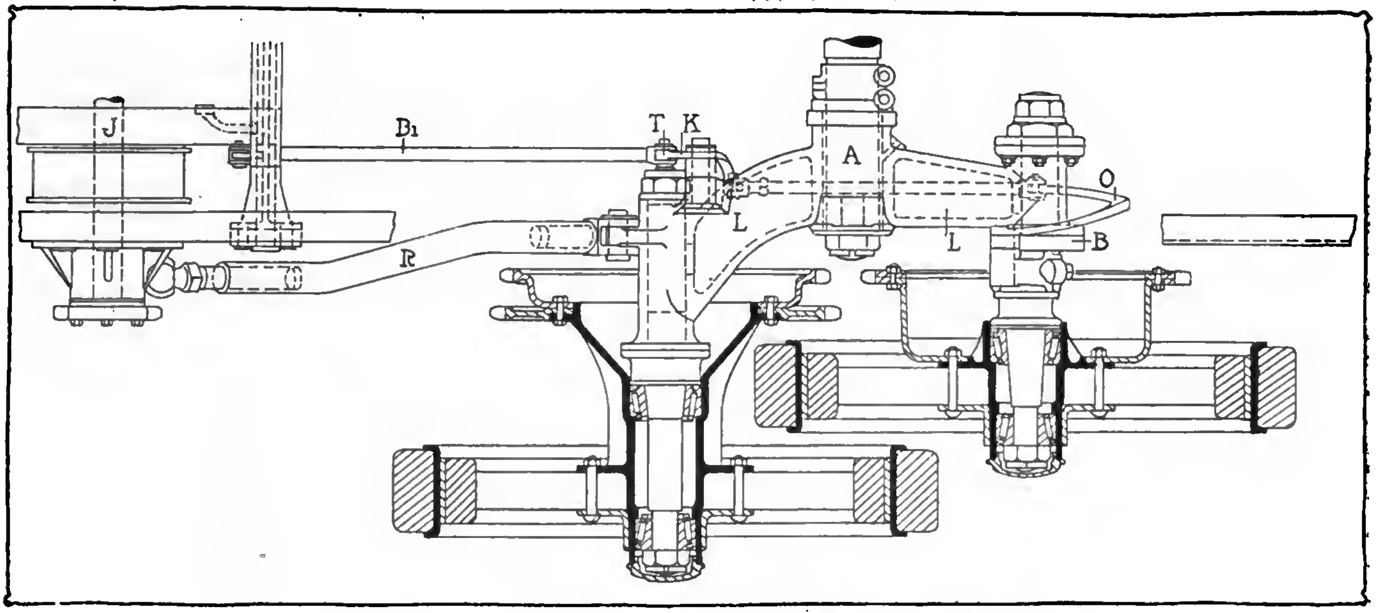

Fig. 1—Plan view of Dow dual wheel mounted on the rear end of a 5-ton Mack truck

Dow Dual Truck Wheels

Bogey Suspension Permits Use of Four Chain-Driven Rear Wheels with Many Advantages

Greater Traction, Lessened Depreciation and No Skidding Among Properties

INCORPORATING the principle of the Bogey truck with its various advantages, adapted to the requirements of freight automobile construction, the Dow dual wheel set made by the Dual Wheel Company, 1733 Broadway, New York City, is now being introduced in the truck market. The use of this wheel set includes a pair of levers having a wheel on each end and free to oscillate on the ends of the axle.

The Dow wheel is the invention of H. B. Molesworth and Charles Edgar Masterman, of London, England. The English patents having been granted, American patents were applied for and the fundamental letters patent protecting this invention is No. 907,847, granted on December 29, 1908. This patent with the other American rights was assigned to Alexander Dow.

The construction of the wheel is shown in Figs. 1 and 4, being plan and side elevation of the Dual design. As Fig. 1 shows the wheels are mounted on the ends of a lever L which is pivoted at its center on the end of the axle A. Referring to Fig. 4, it is seen that the two wheels are not the same distance from the longitudinal center line of the chassis, but that the front wheel is further from this line than the back wheel, the distance between adjacent plans of the wheels being the same as in the case of dual wheels mounted, in the ordinary way, on one axle. The drive is taken from the jackshaft J, which carries the differential to both wheels by separate chains and sprockets, both running at exactly the same speed, they being of the same diameter. The brake construction is as follows:

The brake drum B is fitted only on the rear wheels of the

Solid Tires for Commercial Vehicles

(*Continued from page 485.*)

coated fabric, and the beads of the tire are clamped in position on the steel S. A. E. felloe band by outside flanges and a series of through bolts. The block tire, which has just been placed on the market, is of the individual block type. The method of attachment differs from any other tire of this description on the market. The blocks are laid on the permanent rim and retainers in the shape of an offset figure 8 are placed over the blocks and bolts pass through the center of the retainer and the wooden felloe to secure the blocks. In addition the sides of the retainers are clamped by outside flanges. The blocks are staggard or in other words are placed alternately with the block on one side, filling the corresponding gap between two blocks on the other side.

The United States Tire Company, New York, are offering two new types of tires for motor trucks, namely the demountable and the standard block tire. The demountable tire was placed on the market last year, but the block tire is new. The demountable type tire has a steel and hard-rubber base. The inside of the metal base is beveled on both sides to fit wedge-shaped flange rings used in connection with the rim. A section of the tire is shown in Fig. 7, from which it can be seen that the standard S. A. E. rim is employed without interliners. The wooden felloe is drilled to receive the bolts that hold the side flanges in place. The flanges D and F differ in shape to most others of this class in that the wedge surface on the top continues the entire width. The spacer E is split, the same applying to the outside flanges. This permits of an increase in tension from time to time, if such is needed, and obviates the possibility of the rings freezing to the rim. To accommodate the split flange rings, the holes in them are slotted to give the rings the necessary expansion.

The United States block tire is an individual block tire in every sense of the word. Each and every block can be removed and replaced separately and the tire will fit a standard S. A. E. rim without alteration or drilling of additional holes. The sectional view in Fig. 7 shows the method by which the blocks are held in position. Each block has a steel base with chamfered sides. The sides fit under the center ring A and are held on the outside by the undercut flanges B and C. The side view of the tire, Fig. 7, shows how each block has its individual flange piece, held in position by two nuts and lock washers. Upon removal of the rim section the block can be taken out without disturbing the remainder of the tire.

system and is the emergency brake of the truck, but through the chain brakes all four wheels. The drum is intended to be operated by lever through connections, being such that when the chain between the two wheels of the system is being adjusted, it is not necessary to change the brake adjustment; the latter is not interfered with by either the front or rear wheel of the system riding over elevations or dropping into depressions. This is accomplished as follows: The brake connection rod B1 parallels the radius rod R and couples with a bellcrank K at a point T which is in alignment with the center of the hub of the front wheel of the system. The bellcrank K works on T as a center and has a connecting arm K which is hooked at its rear end. The chains between the front and rear wheels of the system are adjusted by the rear stub axle having the portion carrying the wheel eccentric to the portion in the housing. This dual system can be fitted on any standard chain-driven truck, such equipment calling for the elimination of the old axle but permitting the use of the original springs.

The springs rest on the axle A which acts purely as a weight-carrying member. Through this axle and the horizontal levers the weight is so distributed as to be carried equally by all four wheels, and the axle is so mounted that exactly twice as much weight rests on it than does on the front axle of the truck. The dual equipment itself adds about 400 pounds to a 5-ton truck. The centers of the front wheelhubs of the dual wheel equipment occupy the same position as the rear axle, before the dual construction is installed. By this arrangement the dead axle A is placed farther back, the wheelbase being consequently lengthened by 12.5 inches. The tread, on the other hand, is not increased; but, in the case of a 5-ton Mack truck, has been reduced to 70 inches, the standard tread for commercial vehicles of this type being 71 inches.

As each of the four rear wheels carries the same weight, the weight of each individual wheel is reduced 50 per cent., the tire surface being the same as in the case of single wheels. This results, of course, in a saving of tires. As the tires contact at four points with the roadbed, side-skidding is made practically imposssible; while the use of four tractive wheels in itself insures good traction under almost all conditions. Incidentally, the brake efficiency is increased—according to the claims of the maker—due to the use of four road wheels. Another advantage claimed is the saving in fuel in climbing out of a hole or over a road obstacle, as it is easier to get traction with two out of four wheels than with two wheels only; spinning of the wheels is therefore made practically impossible, since the connection of the wheels through the medium of the jackshaft keeps any individual wheel from speeding up. The vibration of the entire truck mechanism and the effect of road shocks is indeed remarkably small, as was witnessed by a representative of The Automobile during a test. The above-mentioned 5-ton Mack truck was run against a curbstone, mounting it with an almost unnoticeable shock, while holes and bumps in the road were taken with the greatest ease and producing very little vibration. This latter point is perhaps one of the most important advantages of the Dow Dual scheme, as it necessarily tends to reduce depreciation and thus results in a direct saving of money.

Fig. 2—Dow dual wheels and chain drive

Fig. 3—Dow wheels have minimum clearance

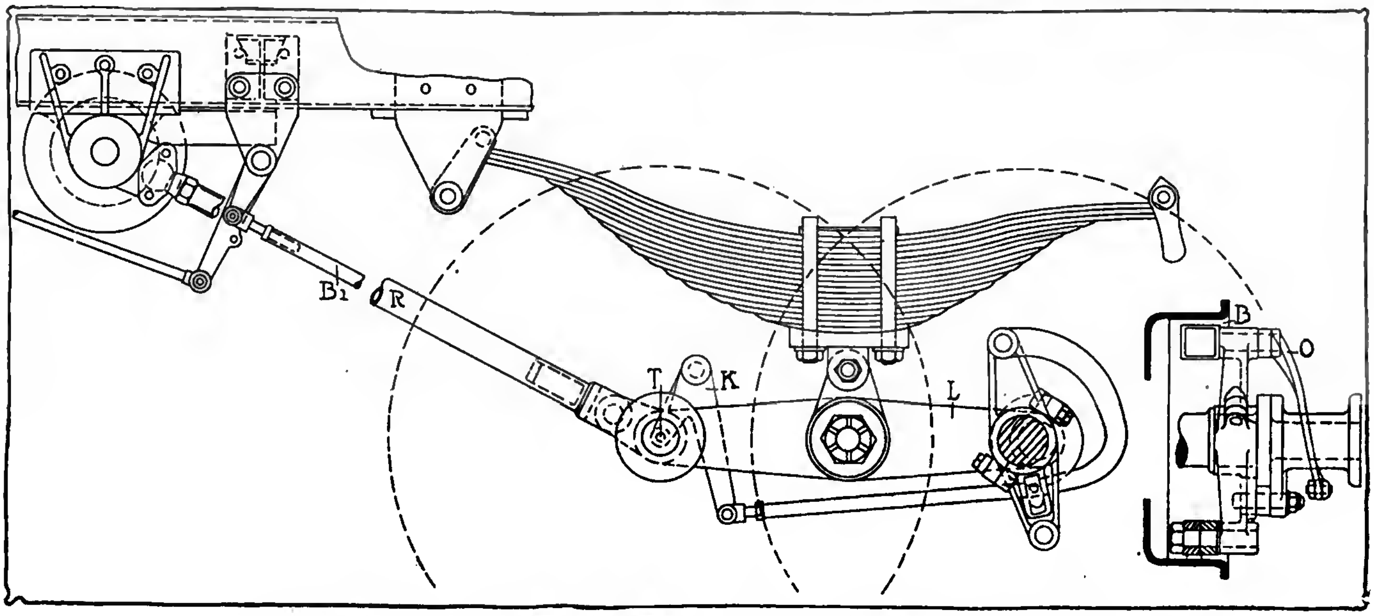

Fig. 4—Elevation of Dow dual wheel rear unit, showing brake adjustment mechanism

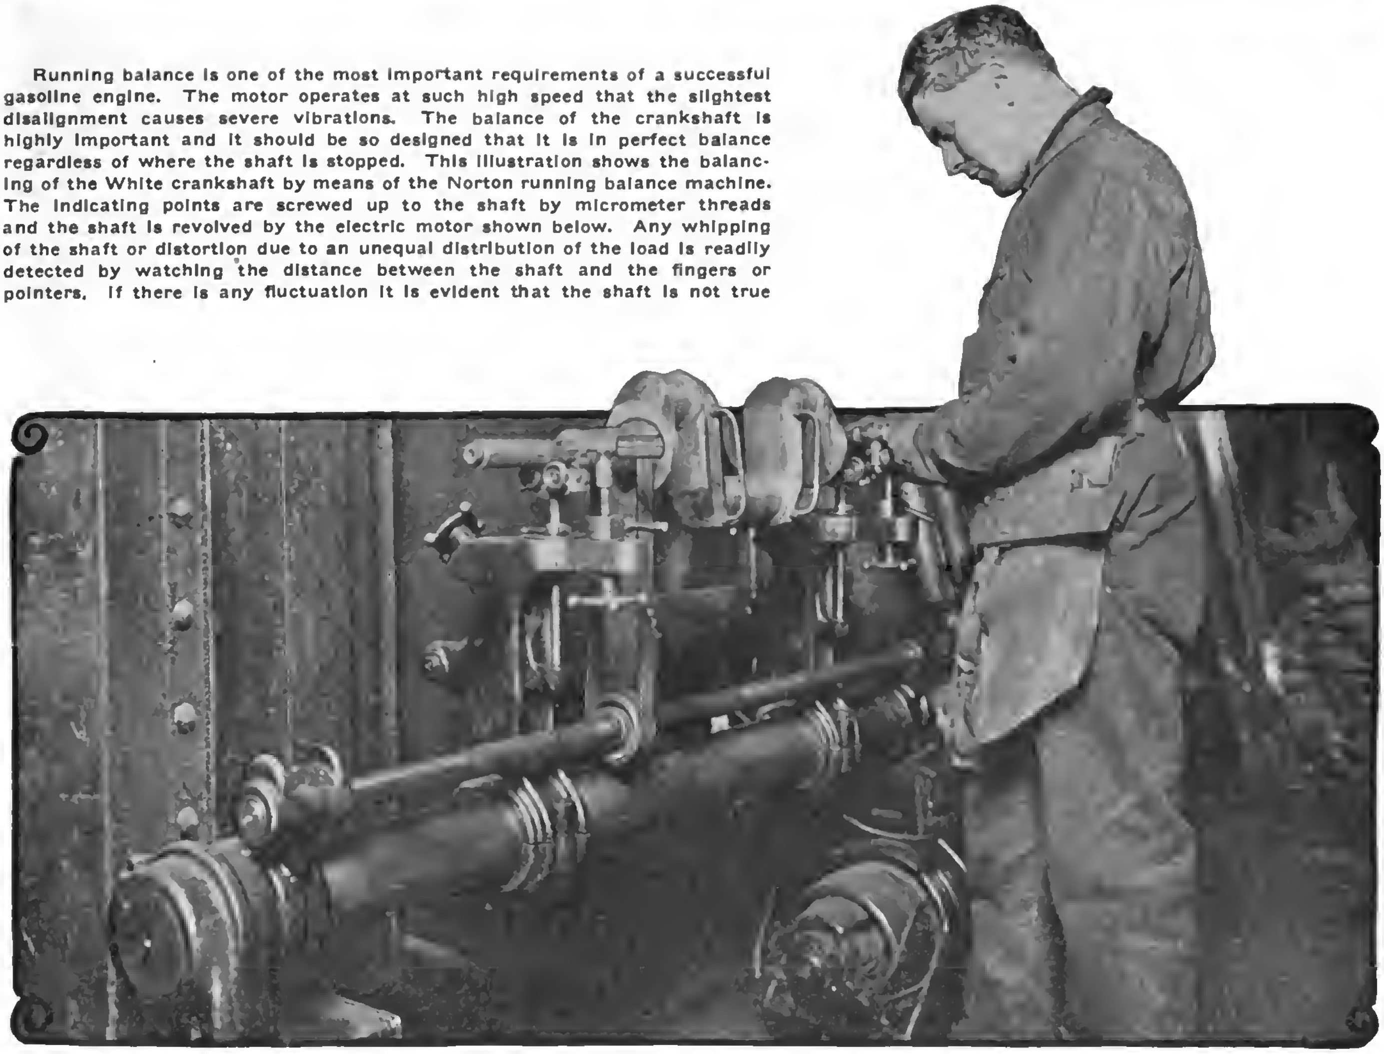
Factory Miscellany

Running balance is one of the most important requirements of a successful gasoline engine. The motor operates at such high speed that the slightest disalignment causes severe vibrations. The balance of the crankshaft is highly important and it should be so designed that it is in perfect balance regardless of where the shaft is stopped. This illustration shows the balancing of the White crankshaft by means of the Norton running balance machine. The indicating points are screwed up to the shaft by micrometer threads and the shaft is revolved by the electric motor shown below. Any whipping of the shaft or distortion due to an unequal distribution of the load is readily detected by watching the distance between the shaft and the fingers or pointers. If there is any fluctuation it is evident that the shaft is not true



Balancing the White crankshafts in the testing department of the company's factory at Cleveland

SANFORD Truck to Build—The Sanford Motor Truck Company has purchased from the Syracuse, N. Y., Savings Bank a brick building and will occupy it for factory purposes. Alterations and improvements are being made in the plant which has a floor space of upward of 60,000 square feet. New machinery, including a large freight elevator, is being installed. The plans call for a plant with a manufacturing capacity of 1,000 motor trucks a year.

Lee & Porter Add—The Lee & Porter Manufacturing Company, Buchanan, Mich., will erect a frame addition to its plant for making automobile axles. The new structure will be 32 feet by 90 feet with concrete foundation.

Factory for Centralia.—W. A. Perkins, Seattle, Wash., is interested in the organization of a company with a capital of $2,000,000, which will construct an automobile factory in Centralia, Wash. The proposed structure will cost about $250,000.

Work on New Pilot Factory—Construction work has started on the new addition to the plant of the Pilot Motor Car Company, Richmond, Ind. The new building, which will be two stories high and 120 feet long, will be finished in 40 days.

Bidding on Ford Plant.—Bids are being received for the structure of a five-story factory, 150 feet by 150 feet in size, for St. Louis, Mo., for the Ford Motor Car Company, Detroit, Mich. It will be of reinforced concrete and will cost approximately $150,000.

Enlarge Chalmers Plant.—The Chalmers Motor Car Company, Detroit, Mich., is reported to have made plans for the erection of a new building, with 24,000 square feet floor space, to be used for general manufacturing purposes. This will give the Chalmers a combined floor space of over 1,000,000 square feet.

More Freight Cars Needed—The traffic manager of the Ford Motor Company, Detroit, Mich., estimates that more than 30,000 cars will be needed to care for the factory's shipping during the coming year. To take care of this large amount of business five additional side tracks are being built at the factory.

New Departure's New Plant—Increased business will necessitate the immediate operation by the New Departure Manufacturing Company, Bristol, Conn., of the plant of the Whitlock Coil Pipe Company at Elmwood, Conn., recently acquired. The home plant of the company at Bristol is working to capacity. The Whitlock plant was taken on to meet the need for additional factory space.

Shows, Conventions, Etc.

Jan. 27-Feb. 13....Troy, N. Y., Annual Show, State Armory, Troy Automobile Club.
Feb. 8-15..........Hartford, Conn., Annual Show, State Armory, Hartford Automobile Dealers' Association.
Feb. 8-15..........Minneapolis, Minn., Annual Automobile Show.
Feb. 10-15.........Chicago, Ill., Truck Show.
Feb. 10-15.........Winnipeg, Man., Show, A. C. Emmett.
Feb. 10-15.........Ottawa, Ont., Ottawa Motor Show, Howick Hall, Louis Blumenstein.

Foreign

March.............France, Sealed Bonnet, 3000-Mile Run.
March 31..........Montevideo, Uruguay, International Competition of Agricultural Motor Vehicles.
April..............Barcelona, Spain, International Exhibition.
May...............St. Petersburg, Russia, International Automobile Exposition, building of Michael Maneze, Imperial Automobile Club of Russia.

Wright Leaves Springfield Body.—J. A. Wright, body designer and general foreman of the Springfield Metal Body Company, Springfield, Mass., has gone to New Haven, Conn. He is now with the New Haven Carriage Company.

Morrow's One-Story Addition—The Morrow Manufacturing Company, Elmira, N. Y., manufacturer of automobile parts and accessories, has plans in progress for a one-story addition to its plant, which will add about 50,000 square feet of floor space.

Michigan Builds New Office.—The Michigan Motor Car Company, Kalamazoo, Mich., is preparing to erect a new office building on a vacant tract adjoining its factory. The new structure will be equipped in the most up-to-date manner and will represent an outlay of $250,000.

Appraisers Examine Knox Factory—The entire assets, real and personal, of the Knox Automobile Company, Springfield, Mass., are now being appraised by the American Appraisal Company. No definite action on the proposition to reorganize the company will be taken until a full inventory of the plant is taken.

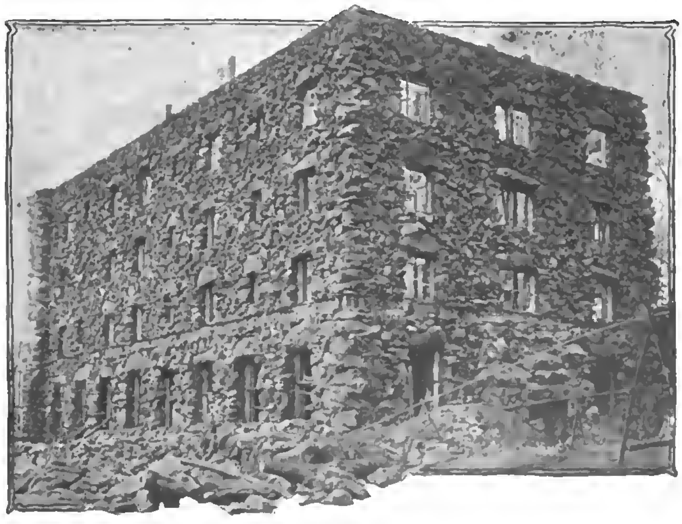
Ford Assembling in Hutchinson—Arrangements have been made with a Hutchinson, Kan., automobile concern by the Ford Motor Car Company, Detroit, Mich., to utilize part of the establishment for the assembling of Ford cars for the central and western parts of Kansas. The work is expected to give employment to about thirty men.

Steel Wheel Company Builds—The Steel Wheel Company, Bethlehem, Pa., which will manufacture a spring steel wheel for use on automobiles and motor trucks, will shortly locate a factory on Broad street in that city. It will be of three stories with ample floor space for the assembling of machines and the manufacture of wheels.

Gould to Superintend Alco Manufacture—J. W. Du B. Gould, of 30 Church street, New York City, has made arrangements to connect with the American Locomotive Company, Providence, R. I., in the capacity of an efficiency engineer. He will superintend the manufacture of automobiles with a view to obtain greater factory efficiency.

Davis-Bach's New Plant—The Davis-Bach Manufacturing Company has established itself in a model plant at Alliance, O. Incorporated under the laws of Ohio, the new industry will specialize in the manufacture of autmobile parts and steel stampings, and also its own line of radiators, airless tires, horns, etc. C. H. Davis is president, and J. J. Schmidt, vice-president.

Budd Buys Grabowsky Plant—Negotiations have been completed by which the Edward G. Budd Manufacturing Company, Philadelphia, Pa., purchases the plant formerly occupied by the Grabowsky Power Wagon Company, Detroit, Mich. Extensions will be begun immediately to cost about $200,000. The property purchased contains a modern reinforced concrete factory building, four stories in height, containing 72,000 square feet of floor area and a modern power building. It is planned to begin at once the erection of a factory building that will contain about 135,000 square feet. Between 300 and 500 men will be employed, and it is expected the plant will have an output of at least 30 completed bodies a day by next May. The company manufactures pressed steel bodies for commercial and pleasure cars, the parts being welded to form one piece, practically without joints or seams.



East wing Grove Park Inn made from crude mountain road rock

News of the Week Condensed

Packard truck of 3 tons capacity drawing a wagon train of fifteen wagons up a North Carolina mountain

MIDSUMMER Show for Detroit—Harry Fosdick, director of sales for the Hupp Motor Car Company, Detroit, Mich., states that there is only one drawback in regard to automobile shows, and that is the time of holding the events. He thinks that the most opportune time is in midsummer, just after the different manufacturers announce their new models, and he with a number of manufacturers made a proposal during the recent New York show to the effect that it would be for the advantage of all concerned to stage the next national show at Detroit at that time of the year.

Havers Makes Hard Trip—J. R. Elliott, of Portland, Ore., recently drove a Havers car from that city to Medford, a distance of 300 miles, over the roughest roads of that state.

Wheeler with Johns-Manville—The H. W. Johns-Mansville Company, New York City, has appointed C. L. Wheeler as traveling representative in its Atlanta, Ga., territory.

Handles J. M. Shock Absorber—The Powell-Elliot Auto Repair Company, Brooklyn, N. Y., has acquired the general agency for that city and Long Island for the J. M. shock-absorber.

Manitoba Spends $1,000,000—A report issued by the Highways Commissioner for the Province of Manitoba shows that a sum over $1,000,000 was spent during 1913 on the highways of the province.

Taffinder Retires—S. N. Taffinder, of Monterey, N. L., Mexico, has retired from the management of the Fronterizo Garage, for which he previously held power of attorney from Antonio Elosua and his wife.

Automobile Conference—The Automobile Underwriters' Conference met recently and elected officers for the ensuing year as follows: C. F. Jungman, president; W. F. Whittlesy, vice-president, and D. F. Cox, secretary.

Fisk Factory Branch in Winnipeg—The Fisk Rubber Company of New York City has opened a direct factory branch in Winnipeg, Man. The branch is one of the first in Canada to be operated directly by the factory which manufactures the tires.

Service Department Established—Joseph Maw & Company, Ltd., Winnipeg, Man., has established a service department in its agency with Frederick Sager manager. One of the principal functions of the department is the instruction and education to the owners in the proper care of their cars.

Mitchells for Moving Pictures—Both the Kinemacolor and the Universal Film companies, with three others—the Majestic, Carlton and Vitagraph—are using Mitchells in their moving pictures and also for the transportation of the actors and paraphernalia to and from the scene of the plays.

Car Ordered by Wireless—What is probably the first order ever taken via wireless by an automobile salesman was recorded recently by G. N. Jordan, Los Angeles, Cal., branch manager for the R-C-H car. The order came from C. E. Hansen, who was aboard the steamer Mauretania returning from Europe.

Korea's Seventh Car Hudson—Korea recently bought its seventh car, a Hudson. All of the cars are American makes and their importation has extended over a period of 4 years. The fewness of automobiles in that country is probably due to the fact that it is a very mountainous region and has very few good roads.

Corbin Speedometer on Keeton—Colonel Wilbur C. Brown, general sales manager of the Corbin-Brown speedometer division of the American Hardware Corporation, New Britain, Conn., has arranged to outfit the Keeton car entered in the Indianapolis, Ind., 500-mile race with a 200-mile speedometer, something never before made.

Inter-Provincial Highway Movement—The movement for the construction of an inter-provincial highway between Montreal and Toronto and Montreal and Ottawa is meeting with success. This highway entails the construction of bridges connecting Montreal with the mainland from a point at St. Anne de Bellevue to Ile Perrot and another bridge from Ile Perrot to a point in Vaudreuil County.

Amend Automobile Bill—The Dunn automobile license bill, up for hearing recently before the House Tax Committee in St. Paul, Minn., probably will be amended to eliminate a license based upon the horsepower of automobiles and to fix a flat registration fee for each machine of about $10. It is probable that the money collected from automobile registration will be distributed among the counties for road purposes, instead of being handled directly by the State highway commission, as the bill provides.

Texas Motor Speedway Formed—J. D. Christenson, of St. Louis, Mo., is named as the principal stockholder in the Texas Motorway Company, which has just been organized for the purpose of constructing an automobile highway between Dallas and Del Rio, Tex., a distance of approximately 500 miles. The company has a nominal capital stock of $10,000, divided into 100 shares of $100 each. Mr. Christenson owns sixty-four of the shares, G. W. Baker, of Dallas, thirty-five, and G. L. Cade, of Dallas, one.

Seymour with White—Joseph Seymour has joined the selling force of the White company in New York City.

Bill with Disco Starter—H. L. Bill, of Detroit, Mich., has become manufacturing expert for the Disco Starter Company, of that city.

Bates with Firestone—G. J. Bates has recently connected with the Firestone Tire & Rubber Company, Akron, O., having charge of the sales in the pneumatic tire department.

Automobile Trade in Mexico—Three passenger automobiles and two motor trucks, all of American make, have been imported into northeast Sonora, Mexico, within the past 2 months.

New Georgia Road—It has been decided to begin immediately the construction of a temporary highway through the great Altamaha swamp, which will, as rapidly as possible, be made a part of the Savannah, Ga.,-Jessup highway.

Lexington Club Elects—The New Lexington Automobile Club, New Lexington, O., has elected the following officers for the year: C. C. Chappelear, president; H. A. Lowe, vice-president; C. L. Chuet, secretary, and J. O. Cullen, treasurer.

Philadelphia Tire Firms Combine—The M-S-H Sales & Rubber Company and Meeley Tire House, Philadelphia, Pa., have been consolidated and will hereafter be known as the Meeley Rubber Company, Inc., with headquarters at 660 North Broad street.

Inspector to Enforce Laws—The Ohio State Automobile Department, located in Columbus, O., will soon start out a traveling inspector to make the rounds of Ohio cities with a view of inforcing the State automobile law with reference to securing 1913 number plates.

Supply House in Bankruptcy—Millie Wachman, operating under the name of the U. S. Auto Supply & Manufacturing Company, Detroit, Mich., has filed a petition in bankruptcy in the United States Court. The assets are given at $9,100 and the liabilities at $10,731.45.

Jiffy Directors Re-Elected—At the annual meeting of stockholders of the Jiffy Auto Curtain Company, held in Chicago, Ill., recently, the entire board of directors holding office this past year were re-elected and the reports of business for the past year were presented.

Auburn's Fire Apparatus—Auburn, N. Y., will have after February 15, when work will be completed, a completed equipped automobile fire apparatus. The station cost $15,000 and is used by Automobile Fire Company No. 3, which has been especially drilled for the new service.

Automobile Trade Association—Owners of garages and automobile repair establishments of Beaumont, Tex., recently formed the Beaumont Automobile Trades Association with all the seven proprietors in the city as members. J. G. Minter is president; C. A. Ross, vice-president and H. P. Jirou, secretary.

Milwaukee's Fire Equipment—Milwaukee, Wis., recently installed a motor-propelled fire-fighting equipment, a combination hose, chemical and flying squadron car built by the Stegeman Motor Car Company, of that city, at a price of $5,500 with full equipment. The accompanying illustration shows the truck.

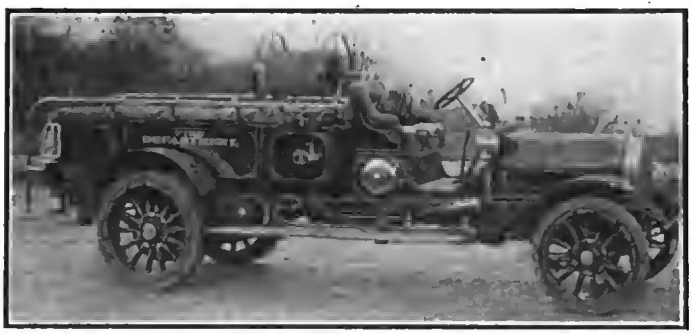
Savannah Dealers Form Organization—Savannah, Ga., automobile dealers have formed a temporary organization and set a time and place for a more formal meeting at which a permanent organization will be perfected. J. E. Finney, agent for the Buick people, was made temporary chairman. The purpose of the organization is to encourage better business methods by co-operation.

Manchurian Passenger Service—An automobile passenger service has been inaugurated between Tsitsihar and Blagovestchensk by the Eikhenbaum Company, Pristan, Harbin, Manchuria, China. Two closed and one open automobiles are to be used and the fare for a single trip in either direction is in the former 100 rubles, $51.50, and the latter 75 rubles, $38.63; 36 pounds of baggage will be allowed.

Ohio Treasury Enriched—The Ohio State treasury was enriched $153,034.17 when a certified check for that amount was turned over to Treasurer Brenneman by J. A. Shearer, Ohio register of automobiles. The amount represented the receipts of the department for the month of January less the expenses of the department. The total receipts were $169,319.65 and the expenses $16,327.52. The gain over the same month last year was $59,068.40.

Drivers' Club Formed—The Auto Drivers' Protective Association of Minneapolis, Minn., has been formed and has quarters at 735 Temple Court. The officers are: President, B. C. Montgomery; vice-president, W. H. Feitzler, and secretary-treasurer, B. M. Emerson. Mr. Geitzler will be manager. The purpose is to put driving on a good basis, to get legislation to control speed and to protect the right of its members, provide attorneys in case of arrest and hospital care in case of accident.

"Little Chunk of Cole" at the Chicago Cole Exhibit—He just smiles



New Stegeman flying squadron car of Milwaukee Fire Department

Jones Manager of Cole—H. S. Jones has been appointed manager of the Cole Motor Company, Philadelphia, Pa.

Will Attend Washington Convention—A delegation of merchants and farmers from Louisiana will attend the good roads convention in Washington, D. C., in March.

Bradford Now Manager—B. C. Bradford of Detroit, Mich., has taken the position of manager of the United Motor, Columbus, O., Company, succeeding F. E. McClure.

Organize Wabash Automobile Club—Wabash, Ind., automobilists held a meeting recently and organized an automobile club. C. H. LaSalle was named chairman and William Dixon, secretary.

Cortland Automobile Club's Banquet—The annual banquet of the Cortland Automobile Club was held at the Messinger Hotel, Cortland, N. Y., recently, and 230 members, with many friends, were present.

Wage Earners Number 75,721—The number of wage earners in the automobile industry in the United States is 75,721, and the automobile wage standard is said to be estimated somewhat higher than that of other industries.

Fort Atkinson Club Elects—The annual election of the Fort Atkinson, Wis., Automobile Association resulted as follows: President, Gavin Coppins; vice-president, R. F. Colby; secretary, C. A. Downing, and treasurer, G. E. Ward.

Peerless Sales Company Formed—The Peerless Sales Company, Ltd., Winnipeg, Man., was recently formed to sell the Peerless filler. This new concern is backed by prominent Winnipeg men and has for its managing director G. E. Webb.

Fire in Chicago Salesrooms—Fire destroyed $30,000 worth of goods in the building at the Gardner Engine Company's Chicago, Ill., building. The Hester Manufacturing Company and the Motor Car Supply Company also occupy this building.

Peerless Moves in Columbus—The Columbus, O., branch of the Peerless car, of which F. J. Girard is manager, has moved its salesroom and service department to 168 North Fourth street. The new salesroom and repair shop is 168 feet by 35 feet.

Meyers Studebaker Manager—Henry Meyers has taken charge of the wholesale distribution of Studebaker cars and trucks for New England in the place of Philip Hawley, who resigned a few weeks ago, making Boston, Mass., his headquarters.

Amends By-Laws—The St. Louis, Mo., Automobile Manufacturers' and Dealers' Association has amended its by-laws to prevent exhibitors at the spring show held in the Coliseum each year, exhibiting at the show given by the association in the fall of each year.

New Tire Filler—A patent has been granted on a tire filler to A. J. Causey, sheriff of Amite County, Miss. A company has been formed to exploit the invention. The concern has applied for a charter under the name of Causey No-Leak Manufacturing Company.

Wants Automobiles—The purchase of automobiles for the use of the automobile bureau of the secretary of state in Albany, N. Y., and Buffalo will be recommended to the Legislature by Secretary May. The cars are needed to try out applicants for chauffeurs' licenses.

Goodyear Sales Large—At a banquet held recently by the Goodyear Tire & Rubber Company, Akron, O., in Chicago, Ill., F. A. Seiberling, president of the company, announced that the Goodyear sales for the year 1912 approximtaed $25,000,000, nearly doubling the sales of 1911.

Miller Sells His Interests—A. R. Miller of Barthel, Daly & Miller, New York City, importers of Schafer ball bearings, has sold his interest to the remaining partners. Mr. Miller will still continue as western representative for the firm, which will be known in the future as Barthel & Daly.

Baltimore Club Meets—The regular monthly meeting of the Automobile Club of Maryland, Baltimore, Md., was held at its clubrooms recently and the evening was spent in the discussion of the advisability of ordinances regarding the emission of smoke and the elimination of powerful lights from automobiles in the city.

Farmers' Day Show Feature—One of the features of the annual automobile show to be given at the Billy Sunday Tabernacle, Columbus, O., on March 8, will be farmers' day, which has been fixed for March 14. It is the intention to make this day one for the rural population of the state and a special program will be arranged.

Big Los Angeles Sale—The sale of half interest in the Pacific Coast Simplex and Mercer Agency by George Bentel of Los Angeles, Cal., to George Mackey of the same city, has just been announced. The deal is one of the largest and most important of the season as the territory controlled extends into Canada and south to Mexico.

Chance for American Agency—An American consular officer has forwarded a copy of a letter from a foreign government which desires to substitute automobiles generally for horses and carts for carrying rural mails. His company also desires to deal in automobiles, availing itself of the mail service as an advertising medium. As gasoline is an expensive item in that country, the firm wants a make which would be economical in that respect. If it can obtain cars run on kerosene, which can be depended upon, this will be a controlling factor in making selections. Those interested will get all information at the Bureau of Manufactures, Washington, D. C., file No. 10,359.

Automobile Incorporations

AUTOMOBILES AND PARTS

ALEXANDRIA, VA.—Express Spark Plug Company of America Incorporated; capital, $10,000 to $200,000. Incorporators: C. H. Duffey, John Keane, Leo Loughran.

ANDERSON, O.—Clark-Moody Automobile Company; capital, $10,000; to deal in automobiles. Incorporators: John D. Clark, Louis W. Moody, Maud B. C. Clark, Anna M. Moody.

CINCINNATI, O.—Powel Crosley, Jr.; capital, $30,000; to manufacture a six-cylinder car.

CLEVELAND, O.—Chandler Motor Car Company; capital, $1,000. Incorporators: Isadore Grossman, Claude W. Sbimmon, Harry C. Gahn, E. L. Fraser, S. D. Howells.

CLEVELAND, O.—Motor Van Delivery Company; capital, $10,000; to carry on a general trucking business. Incorporators: Elizabeth Grabam, S. T. Stewart, John R. Gaunter, Alice B. Gaunter, O. D. Eshelman.

COATESVILLE, PA.—Watts Wagon & Automobile Company; capital, $5,000. Incorporators: F. N. Watts, Robert C. Birmingham, H. J. Faust, F. N. Pratt.

CONNERSVILLE, IND.—Howard Motor Car Company; capital, $10,000; to manufacture sutomobiles and accessories. Incorporators: Guilford C. Babcock, Harry Tuttle, Clarence L. Millard.

DETROIT, MICH.—Detroit Trailer Company; capital, $5,000; to manufacture automobile trailers and accessories. Incorporators: Stanley R. DuBrie, William H. Turner, A. C. Turner.

EL PASO, TEX.—Longwell Automobile Truck and Sales Company; capital, $10,000; to deal in motor trucks. Incorporators: J. J. Longwell, H. M. Andreas, J. A. Tays.

FT. WAYNE, IND.—Fox-Shryock Auto Company; capital, $10,000; to do an automobile sales business. Incorporators: William W. Sbryock, Bartlett W. Shryock, George T. Fox.

GREENVILLE, O.—York Supply Company; capital, $25,000; to deal in automobiles, supplies and accessories. Incorporators: C. F. York, C. H. York, A. Z. Heller, J. H. Byord, Lillie N. York.

KINGSTON, PA.—D. and H. Auto Company; capital, $25,000; to buy, sell and deal in and witb electric, steam and gasoline vehicles. Incorporators: John M. Deatrich, J. G. Harris, Lester Harris.

KNOXVILLE, PA.—Hollis Automobile Traction Company; capital, $250,000; to manufacture, deal and sell in and with motor vehicles and all accessories thereto. Incorporators: O. A. Hollis, J. H. Mering, R. W. Egan.

MERCEDES, TEXAS.—Sterling Automobile Company; capital, $10,000. Incorporators: A. H. Crawford, W. D. Chadwick, G. E. Simpson.

MOBILE, ALA.—Mobile Overland Company; capital, $8,000; to deal in automobiles. Incorporators: Morgan L. Duke, Henry Tonsmeire, Norwood A. Richards.

NEW YORK, N. Y.—Accessories Sales Company; capital, $50,000; to manufacture, sell and deal in and with automobiles and all accessories thereto. Incorporators: Charles Hymann, James R. Howe, Jr., Forrester A. Gin.

NEW YORK, N. Y.—Atlantic Transportation Company; capital, $10,000; to engage in the trucking business. Incorporators: William T. Gridley, Alhert B. Colton, Paul Englander.

NEW YORK, N. Y.—Chrome Manufacturing Company Incorporated; capital, $25,000; to deal in motor and other vehicles. Incorporators: James E. Marshall, Wm. H. Buckley, William P. Green.

NEW YORK, N. Y.—Dann-Gorman Company Incorporated; capital, $10,000; to deal in automobiles. Incorporators: Thos. F. Dann, John L. Gorman, John B. Gouger.

NEW YORK, N. Y.—Veersc Motor Truck Company Incorporated; capital, $10,000. Incorporators: Harry B. McGinley, Edward L. Whittemore, Geo. H. Hinnau.

NORFOLK, VA.—Tidewater Automobile Association Incorporated; capital, $500 to $15,000. Incorporators: D. P. Paul, M. Levy, C. L. Young, J. K. Water.

Nadall with Stewart-Warner—Berne Nadall has joined the staff of the Stewart-Warner Speedometer Corporation, Chicago, Ill.

Bergougnan Tires in New York—The French Etablissement Bergougnan, which is preparing to invade the American market with its tires, has leased the premises at 49 West Sixty-fourth street, New York City.

Bryant Resigns from Franklin—G. H. Bryant has resigned as advertising manager of the Franklin Automobile Company, Syracuse, N. Y. He is succeeded by W. M. Williams, who has been assistant advertising manager.

Club After Noisy Automobilists—Noisy automobilists and motorcycles and irresponsible chauffeurs are being raked over the coals by the Savannah, Ga., Automobile Club. Automobiles with open mufflers are the greatest nuisances.

Hagerstown's Automobile Show—At a meeting of the 25 automobile agencies at Hagerstown, Md., arrangements were made to hold an automobile show. At least 100 cars will be on exhibit. The show probably will be held the first week in March.

Automobiles for Agricultural Work—The automobile is to be generally used in agricultural extension and development work in Minnesota. Seven automobiles are to be added this year to the extension equipment of the agricultural department of the University of Minnesota.

Ontario and Quebec Licenses—Mayor Ellis recently returned to Toronto, Ont., giving notice that he would at the next session of the Legislature move to amend the law relating to automobile traffic. This means that the Legislature will be asked to authorize the reciprocity of licenses between Ontario and Quebec.

Best in Savannah—Among the guests at the De Soto Hotel, Savannah, Ga., is Vice-President W. F. Best of the Nyberg Automobile Company, Anderson, Ind., who is in the city on business connected with the automobile industry and also for the purpose of looking over the field with the idea of establishing a branch office there.

Western Electric Adds Officers—The Western Electric Company, which through its alliance with the Pittsfield Spark Coil Company, has chosen two new vice-presidents. Gerard Swope, general sales manager, and A. L. Salt, general purchasing agent, have been appointed to these newly created positions at a meeting of the board of directors.

Minneapolis Club Improves—Improvement work which the Automobile Club of Minneapolis, Minn., has decided on for 1913 is as follows: To improve the water front of the club property on the Minnesota River; raise the membership to 1,200 or more, and put up at least 100 additional road signs.

New Motor Bus Line—A corporation has been formed in Worcester, Mass., called the Worcester & Paxton Motor Company, to operate a motor express and passenger service between the two places. George H. Johnson, of Paxton, is president and treasurer; J. N. Peck, vice-president, and George C. Douglass, clerk.

North Dakota Registration Statistics—A report of the secretary of state of North Dakota, just issued, of automobile and motorcycle licenses for 1912 goes to show that Cass county leads in number and Oliver county has the minimum. Grand Forks county is second. In all there are 8,897 automobiles in the state and 469 motorcycles, with tax receipts of $28,398.

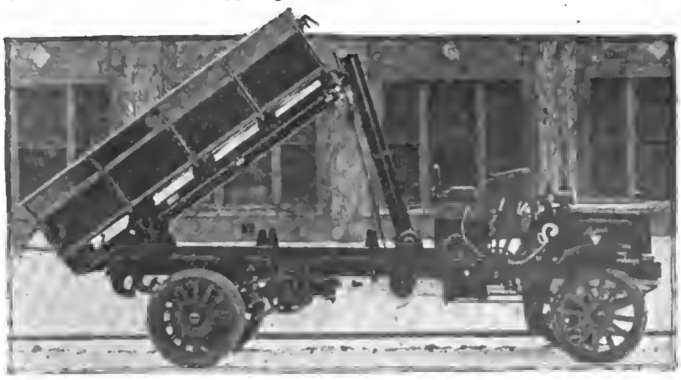
Syracuse License Distributing Point—The Automobile Club of Syracuse, N. Y., through its president, H. W. Smith, asked Governor Sulzer's board of inquiry at Albany recently that when the new legislation is prepared Syracuse be made a distributing point for automobile licenses, it being argued that Rochester is too far away to require Syracuse automobilists to go there for them.

Wants Fire Department Motorized—Fire Chief C. W. Ringer of Minneapolis, Minn., is expecting favorable action on a $150,000 bond issue so he can continue to motorize the department. Eleven pieces will be added if the bond issue is authorized for the purpose. He believes that with $350,000 he could do away with the horse entirely, which would be a saving of $50,000 a year, he estimates.

Two Los Angeles Agencies—Because of the greatly increased demands upon its services the branch of the Chalmers Motor Company at Los Angeles, Cal., will in the future be conducted in two separate establishments, one of which will handle the wholesale and the other the retail sales. The former will be under the Western Motor Company, while the latter will do business as the Chalmers-Los Angeles Company.

Work on Coast-to-Coast Road—The painted automobile trail from New York to the coast is being marked along the Southern Minnesota division of the Chicago, Milwaukee & St. Paul road. A crew is now marking the course with posts in the vicinity of Albert Lea, Minn. Posts are painted with broad stripes so the motorist can travel day or night. Where there are no standing telephone poles the crew is setting posts for markers.

Ontario's Registration Large—Ontario's revenue last year from the sale of licenses for automobiles totaled $50,831.25, twice the amount received during the year 1910, which was $24,394. The revenue for 1906, the first year fees were imposed, was only $15,235.15. The licenses issued last year totaled 11,339, and for 1910, 4,390, while in 1906 1,176 were issued. Fees collected for issuing charters to automobile corporations totaled $235,663.10.



New Packard dumping body, showing same in tilted position

Automobile Incorporations

PITTSBURGH, PA.—Pullman Taxi Service; capital, $5,000; to conduct a taxicab business. Incorporators: W. M. Laird, W. S. Laird, W. M. Laird, Jr., E. F. Kramo, A. W. Tennant.

ROCHESTER, N. Y.—Alling & Miles Incorporated; capital, $20,000; to do a general automobile business. Incorporators: Edmund M. Alling, Alice R. Alling, Milton B. Miles.

STAUNTON, VA.—Flynn-Allen Tire Corporation; capital, $10,000; to manufacture tires. Incorporators: J. J. Flynn, G. Allen.

STRATHROY, ONT.—Loyal Motor Car Company, Ltd.; capital, $500,000; to manufacture and deal in automobiles and accessories, machinery and vehicles of other kinds. Incorporators: D. W. Henry, J. M. McEvoy, H. E. Anderson, C. S. Parker, C. C. Wright.

TOLEDO, O.—General Motor Truck Company; capital, $50,000; to manufacture motor trucks. Incorporators: C. B. Grandy, C. O. Norton, E. M. Dotson, W. C. Prickett.

WHEELING, W. VA.—Lavender Automobile Supply Company; capital, $25,000; to operate and let for hire automobiles, operate garage and storage houses. Incorporators: A. E. Kennard, Jr., C. E. Lavender, R. M. Lavender, A. E. Kennard, Sr., Annie Kennard.

GARAGES AND ACCESSORIES

BROOKVILLE, O.—Brookville Automobile Company; capital, $10,000; to operate a sales agency and operate a garage and repair automobiles and other motor vehicles. Incorporators: J. Ward Somers, Edward S. Somers, V. T. Somers, John K. Somers, Anna Somers.

CLEVELAND, O.—Motor Car Service Station Company; capital, $100,000; to repair automobiles of all kinds and operate a storage business. Incorporators: Paul S. Knight, M. Marquard, Don C. Mills, M. W. Spear, W. P. Godfrey.

COLUMBUS, O.—Park Motors Company; capital, $30,000; to conduct a garage and repair shop and devote considerable attention to the development of a starter which is being experimented upon. Incorporators: Scott Van Etten, Charles Parkison.

HAMILTON, O.—Hamilton Taxicab Company; capital, $5,000; to engage in the transportation of passengers and baggage for hire. Incorporators: J. A. Weigel, Cora A. Weigel, George J. Kalbheir, Louise E. Weigel, Caroline Weigel.

HARROLD, S. D.—Allen-Schultz Company; capital, $50,000; to manufacture an automobile tire filler.

HOPKINSVILLE, O.—Christian County Automobile Club; to carry on an automobile club. Incorporators: J. F. Bible, Frank Bassett, H. A. Keach.

NEW YORK, N. Y.—Aeroplanes Motors & Equipment Company Incorporated; capital, $20,000; to manufacture and sell aeroplanes and equipment. Incorporators: Bernard Cowen, Max Miller, Maurice Lazone.

NEW YORK, N. Y.—Commercial Lubricating Company Incorporated; capital, $2,500; to deal in oils, greases, etc. Incorporators: Agnes R. Mayfield, Louis Preau, John J. Crawford.

NEW YORK, N. Y.—Munnich's Garage Incorporated; capital, $500. Incorporators: Christopher Munnich, Elizabeth Munnich, John Munnich.

NEW YORK, N. Y.—United Garage Company; capital, $14,000. Incorporators: Knud Mynter, Edwin B. Smith, Samuel Ecker.

SPRINGFIELD, O.—Maitland Rubber Company; capital, $10,000; to manufacture rubber and deal in rubber articles of all kinds, including tires and other automobile accessories. Incorporators: Frank R. Talbott, Cora P. Coitwell, Frank P. Patrick, Garnet W. Brand, Henry H. Durr.

WHEELING, W. VA.—Adolph Schick; capital, $10,000; to manufacture a wheel for automobiles invented by Adolph Schick.

WILMINGTON, DEL.—Colonial Tire & Rubber Company; capital, $25,000; to manufacture tires for automobiles. Incorporators: F. D. Buck, George W. Dillman, B. M. Grawl.

CHANGES OF CAPITAL AND NAME

SPRINGFIELD, O.—Robbins & Myers Company; increase of capital from $50,000 to $1,000,000.

SPRING Wheel Construction—Resiliency is furnished by bow and spiral springs in place in a space formed between two concentric rims.

The subject matter of this patent is a wheel, Fig. 1, which consists of an inner rim I and an outer rim O spaced from one another. The opposed faces of rims I and O have pins projecting into the space formed between them and bow springs B, the ends of which are provided with openings engaging the pins are mounted intermediate the rims. Spirals springs S are in position on the pins. The inner portions of the springs B are so shaped as to fit the curvature of the inner rim I; these inner portions P are relatively longer than the outer portions Q of the springs B, and, as Fig. 1 shows, the intermediate portions of the bow springs lie diagonally between the rims I and O.

No. 1,051,745—to Ola C. Messick and Frank Jefferson, Seaford, Del. Granted January 28, 1913; filed April 25, 1912.

Headlights Cut-Off Shade—Consisting of hoods which may be moved in front of the headlight flame or bulb by a mechanism controlled from the driver's seat.

Fig. 2 illustrates the cut-off shades for automobile headlights described in this patent. This device consists of a number of lamp hoods H, one of which is carried by each lamp casing. The hoods of the two headlights are fitted with stub shafts, which ahe connected with hood-operating rods R; the latter are engaged by a coupler member C. A bell crank B carried by the front of the car is connected to the coupler member and to an operating link O adapted to pass along the side of the automobile so that by operating a suitable control mechanism from the driver's seat the shades may be positioned in front of the headlights or lifted from this position.

No. 1,051,388—to Maurice F. Castleman, Berryville, Va. Granted January 28, 1913; filed March 7, 1912.

Resilient Automobile Wheel—Consisting of three rings so arranged as to form the base for a solid annular tire.

This patent describes a wheel, Fig. 3, consisting of a felloe, a pair of endless rings R secured to its lateral faces and transversely aligned appertures in which cross bars C are mounted. Treads forming members M have their lateral walls concentric with the flaring portions of the rings R and their ends overlapping with the lateral walls, in engagement with the inner faces of the outwardly flaring portions of the rings. The contacting portions of M and R form frictional joints J resisting inward pressure on M. The outer faces of M are formed with a continuous circumferential groove G, which constittes a seat for an elastic tire T. Snrings S hold the members M and the cross bars C together.

No. 1,051,457—to Bert Halaster Seevers, Akron, O. Granted January 28, 1913; filed August 2, 1912.

High-Tension Ignition—Including means for producing a high-frequency, oscillatory discharge at the spark plugs for igniting the cylinder charge.

The ignition system, Fig. 4, includes a current source S, a self-induction coil, a condenser C, a discharge circuit D for the same and a resonator R attached to the spark plugs for producing oscillatory high-frequency discharges at the same. When the circuit controlling the whole system is closed, the current flows from the battery S through the coil, which attracts an armature, charging the condenser. As the armature returns to its normal condition, closing the discharge circuit, a current is shot from the condenser through D and the resonator fitted to the spark plugs, thereby producing the above mentioned discharge.

No. 1,051,642—James E. Seeley, Los Angeles, Cal. Granted January 28, 1913; filed April 29, 1907.

Pneumatic Tire—Consisting of a single tube designed to be inflated.

The tire, Fig. 5, is of resilient material and formed with a thick portion P opposed to the rim of the wheel and being formed with an inner side I, which is straight in the direction of the width of the tire. I has a port formed in the longitudinal center of the portion P and a main air conduit A, which communicates with the port. A non-return valve of suitable construction serves for the inflation of this tire.

No. 1,051,738—Garrett Kavanagh, St. Johns, New Foundland. Granted January 28, 1913; filed January 29, 1912.

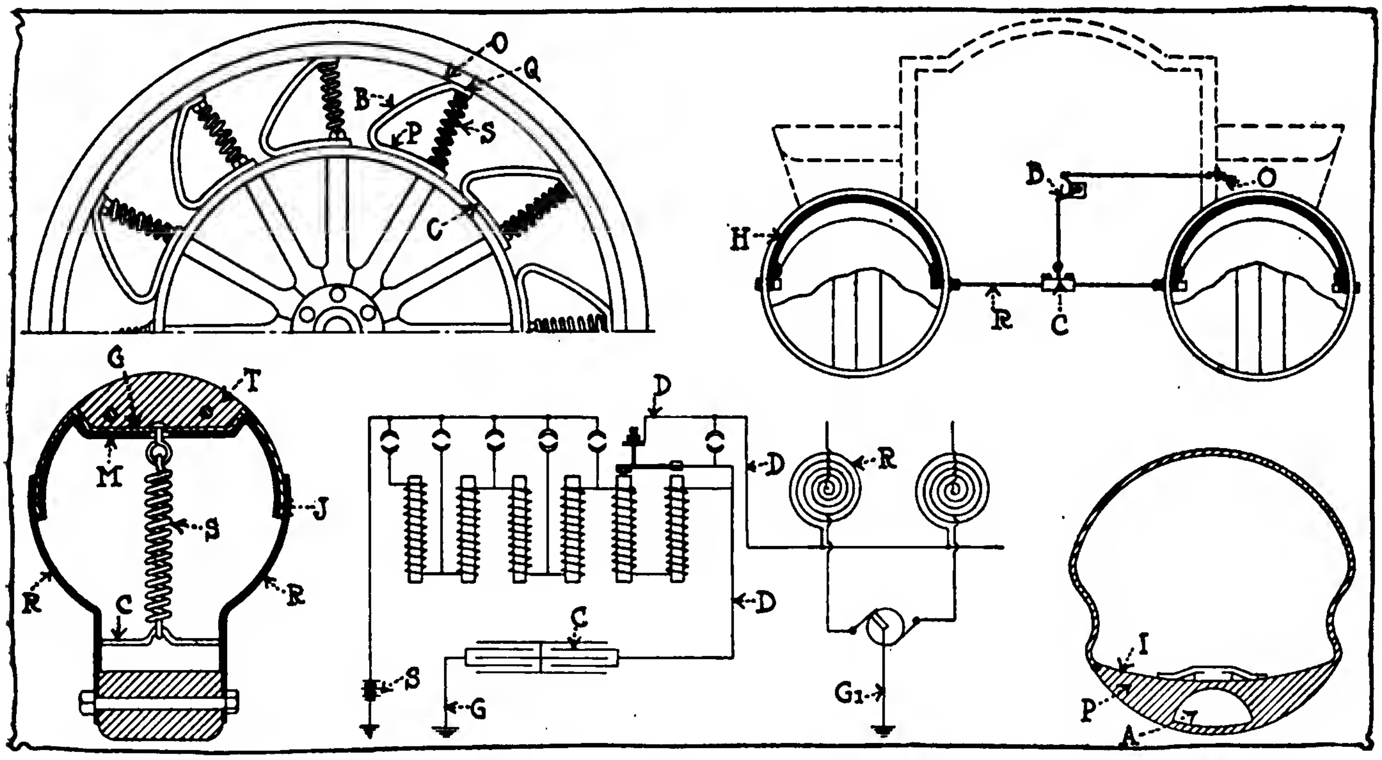


Fig. 1—Messick wheel. Fig. 2—Castleman shade. Fig. 3—Seevers wheel. Fig. 4—Seeley ignition. Fig. 5—Kavanagh tire

The Automobile

Automobiles Now Form 59 Per Cent. of Massachusetts' Vehicles

Actual Counts Made on Public Highways Reveal Relative Proportions of Horse-Propelled and Automobile Traffic—Second Census, Made in 1912, Indicates Big Increase in Automobiles Over Number Recorded in 1909

By James T. Sullivan

BOSTON, MASS., Feb. 14—Traffic census is the necessary foundation for true and just traffic taxation. It is impossible to know just how much of the road maintenance cost should be borne by the automobile public unless the relative destructive effects of horse-drawn and horseless vehicles are determined by actual count and experimentation. Therefore, any activity tending to shed light upon this question deserves the full support of automobilists.

It is significant and not a matter of chance that New England leads in this work of determining the relative effect of horse and motor traffic upon public highways. The Northeast, prominent both as a user of pleasure and commercial cars, and evidencing its progressive constitution by the use of these vehicles, is necessarily the leader in this work. Among the New England states, Massachusetts leads in progressive spirit, and Massachusetts it was that first introduced practically the idea of counting horse and motor vehicles. This state, in which at present one person in every fifty-nine owns an automobile, naturally recognized the importance of the problem before any others did so. Consequently, in 1909, the authorities planned and executed a scheme for arriving at a fairly exact knowledge of the relative proportions of the two kinds of road vehicles. In 1912 the second census was taken.

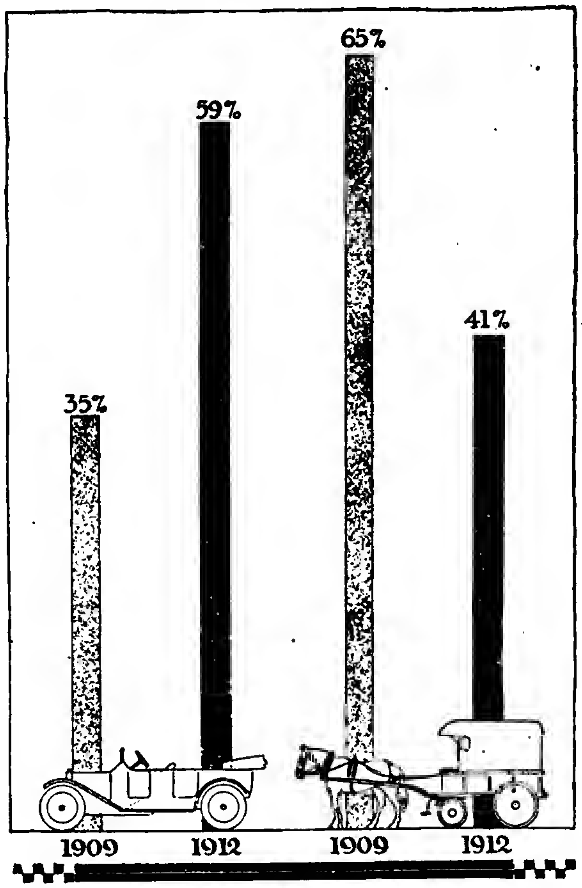

Diagram illustrating the comparative percentage of horse-drawn and self-propelled vehicles which traversed the roads of Massachusetts during the months of October, 1909, and October, 1912, according to count by observers of the state highway commission

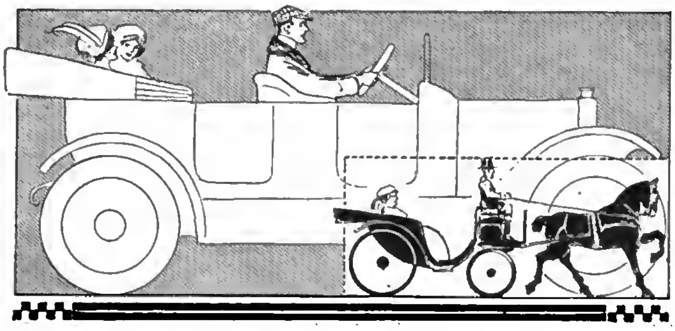
The method of procedure used to obtain this information being described below, it remains but to bring out a few principal results of the investigation. The first census showed that of the vehicles counted on the highways of the state 35 per cent. were automobiles and 65 per cent. horse-drawn. In 1912 59 per cent. of the traffic was self-propelled and only 41 per cent. utilized the tractive effort derived from real horsepower. This alone shows the tremendous increase of the automobile in Massachusetts. The actual numbers are not of such importance, as they vary in proportion to the number of counting stations, of which there were more in 1909 than in 1912.

The advocates of horse traffic, that is, the owners of horse-drawn vehicles, would, of course, argue that there being more automobiles than horse-drawn vehicles, automobiles as a whole and each car in particular, should pay higher taxes than horse vehicles, or the whole expense of road maintenance. They forget, however, the different effects of horses' hoofs and automobile wheels upon the road. A horse, in moving over a road,



In August, 1912, the road traffic in Boston parks showed a ratio of one horse-drawn vehicle to four automobiles

destroys the roadbed as effectively as only a horseshoe can do it. Steel formed with rectangular edges, driven by vertical fall into the surface, still more depressed to give the fulcrum about which the weight of the horse body is thrown forward. On the other hand, the automobile wheel, shod with elastic rubber, forming an almost perfect ring which gradually engages at every instant the road, without leaving it, and always applying the driving force in a direction almost parallel to the horizontal direction of travel. It would be worth while to make tests of this situation for once; running a horse-drawn wagon over a sample stretch of road, and then an automobile over a similar stretch; no doubt the result would be interesting to both automobile and horse-vehicle users, but more gratifying to the former than the latter.

As a matter of fact, while it cannot be denied that automobiles traveling at high speed do destroy the roadbed to some extent by the adhesion of the tires which lasts a very short space longer than the actual driving engagement of the tire surface with the road, a very different situation obtains when the car is traveling at moderate speed. In this case the above mentioned tearing effect of the tires on the road is practically nil, and to a certain extent they act even as rollers which assist in the setting of the road material on the foundation. Now, as an overwhelming majority of automobiles on American roads travel at a normal speed no greater than 30 miles an hour, the beneficial effect of this road traffic by far exceeds the destructive efforts of high speed vehicles.

A study of the following report on the recent Massachusetts vehicle census will bring out the facts that in the methods employed there is room for more than one improvement, and it is up to automobilists' organizations to discover such and bring about their practical introduction in vehicle census work. All, however, will admit that the census idea is meritorious.

It may be said that there are two very good reasons why comparative figures relative to traffic over the roads of Massachusetts are of interest at the present time. One reason is the fact that there is agitation in a number of states to increase the fees for motor trucks, and already legislation to that end has been considered in Massachusetts and will be enacted at this session of the Legislature. The other reason is that states elsewhere may get some idea of what a traffic census will reveal, and as it is an intelligent way to get at the real damage done to highways because of the use of the roads by vehicles it will save states lots of money by delving into it as Massachusetts has done. Once the effects of various kinds of traffic are known, authorities will cease to consider the automobile public free game.

The first census was taken in 1909 and another was taken last year so that they were just 3 years apart. The Massachusetts Highway Commission worked out and carried on the census. It was decided that as August was a month when about everyone was on the roads it would be the best on which to get the abnormal traffic, while October would be the better for getting the ordinary traffic figures. So six days were picked out in the middle of each month, and in 1909 the commission planted men at 237 stations on the various highways of the state in August and at 240 stations in October, divided into five sections.

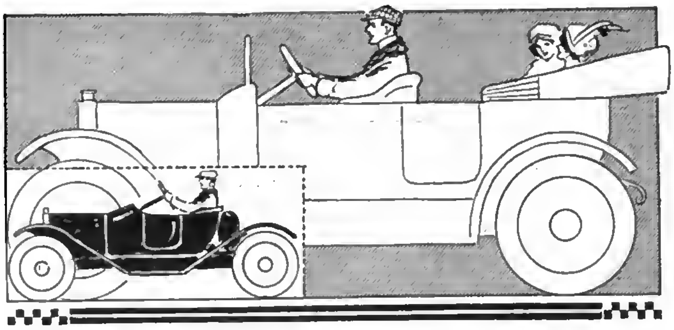
*One night only.

These men were given cards to tabulate all vehicles that passed a given point between 7 a. m. and 9 p. m. In 1909 they tabulated the vehicles, dividing them into horse-drawn, light and heavy, using one, two or more horses. The motor cars were divided into runabouts and touring cars. As motor trucks were not much in evidence in 1909 they were omitted that year, but they were included in 1912. Not only were the highways under state supervision watched, but also the park system, the Metropolitan, which takes in a radius of about 10 miles around Boston; the Boston park department, and a few roads on the outskirts.

When the census was taken in 1912 the number of stations were reduced to 155 and held into four divisions. But practically as much mileage was covered in 1912 for the stations were a little further apart, the commission having had the experience of the previous census to guide them in placing the stations. The map given on page 498 shows the divisions according to 1912. The first of these began up at the northwest corner of the state near the New York and Vermont line and sweeping down through the Berkshires toward Connecticut, passed through the principal towns and the larger cities, then turned easterly toward the center of the state. This route takes in the more traveled through roads leading to New York and there were thirty-eight stations on it. Division 2 began at about the same place, but went easterly in a more direct line to the center of the state. It had fifteen stations. Both of these routes took in the mountainous part of the Bay State. And the Division 2 was also a through route branching off to allow motorists to go through New Hampshire in the southwestern portion and the southern part of Vermont.

Division 3 took in the most populous section of all. This route, or these routes, radiated from Boston to Worcester on the west in the middle of the state and also took in the whole northeastern part, which comprises the famous North Shore district where thousands go to spend the summer; and over the routes used going to and from the White Mountains and the resorts in Maine. The section is flat and the roads are good. On this section there were established fifty-three stations in August and fifty-six in October. Division 4, while not so populous as Division 3, is nevertheless very well peopled and it comprised the southeastern section of the state extending to Cape Cod from Boston. In this place, like in Division 3, there are a number of cities and many towns. In fact, the greater part of the population by far are centered in these divisions. The land in the last division is level or rolling, and more of a sandy nature. There



Showing the ratio of large cars to runabouts, about four and a half to one, in Massachusetts last year

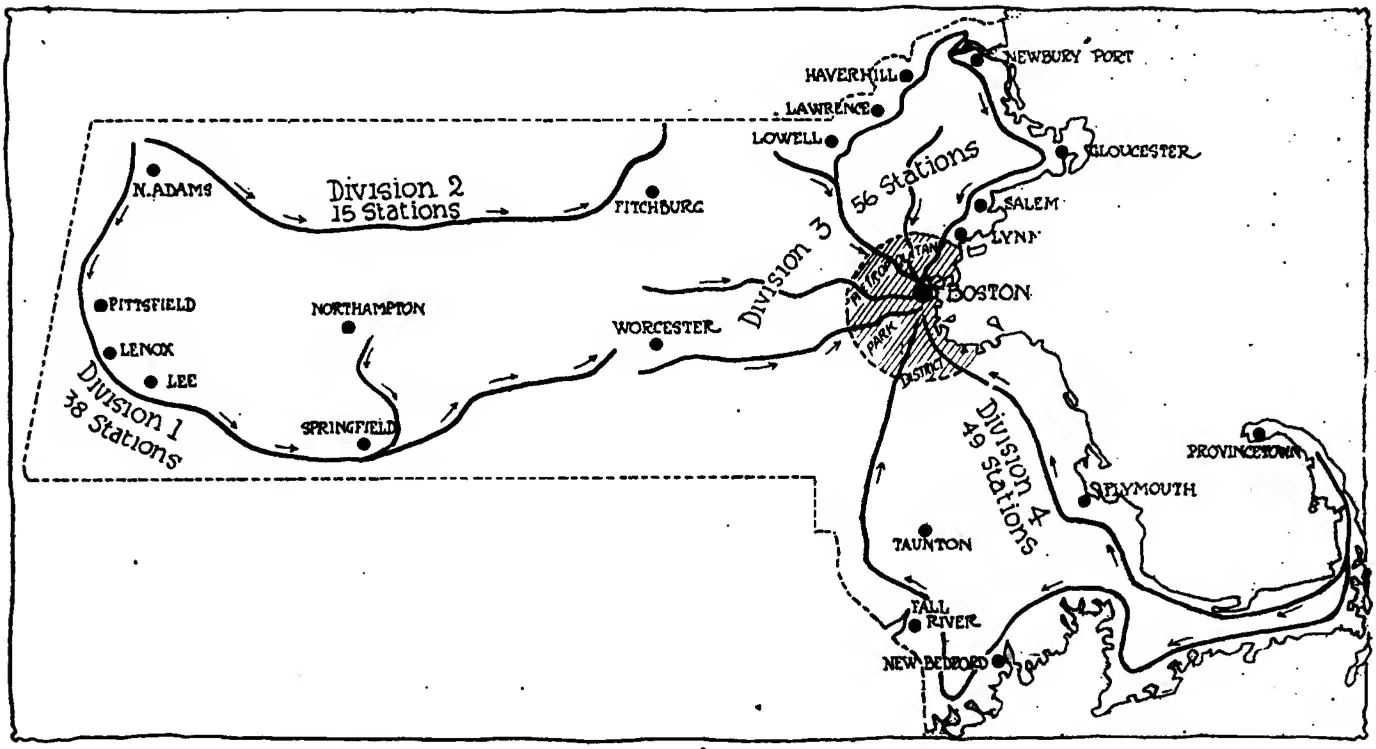
†Average percentages.



Map of the state of Massachusetts, showing the divisions of main roads over which the traffic census was taken

were forty-nine stations on this division. One night in each month was gven over also to a census, but only three stations were established in August and five in October. The Metropolitan Park had eight stations and the Boston Park system three.

With all these arrangements it was possible to get some figures that throw some light on matters that are at variance with the statements made to legislative committees relative to what motor traffic does to the road. For example, Mayor Fitzgerald, of Boston, recently said that horse-drawn vehicles were driven off the Boston parks by the motor cars, and yet this census shows that one in every six in August and one in every four in October using the parks were horse-drawn vehicles. Other statements will be taken up later, particularly as to trucks. Going back to August, 1909, there were 64,900 vehicles of all kinds registered by the watchers on the roads, and of this number 27,309 were motor cars. Compared to the 37,591 horse-drawn vehicles the percentage was in favor of the latter, the figures standing 58 to 42. This was a very close division.

When it is considered that in August, 1912, with 155 stations registering instead of 237, 60,200 vehicles of all kinds were tabulated, of which 40,391 were motor cars and but 19,809 were horse-drawn, it gives food for study. That changed the percentage to automobiles 67, horse-drawn 33. Of course, there was a large increase in the number of motor cars registered, and also in the number of tourists. But the figures seem to indicate the fact that motor cars make long trips, and so during the day the same car would be recorded several times while on the route. Moreover, as the number of stations were diminished, and the distance increased, many horse-drawn vehicles on the road turned off before coming to a station. Therefore the percentage would not be so high for motor cars had the number of stations been as large as in 1909, although it would have still changed in favor of the motor vehicles.

26,284 Horses on the Road in August, 1909

Giving consideration now to the traffic from a truck standpoint for a digression, in considering August of both years, one finds that in 1909 there were 17,969 heavy teams drawn over the highways in August. Of this number 7,113 were drawn by two or more horses, while 11,958 were drawn by one horse each. That represented at least 26,284 horses who were pounding their way along the state highways drawing steel-tired vehicles and doing their share to damage the roads. Motor trucks were not tabulated that year, so a comparison may not be made for 1909 on that basis. However, in August, 1912, trucks were registered and it was found that 1,764 were on the roads. There were 19,809 horse-drawn vehicles registered that month, of which 10,489, or more than 50 per cent., were heavy vehicles. Of this number 3,725 had two or more horses and 7,278 one horse each. So that the horses on the road numbered at least 14,728 exclusive of those drawing pleasure vehicles. This is a reduction by about 40 per cent. from the 1909 figures, but consideration must be given to the great reduction in the number of stations. So the motor trucks were but 10 per cent. of the number of heavy vehicles on the road.

Motor Trucks 3 Per Cent. in August, 1912

Just for the purpose of comparison let us assume that the horse-drawn vehicles, the heavy ones alone, for we are now dealing with the trucks, traveled but 10 miles a day while the motor-driven vehicles went 50, it means that the horse-drawn vehicles averaged 104,890 miles, while the motor vehicles averaged 87,200 miles. Therefore it is reasonable to assume that the horse-drawn vehicles traveling over roads on hot days when the sun was burning up the roads did something to add to the damage that so many are always trying to blame on the motor cars. And it should be particularly noted that the motor trucks were but about 3 per cent. of the total traffic in August, 1912, while the heavy horse-drawn traffic was 28 per cent.

Turning now to the month supposed to represent the ordinary traffic conditions it is found that in October, 1909, there were 52,932 vehicles tabulated. That was nearly 12,000, or 7 per cent., less than August of that same year. Of this number there were 34,423 horse-drawn and 18,509 motor vehicles. The decrease showed more in motor cars, where there were 8,800 less than in August, while there were 3,168 less horse-drawn vehicles, which brought the motor cars down to 35 per cent. from 42, and ran the horse-drawn up to 65 per cent. from 58. Then comes October, 1912, furnishing another basis for comparison. With eighty-two less stations than in 1909 there were 49,924 vehicles registered, a difference of 3,008 less between the two Octobers. Of this number 29,204 were motor vehicles and 20,720 horse-drawn, the percentages being 59 and 41 respectively, or 18 per cent. more automobiles. As this is a supposedly normal month it makes an interesting table for it shows that people were turning to motor cars, perhaps, as there was a gain in the figures for power vehicles of 10,695, while the horse-drawn vehicles decreased 13,703, when compared to October, 1909.

The truck and heavy horse-drawn vehicles form another further interesting comparison. In October, 1909, no trucks were tabulated. Last year there were 1,836 trucks noted on the highways. This was but an increase of 72 over August, an indication that the motor truck business was growing a little. In October, 1909, there were 34,423 horse-drawn vehicles tabulated, of which 17,967, or more than 50 per cent., were heavy vehicles, 7,310 having two horses each, 11,567 one horse. In the same month last year, while the totals were smaller, the percentage of heavy traffic by horse-drawn vehicles had increased, for of the 20,720 noted 12,168, or about 60 per cent., were the heavy sort. And this number was about 24 per cent. of the entire traffic. Again of the heavy vehicles 5,128, or about 40 per cent., had two or more horses and 7,638 one horse each. This made at least 17,894 horses on the roads in October, 1912, hauling heavy loads. It does not include the horses drawing lighter vehicles, of which there were nearly 8,000 more.

Trucks Gain 72 Over August Figures

Now, as August is claimed to be an extraordinary month and October an ordinary one in traffic here again is an interesting basis of calculation. In August, 1912, there were 60,200 vehicles of all kinds recorded, while in October that same year but 49,924 were tabulated, a drop of 10,276. Motor cars dropped from 40,391 to 29,204, a loss of 11,187. But the horse-drawn vehicles in October, the ordinary month, increased to 20,720 over the 19,809 in August, the extraordinary month, a gain of 611, and of these figures the gain in heavier horse-drawn vehicles was the larger, for while in August last year 10,489 were registered, yet in October the figures went up to 12,168, or 1,679 more. In other words, of the gain in horse-drawn vehicles more than 1,000, or about 60 per cent., were the heavy vehicles. And it must be remembered that the trucks gained seventy-two in October over August. Figuring again on the basis of mileage that the trucks might average 50 miles and the horse-drawn vehicle but 10, it would mean that the motor-propelled vehicles covered 91,800 miles to the 121,680 miles of the heavy laden horse-drawn vehicles.

Moreover, it is well worthy of note that the number of motor trucks increased by seventy-two between August and October, 1912, especially as August is reckoned an extraordinary traffic month while October is an ordinary month from this viewpoint.

The figures for the parks are confined more to pleasure vehicles so that heavy traffic cannot be estimated so well, but they show a large gain on the part of the trucks and omnibuses in October over August last year. The motor cars dropped in the fall month due no doubt to the fact that there were less visitors in Boston going through the park systems.

Touring Cars Are Most Numerous

Another interesting feature to note is the division between the motor cars. In 1909 in August 5,922 were runabouts, while 21,387 were touring cars, or about three and one-half times as many of the larger cars as the smaller ones. In August last year the figures were, runabout 6,555, touring cars 32,072, showing that the percentage was growing, so that there were nearly five times as many big cars as little ones—basing touring cars as big ones for comparison—than in the same month three years before. And this with a smaller number of stations. In October, 1909, there were 3,995 runabouts and 14,514 touring cars, so that the percentage was just a little bit more than in August of that same year. In October, 1912, the figures showed 5,083 runabouts and 22,285 touring cars, so that there were more than four times as many of the larger cars, so called, that month. In other words, the runabouts kept up a pretty good percentage last year, gaining a bit over 1909.

Summing the whole matter up, therefore, from all angles legislators in all states in this country should give consideration to figures such as these before assuming to tax further the motor vehicles. In the Bay State the pleasure motor vehicles have been responsible for the state receiving approximately $1,000,000 in fees covering both the years this traffic census was taken, while there never was $1 collected from horse-drawn vehicles. And Col. Sohier, chairman of the Massachusetts Highway Commission, has stated in a speech made last fall, that there were instances where a change from horse-drawn vehicles to motor trucks has saved the wear and tear of the road. Moreover, the weather has much to do with the destruction of highways, for there is on record in one of the old reports of the Highway Commission a report of a macadam road going to pieces due to winter weather and over which a motor car had never been run. That motor cars and trucks damage roads is admitted, but whenever the opportunity arises to get extra money in any way it is the users of these vehicles that are always the target, while the owners of the horse-drawn vehicles are never even considered. So it would be well for all those interested in the future of the motor industry to make a study of the figures in this article.

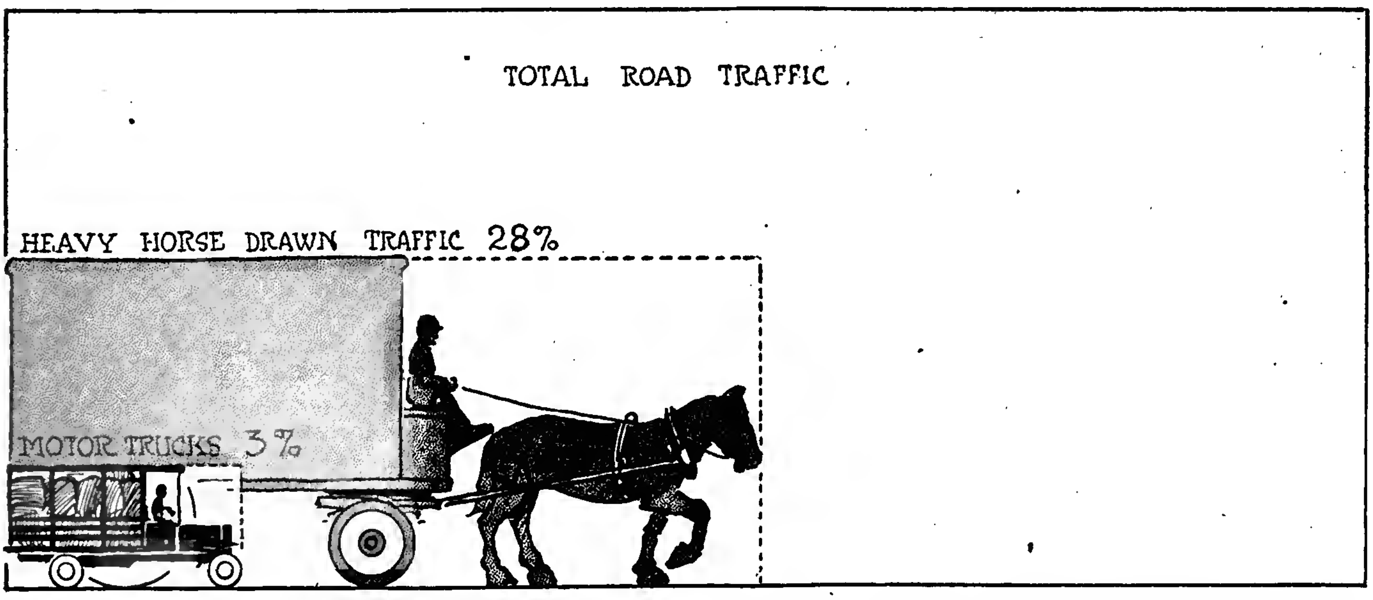


Diagram showing the relative percentages of heavy horse-drawn traffic and motor trucks on the roads of Massachusetts, from figures taken in August, 1912

New Standard Oil Fuel

Motor Spirit Announced To Sell at 3 Cents Cheaper Than Gasoline To Solve Fuel Problem

New Fuel Runs From 52 to 55 Degrees Baumé—Gives More Miles Per Gallon

CHICAGO, Feb. 18—(*Special Telegram*)—With a new fuel selling at 3 cents a gallon less and with 25 per cent. more power and 25 per cent. more mileage per gallon than gasoline the Standard Oil Company comes to the rescue of the automobilist in his fight with the higher cost of motoring. Motor spirit is the name of this new fuel announced today by the company. It resembles gasoline very closely except that it is yellow in color and has a very pungent odor. It has a slightly greater range of boiling points than has gasoline, its minimum point being somewhat lower than that of the older fuel and its maximum slighter. This allows a motor to be started as easily or more easily with this fuel than with gasoline. In gravity it is somewhat heavier than gasoline, ranging from 52 to 55 degrees Baumé while gasoline ordinarily runs from 58 to 60 degrees. It is not so much the lower cost of the fuel nor its greater power that means so much to the motorist. It is the fact that by its production the output of fuel for gasoline engines from a given amount of crude petroleum practically is doubled. This will tend to prevent further rises in the price of gasoline.

New Process for Making Spirit

Motor spirit is an additional by-product of petroleum to any which has been obtained heretofore, that is, in addition to the quantity of gasoline which formerly had been obtained from a given amount crude, almost the same quantity of motor spirit is obtained. This has been made possible by an invention of W. M. Burton and patents for the process have been granted only since the first of the year.

It is stated that the yellow color and the offensive odor could be done away with by a process of deodorizing and decoloring similar to that employed with gasoline, but such refinement would make the product just as expensive as the older fuel. The use of motor spirit requires a slight adjustment of the carbureter as it requires more air for combustion than does gasoline. Although the new fuel has the very desirable advantages of lower cost and increasing economy in miles per gallon, it has in its present state several disadvantages which may militate against its widespread adoption, particularly for use in pleasure cars. In fact the Standard Oil Company is not offering motor spirit as a pleasure car fuel but only as a fuel for motor trucks and for stationary engines.

One of the chief disadvantages, particularly where cars are to be driven on the boulevard, is that the exhaust is in the form of a white smoke, quite similar to that due to an excess of oil.

It is stated, however, that by reducing the quantity of oil smoking is to a great account overcome in fact, it is found that quite a little less cylinder oil may be used safely with motor spirit than it would be safe to use with gasoline. There is a slight carbonizing of the cylinders similar to that found when an excess of oil is used but this deposit is soft and a weekly application of kerosene has been found to keep the cylinders clean. The fuel although giving initial explosions on starting and letting the motor run for several minutes will seem to choke up occasionally until the manifold gets warm. This is due to the condensation in the manifold which seems to be much more pronounced than when gasoline is used. With the short intakes, however, this difficulty could be avoided. The odor of motor spirit, though unnoticeable in open air or in small quantities, be-

Automobile Securities Quotation

This week's automobile stock market witnessed an almost general decline, the reason being the strike now pending in Akron and by which several of the largest tire manufacturers are seriously affected. Following are the losses of some of the principal issues, comparing Wednesday's quotations with those of 1 week ago: Goodyear common, 160; Firestone common, 130; Miller, 35; Swinehart, 24; Goodrich common, 15; Goodrich preferred, 11; Consolidated common, 3, and preferred, 26. The fact, however, that Firestone preferred remained unchanged and Goodyear preferred fell but 5 points, seems to indicate that the situation is hopeful of an early settlement. Among other changes are the declines of Garford, 6; Chalmers, 5; General Motors common, 4; Studebaker common, 4 1-2; White and Overland, 2 points each. International Motor preferred rose 40 points.

comes somewhat pronounced when a tank full of the fuel is kept in a closed room. For motor truck work where there is little objection to smoking and where the odor is not a fault, motor spirit will have its greatest field. The great consumption of gasoline by commercial vehicles has been threatening the available supply for some times and has been advanced as a chief reason for the increase in price of gasoline. The new fuel, however, should do very much to relieve this situation. Motor spirit has been under test by the Standard Oil Company in its own pleasure cars and trucks for several weeks and has proven its superiority of efficiency.

Chandler Plans Working Out

DETROIT, MICH., Feb. 17—It is learned that as long ago as last August F. C. Chandler, general manager of the Lozier Motor Company, and Samuel Regar, treasurer of the same organization, tendered their resignations and employed J. N. Whitbeck, who severed his connection with the engineering department of the Lozier company at the same time, to design the new Chandler six. C. A. Emise, sales manager, M. S. Mead, Eastern sales manager, and J. R. Hall, former manager of service, also tendered their resignations, but continued their connections with the Lozier organization until released.

It is understood that the car will not be manufactured in Detroit, although it will be built in one of the cities recognized as an automobile manufacturing center.

Akron Plants Crippled

Strike Calls Out 14,000 Tire Workers, As Firestone Wage Cut Gives Rise to Discontent

Principal Plants Shut—Strikers Organize Their Campaign —Violence Expected—Stocks Collapse

AKRON, O., Feb. 19—A paralyzing blow which has sent stocks tumbling down the scale to the extent of more than 100 points in the case of two of the largest tire makers of Akron, and which threatens to spread to other centers, has occurred in the form of a strike on the part of the rubber workers.

The strike started in the plant of the Firestone Tire and Rubber Company when the wages of some of the workmen were cut from $3.50 to $3.00 a day in order to fulfill a reduced rate contract with the Ford Automobile Company. The men left the factory and waited at the gates and acted as pickets. In a short time they had recruited a formidable number and the plant was compelled to shut down. The trouble at the Firestone plant has pricked the bubble of contentment among the workers in the other local plants and as a result there is a general walkout on the hands of the other concerns. It has been necessary to close the plants of the Buckeye, Swinehart and Miller companies and the others in this city are badly crippled. The workers in the plants have already taken steps to form a union and representatives of the Industrial Workers of the World have come to Akron to take the situation in hand. It is possible that the trouble will spread to other plants throughout the United States. Local prosperity has been dealt a severe blow. The Mayor has deemed it wise to order all saloons closed and in anticipation of violence has requested troops. A wage scale committee has been appointed by the strikers as a preliminary to arbitration.

Barley Buys Halladay Plant

STREATOR, ILL., Feb. 17—A. C. Barley has bought the property and business of the Streator Motor Car Company from the Merchants' Realization Company. While he expects to carry on the manufacturing operations on conservative lines, the business will be so operated that the old Halladay agents can be supplied with the cars they require.

Model 30 will be made and sold with electric starting and lighting equipment, listing at $1,450; a limited number of model 40 cars will also be made and sold with equally up-to-date equipment, for $1,935. Plans are also on the way for the manufacture of a few sixes, but nothing definite has been announced in this respect as yet.

30 Per Cent. Settlement for Thomas

BUFFALO, N. Y., Feb. 18—Edwin L. Thomas, 246 Bryant street, this city, has announced that he is willing to redeem the creditors' extension notes issued under the date of February 15, 1911, payable August 15, 1912, at 30 cents on the dollar, if these notes are sent to the office of the Commonwealth Trust Company, Buffalo. This settlement, according to Mr. Thomas, shows a possible margin of from 2 to 5 per cent. in his favor, but as the receivership will probably continue in effect for no less than another year, such a settlement will assist the present holders in obtaining their money earlier than would otherwise be possible.

Admiral Company Officers Chosen

DETROIT, MICH., Feb. 17—At a meeting of the stockholders of the Admiral Motor Car Company, of St. Louis, Mich., the following directors were elected: Dr. A. R. Wheeler, David Harrison, J. H. Whitney, William L. Yost, Don C. Evans, G. Earl Porter and Howard Dewey, all of St. Louis. At a meeting of the directors the following officers were chosen: President, Dr. A. R. Wheeler; vice-president, J. H. Whitney; secretary and general manager, Don C. Evans; treasurer, William L. Yost. Mr. Evans, who becomes general manager for the company, for 2 years was sales manager for the Alma Manufacturing Company, at Alma. The company will build a truck.

Market Changes of the Week

A weaker tone was developed in tin on Monday in Europe, prices here were sympathetically lower. Fluctuating throughout the week, it finally closed at a loss of $.25 per hundred pounds. Lead remained quiet but steady at $4.30 per hundred pounds. Electrolytic copper was offered at concessions here and in Europe, the closing prices on electrolytic and Lake coppers here being $.14 1-2 and $.14 7-8 respectively, sustaining losses of $.00 3-4 and $.00 5-8. There was an absence of new developments in the market for refined petroleum yesterday. Both prices on Kansas and Pennsylvania wells remaining constant at $.88 and $2.50 a barrel throughout the week. There was an absence of fresh developments of importance in the market for scrap rubber.

An easy tone pervaded the leading crude rubber markets of the world yesterday, and the reactionary tendency which developed on Monday made further progress. This applied to the markets on both sides of the water. The depression was attributed largely to the trouble which developed on Monday, causing the affairs of a leading crude rubber company to be placed in the hands of a receiver.

U. S. Obligation To Be Paid

Announcement has been made, on February 14, by the reorganization committee that obligations of the sub companies of the former U. S. Motor Company will be paid after that date, at the office of the Central Trust Company, of New York, 54 Wall street, to holders of certificates of deposit which represent notes made or endorsed by Alden-Sampson Manufacturing Company, Brush Runabout Company, Columbia Motor Car Company, Dayton Motor Car Company and Maxwell-Briscoe Motor Company. The same applies to claims against the above-mentioned companies which have been admitted as valid obligations by the committee. These are to be paid in full, properly endorsed in blank, the holders being entitled to receive part cash and part voting trust certificates properly endorsed in blank, for the notation thereon of the amounts payable in both respects.

Fisk Rubber Company Issues $3,000,000 Stock

Par Value of Shares Is $100 Each on 7 Per Cent. Cumulative First Preferred Stock

For the Year Ending October 31, 1912, the Company's Net Earnings Were $758,421

THE Fisk Rubber Company, of Chicopee Falls, Mass., has arranged with William Salomon & Company, New York City bankers, for the issue of $3,000,000 7 per cent. cumulative first preferred stock in shares of a par value of $100 each. The quarterly dividends are payable on February 1, May 1, August 1 and November 1, and the entire issue or part of it is redeemable by the company at 120 and accrued dividends on 60 days' notice.

The full capitalization of the company is $15,000,000, consisting of:

	Authorized	To Be Issued
Cumul. first pref., 7 per cent.	$5,000,000	$3,000,000
Cumul. sec'd pref., 7 per cent*	2,000,000	2,000,000
Common	8,000,000	8,000,000
	$15,000,000	$13,000,000

*Convertible into common stock.

For the year ending October 31, 1912, the net earnings were $758,421. For the fiscal year ending that day of 1913, net earnings are expected to exceed $900,000, insuring net profits of fully $250,000. There is no funded debt and such cannot be incurred without the consent of three-fourths of the holders of first preferred stock, the same applying to mortgages, bonds, notes and other indebtedness maturing later than 1 year from date.

An annual sinking fund will be created for the purchase of first preferred stock; during 1914 and 1915 an amount equal to 7.5 per cent. of the entire authorized first preferred stock; after that, an amount equal to 15 per cent. of the net profits of the company will be set aside. During the past year the Chicopee Falls plant has been working at the rate of 24 hours a day, without producing more than 25 per cent. of the immediate requirements.

The Chicopee Falls company is now at the point of acquiring the property and business of the Fisk Rubber Company, of Delaware. Its own business during the past 5 years was as follows:

Year ending October 31	Automobile Casings	Automobile Tubes	Bicycle Tires
1908	57,695	40,960	84,387
1909	78,259	59,077	103,085
1910	96,692	88,061	168,990
1911	125,279	121,584	207,561
1912	221,826	198,925	240,623

On the basis of an appraisal made by the American Appraisal Company, Milwaukee, Wis., the total net tangible assets, exclusive of good will, trademark and patents, aggregate $5,000,000, the net quick assets alone being in excess of the issue of preferred stock now being arranged for.

Price, Waterhouse & Company, chartered accountants, have inspected the books of the Fisk company and report that, for the past 4 years, the net earnings available for payment of dividends were $1,337,485, averaging $334,371 per year, which exceeds the dividend requirements on the first preferred stock issue of $3,000,000 by 50 per cent. For the fiscal year ending October 31, 1912, the available net earnings aggregatd $508,421, which is 250 per cent. of the amount necessary for paying the dividend on the present issue of stoek.

In case the company shall have failed in respect of four quarterly periods to declare and pay the regular first preferred dividend, the holders of the second preferred and common stock shall have no voting power and the holders of the first preferred stock exclusively shall possess voting powers for all purposes, except as stated below, as long as there shall be any arrears in dividends upon the first preferred stock:

The company shall not without the vote or consent of at least three-fourths of the outstanding first preferred stock, and three-fourths of the outstanding second preferred stock and common stock;

(1) Sell or dispose in any way of the property and business of the company in their entirety.

(2) Dispose of any plant, the disposition of which would materially reduce the earning capacity of the company, unless the proceeds of such disposition shall be set aside and applied to the increase of the physical assets of the company or to the retirement of its first preferred stock.

(3) Create any mortgage or other lien to secure an issue of bonds or otherwise.

(4) Create or issue or guarantee any bonds, notes or other evidences of indebtedness maturing later than 1 year from the date of issue.

(5) Create any shares of stock having priority over or on a parity with the authorized first preferred stock or increase the authorized first preferred stock.

(6) Issue any of the authorized first preferred stock in excess of $3,000,000, except for cash at not less than par, nor unless the net earnings and income of the company before the payment of dividends on the first preferred or other stocks for the then last preceding fiscal year or the average of such net earnings and income for the preceding 3 fiscal years, whichever shall be greater, shall have been at least equal to three times the annual dividends on the first preferred stock outstanding and so to be issued. Except as above provided, the first preferred stock shall have no voting power.

Weed Obtains Permanent Injunctions

The Parsons Non-Skid Company and Weed Chain Tire Grip Company, New York City, were granted permanent injunctions in United States District Court in the cases of the Auto Company, Mutual Taxi Company, Renault Taxi Company and F. M. Elmond. All the defendants, who were using chains infringing on the Parsons-Weed patents, consented to the action of the court, which is thus final in these specific cases.

Injunction Against E-Z Chain

CHICAGO, Feb. 17—The United States court for the Northern district of Illinois, Eastern division, today made permanent the injunction against Edward D. Lewis, Thomas V. Garvin and Mathew J. Frambach, doing business under the name of the E-Z-On Chain Tire Protector Company and the Hartley Manufacturing Company, secured recently by the Parsons Non-Skid Company, and the Weed Chain Tire Grip Company. This is one of a half a dozen cases started by the Weed people for alleged infringement of their patents, as exemplified in the E-Z-On chain. The others made no answer.

Ford Move for Injunction Denied

The Ford Motor Company's motion for an injunction preventing Bowring & Company, New York City, from shipping cars to New Zealand was denied in the United States Supreme Court, Special Term, Part I, New York, on February 11 by Justice Davis. The Ford Motor Company alleged that Bowring & Company, together with individuals named Vanderpool & Chavez, had formed a conspiracy for unauthorized export of Ford cars to the territory mentioned. The reason for the court's action was that the Bowring company bought the automobiles in regular course of business from the individuals.

Wisconsin Association Meets

MILWAUKEE, WIS.—James T. Drought, of Milwaukee, the best known Wisconsin motorist in American motoring circles, was elected president of the Wisconsin State Automobile Association at the annual meeting of the directorate in Milwaukee on February 14. Other officers were elected as follows: First vice-president, Max G. Kusel, Watertown; second vice-president, Dr.

C. A. Conro, Rhinelander; secretary, H. A. Appel, Milwaukee; treasurer, George A. West, Milwaukee. Executive committee, Russell H. Jones, Kenosha; H. L. Halverson, Whitewater; George A. West, William H. Raymond and Isaac G. Hickman, Milwaukee. Mr. Raymond was also recommended to the A. A. A. as Wisconsin representative on the contest board for the present year. The fourth annual reliability tour was given in charge of the executive committee with full power to act. There is some talk of going back to grade 1 rules which governed the 1910 and 1911 tours, but were supplanted by grade 3 rules in 1912. Last year the Milwaukee dealers remained out of the tour, but the entrance of President Hickman, of the M. A. D. A. into the councils of the state association is believed to presage a return of the dealers to the contest activities of the state. Reports of officers showed that the state association now has a membership of 1,500 and a campaign will be made during this, legislative year, to double or triple the number by the employment of a state organizer.

Columbus Buggy Creditors Confer

COLUMBUS, O., Feb. 15—At a meeting of the creditors of the Columbus Buggy Company, of Columbus, O., which went into the hands of Daniel McLarin as receiver some time ago, a committee consisting of George W. Bright, E. R. Sharp, D. N. Postlewaite, B. G. Watson, Thaddeus Dunlap and George W. Lattimer was named to draft a plan of reorganization to be submitted by mail to the creditors. A number of different plans of reorganization were discussed, but none was indorsed.

Grossman Not Violating Injunction

Justice Holt, in the U. S. District Court, Southern District of New York, ruled on February 11 that the motion of the Rajah Auto Supply Company, claiming that the Emil Grossman Company had violated an old court injunction, be denied.

Emil Grossman Company, New York City, furnished a set of porcelains ordered by a user of Rajah spark-plugs in Connecticut. The denial of the motion was founded upon the ground that the defendant has not advertised the porcelains to be Rajah products, so that the entire matter would seem to be a blunder on the part of the clerk who sold the parts.

Cleveland-Galion Company Fails

FINDLAY, O., Feb. 17—The Cleveland-Galion Motor Truck Company, a $1,000,000 corporation, has been placed in the hands of a receiver, Attorney A. B. Thompson, of Cleveland, being named as such court officer. The appointment was made on request of Elliott Bright, creditor to the amount of $350, and was concurred in by the company. Mr. Bright says the company is solvent, but that threats of litigation and possible filing of suits by other creditors might affect the stability of the company.

New Underwriters' Association

CHICAGO, Feb. 15—Following along the lines laid down by Eastern insurance men, the Western Automobile Underwriters' Association was formed here last Wednesday. P. D. McGregor, of the Queen company was elected president and F. J. Sauter, secretary-treasurer. Negotiations are on for co-operation with the Eastern conference which will provide for an interlocking board of directors.

Broadwell Resigns from Hudson

DETROIT, MICH., Feb. 14—The Hudson Motor Car Company announces the resignation of E. H. Broadwell, who has held the position of vice-president and director of sales. Mr. Broadwell's disposing of his Hudson interests is the result of a disagreement as to company policy. The directon of the sales work has been assumed by C. C. Winningham.

New York's Fees Increase $129,481

List of Recommended Amendments to the State Automobile Law Included in Secretary's Report

Details of Incorporation and Automobile Bureau Work During 1912 and Comparison of Both Offices

THE report of the New York Secretary of State covering the year 1912 has just been published, containing the details of the incorporation and automobile bureau work. The following is a comparison of the work and revenue of both offices:

	1911	1911	1912	1912	Increase
Corporation	$133,989	8,357 Inc's	$136,663	8,757 Inc's	$2,674
Automobile	918,197		1,047,678		129,481
	$1,052,186		$1,184,342		$132,155

Compared with the receipts, the disbursements are as follows:

1911	$221,597
1912	185,680
Decrease	$35,917

A number of amendments to the state automobile law which are being recommended in former Secretary Lazansky's report to the Legislature follow:

Requiring all persons who operate motor vehicles to be examined as to their qualifications and he licensed.

Making it a misdemeanor punishable hy fine of not less than $250, or imprisonment for not more than six months, or both, for operating a motor vehicle without a license granted as ahove stated, and making it a misdemeanor similarly punishable for an owner to permit an unlicensed person to operate his motor vehicle.

Making it a misdemeanor, similarly punishahle, for operating a motor vehicle not registered or on which there are not displayed the number plates required hy the act.

Providing that in cities of the first class, no license shall be granted hy the secretary of state without the approval of the commissioner of police, first ohtained.

Giving the secretary of state the power to refuse any application for registration or license for cause, subject to review hy the courts in a proper proceeding.

Giving the secretary of state the right to suspend a registration or license for cause and, after a hearing, the right to revoke a registration or license subject to review by the courts in a proper proceeding.

Providing that no person under the age of eighteen years shall operate a motor vehicle.

Providing that the operation of a motor vehicle hy a person who is intoxicated ahall be a felony punishable hy imprisonment only.

Providing a uniform aet of rules throughout the state regulating the speed with which a motor vehicle may be operated within limits of towns, villages and cities, etc.

Prohibiting local ordinsnces with reference to speed.

Empowering the secretary of state to appoint inspectors to co-operate with police authorities in the enforcement of the motor vehicl elaw.

Giving the secretary of state authority to require applicants for licenses to permit prints of their fingers to he taken.

Making effective the power of the courts to punish violators of the motor vehicle law, hy specifically providing for imprisonment as well as fine.

Requiring numher plates issued to manufacturers and dealers to have in addition to the regular number a serial number.

Requiring each manufacturer and dealer to notify the secretary of state within 24 hours, of the name and address of the person to whom he has sold a motor vehicle, and to whom he has, under the law, granted the temporary use of the manufacturer's number plates, giving the serial number of such plates. The failure to notify the secrctary as above shall be a misdemeanor punishable by fine or imprisonment or hoth.

Prohihiting manufacturers and dealers from using their plates issued under the law, except for purposes of demonstration or in removing the car from place to place for purpose of sale.

Providing for a uniform flat rate fee for registration and renewals of registration of automobiles at 50 cents per each horsepower or part thereof, with a minimum fee of $5. This will be more equitable than the present fees which are $5 for automohiles of 25 horsepower or less, $10 for cars of 25 horsepower and less tban 35 horsepower, $15 for 35 horsepower and less than 50, and $25 for 50 horsepower or more. It will also result in greater revenue.

Requiring the secretary of state to furnish without charge lists of owners and chauffeurs to the police in cities of the first class.

Giving to non-residents the right to operate their cars in this state provided they have been licensed to operate tbeir cars in their own states.

Providing that the owner of every garage shall keep a record of every motor vehicle which enters or leaves the same.

In the table on page 329 of THE AUTOMOBILE for January 30 the population per car for the State of California was given as 254 whereas it should have been 25.4.

French 2,680-Mile Run

On March 1 Thirty-Four Cars Will Start on 14-Day Sealed-Bonnet Touring Competition

Talbot Makes 103 Miles in 1 Hour on Brooklands—Three Peugeot Cars Will Race at Indianapolis

PARIS, Feb. 17—Agricultural motor activities promise to be an important feature in France during the present year. During the month of April the agricultural commission of the A. C. F. will hold a series of motor plowing matches and demonstrations of the use of the internal combustion motor to agriculture at Algiers, in Algeria. The rapid growth of this colony and the importance it is assuming for the supply of fruits and vegetables to the French markets make it a particularly attractive field for the motor agriculturalist.

Paris will hold its annual and national agricultural exhibition during the present month, when, in order to encourage farm workers to study the use of machinery, there will be a series of practical competitions for farm mechanics. There will be two distinct classes, one for men who are qualified to look after stationary machinery and the other for mechanics who can handle motor plows in the field. In the first class the various features on which the men will be examined will be the following: Starting an internal-combustion motor, adjusting carbureter and ignition and finding the causes of a breakdown; starting a locomobile and a thresher driven by a locomobile; fitting up a mechanical creamer; indicating the attention to be given an internal-combustion and a steam engine during and after work; showing how repairs should be carried out on various types of machinery. For men capable of handling machinery in the fields the examination will cover the following points: Fitting up a double Brabant plow; fitting up and regulating a mechanical seed sprinkler; adjusting a reaper and a reaper and binder; starting and looking after a gas motor; indicating attention to be given to a gas motor, plows and various agricultural machinery; indicting attention to be given to horses and oxen on the field and in the stable.

From March 25 to April 15 there will be another agricultural exhibition, when the Agricultural Commission of the A. C. F. wil hold a motor-plowing competition in which the sum of $2,000 wll be offered in prizes.

Talbot Makes 103 Miles an Hour

LONDON, ENG., Feb. 18—(*Special Cable*)—On Saturday, February 15, a 25.6-horsepower Talbot car, driven by Lambert, broke the Brooklands 1-hour record by making 103 miles, 1,470 yards during that space. Lambert's car thereby beats the former world's record for 1 hour, established by Hemery, of 97 miles, 1,037 yards on a 59.6 horsepower Lorraine-Dietrich. The Talbot car used Palmer cord tires.

Must Test on Speedway

INDIANAPOLIS, IND., Feb. 17—Local motor car manufacturers are much opposed to a bill that has passed the state Senate, forbidding motor cars to be tested on any street or highway in this county, permitting such cars to use the streets and highways only for the purpose of reaching any track used for testing purposes. The effect of the bill would be to force all manufacturers to test their cars at the Indianapolis Motor Speedway, the manufacturers say.

As the bill passed the lower house, it prohibited test cars using any street or highway in the state. The Senate amended it to include this county only. The bill will be returned to the House for action on the Senate amendments.

Having rejected a plan for a state highway commission, the House committee on roads has prepared a good roads bill. This provides for the appointment of a county road superintendent by the county commissioners in each county. The road superintendent is to direct all road repairs and construction and is to be allowed not to exceed four assistants for each 100 miles of highways under his control.

One of the features of the bill is that it requires an annual state motor car license which would range from $5 to $25, according to the size and capacity of the car. The money thus raised is to be divided among the counties, one-third equally, one-third on the basis of the number of miles of free gravel roads and the remaining third on the basis of the number of motor cars licensed from each county.

Peugeot Cars for Indianapolis Race

INDIANAPOLIS, IND., Feb. 17—The management of the Indianapolis Motor Speedway has been notified by wire that three Peugeot cars will be entered in the 500-mile race to be held at the local speedway May 30. The word comes from A. G. Kaufmann, of New York City, American agent for the Peugeot line, who says the factory has agreed to enter the cars. Formal entries are expected in a few days. According to the dispatch, the drivers will be Georges Boillot, Goux and Zuccarelli, all of whom are foreign drivers of note. Boillot won the last European Grand Prix. Details of the Peugeot cars to be entered have not been received, although it is understood that they will be either the same cars that participated in the French Grand Prix or machines of similar design.

Shorter Course for Big Races

SAVANNAH, GA., Feb. 14—If the recent recommendation of the course committee of the Savannah Automobile Club is adopted by the committee of the whole the Grand Prize and Vanderbilt Cup races will be run over a 12-mile course next November. As the sub-committee is composed of three of the most influential members of the general course committee it is pretty certain their judgment will prevail.

The new plan provides for a track that is 5 miles shorter than the one over which the last two big races were run here, and has the additional advantage of making it unnecessary for the county to build any additional roads.

The cars will start in front of the grandstand on Waters avenue as heretofore. and will run out to the Montgomery Cross Road; then out on the Montgomery Cross Road to Sandfly; from Sandfly to Norwood avenue; then to LaRoche avenue; then to the Skidaway road; over the Skidaway road to Dale avenue; then down the home stretch back to the starting point on Waters avenue.

Columbus May Not Have Show

COLUMBUS, O., Feb. 14—After having made arrangements in every way for holding the Columbus Automobile Show in the Billy Sunday tabernacle, March 8 to 15, a split occurred between the Columbus Automobile Show and the Columbus Auto Trades Association which resulted in the former organization withdrawing from the show committee. This leaves the matter up to the Columbus Auto Trades Association and it is extremely doubtful if the show will be given at all this year though hope is still expressed by some. Some of the dealers favor the show while others are indifferent.

The cost of gettng the tabernacle ready for the show was in excess of $10,000 and the question of guaranteeing this expense was the cause of the split. It was believed that the Columbus Automobile Club should not guarantee the expense without the chance of some profit, which was denied it. It may be that a show will be given later.

175,000 at Chicago Show

One-Sixth More Visitors Than in 1912 and 800 More Dealers Illustrate Success of the Show

Shows in Minneapolis, Hartford, New Orleans, Washington and Newark Gratifying

CHICAGO, Feb. 17—With the closing of the doors of the Coliseum last Saturday night ended what was probably the most successful automobile show which the Windy City ever had the opportunity to witness. The 175,000 people that passed through the doors during the 2 weeks of the show were different from the visitors in other years in that a greater percentage of them came on business and fewer came to view the displays and decorations as a spectacle. As a result of this there was more real business done at the exhibition just closed than at preceding ones.

Samuel A. Miles, manager of the show, estimates that the attendance as based on the paid admissions showed an increase of more than 15 per cent. over last year's figures. One of the gratifying features was the increase in the number of dealers in attendance. The registration shows that there were 3,800 dealers in attendance, 800 more than last year. That the delegations of dealers were cosmopolitan in character is evidenced by the fact that they came from as widely separated points as Berlin, Germany, and Sydney, New South Wales.

Commercial vehicles held the floor during the second week of the exhibition, and the reports from the exhibitors indicate that the business done was far greater than that of previous exhibitions.

Minneapolis Has Business Show

MINNEAPOLIS, MINN., Feb. 14—From an educational and sales viewpoint the sixth annual automobile show of the Minneapolis Automobile Trade Association, Feb. 8-15, in the Armory annex, and the first national show, is declared a success. A great many dealers sold a good many cars at retail and on contract, and several sold no cars, but every dealer expressed the opinion that the show was a success, considering the educational results as the most desirable feature. At the show there were 118 exhibits, 175 pleasure cars, twenty-five commercial vehicles, fifty chassis, twenty-five commercial vehicles and thirty-five accessory exhibits. Sales are estimated at $1,250,000. The attendance was nearly 200,000.

HARTFORD, CONN., Feb. 15—The sixth annual show of the Hartford Automobile Dealers' Association, held at the First Regiment Armory under the auspices of the city battalion of the state militia, which concluded this evening, was a success.

Several Shows in Wisconsin

MILWAUKEE, WIS., Feb. 14—Two important local motor shows are being held in Wisconsin this week, and a third is scheduled for next week. At Madison, the state capital, eighteen dealers are exhibiting cars at the third annual show in the city market building, the dates being February 18 and 19. It is essentially a retail show and while many sub-agencies are placed at this tme, the principal business of the show is to make sales to the consumer direct.

Oshkosh's third annual show is being held in the National Guard Armory and will run 4 days, instead of 3. The Oshkosh show draws from the entire Fox river valley and is a retail sellers' affair, much like the Madison show. It has an attendance of approximately 6,500 during its run.

Eau Claire, the center of the northwestern part of the state, will give its show in Fournier's Academy from February 2 5to 28. Forty cars will be exhibited and an attendance of 6,000 is expected.

NEW ORLEANS, LA., Feb. 19—There are 108 cars on the floor of the Washington Artillery Hall. One of the features of the show is the increase in number and prominence of the commercial vehicles. As there has been considerable trouble with springs on trucks forced to use the cobble-stone streets of the harbor districts especial attention is being given extra heavy springs, several designs of which are on exhibition. Shock-absorbers of various makes are being urged by the commercial car men as well as those selling pleasure vehicles. Floor space in the main show was so limited that a number of overflow exhibits have been arranged. Several trucks are being demonstrated in the streets adjacent to the show, while an engine and numerous accessories are being displayed in hotels and business houses.

Denver Show Opens March 4

DENVER, COL., Feb. 17—The dates for the twelfth annual automobile show at this city have been fixed as March 4 to 8. The show will be held in the Auditorium, which will be elaborately decorated. Red and white have been decided upon as the official colors for the exhibition. The regular lighting equipment of the Auditorium will be supplemented by a large number of powerful electric globe-lights, one to be hung at the top of each of the white columns to be installed.

Many Sales at Washington

WASHINGTON, D. C., Feb. 15—Washington motor car dealers are elated over the success that marked the first motor car carnival or opening week, which came to an end tonight. Sixteen dealers, representing many of the most popular makes of cars on the market, participated in the affair, and the sales made during the week more than justified the expense entailed by the dealers. The carnival week was inaugurated with a motor car parade in which nearly 500 machines took part, a record-breaking crowd being out to witness the parade, which was over the principal streets of the city.

Newark Show Success

The sixth annual automobile show held in Newark, N. J., opened on the night of February 15. More than 300 pleasure cars and commercial vehicles were on exhibition, representing forty-eight pleasure car firms and twenty-one commercial firms. In point of attendance the show has proved a decided success. As a special feature the show committee has obtained the National racing car which made such an enviable record last year and also the trophies won by the Marmon company.

St. Louis Show Two Weeks

ST. LOUIS, MO., Feb. 15—The eighth annual St. Louis Spring Automobile Show will be much larger than was at first anticipated. It has been decided to make it a two week's show. The first week will be for pleasure cars and accessories, while the second week will be devoted to a display of commercial. The show will open on February 24 and continue until March 8.

SAN FRANCISCO, CAL., Feb. 15—San Francisco will see its first annual truck show this year, which will open in the Coliseum Hall April 1 and will keep open until April 16.

Digest of the Leading Foreign Journals

Constructive Improvement to Simplify Automobile Fire Engines Takes Another Forward Step in Germany—Body Builder Gives Strict Rules for Caretaking Showing Ultimate Unfitness of Paint and Varnish for Motor Cars

NEW Type of Centrifugal Fire Pump.—While America still stands doubtful towards the mobile and relatively inexpensive fire engine which is essentially an automobile with a high-speed pump actuated from the automobile motor, and permits the fire departments to place large orders for equipments of the old and accustomed types, Germany and, more recently, France are going ahead developing and improving the simpler machines in which it is always the same engine power which serves transportation and fire service purposes, and the designers in these countries have succeeded in removing most of the shortcomings which in the United States are still mentionel as decisive against the new type. While both Germany and France are divided with regard to the relative merits of centrifugal pumps, pumps with rotary pistons and pumps with high-speed reciprocating pistons, they have managed to develop each of these varieties to such a point that those fire departments which are friendly to the new movement no longer insist that the new apparatus shall be dimensioned and powered with a view to fitting into the older conditions, or to working in unison with steam pumps or chemical engines, but accept the idea that the fire-fighting tactics should be modified to agree with the capacity and range of the best new engines in which respect there are always some compromises to be made, however, since the construction is in a state of constant development.

It is at the same time emphasized by one of the leading authorities on automobile construction in Germany (Privy-Counselor Riedler) that the advancing development of the centrifugal pump for fire engines holds out the best promise so far mechanically realized for the eventual perfecting of a simplified hydraulic transmission for automobiles and commercial motor vehicles.

The weakest point in the fire engine with centrifugal pump has so far been found in the special provisions which had to be made in order to make it act as a suction pump, so as to draw water from a lower level where no hydrant pressure is available, at the start of operations. If the supply hose leaked or joints were not screwed up tight, dependence had to be placed in these provisions not only at the start but also after every intermission in the play of a stream. The continued operation of the pump was not in itself sufficient to prevent the column of water in the supply hose from breaking, under these conditions, if the flow of water from the hose nozzle was not kept up. The provisions adopted to offset this limitation of the centrifugal pump consisted usually in switching into the water circuit a small positive pump. capable of acting on air as well as on water, or in equipping the vehicle with an auxiliary water tank holding 75 to 100 gallons of water from which the supply pipe could be filled at the start and after interruptions. Altogether the troubles experienced at this point have accounted for the preference shown for rotary piston pumps in Berlin and some other German towns and for reciprocating piston pumps in France. despite the greater complication of mechanism and gears which is necessary with these types (see THE AUTOMOBILE of Jan. 30, page 351) but, on the other hand, the great simplicity of the centrifugal pump and the wide range of fire conditions which it can meet by mere throttle control, so far as the reach and volume of the stream thrown by it are concerned, have acted as a powerful stimulus among designers of this class of pumps for improving it from all points of view and especially ridding it of the one important drawback referred to. The latest improvement of this nature is described by Engineer Schwerdtfeger with reference to the illustrations reproduced in Figs. 2 and 3. The general contours of the fire engine, made at the Adler works at Frankfurt am Main, to which it is applied, are shown in Fig. 1. Instead of having side seats and a hose reel it can also be equipped as a touring car, giving additional comfort for long runs, and is in that case scarcely distinguishable from a large automobile, excepting that the pipe joints, the larger one for coupling the suction or supply hose and the smaller one for the pressure hose, are visible at either side at the middle of the vehicle, and that the vehicle in service carries the suction hose on the running-boards while the pressure hose is stowed in the rear of the carriage body.

The construction of the chassis is interesting at many points, but the one feature which craves attention outside of Germany is the improved centrifugal pump, because it is capable of operating on air and therefore can draw water from a lower level. thus representing an advance step in the very principle of centrifugal pumps. To be sure, a water tank is employed for this purpose but it contains only 9 gallons. It is located back of the dashboard, in front of the driver who can connect and disconnect it, with relation to the pump, by means of a small handwheel. No check valve at the lower end of the suction hose is required in order to make the suction effective. The construction therefore has the full advantage of the centrifugal system in being able to handle water in which there is sand or mud. It is also shorter than the ordinary high-pressure centrifugal pump with four speed translations.

PRESSURE RAISED FOUR TIMES BY TWO WHEELS

In Fig. 2 the Roman figures II to X indicate the course of the water in the conduits of the pump, here shown in longitudinal section. It flows in through one of the two suction pipes—the one not used being plugged—and reaches the introductory channel L. This channel does not take it to the entire area of the central entrance to the first centrifugating disk A but only to the upper half of this area. Here its speed is increased and it enters the channel II and is bypassed through III back to the lower half of the centrifugating disk A where the speed and pressure are again raised. Passing from IV to V and from V through VI to the lower entrance to the second centrifugating disk B and thence through VII to VIII to the upper half of the same wheel and out through channel IX into the pressure channel X, the water again reaches higher speed and pressure twice; so that, in all, four advancements of the pressure are accomplished by means of two centrifugating disks.

As the water enters the centrifugating chambers from opposite sides, end-thrust of the pump shaft is avoided by this construction, which means a considerable simplification in the mechanism of the bearings.

The suction and pressure pipes are located so high with relation to the pump body that the water does not run out of the latter when the supply hose or pressure hose is uncoupled. The pump body thus remains almost full of water after an interruption of service and is also connected with the small water tank previously mentioned by two pipes, one opening into the suction chamber of the pump and the other into the pressure chamber X. When the engine is in normal operation both these conduits are closed. At the start—provided no hydrant pressure is available—they are both opened, and when the tank is to be refilled only the conduit leading to the pressure channel is open. The operation under this most trying condition is as follows:

AIR EVACUATED BY CENTRIFUGAL PUMP WITH WATER JOINTS

In order to start, the suction hose is attached and connected with the water supply, while the slide valves of the suction pipe as well as the slide valves or the different pressure hose couplings remain closed. The pump is completely filled with water from the tank, and the pump is then clutched to the motor shaft. (In the Adler construction the shaft from the vehicle clutch to the gear box runs through the hollow pump shaft.) A circulation of water between the tank and the pump is now effected, and the water from the tank runs into the suction chamber of the pump through the pipe shown in Fig. 3 above the letter Z which represents a specially shaped trough causing the water to fall in two cascades into the introductory channel (L in Fig. 2), and the latter is divided into three compartments by means of two ribs FF. The water falls mainly into the two outer chambers, while the central one contains mainly air. Now the slide valve to the suction hose is opened a little and air is drawn out of it, the water making the pump act efficiently as an air evacuater, and the mixture of air and water is passed through the pump to the water tank where the air separates from the water and passes into the atmosphere through an overflow pipe. Meanwhile the water from the low-level supply has replaced the air taken from the suction hose, the slide valve for the latter has been opened completely and the condition for normal operation has been established. The conduit from the water tank to the suction chamber is now first closed, whereby the tank is refilled until it begins to overflow, and then both the conduits from the tank are closed.

Trials with this construction have shown that water can be raised 9 meters in less than one minute and without failure, and that in the subsequent normal operation the pump continues to raise the water this height while at the same time developing a pressure of 8 atmospheres, corresponding to the work of raising the water, inside of the hose, to a height of 80 meters.

With four hose simultaneously at work, each with an interior hose diameter of 52 millimeters (a little more than 2 inches) and a nozzle diameter of 10 millimeters, streams were thrown to a height of 30 meters and the delivery amounted to 800 liters (211 gallons) per minute. The motor in the machine develops 40 horsepower at 1,500 revolutions per minute.—From a more complete description by Schwerdtfeger in *Der Motorwagen*, January 20.

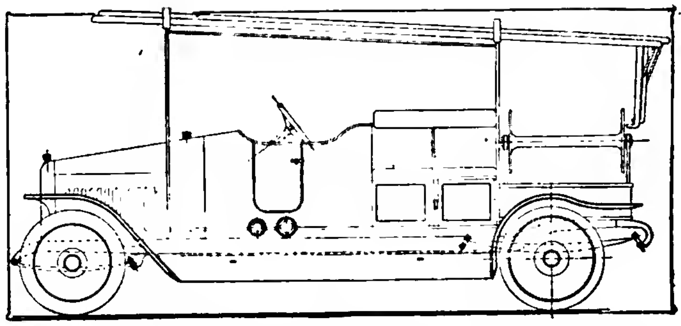

Fig. 1—General view of Adler fire engine with Gentil pump

DIRECTIONS for Grooming an Automobile—A double interest attaches to the directions given by Georges Kellner, of the well-known carriage-building firm of Kellner & Sons in Paris, with regard to the care to be given the bodies of automobiles. In the first place they proceed from the best knowledge on the subject and may be applied directly by any owner of automobiles in his relation to his chauffeur, caretaker or stableman, and, secondly, their very exacting nature suggests the urgent need of devising materials and a finish for automobile bodies which may be kept in presentable order with much less of care and labor than is now involved in the task. The directions are given in full in the following:

The care of the carriage work is a very important question to the owner of a vehicle. Every owner who is economical and careful of the elegance of his conveyance should always before entering his automobile throw a rapid glance over it to see that everything is proper and correct.

He should also occasionally assist at the washing of it. A conscientious mechanic can only be flattered to see that his principal is interested in his work.

The durability of a carriage body depends upon the quality of its manufacture, the maintenance of it and upon its paint. A vehicle should therefore always be well covered with its paint and its varnish. At this point the proverb that a stitch in time saves nine may be seriously applied. To wait till the paint becomes rough or the wood exposed before having the work done over is from no point of view advisable. It is necessary to groom this coat of paint and varnish with extraordinary care and not to forget that this care must be so much more assiduous the more the vehicle is exposed to wear and tear.

Water is the enemy of carriage work and the greatest cause of its deterioration. It rots it when it is in the wood; it rusts and disintegrates the sheet metal. A carriage body into which water enters by slow degrees is doomed to early decay.

Consequently, washing with a hose should be completely prohibited. Water used in too great abundance and at too high pressure deteriorates the paint at the joints, works in between the moldings and the panels, penetrates to the door drops and to

Fig. 2—Longitudinal section of Gentil centrifugal fire engine pump. The course of the water is indicated in the succession of Roman figures from II to X

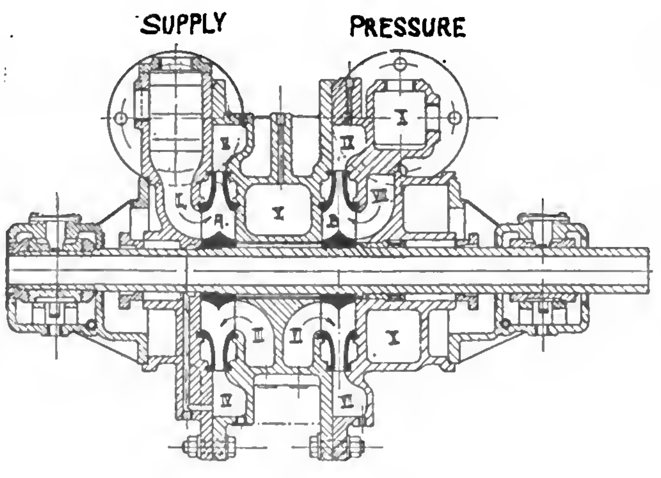

Fig. 3 — Transverse section through supply pipes and introductory chamber of Gentil pump

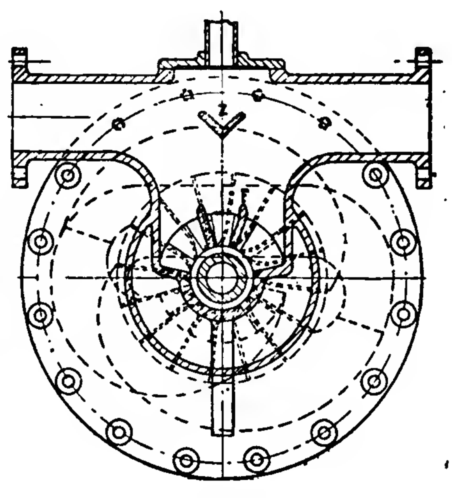

the linings, remains in corners where it cannot readily be wiped off, and can in the long run loosen the glued joints, make the wood swell and the paint fall off.

If the hose is tolerated, as it unfortunately is, it should at all events absolutely be provided with a rose so as to break up the power of its stream.

At the Kellner establishments the hose is tabooed. At the largest garage in Paris it has been abolished.

In one word, water should be used freely in washing the carriage but not in excess. To this end, washing with a pail of water and a sponge is a hundred times preferable to washing with a hose.

On the other hand, it is of the highest importance that a vehicle is well wiped after the washing, so that no water will stay long at any one point or streak the varnish.

The varnish should be particularly well treated, so as to remain brilliant for a long time and thereby fulfil its mission as a protector.

All dirt should therefore be removed at once upon the return of the vehicle to the stable before it has had time to dry. Unless this is done, the dirt leaves spots (especially on freshly painted vehicles) which detract notably from the lustre of the varnish and are difficult to remove.

The dirt must not be removed by rubbing. The mop is a poor instrument, even for the wheels. By using it, one spreads the dirt which acts like sandpaper and destroys the whole brilliant and protecting surface of the varnish. The mob is a stable tool intended for assisting in cleaning the feet and legs of horses but not for brilliant surfaces. The continued use of it ends by laying the wood bare.

Other things to be prohibited are: The addition of kerosene or gasoline to the water used for cleaning and the use of soap. Both these expedients roughen the varnish in the long run. Finally, hot water is banned because it makes the varnish crack or peel off; it may also affect the glue in the woodwork.

NECESSARY UTENSILS

Two good and large sponges; one for the carriage body and one for the chassis and wheels; two shammy skins.

The sponge and the skin intended for the running gear must not be used for the body, to avoid carrying oil and grease from one part to the other.

Two or three pails.

A large trough, to assist in filling the pails rapidly, if other means for this purpose are not at disposal.

A very soft feather duster, which must only be used for removing the dust which settles in the stable. Further, the dusting must be done very lightly with the ends of the feathers. The dust of the road must always be rinsed off with water.

A brush for the upholstering; a whisk broom for the mats or rugs.

A beater, a skin ball or soft rags.

A jack, a footstool.

Washing should be done in the shade, so that the water shall not dry too rapidly. The sunlight drying it up quickly, is likely to leave streaks or spots on the varnish.

In the winter the washing should be done in a sheltered place where the water will not freeze on the vehicle, but under no circumstances should hot water be used.

All interior and exterior cushions should be removed; also all the carpets, and these should be brushed after the washing.

All the upholstering should be beaten and brushed.

The windows of close vehicles should be raised and the tops of open ones should be removed to avoid getting water into the interior.

Begin by removing the worst of the dust and dirt. To this end, throw from a distance of a step or two, one, two or three pails of clean water against each exposure of the vehicle (the two sides, the rear and the front part of the running gear). Thereafter, fill the pails with fresh water again and return to the part at which work was begun and start by dashing water obliquely from a well-soaked sponge against the panels to loosen the dirt and make it drop off. Finish by sopping the panels lightly with the sponge. Under all circumstances, do not rub so long as the dirt has not yet been removed.

In the case of a close vehicle or one with a top, begin with the roof, washing it with a sponge full of water and wipe it dry at once. The sponge should be frequently rinsed out in the pail and the water in the latter should be changed as soon as it becomes too dirty.

When the carriage body has been washed, remove first—while always proceeding in the same order—all surplus of water by using the sponge for this purpose after squeezing it off, wet the shammy skin and wring it off and, with it, dry conscientiously the panels, the window panes and all the corners where water might linger.

Wring off the shammy skin from time to time by twisting it around the pail handle, so as to remove the water which it has absorbed.

When the body has been finished, pass to the motor hood, to the chassis and to the wheels, wiping each of these parts dry as soon as it has been washed.

When the washing is done, attend to the nickel and other plating, beat the cushions, clean the carpets and put them back in place; then rinse the sponges and the skins and empty the pails.

Two hours are required for the cleaning which has been described and which is usually done in the morning.

Every neat chauffeur should be careful not to place rags, wrenches or maps under the cushions, as this practice spoils the shape of the cushions and gives the vehicle a messy appearance which is in bad tone.

SPECIAL REMARKS

It is difficult under certain circumstances to proceed at once to the washing of a vehicle after it has been out. An automobile may be called upon to go out several times in one day; sometimes even morning, afternoon and evening. It is impossible to wash thoroughly after each of such trips. The amount of work involved cannot be asked of one man, although a vehicle used so severely should have more care than ordinarily is required. In such cases it is necessary to have a stableman or to put the vehicle up at a garage where special men do the washing.

However, a careful chauffeur can find time to give his vehicle a superficial cleaning after each trip, even in the evening. He can throw water over it and rapidly wipe the carriage body and the top of the fenders. This will take about 45 minutes.

A vehicle which has been out in dry weather and is covered with only a very light coat of dust, can at a pinch remain in this condition if it is intended to go out once more the same day, but it must in all cases be washed after the second outing. A vehicle which has been out should never be left unwashed more than 24 hours.

MISCELLANEOUS ADVICE

From other advice given by Mr. Kellner, most of which is familiar, a few extracts are presented:

The private garage should not be near to a horse stable, as the ammonia in horse dung causes paint and varnish to crack. A carriage should never be placed near to a stove. In storage it should be washed once in a while to keep the varnish bright, and upholstery should be brushed to keep moths out.

If leather tops harden they should be rubbed with neat's foot oil and brushed till they shine. No top should be left long folded but should be raised at every chance to obviate wrinkles and cuts. Celluloid windows are cleaned with alcohol.

Obstinate mud spots are removed by rubbing them lightly with a wad of cotton soaked in linseed oil. It is useful to have at the private garage a pot of black japanning, wherewith to touch up from time to time the lamp brackets (if they are black), metal wheel rims and the under part of steps and fenders. It should be applied only in very light coats.—From *Omnia*, January 18.

Preventing Vibration

Periodicity of Rocking Moment Broken by Lanchester Device Using Four Rotating Weights

Device Is Absolutely Silent and Is Invisible—Used on Fours or Sixes

IT is a well known fact that the balance of an ordinary four-cylinder gasoline motor is not perfect. At high speeds of revolution the vibration of a four-cylinder engine becomes quite a serious factor, both as affecting the comfort of a vehicle and as prejudicial to the durability of both chassis and body work. It is in fact on this want of balance of the four-cylinder engine that the demand for the six-cylinder engine is mainly based. It is true tbat the six-cylinder engine for a given power has the advantage of more uniform torque, that is to say, for any given mean torque there are less extreme limits of maximum and minimum, but the advantage of the six-cylinder engine in this respect is a secondary matter as compared with its advantage in the matter of smooth running as dependent upon more perfect balance.

The main piston movements on a four-cylinder engine may be said to be balanced, since the pistons of Nos. 1 and 4 cyliders are at their highest point when Nos. 2 and 3 are at their lowest point and vice versa. If the connecting rods were of infinite length, or in practice of such a length that their extreme angularity were very small, all four pistons would reach mid-stroke position at the same instant and at all other points Nos. 1 and 4 pistons would by their motion accurately compensate for Nos. 2 and 3. In an actual engine with a rod length of about two and a quarter times the stroke, Fig. 1, there is a considerable error in the position of the pistons when they should be at mid-stroke, thus when the crank pin is at 90 degrees from the dead center all four pistons are somewhat below their mid-stroke position, in the case of an ordinary 20 or 25-horsepower engine the error of position amounts to about .25 inch. This downward displacement of all four pistons due to connecting rod angularity takes place twice per revolution, or (regarding the main piston motions as mutually balancing each other) there is left a displacement of the whole reciprocating equivalent mass through the distance of .25 inch vertically taking place twice per revolution.

Analysis shows that this displacement may be approximated to a very close degree as a harmonic motion of twice the crankshaft period and in the new anti-vibrator a simple means has been found to compensate for this source of disturbance.

The serious magnitude of this secondary vibration on existing four-cylinder engines is scarcely appreciated by many designers; it amounts on an ordinary 25-horsepower four-cylinder motor at full running speed to as much as .5 ton applied alternately upwards or downwards twice per crankshaft revolution. The importance of eliminating a want of balance of this magnitude can scarcely be overstated.

On an open car, the vibration due to the cause under discussion is always felt at certain critical speeds and has hitherto been looked upon as inseparable from the four-cylinder design. Of recent years the trouble has become aggravated owing to a powerful sympathetic vibration or resonance set up in landaulettes, limousines, and other closed forms of body such as have to-day come into general use. It has therefore become difficult in a four-cylinder car to meet the demand for perfect smoothness consequent on the public having become educated up to high ideals by the six-cylinder car.

The new anti-vibrator patented by F. W. Lanchester the well known designer acts by supplying the equivalent of a reciprocating movement equal and opposite in effect to the unbalanced component of the piston and connecting rod motion, of twice the frequency of the main piston reciprocation.

The means employed is shown in Fig. 2. It will be seen tbat there is no actual reciprocating part but in place thereof four rotating weights A are provided, arranged symmetrically in pairs at the extremities of spindles B1 and B2 driven by screw gears C1 and C2 at double the crankshaft speed. The two spindles rotate in opposite directions and so the lateral movements of the balance weights, that is the horizontal components of their motion neutralize one another but the vertical motions combine to give the effect of a single reciprocation. The diagram Fig. 3 explains this action. Here the corresponding position balance weights are numbered 1, 2, 3, etc., and their common center of gravity for each numbered position is given at 1', 2', 3', etc.

It is possible in this arrangement to correct for irregularities of turning moment due to piston inertia, these following the same law as to frequency as the linear secondary vibration. But in the ordinary gasoline motor the advantages in this direction have not hitherto been found sufficient to give any marked superiority to engines corrected in this sense.

The balance weights in any case are quite small. In the arrangement shown in Fig. 2 each weight weighs about .5 pound for an engine of 25-horsepower.

McCue Wheels Used As Regular Equipment

Two American Makers Fit This Make to 1913 Cars

THIS year marks the introduction, to any real extent, of the wire wheel into the automobile practice of America. This type of wheel has withstood a practical test for several years in Europe and is therefore far beyond the experimental stage.

One of the advantages possessed by the wire wheel over the wood artillery wheel is that absolute circularity of the rim, besides truth in the relation of rim to hub, is maintained irrespective of atmospheric changes. This is owing to the fact that only one material is used throughout its construction, and consequently even expansion or contraction of the components, on varying heat conditions, results.

One of the objections raised against the wire wheel two or three years ago in Europe was that moisture found its way through the junction of spokes to rim and caused damage to the rubber tire. If there was any foundation for this objection it certainly does not hold with the present-day methods of accurate spoke fitting and thorough enameling.

The McCue Company is a pioneer manufacturer of wire wheels in this country, and its product appears this year as a standard fitting on some of the important car builders.

The McCue wheel follows European practice in that it belongs to the triple spoke class. It is built on a pressed steel hub O, Fig. 2, of conical shape. The spokes, drawn from a special alloy steel, have enlarged ends to provide a strong fastening. Small semi-spherical depressions in the rim form a seating for the spoke nipples. The method by which each spoke is tightened to a uniform tension is interesting. A special wrench is used for this purpose, so designed that when the tension applied to the spoke reaches the right point, which is in the neighborhood of 1000 pounds, the wrench automatically stops tightening it any further. The wrench is set at the desired tension, and the operator simply tightens each spoke nut until the wrench refuses to make it any tighter.

After lacing up the wheel in this manner, it is trued by hand, and a final absolute truing of the hub to rim obtained by machining the interior of the hub while the wheel is held in a chuck by the rim.

Seventy spokes are used in the standard wheel, made up as follows: outer set, twenty-eight; cross, twenty-eight, and inner fourteen.

A point of considerable importance in the fitting of spokes is the angle at which each spoke enters the hub or flange to which it is fixed, i. e.: the angle between the center line of the spoke and the direction of the hole in the hub which receives it. In bicycle practice the flange is usually at right angles with the axis of the hub, and therefore it is necessary that the spoke end be bent through 90 degrees. Mechanically, this is a weak fastening. It requires that the spoke at that point be much heavier in order to equal the breaking strain of the spoke proper, than would be necessary if the spoke end passed through a hole in line with its axis.

Of equal importance is the outer end of the spoke. The screw thread which is necessary here to take the spoke nipple brings down the tensional strength of the spoke to that of a wire equal to the diameter of the base of the thread. It will be noticed that the ends of the spokes in the McCue wheel are considerably larger than the body of the spoke so as to eliminate any weakness that might follow if the points mentioned above were ignored. A further reason for this enlarging of the ends is that most of the driving strain is met at by these portions of the spokes.

Turning now to the method of mounting and locking the wheel, the inside of the wheel hub is machined to fit accurately the conical surface of inner hub I, Fig. 1 to which it is clamped by the locknut N. The drive is taken by a series of studs S positively connected to the inner hub and which project into corresponding holes in the flange of the wheel hub. The locknut is shown in detail in Fig. 1. It is of the floating type, that is, it is free to rotate on the wheel hub, but cannot be detached therefrom. This is an excellent feature of the wheel. Except for the special wrench there are thus no separate parts to lose or forget, while changing wheels. Two spring-actuated pins P are the means of locking the nut after screwing up. These engage with

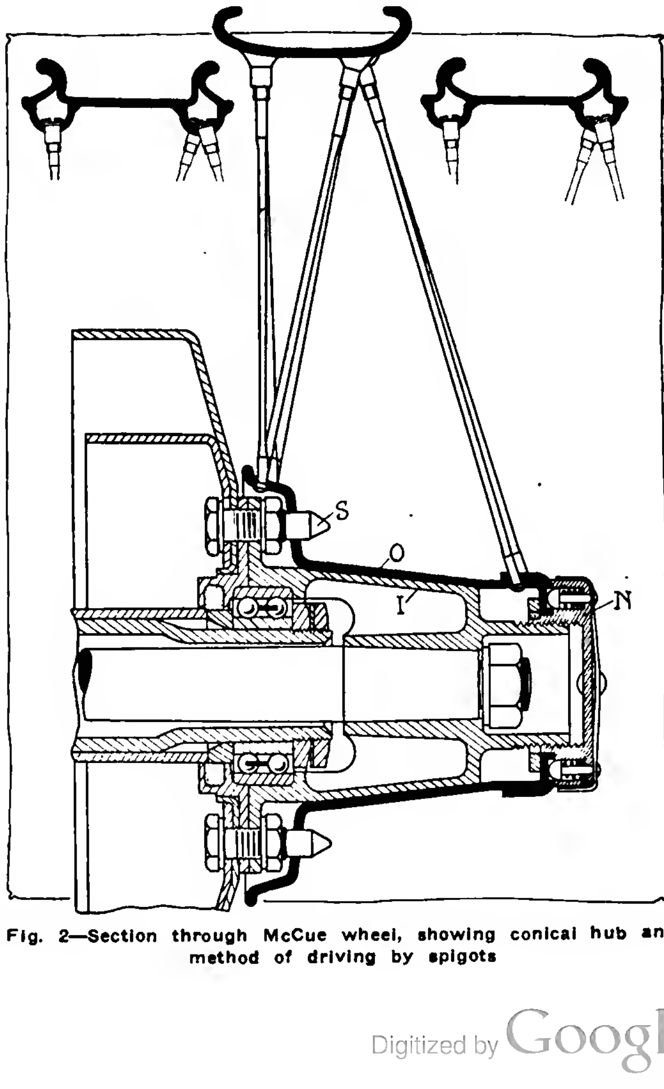

Fig. 2—Section through McCue wheel, showing conical hub and method of driving by spigots

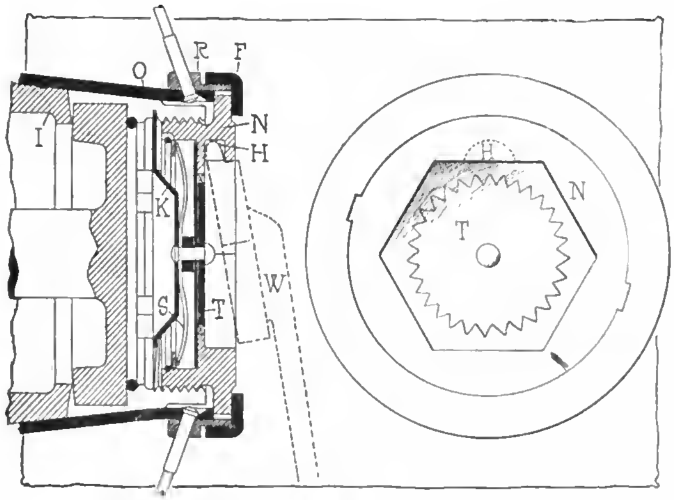

Fig. 3—Special locking device adapted to McCue wheels by Edwards Motor Company

a number of holes H drilled in a flanged ring shrunk on the end of the wheel hub. The springs S are sufficient in themselves to retain the locknut unless considerable turning force be applied, but an absolutely positive lock is insured by the use of a stiff flat spring L, which normally is in such a position as to prevent the pins P from sliding out of engagement.

The operation of removing the wheel is performed by a special wrench W which can only be placed over the nut in such a way that two small notches C engage with the ends of the cross-spring L. On applying force to the handle the spring C is first rotated through a few degrees until the faces B come into contact. This movement uncovers the ends of the pins P which are then free to move against the action of the light springs S and a further rotation of the wrench handle unscrews the nut, drawing the wheel with it by means of a flange on the inside. On replacing the wheel it is impossible to remove the wrench until it is in the position shown in the diagram, owing to the teeth T, which otherwise would be resting on the face of the wrench ring.

In Europe, where the extensible beaded tire is the rule, it has not been the custom to use detachable rims on wire wheels, but the introduction of these wheels to the American market made it necessary to incorporate the Q. D. rim owing to the prevalence of inextensible tires. The very slight addition thus made to the weight carried at the periphery is more than compensated by the greater facility with which tire changes can be made. In this connection it is rather to be wondered at that the European motorist has not demanded the Q. D. rim, even for use with extensibly beaded tires.

The insets in Fig. 4 show a type of detachable rim fitted to some of the McCue wheels. It will be noticed that the rings are reversible so as to be adaptable for either straight-sided or clincher tires.

Another type of Q. D. rim is shown in Fig. 4. This is a product of the Standard Welding Company and is incorporated in the McCue wheels used on the Edwards-Knight and Henderson cars. The method of fastening is shown in the same illustration. The split ring C is provided at its ends with notched teeth T, which project through holes in the rim proper, and are clamped thereto by the latch L. This latter carries an oval-shaped piece P, which permits the ring to be withdrawn when the latch is in the position shown in the lower illustration, but which engages the notches in the teeth when the lever is laid along the rim. No special tools are required in the operation of this locking device. The rims are made to accommodate either clincher or straight-sided tires. The latter type is shown at 4, in which it will be seen that the detachable portion is not altered in any way, being merely reversed.

A locking device which differs from the McCue standard is that shown in Fig. 3. This design has been brought out by the Edwards Motor Company and is incorporated on all the McCue wheels fitted to the Edwards-Knight cars for this year. It is characterized by a smooth and neat external appearance.

The flange on the existing wheel hub is turned off, and a ring R fitted outside through which the spokes pass at their inner fastening. A flanged ring F screwed on to the ring R provides a free seating for the locknut N, allowing it to be turned but not detached. This nut is screwed inside to engage directly with the inner hub I, a hexagonal depression on the front face being provided to take a wrench W for applying and removing the wheel. Actual locking takes place between the toothed disk T and the corresponding aperture in the locknut. A three armed spider K is the means employed to maintain the locking disk in permanent relation with the inner hub O. Rigidly attached to the toothed disk is a flat spring so arranged that the disk is normally forced outwards in engagement with the locknut, being prevented from passing right through the aperture by a guide disk fixed to the inner surface.

A hexagon headed wrench W, shown in dotted line, is the only tool necessary in the operation of applying and removing the wheel. On applying the wrench a tooth projecting from one of its faces engages with a milled hole H in the locknut, forming a fulcrum on which the wrench is swung into place. In so doing the inner surface of the wrench comes in contact with a rivet head in the center of the disk T, thereby forcing in the latter against the action of the spring S, and out of engagement with the locknut N. The locknut is then free to turn and on being rotated forces up the wheel on the inner hub I or withdraws it, by means of the flange F.

Overloading vs. Brake Capacity

Loading a truck above its rated capacity and driving a car at too high a speed are the same sort of misdemeanor, when one comes down to a final analysis of the problem. On the surface, it would seem that a man who owns a truck may put a load of 8 or 10 tons on it, even if the rating is only 5 or 6 tons. One might argue that the excessive depreciation which is the inevitable result of overloading, is as much as the business of the owner as insufficient lubrication or any other neglect. This, however, is not true.

A man who overloads his truck, driving it over public highways, jeopardizes public safety in exactly the same proportion as he exceeds the rated loading capacity of the truck. The reason for this is that the brakes on each vehicle are designed to absorb a certain momentum, that is to say, to nullify the dynamic energy of the moving body by changing it into friction and heat. A certain momentum, that is, the power used for driving the truck at a certain speed, may be absorbed, and no more. If the truck is driven above that certain speed, the brakes will not be able to hold and act as they should.

The Engineers' Forum

Exhaust Gas Analysis

Engineers Discuss Value of Analyzing Exhaust Gases To Determine Engine and Carbureter Efficiency

Hutton and Coffin Give Results and Favor Changes

Part III

Hutton Outlines Importance of Manifold
Coffin Wants More Air in Cylinders

NOTE—These discussions by leading engineers are from stenographic notes taken during the recent session of the Society of Automobile Engineers in New York City when this pertinent subject proved one of the most interesting of the meeting.

NEW YORK CITY—The real carburetion as in the case of gasoline and air is that we propose by the velocity combined with heat that we have in the intake to get a current of air soaked with the true gas, so that the moving column of air, which is the air for combustion, shall be thoroughly saturated with the fuel that is to be burned.

Now thorough saturation, of course, is a combination of two conditions: the presence of the finely divided particles of gasoline just ready to vaporize and a mechanical mixture of those vaporized particles with the air. Now when we are thinking of passing from the carburetion of air by gasoline to the carburetion—and let me put an interrogation mark after carburetion in that sense—to the carburetion of that air with a less volatile fluid, such as kerosene, do we ever in the presence of, say, ordinary temperatures soak or saturate that current of air with the hydrocarbon gas? We may mix it together very intimately with the foggy kerosene particles in a very finely divided state; but is it possible with any non-volatile fued like kerosene to absolutely soak the current of air in the same sense in which we soak it with gasoline?

The manifold has a very important function, much so in gasoline, but even more conspicuously so in kerosene, in its operation of soaking through the air. When we once get that manifold acting slowly, then comes the function of the manifold acting as a vaporizer to help along this reluctant process with kerosene. If the manifold is too long, then comes exactly the same result as observed, that it never gets hot enough the fog settles in the form of a deposit of rain on the bottom of the pipe. If the manifold is short and we have got it going hot and the engine is running at high speed, there is never any chance for this precipitation of kerosene fog, and we carry a product finally to the engine in full condition to burn smokelessly.

Now the problem of varying the speed of passage through the manifold, the problem of varying the volatilization of the liquid fuel, makes me want to ask whether the profession will undertake to confine the use of the term carbureter to a device which makes, without extra heat, a gas that issues from the carbureter valves. If it does not make a gas, but makes simply a fog, a mist of finely divided hydrocarbon particles in the air, I would like to refrain from calling this process carburetion. I do not think this is a true carburetion. If so, a device which uses kerosene and does not make a complete gas of it ought not to be called a carbureter, but we should find some other name for it—an atomizer or vaporizer. Well, those are two good names anyhow. But the thought that is in my mind is would it be sufficient—put it a little high—would the commercial interest permit an arrangement for atomizing kerosene, consent to have it called by some other name than carbureter? It would be scientifically more defensibe, but could it be commercially done?—Prof. F. R. Hutton.

Injecting Air a Great Help

Detroit, Mich.—From the standpoint of the manufacturing interests, I should say that we are principally interested in the results, and I think stand ready to welcome any carbureting device which will do the work, without much regard to whether it is indirect or direct. At least, I think the Standard Oil Company is going to force it into existence. I did a little experimental work 2 or 3 years ago which proved pretty conclusively that if it were possible to construct a motor in such a way that at the end of the intake stroke or the suction stroke, after the cylinder had filled itself with all the charge that it might take through the carbureter, that if we were able to inject into that cylinder a surplus of fresh air immediately over the top of the piston that we had no trouble in burning up everything within the cylinder, that our carbureter troubles largely disappeared and that we consumed everything, even to the cylinder oil, without leaving any residue in the line of smoke through the exhaust. As a matter of fact, we could take a spark-plug which had been deliberately fouled and which refused to work in an ordinary motor and put it in the engine with such a device and take the spark plug out after 5 minutes' running just as clean as the day it was made. This gave, I suppose, merely a condition of air and an excess of oxygen which aided in the combustion of everything which had been taken into the cylinder. We discovered, however, at the same time, that, due to the excess power we developed in that way, that it would be necessary to revise our gas engine practice in so far as construction went. In other words, our bearings were not of sufficient area and many other parts of the motor were not of sufficient strength to take care of the additional power generated. And if a charge were put into the cylinder under pressure, which would seem desirable from his standpoint of getting the speed in the intake pipe up, that then there might be a question as to whether the gas engine as it is now constructed would take care of the higher temperatures and the additional power developed. There is absolutely no question but that in so far as the cylinder contents go, it is possible to put into any cylinder, as our gas engines are now constructed, a charge which shall be a mixture of gasoline and air which will give an explosion that will be too extreme for the parts of the engine to stand up any length of time. Putting it in there wet it is now possible to construct a motor or it is now possible with motors of our present construction, to get within the cylinder, by an addition of air at the end of the suction stroke, or by putting in the charge under pressure, a power which our current practice in gas engine construction will not take care of. We can wreck an engine as we now build it with such practice. I do not know that there would be any difference in taking in a charge under pressure, a pressure applied beyond the carbureter, reaching through the intake pipe into the cylinder, or as we did it, taking the charge, ordinary charge, through the carbureter fairly rich, perhaps, but anything that is so arranged that the piston at the extreme bottom of its intake stroke would open up every part, which would admit air at a pressure of 10 or 15 pounds per square inch, and thereby fill up the vacuum, any remaining vacuum—I use vacuum in the term that there is some portion of the cylinder which of course is not filled through the carbureter. As long ago I think as 9 or 10 years back, in a series of experiments which were conducted in the laboratory at the University of Michigan, we found that piston displacements were not by any means being filled under the method of carburetion which we were using then, and which we still use to-day. We found that our charges filled in something like 90 per cent. of the piston displacement at low speed, down to 55 or 60 per cent. of the possible piston displacement at fairly high speed, and of course we found a great many other things which we probably did not understand as well then, as to the inertia of the gas column, and so forth. But we did satisfy ourselves that we were not getting the gas into the cylinders, because the friction through the valves, the friction of the intake pipe, the restricted passages from one end to the other—and that same situation holds, I think, to-day, and it is probably just as well for gas engines as we now build them that it does hold. Otherwise I think that we should have to change our ideas of design quite materially.

The addition of fresh air at the end of the suction stroke, thereby completely filling the cylinder and adding oxygen and aiding in the combustion of air within the cylinder, will give such an increase of power that the engine will not take care of it.—Howard Coffin—Hudson Motor Car Co.

Where Much Heat Is Lost

New York City—One-third of the money we pay for gasoline is literally thrown into the winds of our radiator cooling fan. For every dollar we pay for fuel we get back less than 15 cents worth of ride. Any man would fire a laborer who worked at the rate of $1 worth of effort for $7 hard cash in wages, yet this is what we get from our mechanical servant, the gas engine, and we are not merely satisfied but delighted.

Owing to the unfortunate habit of water to boil whenever it reaches a temperature of 212 degrees Fahrenheit or less we are compelled to keep the cooling water to the safe and sane temperature of 180 degrees Fahrenheit in order to allow ourselves a slight margin of safety whenever the slope of the ground becomes excessive. This is one source of lost energy. It is the greatest source, too, constituting as it does 30 per cent. of the total heat value of the fuel. What can we do to chop off a few per cent. from this and add the percentage gained here to the percentage that forces the car over the ground? Evidently we can do nothing as long as water is used unless some kind soul discovers non-boilable water or some other miracle happens. Leaving this matter for the few remaining air-cool advocates to gloat over, the next big source of loss, the heat thrown into the muffler, may be mentioned.

It is, of course, thoroughly understood that the exhaust of a gas engine is going to be hot from now until gas engines are no longer in use. The muffler will never be used as a refrigerator for tired tourists' lemonade, etc. The problem is not to take from the exhaust what may be called the liberated heat, but to take from it the heat that still remains bottled up in the form of combustible products. If we had a log fire in a cold room and the fire persisted in going out before the fuel was consumed we would know that there was something wrong and that conditions in the grate were not such that were most conducive to a successful fire. When we throw carbon monoxide into the muffler it is like dragging a half-burned log out of the grate and throwing it away.

The entire secret of good combustion is enough air. What is considered by chemists as sufficient to cause perfect combustion for a given weight of charge will not do. The air must be plentiful enough to be in contact with the burning particle. There must be more than enough. Therefore to stop the loss of power into and through the muffler it is up to the driver to furnish plenty of air by proper carbureter adjustment. Why not inject excess air into the cylinder anyway? Cannot our engineers find a way to do this? A few who have experimented will vouch for the good results and the increase in thermal efficiency. —Carl Vechter, Unattached.

Harking Back a Decade

FROM The Automobile for February 14, 1903:

Some difference of opinion between the Automobile Club of America and the National Association of Automobile Manufacturers has at times been surmised, but has usually been well smoothed over in the interest of the moral effect of a united front by the two leading automobile organizations. Until the Madison Square Garden show, held under their joint auspices, was over, the external appearance of harmony was preserved, but no sooner had this affair been successfully pulled off, before an open declaration of disagreement in views was made by the manufacturers' association in the form of a resolution expressing disapproval of the most important event projected by the club.

But from the outside the resolution by the manufacturers looks as a deliberate challenge to the club to hold no automobile contests in the future without first obtaining the sanction of the manufacturers' organization; in other words, to keep its hands off the development and encouragement of the industry, in general, and limit its activities to matters of sport; failing in which the two organizations will have to measure strength.

With some local variations the display of new automobiles and automobile appurtenances which was placed before visitors at the New York show, is now spread under the eyes of another community, and is being judged by another public. A half dozen Western manufacturers of complete automobiles whose absence from the New York event was deprecated, are exhibiting their products in the Coliseum in Chicago, and a score of their Eastern colleagues, satisfied with the results obtained at the Madison Square Garden, are refraining from further effort. But outwardly the two exhibitions are of the same size and of the same character, though running a little more to parts and accessories in Chicago and little more to complete vehicles in New York City.

The annual meeting of the National Association of Automobile Manufacturers was held on February 4 in New York City and Milton L. Budlong was elected president; H. Ward Leonard, Windsor T. White and Charles Clifton, vice-presidents. Percy Owen was re-elected treasurer and the re-election of Harry Unwin as secretary was ratified.

The Automobile Club of Great Britain and Ireland is loath to give up all hope of holding the race for the Gordon Bennet cup on British soil, and through its latest efforts the club has discovered a stretch of road of over 150 kilometers in length in Ireland, which it has pronounced fully satisfactory as to condition. This road lies in the Province of Leinster, the start being at Naas, some 30 miles southwest of Dublin.

Copper Alloys for Motor Car Service

Copper, Tin, Zinc and Lead the Basic Ingredients of Bronze and Copper Alloys; Properties Important

Paper Presented Before the Detroit Section of the S. A. E. by W. H. Barr, Chairman of the Alloys Division

IN offering a paper on copper alloys one approaches a subject of such magnitude that it can only be treated briefly, in a manner that may prove of interest and service to automobile engineers.

The basic ingredients of bronze and copper alloys are, of course, copper, tin, zinc and lead, and we will consider these metals from a viewpoint somewhat unusual.

Men of mechanical training, especially those who have not made a study of metallurgy, are always interested in knowing something of these virgin metals, their origins and their effect upon each other when brought into alloys or combinations.

Copper was probably the first metal used by the human race. Weapons and ornaments have been found which seem to prove that the men of prehistoric ages made use of it on account of the ease with which it could be worked, and the fact that it was found in the ground in the metallic state. It is claimed by many that its use antedates that of iron.

The copper mines of Wady-Magrah, located in Upper Egypt, are thought to have been worked as early as the second dynasty, upward of 3000 B.C.

The Romans claimed that their best copper was obtained from Cyprus, an island in the Mediterranean, and for this reason the metal was known as "Cyprian Brass"; later, the contraction to "Cuprum," and then to "Cuper," from which our present term "Copper" was derived.

In the United States copper is usually classified in three grades: Lake copper, that brought from the Lake Superior region; electrolytic copper, that refined by the use of electric current; casting copper, that which is not entirely refined, but carries varying amounts of impurities, and as a result is rapidly disappearing from the commercial fields.

In bronze and brass alloys copper is the preponderant metal, being the element with which we can best alloy smaller quantities of other metals. The essential charactertistics of copper are to impart strength and toughness, and in ornamental work varying degrees of rich red color. It is the best conductor of both heat and electricity, slightly excelling silver in the latter respect.

Chemically pure silver was for years believed to have the highest electrical conductivity of all the metals, and accordingly was the basis for the 100 per cent. standard. Recently, however, copper has been produced in so excellent a state of purity as to indicate an electrical conductivity of 104 per cent. was silver as a base.

The United States produces more copper than any other country, or about 65 per cent. of the total production of the world, the total amount for 1911 having been 1,090,000,000 pounds. The first mine worked in the United States was the Simsbury Mine, of Grandby, Conn., in 1705, which proved to be of little value and only small amounts of copper were taken from it.

The specific gravity of copper is 8.82; melting point 1,981.5 degrees Fahrenheit, United States Bureau of Standards; the tensile strength varies with the physical condition, producing the following results: In cast copper the tensile strength is 26,000 pounds per square inch; in bolts 34,000 pounds, and in wire 55,000 pounds.

The tempering of copper has for years been considered a lost art, but among the latter-day scientists the unity of opinion is that this climax of the art never existed.

Tin was first known about the time of Moses, or about 2000 years B.C., and it has been produced in varying quantities ever since. Tin was imported by the Phenicians from the British Islands long before the Christian era. These islands were, on this account, known as the Cassiterides, from the Greek word Kassiteros, meaning tin.

Tin stone, which is an oxide of tin, is, at the present time, the only ore used for the production of metallic tin, and is found in the largest quantities in the Malay Peninsula (Chinese) and the Island of Banka (Dutch East Indies).

The total world's production of tin in 1911 was 233,504,000 pounds, of which the United States consumed about 40 per cent.

Tin is a white metal with a distinctly yellowish tinge, and can be rolled into very thin sheets, but its low tenacity prevents its being drawn into wire. Its specific gravity is 7.29, melting point 449.4 degrees Fahrenheit, United States Bureau of Standards. It has a distinctly crystalline structure and emits a peculiar crackling sound on being bent back and forth, due apparently to the rubbing of the crystals on each other.

The smelting is a comparatively simple operation, as the oxide is readily reduced by carbon at a red heat. The purest metal is obtained from reverberatory furnaces. This is further refined by liquidation, which consists in subjecting the metal to a low temperature on a sloping hearth, where the tin, having a low melting point, runs out, leaving the impurities behind.

Tin produces a decided tempering effect in combination with copper, varying in proportion as it is used. Above 25 per cent. tin, the alloy is too hard and brittle for use. The true bronzes are alloys having these two elements as their main constituents. Up to about ten or twelve per cent. tin, the material is not affected by quenching. Above that percentage quenching from the proper temperature renders the alloy softer than if slowly cooled, being directly opposite to the effect which such treatment has on steel.

Tin also has a high coloring effect on copper, a very small quantity being distinctly discernible.

Tin, in combination with the brasses or copper zinc alloys, when present in small amounts, renders the alloy more sound, more fusible, and capable of taking a better polish.

Zinc, commercially called spelter, is the next important metal. It is of a bluish white color and of a decided crystalline nature and at ordinary temperature is quite brittle. Between 250 degrees and 300 degrees Fahrenheit however, it is malleable enough to permit of rolling into thin sheets and drawing into wire. Zinc is not found in a free metallic state, but is obtained from its ores, which are chiefly sulphide of zinc and carbonate of zinc. The concentration of the ore is attended with considerable difficulty, as the associated impurities are generally of about the same weight as the ore.

The specific gravity of cast zinc is 6.87; melting point 786.9 degrees Fahrenheit. It is a poor conductor of both heat and electricity.

The United States is the largest zinc producer of the world, New Jersey, Missouri, Kansas and Colorado containing the greatest deposits. Our total output in 1911 was 623,122,000 lbs.

Of the different metals that we are considering, zinc is the only one that can properly be called a bearing metal. Used unalloyed for bearings where strength is not essential and its brittleness is not objectionable, there is probably nothing superior to it for wearing qualities.

The Effect of Zinc and Lead

Zinc in combination with copper produces the brasses. Very small additions of zinc render copper suitable for casting. Larger additions cause gradually increasing hardness, but not to as marked an extent as tin. Nearly fifty per cent. zinc can be added before an alloy too brittle for use is obtained. With increasing zinc contents the strength and elongation, as well as the fusibility of the alloy, increases.

In the high copper-tin bronzes zinc is used in small quantities of about one or two per cent., mainly for a cleansing effect. It improves the fluidity of the metal, thus making sharp, clean castings, free from blow holes.

With a higher percentage, the hardness and strength of the bronze decreases, and the brasslike qualities thereby imparted become apparent.

Lead has been known from remote antiquity. It is mentioned in the Bible at a period of about 3000 B.C., and articles made from the metal by the Ancient Romans, in the form of water pipes, tanks, rings, etc., are still preserved. Many European countries produced lead as early as the tenth century and still supply the market. **The United States leads the world at present, the annual production for 1911 having been 795,628,000 lbs., or about forty per cent. of the world's production.** The first lead in the United States was discovered near Jamestown, Va., in 1621, but the present main supply and the richest ores are obtained from the Western States. The principal ore is the sulphide called Galena, which almost invariably carries a small percentage of silver.

The specific gravity of lead is 11.35; melting point 621.1 degrees Fahrenheit, United States Bureau of Standards; tensile strength 2000 lbs. per square inch.

Lead, in combination with copper, is exceedingly difficult to introduce in its best form and remains undissolved as inter-crystalline material. It is, therefore, not an alloy, but rather a mechanical mixture.

The action of the lead in combination with a copper tin bronze is as a lubricant, the small free globules of lead in a bearing being very beneficial.

Although lead makes the alloy denser and more malleable, it has a decidedly weakening effect upon the alloy, as its globules break up the continuity of the crystals. A high lead bronze when broken will show a gray fracture as a result of breaking through the weaker lead globules and not through the crystals of the copper tin mixture.

Phosphorus a Cleaning Agent

In brass, lead also acts as a lubricant and prevents fouling of the tools in working.

Some elements, such as arsenic, antimony and sulphur, have a detrimental influence on bronze, but there is one which has a decidedly beneficial effect, and that is phosphorus.

The function of phosphorus on a bronze is that of a deoxident. It cleans the metals from oxides of copper and tin, and if the correct amount is used for this purpose none remains in the finished alloy. By the removal of these oxides the bronze is rendered more fusible and better castings are possible.

Larger additions of phosphorus harden the metal, but at the expense of toughness. The production of various qualities of phosphor bronze depends more upon the proper proportioning of the various ingredients than upon the quantity of phosphorus.

One of the problems which must be contended with by the sales department of a brass foundry is the lack of information about phosphorus, which results in ridiculous specifications, often asking for phosphorus as high as ten per cent. The specification of phosphorus can with safety be left only to the metallurgist, instead of the ordinary brass foundry foreman, who usually relies entirely upon guesswork. Phosphor bronzes should be secured only from companies of reputation, who make a specialty of their manufacture.

High copper alloys, as related to motor car construction, may be divided into four classes:

1—Soft Phosphor Bronze.
2—Hard Phosphor Bronze.
3—Red Brass.
4—Yellow Brass.

Soft bronzes in general are low in phosphorus and high in lead, the former being used solely as a purifying or deoxidizing agent. **This class of bronze can only be considered for bearings, the high percentage of lead reducing the tensile strength of the alloy, so as to make it unsuitable for severe strains.** Under this head may be mentioned one of the standard S.A.E. alloys, 80 copper, 10 tin, 10 lead. This combination is generally used throughout all motor car construction, and present practice among the best makers finds use for the alloy in a number of places.

It is difficult to recommend a particular alloy to render the best service in any part of a motor car without the specific knowledge of conditions covering its use. Before making an intelligent selection it is necessary to know the bearing pressure, character of lubrication and vibration, as well as the nature and quality of the steel which is used in the rotating piece.

Those phosphor bronzes commonly described as hard are generally high in both phosphorus and tin, and low in lead contents. In those cases where the phosphorus contents runs as high as one and one-half per cent. the tin content is necessarily under twelve per cent., or the alloy would be too brittle. The reverse is also the case, and where alloys contain a mixture of approximately 80 copper and 20 tin, the phosphor contents should not be over one-half of one per cent. An alloy of this character is used to withstand heavy pressures and has no place in motor car construction.

Among the high copper-tin bronzes may be classed the gear bronze most generally used in the United States and abroad, being an alloy of 88 or 90 copper, and from 12 to 10 tin. No standard gear bronze has yet been adopted by the Alloys Committee of the S. A. E., owing to a lack of unanimity of opinion as to what is best to recommend. A few prominent manufacturers of bronzes of their own special formula, which in many cases they believe to be superior to a formula of 88-12 or its approximate. **The composition of 90 copper and 10 aluminum has proven one of the most successful gear bronzes on the market, having an average tensile strength of 60,000 lbs. per square inch, and wonderful bearing qualities.** It has not been generally used owing to the difficulties encountered in its manufacture, only one or two makers having solved the problem of producing perfect castings. The alloy of 88 copper, 10 tin, 2 zinc, probably the most prominent of the United States Standard alloys, fills many requirements most satisfactorily, and for all around use is hard to improve on.

Red brass, commonly known as "Composition," contains a maximum of 85-86 per cent. copper. In this way it can be differentiated from the bronze class. Too often red brass is only an excuse for a visit to the scrap pile on the part of mediocre brass foundrymen, where the scrap is selected with varying degrees of care, depending largely on what the customer will stand for. Fortunately, this condition is being remedied, and that type of brass foundrymen eliminated, through the demand by automobile engineers for a brass of uniform color and texture.

One of the standard alloys which has given excellent satisfaction is 85 copper, 5 tin, 5 lead, 5 zinc. This alloy has an excellent color and may be used in motor car construction where severe bearing necessities of great strength is not a requirement.

Yellow brass may be sub-divided into two classes, one being the type of brass used generally for ornament. The other is manganese bronze, in which the percentage of copper and zinc runs close to yellow brass. Its tensile strength and other remarkable properties are brought about through the use of small quantities of iron, manganese, aluminum and tin in varying proportions. Manganese bronze being very generally used either for experimental or permanent construction, should not be passed without a comment.

If it is the intention to use the casting where rigidity is required, the manufacturer should be so advised. By slightly changing the composition of manganese bronze, it is possible to alter its rigidity and consequently its ductility to a marked extent. In specifying manganese bronze castings, it is wise to adhere to established brands, particularly where the work is being done by your own or a local foundryman who perhaps lacks the metallurgical knowledge necessary to produce or judge a good ingot metal. Unscrupulous refiners of scrap metals frequently offer for sale, under the name of manganese bronze, an ingot which would be decidedly out of place in a yellow brass classification.

Manganese bronze may be used for practically all brackets, foot levers, radiator braces, and all external parts requiring strength in the body. This covers the brakes, lugs, levers, hubs, spider, steering yokes, fan pulley, dust covers, plates, brake lugs, windshields, handles, supports, hinges, buttons, latch, foot adjustment, quadrant, and any parts (not bearing parts) which require the strength of high grade steel.

The correct practical solution of the severe bearing requirements on the modern high-speed gasoline engine is of the utmost importance. In designing engine bearings there are two important conditions that must be taken into consideration.

First, the selection of a proper alloy, having the requisite anti-frictional qualities, and secondly, the selection of a metal having the necessary physical properties as regards strength and resilience.

Requirements of Bearing Metal

A soft babbitt may have the antifrictional requirements necessary for gasoline engine service, though owing to its plastic nature its physical properties render it unsuited for the work. On the other hand, a bearing made entirely of steel would have the necessary strength and resilience, but would be anti-frictional. These anti-frictional qualities are so obviously imperative that in nearly every case these have been considered at the expense of the mechanical or physical properties of the bearing. Soft babbitts have been discarded, and for the reason stated, harder babbitts have been substituted; in many cases the die cast bearings have become generally used as crank bearings in some classes of motors.

In the light of the foregoing facts, **it is not a difficult task to design the ideal bearing, for it resolves itself into combining the best anti-frictional qualities with the highest physical strength and resilience.** These qualities have not been found in any one metal or alloy now known.

It therefore becomes necessary to unite these characteristics in a bearing and this is done by adopting the old-fashioned babbitt lined bronze shell of a modified design. For the bearing surface requirements we select a high tin, so-called genuine babbitt, containing about 90 per cent. tin and approximately 5 per cent. each of antimony and copper.

For the necessary physical property we shall select a copper tin bronze having high strength and resilience. The constituents of this bronze should be so proportioned that upon cooling from the molten to the solid state there is no eutectic formed; that is, no small portions of the alloy may have a lower melting point than the greater part of the mass.

Systems for Salesmen Becoming Popular

Methods of Checking Force Engage the Attention of Most Up-to-Date Concerns

SALESMEN'S work systems for recording the doings of all men from day to day are now in far from common use, although they are constantly increasing. The reason is that many companies, especially those selling high-priced cars, do not wish to put the sales force to any unnecessary trouble, since the number of customers is naturally limited on account of the price of the ware. Where a medium or low-priced automobile is being sold, however, exact records must be kept of the work of all men; not so much for controlling the work done by the men, but for the purpose of knowing with whom the company deals. Likewise, the advantage of a work-recording system overcomes such weak sides of the one-man idea as the difficulties growing out of one man's resigning his position with the company. Finally, the increased orderliness in carrying on the business, has an advantageous effect on all employees connected with that end of the concern. Thus, a number of reasons make the use of such a system desirable.

It hardly remains to be said that not only the factory branch profits from systematically executed work, but that the salesman does as well. It is easier for him to oversee his work, to avoid missing an appointment, to follow up the good prospects and drop the others in due course, to economize on his time and temper, and to make more money in a more pleasant way in a shorter time than otherwise. All these advantages should tend to make salesmen favorably disposed toward systematic recording of their work.

The forms used for recording salesmen's doings are as different as the companies are many. In every case sales contracts, card files, daily or weekly sales reports are used. Besides these, reports of the calls made every day are frequent practice.

Special interest attaches to the system of the Ford branch in Long Island City, N. Y., as this company, representing the Ford Motor Company in the Metropolitan district, naturally does a tremendous amount of business. In many respects, this system resembles others already described—see THE AUTOMOBILE, November 21, 1912—but among the forms used are two which are quite original and should prove of interest to dealers of low-priced cars and business men using such cars. These forms are the salesmen's daily report and the dealers' weekly report.

The salesmen's daily report which is made out in duplicate is a blank, printed on thin white paper, 8.5 inches wide by 11 inches deep and printed in black. Besides the company's letter-head design printed on the top and a space for date and salesman's name, the sheet offers room for the recording of six visits, with all the necessary and desirable details. The name, residence, business address, business and telephone number of the prospective customer are recorded; furthermore, there is space for the make of the car—if any—which he owns at present, together with the model number and its value. Besides, the salesman notes on this form, in which model—touring car, runabout or what else—the party seen is interested. The hour at which the visit was made, the date and hour of the next appointment and eventual remarks also find space on this blank. Some of this information, like the hour at which the party was called on, might seem like superfluous records; but they are not. The time at which a man may be expected to be at his office or home is generally the same every day. Another point should be brought up in this connection. The value of the car used by the prospective owner when seen by the salesman is recorded; but the Ford

company does not take any used cars in exchange for cars sold by it; nor does it allow a discount on the price of the new car. This information is put down simply for the purpose of notifying a used-car dealer who is to sell the car for the account of the purchaser of a new car. Outside of this act—which is purely one of assisting the purchaser in a business of his own—the Ford people take no steps to dispose of used cars and the purchase of a car is the same whether it is the first, second or tenth car bought by any given party.

Each salesman's report is made out in duplicate, one copy being held by the salesman and the other going to the office of the company, where the information is transferred to a card file, containing it on cards marked with the names of the prospective owner. There is also a system for the purpose of insuring all dates being kept and prospectives properly followed up.

Besides the salesmen's report, the above mentioned dealers' weekly report is of interest. This report is made out—in duplicate—by every dealer served by the Long Island branch and a copy is mailed to the branch at week end. The purpose is not only to keep the branch informed of the number of cars held in stock by each of its dealers every week, but also of the names of the people who buy Ford cars, furthermore, of the specific cars sold. As Fig. 2 shows, this sheet is designed for the recording of the motor and car number of each automobile sold, the date of sale, the name of the purchaser and his address. Besides, the dealer states whether the buyer is a sub-dealer or the ultimate user of the car. The latter point is for the purpose of obtaining, from the sub-dealer if such buy the car, the name of the ultimate purchaser. Furthermore, when repair parts are demanded by a dealer for a car in his territory, the company may look up its records and find out whether the user is the purchaser to whom the car was originally sold or not. Incidentally, the sheet affords an opportunity of checking a dealer on his territory, that is, of finding out whether he passes over its limits or not. The sheet affords space for entering twelve transactions, and at the right end, there is space for making a record of all cars unsold on hand, with the car and motor numbers, which, of course, must also be sold by the dealer who sends the record, in course of time.

This sheet is 11.5 inches wide and 8.5 inches high. The print is black and the ruling red and blue, the paper thin and greyish white. The company, after receiving this record, files it, having incorporated the names it contains on its owners' list. The records are filed by the names of the dealers, and all records sent in by one dealer in the order of the dates, so that it is easy at any time to find any dealer's record for any week.

These records, of course, facilitate the handling of a large business to a great extent. Of course, to sell a car as cheaply as possible, up-to-date manufacturing facilities are a prime necessity. But an efficient sales scheme is an important requisite. After all, not to create only; as the poet of industry, commerce and activity says; but to work out in detail, finish up and realize the plans which are prepared, in concrete shape, by the factories.

Communications from The Manufacturer

Manager of Abbott Motor Company Does Not Believe in New York and Chicago Shows

DETROIT, MICH.—Editor THE AUTOMOBILE:—That the annual automobile shows as now conducted, especially the New York and Chicago events, have lived their day and fulfilled their original purpose, is the absolute conviction of the majority of automobile manufacturers. Until the past few weeks few people with authority and influence have felt free to publicly express their views on what heretofore has been considered a delicate subject. The promoters of these shows have been very anxious to suppress anything that has been set afloat that would have a tendency to cause any indifference or unfavorable action on the subject. However, the day has fully arrived when manufacturers are declaring without reservation that the usefulness of these events has already ceased and that they are no longer willing to give their influence and support to this economic waste. It is a well established and accepted rule of political economy, based upon good common-sense, that when a thing has fulfilled the purpose of its existence and become useless, it should at once die a natural and honored death, and give way, if conditions so dictate, to something else. This applies to automobile shows.

The necessity of these events has ceased to be a fact. During the earlier days when the industry required all the encouragement and assistance that could be given it, they were unquestionably a good thing, but the public attitude has changed and the day of educational campaigns to teach people the utility and importance of the motor car has ceased. There is now little more logic in holding these periodical exhibitions than would justify a similar display of railway coaches and street cars.

A few years ago we had "shows" in a very acceptable sense of the term, but not so any longer. Then the new models were not made known until they were displayed at the New York show, but now practically all manufacturers are announcing their respective lines not later than August, and many have ceased to make these announcements altogether. Anybody with any degree of interest now attending these shows, well knows just what he will see. The models shown are for the most part those which have been on the streets from 6 to 8 months.

After as careful analysis of trade conditions as possible, I have been unable to discover any real demand for the annual show. The situation seems to be that while the majority of manufacturers have had their own private convictions in the matter, each has disliked to be the first to take a definite step, not knowing for a certainty in just what light their position might be regarded. Few, if any, of these manufacturers feel that the returns are commensurate with the enormous expenditure intailed and the wisdom of continuing the practice is strongly questioned. Floor space is charged for at extortionate rates and the numerous other expenses incurred amount to a small fortune for each fair sized show. The millions of dollars poured into New York, Chicago and the many other places, is of necessity almost entirely borne by the automobile industry. It has been pointed out by Col. Albert J. Pope, president of the Pope Manufacturing Company, that 60 per cent. of the gate receipts at the Madison Square Garden in 1912 were paid by the industry and that the percentage was even greater at the last show. Besides, these tickets not only pay the rent and decorations but a large percentage of the patronage as well.

Col. Pope also calls attention to the disorganization of the factory and sales departments and business in general during the weeks of the shows, and declares that it is a serious subject that will have to be reckoned with in the near future by the automobile industry. Objection is again made to squelching by the newspapers for large spreads of advertising, which if used at more logical times would bring incomparably greater returns.

The automobile manufacturers are greatly indebted to Col. Pope in taking the lead in the more improved conditions as regards this matter of the shows. The industry cannot afford to incur such expense as are incident to the part participation in such shows as are held at New York and Chicago. The public realizes with a fair degree of accuracy what an enormous amount of money is intailed in this expenditure, and the industry is being criticised severely by sound business men on the outside as a result of this apparent economic waste; and further, that if the industry can afford a performance of this kind as a result of the net return to the business in general the funds so appropriated should be retained by the industry and the buying public given the benefit of same in reduced prices of the product.

It is my firm belief that the time has come when the industry can abolish the matter of automobile shows in New York and Chicago in the winter time without suffering anything in the way of reduction in the total amount of automobile business done in the country. If in the opinion of all manufacturers an automobile show should be held it should be held in the summer season at about the time the manufacturers introduce their new models and hold just one show, and that at some point outside of both New York and Chicago, preferably Detroit.—M. J. HAMMERS, Abbott Motor Company.

Leaky Exhaust Manifold—New Bushings Around Valve Stems—Believes in Right Drive—Putting Gasoline Tank Under Cowl—Changing to Demountable Rims—Reduction of Drive Through Friction Disks—Portable Racks for Wagons

Leak Around Exhaust Manifold

EDITOR THE AUTOMOBILE:—I have a motor that leaks around the point where the exhaust pipe joins the cylinder. I have tried to fix this but it remains in spite of anything I do. I attempted to caulk the leak with asbestos packing but was unsuccessful. What is the cause of a leak of this nature and how may it be stopped?

Allentown, Pa. WILSON PETERHOFF.

It will sometimes happen that the stirrup which holds the manifold to the cylinder will become warped and allow the gases to escape from around the juncture of the manifold and the cylinder. The point at which the warping takes place is that shown in exaggerated form in Fig. 1. This can be remedied by applying a new stirrup.

If the stirrup is not warped or the manifold is not applied in this manner a new gasket should readily stop further leaks. Secure a sheet of gasket paper of the correct size from any accessory dealer and lay it over the joint to which the gasket is to be fitted as in Fig. 2. Gently tap around the gasket with a hammer. The rim of the opening to be fitted will leave a mark on the gasket. By the aid of this the gasket can be cut with a sharp chisel or knife as in Fig. 3. The finished gasket should then be placed in position and the parts replaced. The finished job should have an even appearance all around. The gasket when properly fitted against a smooth surface will not permit any escape of gases at the joint.

It is impossible to caulk a leak of this kind. In fact it is dangerous as it would be very easy to spoil the motor by forcing some foreign matter into the cylinders which could get caught between the piston and the cylinder wall and score the latter. A warped stirrup is a rare occurrence and shows bad work.

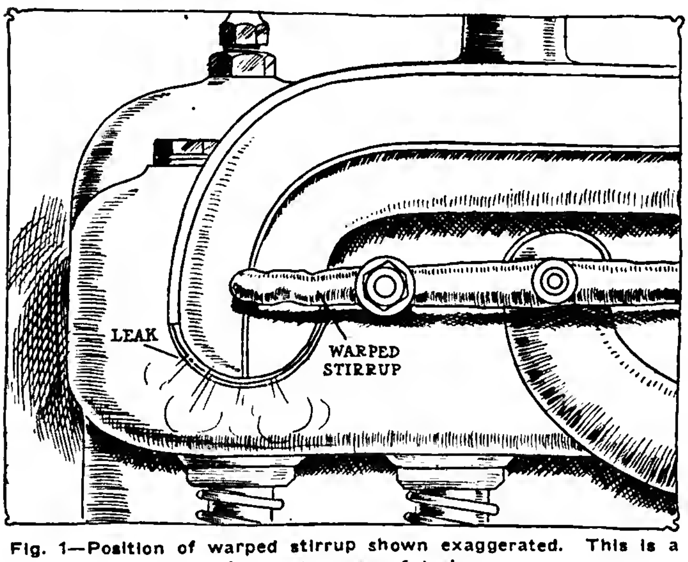

Fig. 1—Position of warped stirrup shown exaggerated. This is a frequent cause of leak

Rebushing Valve Guides

Editor THE AUTOMOBILE:—1—Would it be good or bad practice to bush the worn exhaust valve stem guides, of any standard motor, with brass or bronze bushings? Is there any material that would be better for this purpose?

2—What is the process of making malleable iron castings?

3—What is the distinction between gasoline and benzine?

Dixfield, Maine. T. P. H.

—1—Rebushing with bronze would be good practice and would be more satisfactory than anything else.

2—The process of making malleable iron may be summarized as follows: The proper cast irons are melted in either the crucible, the air furnace, the open-hearth furnace, or the cupola. The metal when cast into the sand molds must chill white or not more than just a little mottled. After removing the sand, they are packed in iron scale or other materials containing iron oxide and subjected to a red heat (1250 to 1350 degrees Fahrenheit) for over 60 hours. They are then cooled slowly, cleaned from scale, chipped or ground, and straightened.

When hard, or just from the sand, the composition of the iron should be about as follows: Si, from 0.35 to 1.00, depending upon the thickness and the purpose the casting is to be used for; P not over 0.225, Mn not over 0.20, S not over 0.05. The total carbon can be from 2.75 upward, 4.15 being about the highest that can be carried. The lower the carbon the stronger the casting consequently. Below 2.75 there is apt to be trouble in the anneal, the black-heart structure may not appear, and the castings remain weak. A casting 1 inch thick would necessitate silicon at 0.35, and the use of chills in the mold in addition, to get the iron white. For a casting .5 inch thick Si about 0.60 is the proper limit, except where there is danger of getting heavily-mottled if not gray iron from the sand molds, and this material, when annealed the long time required for the white castings, would be ruined. For every thin casting Si can run up to 1.00 and still leave the metal white in fracture.

3—There is no definite distinction between benzine and gasoline as far as the oil trade is concerned. If you asked a company to quote you on benzine, they would quote you on gasoline. Four or five years ago gasoline was anything above 70 gravity. Now it is anything above 60. What gasoline is, is fixed by the demand for it and the state of the trade. Very often benzine is taken to mean gasoline in the raw state. That is, before it has gone through the final refining process.

Protests Against Left Drive

Editor THE AUTOMOBILE:—I contend that the left-hand steer is not in accord with true mechanical skill. To illustrate, if a person running an automobile sees a large one coming towards him from the opposite direction and he wishes to avoid all chances of an accident he should be on the right-hand side so as to see how near he can run to the gutter and not enter it; that takes care of the automobile that is approaching him. Again, if you wish to pass an automobile going the same way you should be on the right side of your automobile so as to see how near you are going to the vehicle you are to pass, as the law says you must pass all vehicles on their left. That takes care of the vehicles going the same way you are.

I am well aware that in some cities there is a rule that all automobiles shall stop on the right side of the street; in that case it would, if you were in a runabout, oblige your companion to walk the immense distance of around the back of your automobile in order to reach the sidewalk. Those in favor of the left-hand drive continually harp on the trouble it puts your companion to in having to get out in the mud, as though it was always muddy, when the fact is there is not a muddy day more than one in four, and many people will not run their automobile when it is muddy, and if your car is a touring car that argument has no weight. I think the left-hand drive is a fad and the quicker it is abolished the better for the autoist.

Lynn, Mass. JOHN S. WRIGHT.

Changing Tank Location

Editor THE AUTOMOBILE:—Is it feasible to change the gasoline tank from under the front seat to one like the Henderson car has on the dash, new tank and cowl being made, of course. Will the difference in pressure (gravity) make any difference?

Hasbrouck Heights, N. J. A SUBSCRIBER.

—It is very feasible to do this as there will be no difference at all but in the arrangement of the piping except insofar as the shape of the cowl and the tank are concerned. Any sheet metal worker will do this work for you or it would be possible to do it yourself if you have had any experience in this line. The difference in pressure due to the greater head of the gasoline will make no change in the operation of the carbureter. The float feed device on the carbureter is so designed that it takes care of the supply of gasoline furnished to the spray nozzle regardless of what the pressure on the gasoline may be.

Changing to Demountables

Editor THE AUTOMOBILE:—I have a Mitchell car with Q. D. 34 by 3.5 wheels which I wish to change to demountable rims. Please advise where I can have change made and what type rim you would recommend.

Lewisburg, W. Va. W. D. SLAVEN.

—Any standard rim company will make this change for you at a cost of about $15 for the labor and whatever the price of the rim may be. It is necessary to cut off the spokes about an inch in the average case of making such a change and it is for this that the above amount is charged. The felloe necessary with the demountable type of rim is thicker than that used with the clincher or Q. D. and therefore the change will have to be made. Any good type of demountable rim will be satisfactory.

Ignition of Overland Car

Editor THE AUTOMOBILE:—Would you please explain by a diagram the ignition system used on my Overland model 69?

Brooklyn, N. Y. T. E. D.

—The dry cells for starting are connected in series as shown in the wiring diagram, Fig. 4. These operate through a non-vibrating coil and form one part of the dual system. The high-tension magneto forms the other part. The wiring is as shown in the illustration.

Mathematics of Friction Drive

Editor THE AUTOMOBILE:—I am very much interested in the friction drive for automobiles. As a speed-changing device I consider it ideal. However, there are a few points I don't understand and will thank you very much if you can clear them up for me and no doubt other subscribers will find it interesting also.

Let us take the Cartercar, for example: Suppose the driven wheel is at the outside of the driving disc and that the surface here is, say, 6000 feet per minute. Evidently the most power can be got from the friction at this point. But if we attempt to drive up a steep hill we have got to move the driving wheel in towards the center of the disc. Just when we need the most power is when we have the least as the surface speed is a great deal less as we move in. How is it possible to go up a 50 per cent. grade, as they say in the last issue of THE AUTOMOBILE. I would like to see this figured out mathematically.

Streator, Ill. JOHN DUNN.

—Theoretically the same amount of energy is available at any point on the face of the driving wheel of a friction drive. If all the energy available could be transmitted through the medium of the friction drive this would then be practically true also. As it is the efficiency of the drive varies for different reductions and the practical result only approaches the theoretical. With this in mind the explanation will be simple.

Power is the rate of applied energy. A small amount of energy applied rapidly may develop the same power in foot-pounds per minute as a large amount of energy delivered slowly. A horsepower is 33,000 foot-pounds per minute. The shaft turning over the friction wheel contains so many foot-pounds per minute of power. It delivers all of that to the friction wheel. At any point on the wheel therefore the foot-pounds per minute are the same. Since the linear feet per minute travel of the wheel is greater at the rim than near the center and the foot-pounds are the same, the pounds delivered must be less per minute. Because the foot-pounds are the product of the pounds and the distance moved through in feet. Therefore in moving the vehicle a less number of feet per minute, or in moving the friction wheel a less number of feet per minute, a greater number of pounds resistance can be overcome for the same number of foot-pounds. We secure a wheel which is moving more slowly at a given number of revolutions per minute when we lessen its diameter.

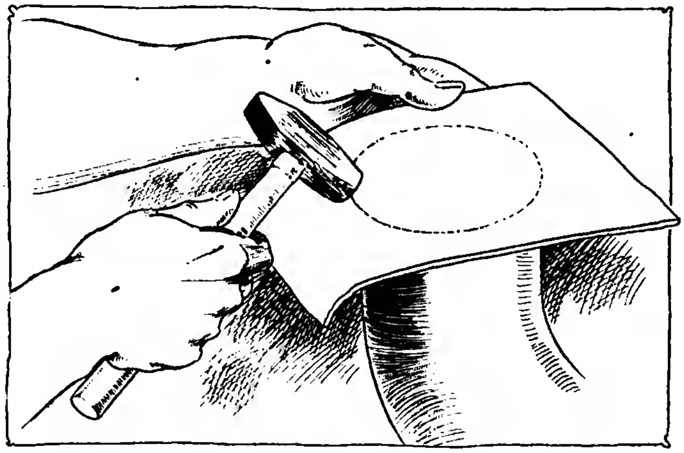

Fig. 2—Outlining the point at which to cut the gasket

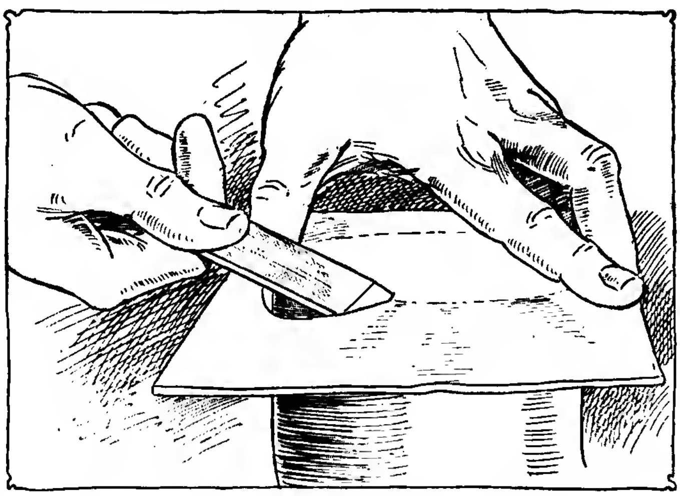

Fig. 3—Method of cutting thin gasket with sharp chisel

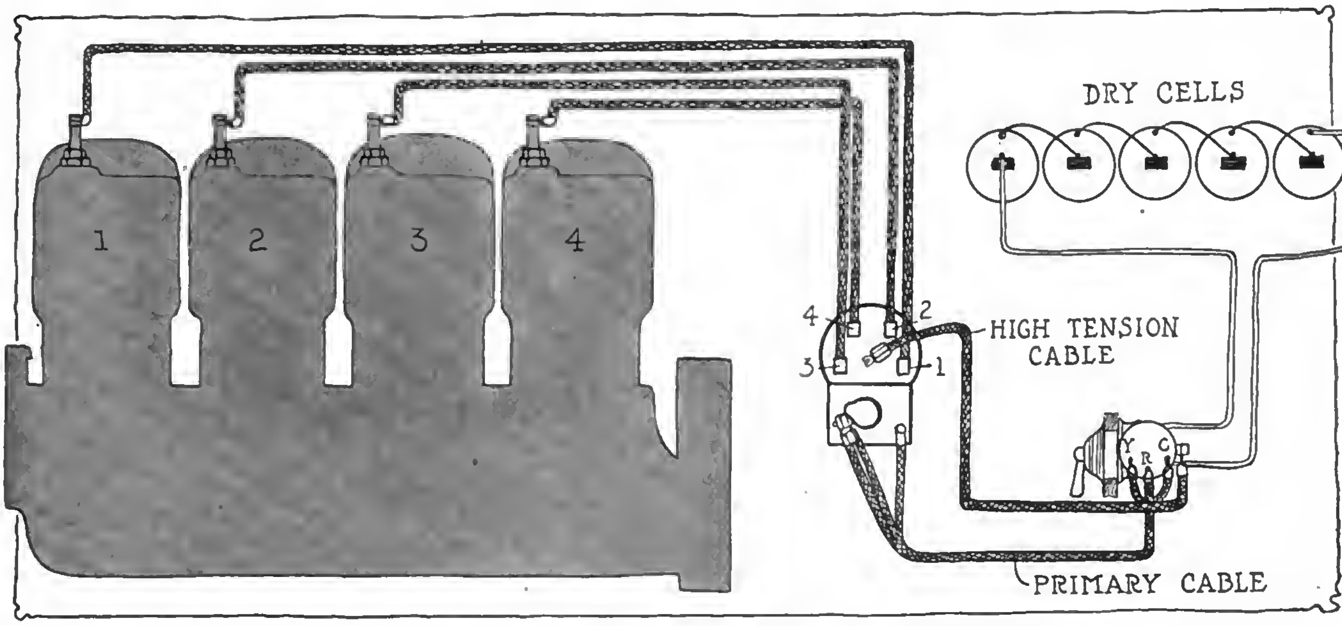

Fig. 4—Wiring diagram of four-cylinder motor using dual system, showing arrangement of batteries, switch, magneto and spark plug

The equation is as follows:

Foot-pounds per minute = pounds × feet per minute.

Therefore in a concrete example 100 foot-pounds per minute may be 10 pounds at 10 feet per minute or 1 pound at 100 feet per minute.

Racks Used on Grocery Trucks

Editor The Automobile:—I am interested in a grocery business which is using two 1-ton trucks for delivering and contemplates the installation of three more.

We have been trying to figure out a practical rack which can be rolled into the trucks after being loaded with groceries and rolled out again when empty. In this way the trucks would not have to remain long at the platform for loading and could be kept running the greater part of the day.

The trouble has been that we want a rack with several shelves for rush days and want to remove the shelves when the loads are light.

Cleveland, O. N. C. Groeh.

—The easiest way to solve your problem would be to equip a small truck, which fits into the body of your truck, with a series of superimposed shelves and to roll the whole business into the truck as soon as the latter draws up in front of the loading platform. The obvious detriment of this system is that two small trucks are needed for every big truck, one being used on the truck while the other is being loaded so as to be ready when the big truck arrives.

A more economic solution is proposed in the illustrations, Figs. 5, 6 and 7. The first illustration shows a closed body, seen from the rear, the side walls of which are fitted with horizontal runways which extend all along the sides of the body. In the illustration three runways are provided and the floor of the truck body providing another runway, there is a possibility of placing four shelves in the truck. Of course, if there is no need for this number, one, two or three shelves may be used. Since, when the load is carried on roller-supported shelves, the load is carried to quite some extent by the vertical uprights which form the edges of the truck-body walls, it stands to reason that these uprights as well as the runways must be of steel and the whole system braced properly so as to be strong enough at every point. Of course, the back of the loading space is provided with a door of optional construction, and it would seem that the two-section type of door, half of which is turned upward and the other dropped, would have many advantages for grocery work.

Fig. 6 shows the small truck which is needed for transferring the roller shelve from the room where they are loaded with the parcels to be delivered to the automobile. This truck, as Fig. 6 indicates, consists simply of a platform and two sidewalks constructed with similar runways as the big truck so that the shelves carrying the goods may be placed on these runways. The spac-

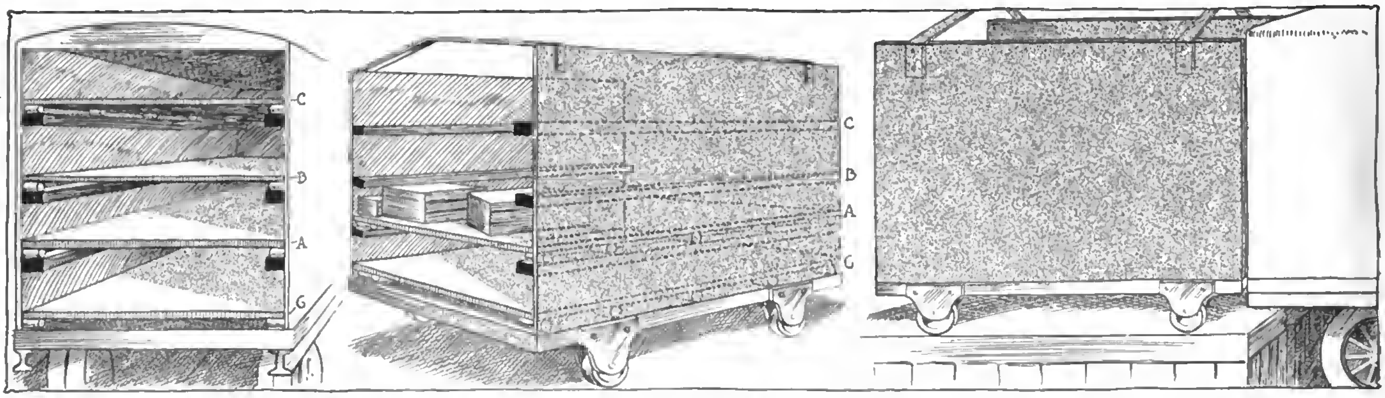

Fig. 5—Rear view of truck designed to take in shelves rolling on runways fitted to the side walls of the body. Fig. 6—Loading truck which supports the shelves carrying goods before they are rolled on to the freight automobile. Fig. 7—Schematic view of delivery wagon, loading truck and inclined platform for driving the latter up to the former. The letters on the runways shown on the automobile truck and those on the loading truck correspond with respect to the alignment seen in Fig. 7 which permits of simple transfer to the loaded platforms from the runways of the small truck to those of the automobile. If the level of the loading platform is not on just such a height as to provide perfect alignment of the runways, an incline plane and additional platform, not shown here, must be used for obtaining this alignment.

ing of the latter on the small truck is likewise the same as on the big one. Of course, the small truck must be of sturdy construction, with steel uprights, runways and overhead braces, if posssible. The best thing to do would be to order the steel body for the small truck to be made by one of the steel-shelf manufacturers, whose products were described in THE AUTOMOBILE of June 27, 1912. The running gear, that is, the wheels could be fitted in any suitable way, by means of casters held in hangers as shown by four small trucks which may be secured to the under side of the truck platform. If the big truck has a loading platform more than 7 feet long it may be necessary to put two shelves on each runway level.

To complete the equipment, the loading platform against which the automobiles abut for loading must be of such a height that the first, second, etc., runways of the small and big trucks correspond. If this is the case, loading may be done in the loading department of the store by a boy, according to standardized rules, all the roller shelves being kept on racks. Shortly before the return of a truck is expected the boy transfers the shelves from the rack to the small truck and the latter is brought near the door, ready to be unloaded to the big truck as soon as the latter arrives. Then the small truck is driven up against the big one and the loaded shelves transferred from one to the other. It is possible, by this process, to accomplish in 3 minutes what otherwise takes perhaps 30. Of course, the loading of the shelves in the loading department must be carried out according to well-proved rules so as to make speedy unloading easy.

Suggests New Spring Suspension

Editor THE AUTOMOBILE:—You will see in Fig. 6 inclosed blueprint of a spring suspension. The object of it is to overcome the boosting of car body by allowing the end springs to oscillate. What do you think of it?

Regarding side strains I do not think there would be any more side strain on the middle spring than on the hangers of the end springs. I do not see how this type of spring could be subject to any more strain than the platform or full elliptic spring; the rods could be set at an angle so as to take most of the side strain.

I believe this form of spring would have more shock-absorbing qualities than the platform or elliptic spring. The wheel upon striking a "bump" would cause the end spring to rock, the shock being taken up by the rocker and half of center spring and doing away with the jolt of the body.

There are cars using a straight spring pivoted in the center and fastened to the frame at the pivot and inner end, the outer end being fastened to the axle. Such a type is used on the King car and would be subject to as much side strain as the spring in question.

Flint, Mich. E. M. MORLEY.

—The opinion of our readers is invited on devices suggested in these columns. The idea is to provoke a discussion of general interest and at the same time to encourage ideas brought out by those who may not be regularly employed in the business.

Foreign Rating Formulae

Editor THE AUTOMOBILE:—I noticed the A. L. A. M. rating for horsepower in one of the last numbers. Can you tell me the European method of rating?

Marquette, Mich. A. A. YOUNG.

—There are several methods in use for rating the horsepower. This is due to the fact that the taxation on the manufacturer is based on the bore in some countries and on the horsepower in others. This condition leads to a preponderance of the long-stroke motor in the countries where the tax is by bore. In Germany the formula in common use is:

$$\text{Horsepower} = .3\,N\,D^2\,L.$$

In England the formula used for some time was the same as ours:

$$\text{Horsepower} = \frac{D^2N}{2.5}$$

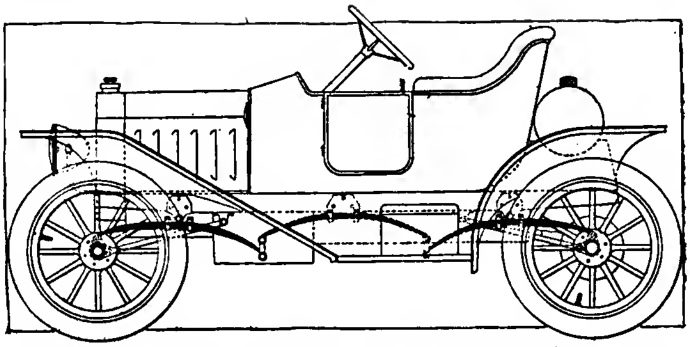

Fig. 8—Novel spring suspension suggested for comfort in driving

They have now evolved a formula which brings in the stroke factor more fully, that is:

$$\text{Horsepower} = .464\,N\,(D + L)\,(D - 1.18).$$

In France they are beginning to use a formula which brings in the most efficient speed of the motor. They are somewhat up in the air at present, however, owing to the fact that they are trying to find a good fiscal formula which will serve the purpose of taxation. The French believe in a different formula for different classes of vehicles. For touring cars of the ordinary type the following formula is used:

$$\text{Horsepower} = \frac{N\,D^2\,L\,S}{2 \times 10^6}$$

For high-speed touring cars the formula is:

$$\text{Horsepower} = \frac{N\,D^2\,L\,S}{1.9 \times 10^6}$$

For commercial vehicles the formula is still further modified to:

$$\text{Horsepower} = \frac{N\,D^2\,L\,S}{1.8 \times 10^6}$$

In all of the above formulæ, D = the diameter of bore of the cylinder, N = the number of cylinders, L the length of the stroke and S the speed of the piston at the highest efficiency.

Tincher Car No Longer Made

Editor THE AUTOMOBILE:—I am interested in the Tincher car and would like to know if they are still made.

Sheffield, Mass. GEORGE BRIGGS.

—THE AUTOMOBILE has no record of the Tincher car after 1910. Perhaps some of our readers can give you further information.

Saving the Seconds

THE proverbial "Save the pennies and the dollars will take care of themselves" should be rewritten for the owner of motor commercial vehicles as "Save the minutes and the hours will take care of themselves."

The minutes must be saved in motor truck operation and if the systems under which the vehicles are operating take recognition of the minutes it is a positive assurance that hours per week will be added to the length of time the truck is moving. The very fact that the transportation engineer has looked after the economy of minutes in loading and unloading the truck; the very fact that the minutes have been taken into consideration in the design of the body with a view to lessening delays; the very fact that minutes have been a prime consideration in the design of the loading or unloading platforms; the very fact that time has been a basic consideration in the drafting of the internal system of the factory, warehouse or mercantile establishment; and the fact that minutes have not been overlooked in manning the truck are all *prima facie* evidences that the transportation engineer has grasped the big problem in individual transportation and is an assurance that the truck will not be standing idle 30 or 45 per cent. of its time and, in the words of the horseman, "eating its head off in the stable, when rents are high and provender is dear." The truck destroys its usefulness when it is standing idle at the loading or unloading platform.

The show which closed last week at the Chicago Coliseum demonstrated that the buyer of today is as much interested in the type of body he is going to fit to his truck as in a great many chassis details. In a word, some of the newest truck body creations are features, carefully planned and worked out, combining not a few details indispensable to the particular industry in which the truck must operate. Thus, for example, although there may be fifty different coal operating concerns in New York City, yet these fifty cannot use the one design of dumping coal body but may require ten to twenty different designs, according to the conditions each operator has to meet. One concern loads from overhead hoppers and calls for a particular type of dump body which may be low and wide; another concern with cross-sidewalk deliveries must utilize an elevating dump body; then again, a Chicago house making deliveries into alleys finds it impossible to use the rear end dump and has to introduce the revolving dump body which permits of turning the body through an angle of 90 degrees and then dumping it to the side; still another operator in the Windy City discovers that he cannot load from overhead hoppers but must shovel the coal into the wagon and to make a truck efficient under such an exigency he has to have some form of demountable body, perhaps made in one or two detachable parts, so that the only loss of time experienced is that consumed while removing or replacing the demountable compartments; a third coal operator requires a compartment body which is not demountable, but one containing 3, 5 or 7 tons with a similar number of compartments and each compartment fitted with its individual unloading means to economize in time; and a score or more of similar examples could be cited to show the necessity for versatility in body design, a versatility made imperative by the varying conditions to be met by the many concerns. The fact that operator No. 1 uses a rear dump body is not the slightest reason why operator No. 2 should use a similar type simply because he does business in the same city and in a contiguous territory. If truck operators are going to economize time by loading and unloading means adapted to their respective businesses then they must design bodies to meet their special requirements. The transportation engineer is the man to determine the body requirements and his investigation must be thorough and not based on mere hearsay. The ultimate success of the motor truck installation is largely dependent on the features of body design and the reconciling of terminal facilities to these requirements.

The motor truck buyer must keep before him always the body situation and must be conscious of the fact that the selection of what he considers a satisfactory chassis is but a part of the problem he has to handle. He must not imagine that because he has used a certain design of body on his horse vehicles that these have simply to be duplicated for his motor vehicles. Such a course may be motor transportation suicide. The motor truck is a new order of things, demanding new methods, new constructions and scientific conduct of loading and unloading operations. The transportation engineer must realize that mere substitution of motor power for horse equipment is not enough and more than mere experience could be considered a satisfactory reference for an applicant for an important position.

Present Location of American Freight Cars

Report of the American Railway Association Shows There Are 2,308,700 Cars in the Country

There Is a Shortage of 825 Cars in the Group of Greatest Automobile Producing States

In view of the great annoyance to which the automobile industry was put during the last shipping season on account of the great shortage in the West of freight cars which could handle the business of delivering automobiles, the present situation is of interest.

The American Railway Association has just compiled its report showing the present location of the freight cars throughout the United States. This report is condensed in the table given below. From this tabulation it is possible to note the condition of shipping facilities throughout America.

An explanation of the table may be of value in order that the reader may readily follow the status of freight car affairs as applied to the automobile industry:

Number of Roads Reporting—This column refers to the number of railroad lines which have sent data to the association for the compilation of the table. It includes every line of importance in the country.

Total Cars Owned—The total number of freight cars owned by the lines reporting.

Home Cars on Home Roads—The number of cars out of the total cars owned given above, which are on the lines of the roads reporting in that particular district.

Foreign Cars on Home Roads—The total number of cars of other lines which are at present on the territories of the home cars.

Total Cars on Line—The summation of the home cars on the home roads and the foreign cars on the home roads.

Excess or Deficiency—The excess is given in light type and the deficiency in heavy type. The excess cars are those standing idle. These are the cars in excess of those required and for which there is no use. The deficiency is the number of cars required above the number available for business of any kind.

Surplus—The number of cars of special types above those required for the specific purposes for which the cars were designed.

Shortage—The number of cars of a special type below those required for the specific purposes for which the cars were designed.

Home Cars in Home Shops—The number of freight cars being repaired in shops of the line by which they are owned.

Foreign Cars in Home Shops—Cars repaired belonging to outside lines.

Total Cars in Shop—A summation of foreign and home cars in the shops.

Per Cent. to Total Cars Owned—Under this general head the foregoing quantities are reduced to a percentage basis.

Group 3, comprising Ohio, Indiana and Michigan and group 6, including Iowa, Illinois, Wisconsin and Minnesota, are of special interest to the automobile industry. It will be seen that group 3, which includes Michigan and Indiana, the greatest of the automobile shipping states, suffers from a shortage at the present time of 825 cars. This, while not promising in view of the fact that the trend of the cars is away from Michigan at present, is not so bad as last year. Group 6 has an excess of over 17,000.

Middle West Has Prosperous Year

St Louis, Mo., Feb. 12—According to a monthly statement issued by the Merchants-Laclede National Bank, of this city, Tuesday, February 11, thousands of the farmers in the territory tributary to this city have become the owners of automobiles as a result of the profits coming to them from their recently marketed crops. What is more to the point the report shows that the farmers who have purchased cars have been able to pay for them.

This situation is contrasted in the report with that prevailing a few years back, when farmers from the same community were compelled to borrow money to buy their cars. "The machines which they have purchased recently," the report says, "are not expensive makes, but they represent excellent investments."

Stroke-Bore Ratio Affects Efficiency

Defining the Term Long-Stroke—High Rotative and Reciprocating Speeds Prohibitive for Practical Reasons—Foreign Engineers Discuss Problem

From Paper Read before the S. A. E. by John H. Wilkinson

IN the earlier days of the automobile industry the ratio of the stroke to bore of a gasoline engine was not a much argued question. Engines of equal stroke and bore were quite common, as well as engines with longer strokes; among the latter, as I remember it, the 4 1-4-inch by 5 1-4-inch engine was very common. Later the square motor became well-nigh universal both in this country and abroad.

It was at this time that the horsepower formula

$$\text{Horsepower} = \frac{D^2N}{2.5}$$

came into general use, being adopted first by the Royal Automobile Club of Great Britain and later by the Mechanical Branch of the Association of Licensed Automobile Manufacturers. **This formula was meant only as a working one relative to the almost universal practice of equal bore and stroke.** As such it served its purpose well, but today is out-of-date because the practice has changed somewhat. Three or 4 years ago the so-called long-stroke motor began to come into use abroad. Its use in England was first stimulated by a 4-inch race in 1908, in which the size of the engine was limited to a 4-inch bore, stroke not being limited. As the power of a motor can be increased by increasing its size in the direction of stroke as well as bore, this naturally led to the building of motors with strokes of more or less extreme length.

Bore Affects English Tax

Another strong incentive for small-bore long-stroke engines is the English annual inland revenue tax based on horsepower by the formula. This tax is pretty high as can be seen by the following table:

	£	s		£	s
6½ horsepower	2	2	33 horsepower	8	8
12 "	3	3	40 "	10	10
16 "	4	4	60 "	21	
			Exceeding 60 "	42	

Still another incentive is that the power classifications for speed and hill-climbing contests all favor the long-stroke motor.

In this country our speed contests are based as far as power is concerned on the volumetric displacement, a classification which I hope to show to be correct scientificially and practically. We have, then, in this country, no good reason for the adoption of any stroke-bore ratio other than that which can be shown to best meet our conditions. It is manifestly improper to classify all motors of even stroke and bore as short-stroke and all others as long-stroke.

If we take as the limits the ratios 1 and 2 and divide these into three classes we will have:

Short stroke	1. to 1.33	ratio
Medium stroke	1.33 to 1.66	"
Long stroke	1.66 to 2	"

This would be a reasonable classification for the sake of definition. Most American motors are in the first or short-stroke class.

Theory teaches us that rotative and piston speeds are limited ultimately by the strength of materials. Practice has taught us that with our present knowledge they are limited by other conditions also, such as lubrication, piston cooling and valve cooling; and that these limits are well within those set by the strength of materials.

To illustrate this point select a 4-inch bore by 5-inch stroke engine and take the explosion pressure at 325 pounds. The total pressure on the piston connecting-rod and bearings will then be 4082 pounds. It is a fair assumption that the connecting-rod must necessarily be strong enough to withstand this load. Now to find the revolutions such that the inertia of the piston equals 4082 pounds we resort to the formula

$$F = .00017\ W N^2 S$$

where F = Stress set up by piston
W = weight of piston = 3 pounds
N = R.P.M.

$$S = \text{Stroke in feet} = \frac{5}{12}$$

Reducing we have

$$N = 4500 \text{ R.P.M.}$$

I think that no one will contend that 4500 revolutions per minute would be a practical rotative speed for a 4-inch by 5-inch engine.

In this country today the practical maximum number of revolutions varies perhaps from about 1600 to 2000 according to the size of engine. For commercial car uses the tendency in maximum revolutions per minute seems to be still more conservative.

Before studying the question in preparation for this paper it had always been the belief of the writer that the long-stroke motor could not properly be run at as high a rotative speed as the short-stroke motor. This, I think has been the general opinion and was the view of the horsepower formula committee mentioned later. However, I have not been able to find any scientific or practical reasons supporting this view and **will attempt to explain later the reasons which seem conclusive to me why long-stroke motors may be run as fast rotatively as short-stroke motors of equal displacement.**

Committee Made Extensive Tests

As relating to this question I show some of the curves and tables of the horsepower formula committee representing the Institute of Automobile Engineers, the Royal Automobile Club and the Society of Motor Manufacturers and Traders. This was a very formidable committee, but its conclusions have been very severely criticised in many quarters. It made tests of 144 engines, 101 of which tests contain all the data required for comparing the effect of stroke-bore ratio in piston speed for values of R or ratio from 1 to 1.61.

CHANGE OF PISTON SPEED WITH VARIATION OF STROKE BORE RATIO R=S/D HIGHEST RECORDED B.H.P.

Number of tests	Stroke bore ratio	Piston speed at max. B.H.P.
15	1.00 to 1.08	1,303 ft. per min.
30	1.10 to 1.20	1,240 " " "
24	1.21 to 1.30	1,385 " " "
25	1.33 to 1.44	1,414 " " "
7	1.50 to 1.61	1,597 " " "
101 engine tests		

The formula deduced by the committee is:

$$\text{Piston speed } \sigma = 600\ (r + 1)$$

Such widely varying results do not seem to me to be an accurate basis of arriving at the proper comparative piston speeds of engine. No attempt was made to show that the conclusion is scientifically or reasonably correct. This is like trying to prove a scientific fact by popular vote. There must be some accurate way of making a proper comparison of piston speeds inasmuch as there are no unknown elements to be considered.

In order to discuss more clearly this and other questions pertaining to the paper, let us compare two engines of equal displacement but of varying stroke-bore ratios. I have selected a

4.5 x 4.5-inch stroke-bore ratio 1
and 3.57 x 7.14-inch stroke-bore ratio 2

Let us assume an equal rotary speed for both, and compare them as to vibration, noise, power, life, control, weight, cost and cooling. The engines, having the same displacement, are practically the same weight. The crankshafts, bearings, etc., can undoubtedly be made of correct size and strength; therefore, unless we find a wide divergence in the forces set up by inertia of the moving parts, we will not find a strong reason why one engine can be run faster rotatively than the other.

Vibration in a four-cylinder engine is caused by varying torque noticeable almost entirely at low speeds, lack of running balance of rotating parts, the effects of which increase rapidly with the speed and which are on the average a very noticeable form of vibration, the unbalanced inertia of the pistons due to angularity of the connecting-rods, and other vibrations due to lack of rigidity in crankshaft, etc.

The vibration due to angularity of the connecting-rods is the only one having a special relation to piston speed, and in high-class engines is the one most apparent. As it increases according to the square of the speed, it is most noticeable at high speed.

$F = .00017\,N^2WS$ — represents the force set up by inertia in each cylinder; as N is equal in both engines, the comparative vibration due to above-mentioned cause will be proportional to WS or the stroke × the weight of the piston, the piston pin and the upper half of the connecting-rod. So the engine in which WS is the smallest quantity will have the least vibration. Proper comparison of weights involves similar designs and purposes. In our practice we use pistons as follows:

4½ inches = 5.00 pounds
3⅝ inches = 2.625 "
3⅜ inches = 2.375 "

From these figures it would evidently be fair to take a 3.54-inch piston as weighing 2.5 pounds. **Theoretically pistons should weigh according to the cube of the bore and would do so if made of steel and machined inside and out.** Practically, using cast-iron pistons, the larger would be a little lighter than the proportional figures.

Piston Speed a Big Factor

The cubes of the bore of these two engines are to each other as 48.8 to 100; the practical weights, 2.5 pounds and 5 pounds are to each other as 50 to 100. It therefore seems that 2.5 and 5 must be substantially correct proportional weights. Our 4 1-2 x 4 1-2 rods 9 inches long weigh on the piston-pin end 1.25 pounds. A similar 3.57 x 7.14 rod 14 inches long should weigh on same end 1.5 pounds; therefore

$$W = 5 + 1.25 = 6.25$$
$$W' = 2.5 + 1.5 = 4$$
$$W\,S = 6.25 \times 4.5 = 28.12$$
$$W'\,S' = 4 \times 7.14 = 28.56$$

These figures are so near alike that we must assume the vibration in the two motors to be practically the same and that there is no basis for the belief that a long-stroke engine is a slow-speed engine on this account.

Now is there any reason to be found why the long-stroke engine canot be run as fast as the short-stroke? About the only other point to be considered in this connection is the friction between the piston and the cylinder. This is a function of the pressure and the stroke × the coefficient of friction, which gives the same result in both. We have then two mechanical machines in which the inertia of the moving parts sets up strains and vibrations of the same intensity and duration and which are resisted and absorbed by structures of equal weight and strength and in which the friction caused by such movement is the same.

The question of relative proper speeds is very important in connection with a proper discussion of the question. If it were conceded that of necessity either style of engine is essentially a slow-speed engine and could not be run so fast as the other, this in itself would show immediately an advantage of the one of higher speed capabilities; it would not show in any way that the high-speed motor was not just as good at low-speed work.

If we take the ordinary view of the question that the long-stroke engine must of necessity run more slowly, then to demonstrate its superiority it must first be shown that the slower speed is more desirable and next that at equal speeds it is a better engine. Further, unless it be conceded that the long-stroke motor has equal rotative speed capacity, it follows certainly that lighter, cheaper and more powerful cars can be built with the short-stroke motor.

In regard to noise, which is today perhaps the most important question relating to an engine, we note that both engines have the same rotative speed and the same displacement; therefore they must have the same size and lift of valves and cams. **So the only point of difference relating to noise will be the greater weight of the moving parts of the valve mechanism in the long-stroke engine, due to the greater distance from the valve-seat to cam; the difference is unavoidable, though small, and might amount to 10 per cent.**

The question of power speeds being shown to be equal depends on the thermal and mechanical efficiency and the thermal efficiency depends on the compression and wall surface exposed to heat of combustion.

Wall Area Is Important

The formula recommended for M.E.P. is $\eta p = 130\,(1 - 1.18/d)$.

It will be noted that the committee admits that the figures supply no evidence of increase of mean pressure with bore, but draws its conclusion from the fact that this is apparent on different engines of the same make and that it is a well-known fact that gases in large vessels lose their heat more slowly than when in smaller ones. The first deduction is open to all kinds of criticism and is admitted by the committee itself to be inaccurate. The second deduction is entirely wrong in application because the bore is not a measure of the volume any more than the stroke. **The real measure of the loss of heat is the ratio of the wall surface to the volume.** The committee might reasonably have said that the greater the displacement of the engine, the higher the M.E.P., compression being the same. To go as far as the committee did, and rate M.E.P. from 68.5 pounds per square inch in a 2.5-inch cylinder, to 99 pounds in a 5-inch, seems to be justified by neither theory nor the facts.

Further, to deduce the effects of wall surface on M.E.P. from results taken at or near maximum brake horsepower, which of necessity was at high rotative speeds, where the sizes of valves, piping and carbureters are by far the principal elements in such M.E.P., indicates a lamentable lack of perception of the problem involved.

In order if possible to get a more rational, practical view of this point, with the good aid of Coker F. Clarkson, I have collected all the data of horsepower curves of our American engines that I could get. I am pleased to say that very few refused this information.

In order to eliminate as many factors as possible and to get as nearly as possible the true capabilities of the engine, the M.E.P. was taken at 800 revolutions per minute, which represented in every instance practically the maximum M.E.P. at any part of the curve. At this speed the effect of valve piping and carbureter sizes is largely eliminated. Of course, the effect of time of valve setting is present in the results and very likely is mainly responsible for the variations. It will be noted, however, that the results are all within a very reasonable percentage of each other and close to what might be expected. No difference traceable to the size, stroke-bore ratio or internal surface as represented by the valve-in-head or T-head engine can reasonably be deduced.

Two figures are given, one for the bare results, the other with the size of the engine and the style of the head. Knight engines are classed as valve-in-head; T.H. = T-head, L.H. = L-head, V.H. = valve-in-head engine.

Size of engine	Style of head	Compression. % clearance to total volume	M. E. P.
4.75 x 5.5	V.H.	17	111
4.87 x 6	T.H.	21.2	100.5
5.5 x 5.5	T.H.	21.2	99.5
4.25 x 5.25	V.H.	22	90
4.25x 5	V.H.	22	90
5.75 x 5.75	T.H.	21.9	89
4.25 x 4.5	V.H.	22.4	95
4 x 5.94		23	101
5.37 x 6	T.H.	22.7	93
4.25 x 5	L.H.	23	93
3.75 x 3.75	V.H.	23	90
4 x 5.12	T.H.	23	89
4.5 x 4.5	L.H.	23.5	91
4.5 x 6	T.H.	24	97
4.5 x 5		24	93
4.5 x 4.5	T.H.	26	90
5 x5.5	T.H.	26	84
4 x 4	V.H.	27	83
4.25 x 5.5	L.H.	29	81.5
4.5 x 5	L.H.	24	81

I quote the following from a paper by L. H. Pomeroy read before the Institution of Automobile Engineers in December last:

"The writer has had two engines under observation during the past few months which only differed in respect to their valve arrangement, one having overhead valves, the other being of the orthodox type. The compression ratios were identical and every precaution was taken to eliminate disturbing factors. The M.E.P. in each case over a speed range from 600 revolutions per minute to 1000 revolutions per minute was substantially the same, about 96 pounds per square inch. The influence of marked changes in valve settings was also negligible."

Let us look a little into the theory of thermodynamic efficiency and see if it will give any light. **The regular losses in the engine are the mechanical friction, the heat loss to the jackets and the heat going out through the exhaust.** The heat lost to the jackets depends on the difference of temperature, the time and the internal surface of the engine exposed to heat. **The larger the engine the greater the volume in relation to internal surface and therefore the less the relative heat loss. Lengthening the stroke of an engine decreases the thermal loss, not because the stroke is lengthened but because the volume is increased.** Any increase in the size of an engine in the direction of either stroke or bore or both will decrease the thermal loss. It therefore follows that in any given engine the less the internal surface the higher the M.E.P., but both theory and practice show this to be a very small amount. Consider the adiabatic expansion curve in two instances. one of which has no internal surface at all and the other an ordinary engine with a jacket loss of 35 per cent. and an exhaust loss of 45 per cent.

Jacket Loss May Be Calculated

The difference in the mean pressure of these curves is about 15 pounds per square inch. Our practical problem then would be: If the difference between no jacket loss and the ordinary loss is 15 pounds per square inch, what is the difference in the case of two engines of a given difference in internal surface?

Our two engines, considering them as T-head with standard size valves, would have internal surface about as follows:

4.5 inches by 4.5 inches, 80 square inches at beginning, 143.6 at end of stroke.

3.57 inches by 7.14 inches, 71.8 square inches at beginning, 150.8 at end of stroke.

As the heat loss is a function of the difference of temperature and the surface, it is easy to figure that if the 3.57 by 7.14 had a jacket loss of 35 per cent., the 4.5 by 4.5 would have a loss of about 36 per cent. It is therefore doubtful whether there would be any difference in M.E.P.

If we had one of the engines with valves in the head, our comparison would be as follows:

4.5 by 4.5, 80 square inches at beginning, 148.6 at end of stroke.

4.5 by 4.5, 53 square inches at beginning, 121.6 at end of stroke.

Here there is a substantial difference in internal surface and we might expect a loss in one of 35 per cent. and in the other of 50 per cent. in the jacket, which might mean 5 pounds M.E.P. difference.

I have seen some curves indicating the surface exposed and the difference in temperature during the stroke. The initial temperature is taken at 3000 degrees absolute and the terminal at 1600 degrees absolute, and the jacket temperature at 212 degrees and 462 or 674 degrees absolute. In the case of the T-head the engine is losing heat at the end of the stroke 66 per cent. as fast as at beginning, and with the valve-in-the-head engine 80 per cent. as fast. Of course, actually the temperature would drop faster in the T-head motor.

Another very interesting reason why the M.E.P. does not increase with size was brought out by F. W. Lanchester, whom I quote as follows:

Heat Loss During Compression

"**There are two factors, other things being equal, that control the mean pressure—the compression ratio and the cooling loss.** If we prescribe some definite limiting value to the compression ratio to be employed, then it must immediately be conceded that the larger cylinder will show a higher mean pressure, owing to its cooling losses being relatively less than those of the smaller cylinder. Thus, firstly, in the smaller cylinder the actual compression will be lower, owing to the greater cooling during the compression stroke, and, secondly, the heat losses during the combustion stroke will be greater; and so the expansion curve will fall more rapidly. But, as a matter of fact, there is no definite prescribed compression value; the compression is limited by the question of pre-ignition. If an engine is given too high compression, pre-ignition will occur or short of actual pre-ignition the explosions will become of a detonating character, and the engine will be correspondingly noisy. The compression has then to be reduced. Now the smaller the cylinder the higher the compression ratio permissible, owing to the greater cooling during the compression stroke—in fact, not only may the compression ratio be increased but the actual compression may be higher; for the temperature of the charge at any given compression is actually lower. Consequently the small engine, though sacrificing mean pressure due to its greater cooling loss, will, if properly designed, receive some compensation from the higher compression that may be employed.

It is an interesting fact that over the range of sizes commonly employed in automobile work these two influences in many cases almost exactly cancel out. Thus in the Daimler sleeve-valve engine I have found it just as easy to obtain a given mean pressure in a small cylinder (70 millimeters diameter) as in a large one (124 millimeters diameter). Thus to obtain (at ordinary barometric pressure) mean pressure as shown by the brake in cylinders of the diameters given, the following compression ratios were employed, the figures representing the total volume in terms of the clearance volume.

Cylinder diameter in millimeters	Ratio
124	4.6
100	5.0
96	5.11
80	5.6
70	6.0

The maximum brake horsepower of our two engines figured from the formula of the above-mentioned committee is

4.5 by 4.5 —	1800 R.P.M.	96 M.E.P.	55 H.P.
3.57 by 7.14	1534	86	46

The deduction from the argument of the writer is that the variation is not worth mentioning. It must be evident that if the figures of the committee are taken that the long-stroke engine is an inferior engine.

The mechanical friction of our two engines differs only in the friction of the wristpin, the crankpin and the main journals. The piston friction being a product of the thrust, the stroke and the coefficient of friction, will be the same in the engines, as the thrust is proportional to the area of the piston and of course the area multiplied by the stroke is the same in both cases. Likewise the ring friction will be equal. The other frictions mentioned will be proportional to the area of the piston alone, crankshaft sizes being the same. This friction will a coefficient of .04 will be at 800 revolutions per minute about 1.25 horsepower for the 4.5-inch engine and .75 horsepower for the 3.5-inch engine, a difference of .5 horsepower.

Larger Piston Hard to Cool

The heat lost through the jacket is a measure of the size of radiator necessary. As to the effect of piston size on cooling it is undoubtedly true that the larger the piston the more difficult it is to keep it cool, but the limiting feature of our present high-speed engines, with necessarily large valves, is more likely the size of the exhaust valve. It is probable that a stroke-bore ratio below 1 might soon be reached where the piston would be more difficult to cool than the exhaust valve, but we are not dealing in practice with such stroke-bore ratios. **The tabulated data of American engines show the practice is to use as high compression in large engines as in small ones.** So far as the writer knows there have been no experiments in regard to cooling carried on which would show us the relative effects in large and small engines. The writer has never been satisfied that if this elemnt were taken into strict consideration, small engines would not be found superior to large ones in M. E. P. and horsepower per cubic inch of displacement.

The life of an engine is governed largely by its speed. Either type will show superiority in this respect at lower speed. **At equal speed there are to be noted two differences which must be considered in the design. The piston of the long-stroke engine, being shorter and yet subject to the same total friction, will necessarily wear faster. Likewise the bearings of the short-stroke engine, being subject to greater pressure at the same speed, will require more area. The friction and wear of valve mechanism cannot vary, as they should be the same in every respect.**

It might be interesting to note here that any increase of weight due to increasing the life of the piston in one case might possibly be balanced by an increase in the other piston from the desire to get better cooling.

As a purely thermal question there is apparently no reason why the stroke-bore ratio cannot be carried beyond even a ratio of two. But as to mechanical design awkwardness begins to be apparent at ratios beyond 1.33; and beyond 1.5 the objections become more or less acute, running into weight and expense without any compensating features. **Any extra long stroke involves too much weight in the valve mechanism and a strong temptation to too short connecting-rods to keep down the height and weight. With L-head engines a design beyond 1.33 exaggerates the valve pocket design. On the other hand, in block engines with two-bearing crankshafts long strokes shorten the distance between bearings and lessen the thrust, thus diminishing the necessary diameter of crankshafts; and in six-cylinder motors the length of motor is shortened.** It might be fair in placing general limits on the stroke-bore ratio to say that it is limited in one direction to 1 by the cooling limit of the piston, and in the other direction to 1.5 by the limits of mechanical adaptiveness.

Discussion by the Engineers

Professor Marshall, among other remarks, stated that the French engineers had apparently gone to the long-stroke motor and that a bore, stroke ratio of 1.5:1 was below the present average. In the speaker's mind, the main point in connection with horsepower was engine's speed and bore.

Professor Carpenter stated that there were certain relations to bore that were not considered. Increased speed gave more horsepower, but with engines of the same size and at the same revolutions per minute there was a falling off in the torque curve. **He also pointed out that the formulæ at present employed, namely, $\frac{D^2 N}{2.5}$ when changed and the divisor altered to 2 instead of 2.5 a better approximation of the horsepower was obtained for square engines. In the case of engines having a greater stroke than bore, he considered that by substituting the factor D^2 by D X L, L standing for the stroke. In the case of the engine having a longer stroke than bore he thought that instead of squaring the bore that it would be better to multiply the bore by the stroke.**

Chairman Alden stated that there were two schools of engineers in England, and during a recent visit abroad he was present at a meeting of the Institute of Automobile Engineers when a paper was read by Professor Watson, who had made some exhaustive tests upon a single-cylinder Daimler engine. It was admitted by everyone present at the meeting that these tests were more complete than any heretofore made, and theoretically they were excellent, but owing to the fact that the motor chosen was out of date, being 4 years old and badly worn, the test was not of much practical value. Mr. Lanchester, the engineer of the Daimler company, England, took part in the discussion and showed that the shape of the combustion chamber on present day engines had no particular bearing upon the horsepower curve.

Howard Coffin remarked that he did not think that foreign engineers could show the American engineer much; that conditions in England and France were peculiar. There was not the spirit of co-operation abroad and he thought that the work that was being carried on here was just as much to be depended upon as abroad. Mr. Coffin was of the opinion that the short-stroke motor could give more horsepower per pound of weight than the long-stroke motor.

Mr. Riker stated that he had studied the question of the tendency toward long-stroke motors in Europe and found that the crux of the problem was not one of design so much as compulsion. The horsepower of the engines in Europe form the basis for taxation, which was very heavy, and in order to give the buying public as much horsepower for a given bore as possible, thereby avoiding excessive taxation, the stroke had been unduly lengthened. Conditions in this country were entirely different. The buying public here demanded a car that it was possible to drive most of the time on high gear; also that vibration was most detrimental from a selling point; absence of vibration and high-gear driving could not be obtained satisfactorily in the long-stroke motor. Further the buying public in this country prefers six-cylinders.

Factory Miscellany

Ingersoll crankcase milling machine used by the Haynes Automobile Company, Kokomo, Ind.

WHEREVER it is possible to do two or more things at the same time money is being saved. In this age of economy a tool which can do this, and do it as well as another tool which operates on single jobs, is of the highest interest. The above photograph shows a milling machine which faces three sides of the Haynes crankcases at one time. One workman alone takes care of the machine and sends the work through. After this machine is through with a piece of work the latter is entirely finished and can go directly to the assembling room. When the three sides are done simultaneously in this manner, alignment is a simple problem and cause no further trouble.

EIGHT Plants for Queens—The Borough of Queens, N. Y., is to have eight new plants, which will affect the automobile trade in general. The factories planned and under way will employ about 20,000 hands. A list of these plants is as follows: Pierce-Arrow Automobile Company, Buffalo, N. Y., is erecting a four-story building on Freeman street, 200 feet by 205 feet, with extension 51 feet by 54 feet, the estimated cost is $300,000; the Goodyear Tire & Rubber Company, Akron, O., is to erect a building six stories high on Jackson avenue and Honeywell street, to cover 93,000 square feet of ground and to cost $250,000; the General Vehicle Company, Long Island City, N. Y., is building a $350,000 addition to its plant; it is now employing 550 men and will double the number when new plant is ready; the Simplex Motor Car Company, New York City, is to build a factory on Vernon avenue; the Edwards Motor Car Company, Long Island City, N. Y., has purchased a site and is preparing to build a large plant on Berden avenue just east of Dutch Kills Creek; the Ford Motor Company, Detroit, Mich., is to add five stories to its three-story plant on Jackson avenue which will cost $50,000; the American Locomotive Company, Providence, R. I., will double the size of its present plant on Jackson avenue by adding a second story to the building costing $40,000, and the Packard Motor Car Company, Detroit, Mich., is preparing to enlarge its big building on Thomson avenue; plans are not yet filed, but it is stated that two stories are to be added.

Mayer Carbureter Builds—The Mayer Carbureter Company, Buffalo, N. Y., is planning the erection of a factory in Detroit, Mich.

New Atlanta Tire Factory—The Interstate Automobile Tire & Rubber Company, Atlanta, Ga., is to erect in the near future a factory to manufacture its products.

Kentucky's Cincinnati Factory—Ground was recently broken in Cincinnati, O., by the Kentucky Motors Company, which is to erect a plant on that property.

Wolverine Supply Adds—The Wolverine Motor Supply Company, Detroit, Mich., has had plans prepared for the construction of a two-story, 74 feet by 84 feet brick addition to its plant.

Canadian Plant for Goodrich—The B. F. Goodrich Company, Akron, O., manufacturer of rubber tires, will build a factory at St. Catherines, Ont., to employ about 1,000 men. The town has given the company 17 acres of land and fixed the assessment at $10,000 for 10 years.

Shows, Conventions, Etc.

Feb. 15-22.........Albany, N. Y., Annual Show, State Armory, Dealers' Association.
Feb. 15-22.........Newark, N. J., Annual Automobile Show, First Regiment Armory, New Jersey Automobile Exhibition Company.
Feb. 16-23.........Richmond, Va., Annual Show.
Feb. 17-22.........Kansas City, Kan., Annual Automobile Show.
Feb. 18-19.........Madison, Wis., Annual Show, City Market Building, Dealers' Association.
Feb. 18-21.........Grand Forks, N. D., Annual Show, Auditorium, Dealers' Association.
Feb. 18-22.........Baltimore, Md., Annual Show, B. A. D. A.
Feb. 19-22.........Bloomington, Ill., Annual Show, Coliseum, McLean County Automobile Club.
Feb. 19-22.........Geneva, N. Y., Automobile Show, Armory, Louis Blumenstein.
Feb. 19-22.........Kalamazoo, Mich., Annual Show.
Feb. 19-23.........New Orleans, La., Annual Show.
Feb. 19-27.........Topeka, Kan., Annual Show.
Feb. 20-22.........Canandaigua, N. Y., Automobile Show, Louis Blumenstein.
Feb. 22-Mar. 1.....Brooklyn, N. Y., Annual Show, 23rd Regiment Armory.
Feb. 24-27.........Kansas City, Mo., Truck Show.
Feb. 24-Mar. 1.....St. Louis, Mo., Annual Show.
Feb. 24-Mar. 1.....Memphis, Tenn., Annual Show.
Feb. 24-Mar. 1.....Omaha, Neb., Annual Automobile Show.
Feb. 24-Mar. 1.....Paterson, N. J., Annual Show, Paterson Automobile Trade Association.
Feb. 24-Mar. 5.....Cincinnati, O., Annual Show, Music Hall, Cincinnati Automobile Dealers' Association.
Feb. 25-28.........Eau Claire, Wis., Annual Show, Armory, Dealers' Association.
Feb. 25-Mar. 1.....Syracuse, N. Y., Annual Show, Syracuse A. D. A.
Feb. 26-Mar. 1.....Fort Dodge, Ia., Annual Show.
Feb. 26-Mar. 1.....Glens Falls, N. Y., Automobile Show, Louis Blumenstein, Manager.
Feb. 27-Mar. 1.....Toronto, Ont., Annual Show, Toronto Automobile Trade Association.
March 3-8.........Bridgeport, Conn., Show, Park City Rink, B. B. Steiber.
March 3-8.........Denver, Col., Annual Show, Municipal Auditorium.
March 3-8.........Springfield, Mass., Automobile Show, New Auditorium Building, United Amusement Company.
March 3-18.......Des Moines, Ia., Annual Show, Pleasure Car Section, Coliseum, Dealers' Association.
March 5-8.........Tiffin, O., Annual Show, Tiffin *Daily Advertiser.*
March 5-8.........Louisville, Ky., Annual Show, Dealers' Association.
March 5-8.........London, Ont., Annual Show, Drill Hall, Louis Blumenstein.
March 8-15........Boston, Mass., Annual Automobile Show.
March 8-15........Columbus, O., Annual Show, Billy Sunday Tabernacle, Automobile Club and Traders' Association.
March 11-15.......Buffalo, N. Y., Commercial Vehicle Show, Auditorium, Automobile Dealers' Association.
March 12-15.......Ogdensburg, N. Y., Automobile Show, Louis Blumenstein, Manager.
March 19-26.......Boston, Mass., Annual Truck Show.
March 20-24.......New Orleans, La., Annual Show, N. O. A. D. A.
March 24-29.......Indianapolis, Ind., Annual Automobile Show.
March............Nashville, Tenn., Annual Show, Nashville Automobile Dealers' Association.
March............Pittsburgh, Pa., Annual Automobile Show.
April 1-6.........San Francisco, Cal., Motor Truck Show, Coliseum Hall. *Motor Field.*
April 5-19.........Pittsburgh, Pa., Annual Show, East Liberty Market House, Dealers' Association.

Race Meets, Runs, Hill Climbs, Etc.

May 30...........Indianapolis, Ind., 500-Mile Race, Speedway.
July 27-28.........Tacoma, Wash., Tacoma Road Races.
Nov. 24...........Savannah, Ga., Vanderbilt Cup Race, Motor Cups Holding Company.
Nov. 26...........Savannah, Ga., Grand Prize Race, Automobile Club of America.

Foreign

March.............France, Sealed Bonnet, 3000-Mile Run.
March 31.........Montevideo, Uruguay, International Competition of Agricultural Motor Vehicles.
April.............Barcelona, Spain, International Exhibition.
May..............St. Petersburg, Russia, International Automobile Exposition, building of Michael Maneze, Imperial Automobile Club of Russia.

Bremer-Wilson Moves—The Bremer-Wilson Manufacturing Company, Chicago, Ill., has moved to 1475 Michigan Boulevard, that city.

San Antonio Club Opens—The San Antonio, Tex., Automobile Club had its formal opening on February 1. Dr. Frederick J. Fielding is president.

Fisk Tire in Winnipeg—The Fisk Rubber Company, of New York City, opened recently a completely equipped branch house in Winnipeg, Man.

Improvement in Cuero—The machine shop for the Texas Motor Car & Supply Company, Cuero, Tex., will be located in the west Main street building.

McGraw Tire Output Large—$1,160,000 worth of tires were manufactured and sold by the McGraw Tire & Rubber Company, East Palestine, O., during 1912.

Overland's Foundry—A $35,000 foundry, 100 feet by 296 feet, is to be erected on the Spear brick yard site in Toledo, O., by the Willys-Overland Company.

Frisco's Two Studebakers—Two Studebaker cars have recently been put in service by Uncle Sam in San Francisco, Cal., in connection with the parcel post.

Kentucky's Machine Shop—The Kentucky Motor Car Company, Cincinnati, O., has issued plans for a two-story brick and concrete garage and machine shop, to cost $50,000.

Detroit Dash Company's Fire—The plant of the Detroit Auto Dash Company, Detroit, Mich., was recently damaged by fire of unknown origin to the extent of $10,000. The plant, which employed about fifty men, will be shut down about a week as a result of the fire.

Universal's Addition—The Universal Motor Truck Company, Detroit, Mich., is preparing plans for an addition to its present factory building. The addition will cost $250,000 and will double the capacity of the plant.

Pilot Enlarges—The construction of the addition to the plant of the Pilot Motor Car Company, Richmond, Ind., was commenced recently and ground for the new 120-foot building was broken. The new building will be two stories high.

Fire at Goodyear Plant—Fumes of burning rubber greatly hampered the work of the firemen at a blaze which started in the reclaiming department of the Goodyear Tire & Rubber Company, Akron, O. The fire was caused by the explosion of an acid container.

Penn Plant Sold—At a bid of only $400 more than the $50,000 mortgage resting on the plant, the real estate of the bankrupt Penn Motor Company, New Castle, Pa., was sold recently at public auction. George Roth and J. M. Jack, of Pittsburgh, Pa., were the purchasers.

Women in Automobile Plants—The plant of the Ford Motor Car Company, Detroit, Mich., employs about 100 women in the magneto department, to wrap the coils, tin them, and the like. This department is the only one outside of the office where women are employed.

New Toledo Lamp Factory—A new General Electric Company, to be known as the General Electric Miniature Lamp Factory, will be located in Toledo, O., and be in operation by April 1. Automobile headlights and electric lights for all uses on such machines will be made by the new branch. The plant will employ 300 men at the opening.

Flanders Spending $1,000,000—Walter Flanders, now the head of the reorganized United States Motor Company, stated recently that the Maxwell Motor Company, Dayton, O., which succeeds it, will spend $1,000,000 annually among the Dayton factories for equipped brass cylinder work, or any kind of drop forging which is used in the automobile business.

Repair room of the Goodyear Tire & Rubber Company, Akron, O.

Benguet road in the Philippine Islands, showing one of the cars used in bus service in this region. There are eight cars on the line

FRENCH 1912 Automobile Exports—The following statistics of exports of automobiles from France are taken from an article published in the *Petit* of Havre: The year 1912 showed a decided advance in the automobile exports in comparison with those of 1911. These exports amounted to 230,167 metric quintals (metric quintal equals 220.446 pounds) as compared with 175,591 in 1911. The exports of industrial cars, farming wagons and heavy vans increased from 7,262 quintals in 1911 to 8,158 quintals in 1912. Among the countries of destination of these exports the United Kingdom stands first, having taken 60,765 quintals, as compared with 54,585 in 1911; Belgium follows with 55,799 quintals, as compared with 34,737 in 1911; Algeria with 21.640 as compared with 13,769 in 1911; Germany with 17,699, as compared with 14,624 in 1911; Argentina with 14,937, as compared with 9,265 in 1911, and Brazil with 11,994, as compared with 7,271 in 1911. The imports of automobiles into France, according to the same source of information, increased from 12,819 metric quintals in 1911 to 15,051 in 1912. These figures are all necessarily provisional and no valuation was given.

Westman with Henderson—E. E. Westman has taken a position as purchasing agent of the Henderson Motor Car Company, Indianapolis, Ind.

East Joins Timken—G. L. East has joined the publicity staff of the Timken Roller Bearing Company, Detroit, Mich., as assistant advertising manager.

Johns-Manville's Newark Office Moves—The H. W. Johns-Manville Company, New York City, announces the removal of its Newark, N. J., office to 239 Halsey street.

Trask with Marmon—C. A. Trask, formerly with the Henderson Motor Car Company, Indianapolis, Ind., recently joined the Nordyke & Marmon Company, Indianapolis, Ind.

Des Moines Show Plans—The Des Moines Automobile Show will be devoted only to the pleasure car end, although a few trucks may be shown. The show is to be held March 3.

Wants Motor Truck Prices—The Texas Motorway Company, C. L. Cade, engineer in charge, 511 Sumpter Building, Dallas, Tex., wants prices on motor trucks for passengers and freight.

Zink's Kerosene Carbureter—C. S. Zink of St. Louis, Mo., who has perfected an efficient kerosene carbureter, is in Indianapolis, Ind., trying to obtain permission to demonstrate it for various manufacturers.

McIntyre Building Partially Destroyed—Fire at Auburn, Ind., recently destroyed a three-story brick building belonging to the W. H. McIntyre Company. The loss on the building and its contents was about $100,000.

Bryant Resigns from Franklin—G. H. Bryant has resigned as advertising manager of the Franklin Automobile Company, Syracuse, N. Y. He is succeeded by W. M. Williams, who has been assistant advertising manager.

Bosch Appoints Two Distributors—The Bosch Magneto Company, New York City, has appointed the Kansas City Automobile Supply Company, Kansas City, Mo., and the Powell Supply Company, Omaha, Neb., as its distributors for its product.

Strauss Changes Position—M. F. Strauss, recently with the American-Marion Sales Company, New York City, has accepted a position with S. P. Townsend & Company, Orange, N. J., taking charge of their drafting department and general engineering work.

Leases Large Southern Garage—A. E. Reid, distributor of the Overland car in Louisville, Ky., has closed a lease for 5 years for the Olds Motor Works branch, which was recently abandoned by them and will take possession of the new $110,000 structure in the near future.

Two Indianapolis Changes—Two changes in location have taken place in Indianapolis, Ind., the A. & M. Service & Sales Company moving to Capitol avenue and Vermont street, while the Hunter-Hammond Automobile Company has moved into the quarters vacated by the A. & M. concern.

Burt's Los Angeles Home—The W. J. Burt Motor Car Company, Los Angeles, Cal., during the past week occupied its new home at Pico and Home streets. The new building is 60 feet by 155 feet and two stories in height, giving 19,000 square feet. W. J. Burt is state agent for the Auburn.

Automobiles in Yosemite Valley—Los Angeles automobilists are becoming more enthusiastic daily over the prospects of the wonderful Yosemite Valley being thrown open to automobiles by the Government. A telegram, stating their wants, was sent by the Los Angeles, Cal., Chamber of Commerce to the California Senators and Congressmen.

New Agencies Established During the Week

PLEASURE CARS

Baltimore, Md.	Standard	Zell Motor Car Co.
Montreal, Que.	Baker	Stockwell Motor Car Co.

Schaffer, Treasurer Keeton—H. S. Shaffer has become treasurer of the Keeton Motor Company, Detroit, Mich.

Syracuse Show Large—The Syracuse Automobile Dealers' Association will hold its fifth annual exhibition on February 25. There are 166 exhibits listed, with a number of novelty booths.

Dunwoodie with Maxwell—David Dunwoodie of Dayton, O., will join the executive force at the head office of the Maxwell Motor Company, Inc., and take charge of the sales of its cars.

Goodyear's New Building—The Goodyear Tire & Rubber Company, Toledo, O., branch, is moving into its new building, corner Madison avenue and Fourteenth street. This concern will carry about a $500,000 stock of tires.

Motometer Opens Chicago Office—The Motometer Company, Inc., New York City, makers of the Motometer, the new device attached to the radiator cap for indicating to the driver the heat of the motor, has opened a Chicago, Ill., branch at 1322 Michigan avenue.

Electric Vulcanizer's New Officers—The Electric Vulcanizer Company, Minneapolis, Minn., has reorganized with new officers. It will sell tires as well as repair them. The officers are as follows: E. M. Thorsteinson, president; J. H. Dupont, secretary, and J. E. Brandon, treasurer.

Inter-State Club's Officers—The following officers were recently elected in the Inter-State Boosters Club, an organization in the Inter-State Automobile Company, Muncie, Ind.; C. P. Brockway, president; B. J. Cline, advisory board; C. V. Morse, chairman, and B. D. Vogel, secretary.

Deadwood's Automobile Show—An automobile show is to be given in the auditorium March 31, in Deadwood, S. D. The show is the outcome of the formation of the Black Hills Automobile Dealers' Association, attended by twenty dealers of the section, to promote the interests of the trade.

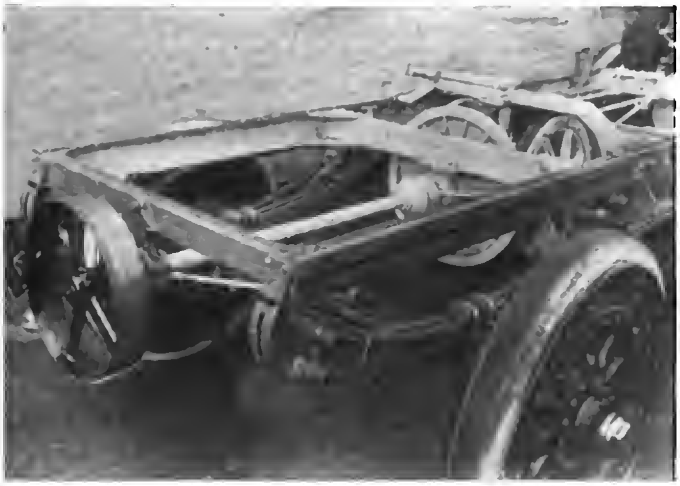
Bradley Invents Engine—Dr. A. Bradley of Albert Lea, Minn., has invented a new automobile engine, has tested it and found it to be practical for his use, developing 60 horsepower. The engine, 4-cylinder, 4-cycle, and has only two moving parts, not counting the crankshaft and the pistons.

Brazil to Improve Roads—Brazil is to have improved highways. The Empreza Autovairia Paulista has been granted permission by the government to construct a road between Sao Paulo and Santos, Brazil. Reports state that this company has floated a loan for this purpose, netting $650,000.

Minnesota Dealers' Association Formed—The Minnesota Retail Automobile Dealers' Association was recently formed in Minneapolis, Minn. It is formed to combat price-cutting by distributors and curbstone dealers and to eliminate the latter agent from the market. C. W. Jewett was elected president.

Long Island Club's Run—The Long Island Automobile Club will hold an informal run on Washington's birthday, to be counted in the competition for the trophy to be awarded to the member taking part in the most competitions during the season. The run will start from the club house and end at the Brooklyn automobile show.

View of the Rochester, N. Y., automobile show, held at Exposition Park



Rear view of Service truck, shown at Chicago, with its cushion wheels and pulley attachment for driving machinery

Plumb Sales Manager—F. W. Plumb has joined the Palmer-Moore Motor Truck Company, Syracuse, N. Y., as sales manager.

Hall Universal Manager—H. W. Hall has been appointed manager of the Boston, Mass., branch of the Universal Motor Truck Company.

Syracuse Club's Banquet—The Automobile Club of Syracuse, N. Y., is planning its annual banquet for March 6 in the ballroom of the Onondaga.

Crockett Locomobile Truck Manager—Frank Crockett has been appointed manager of the truck department of the Locomobile's Boston, Mass., branch.

Futtermans Control Superior Lamp—Harry, Myer and Abraham Futterman have taken over the control of the Superior Lamp Manufacturing Company, New York City.

Sarles Elected President—The North Dakota division of the Meridian Road Association has re-elected former Governor E. Y. Sarles as president and C. W. Graves as secretary.

Dart to Conduct Shows—F. W. Dart has completed an organization that will conduct shows throughout the country next season. Mr. Dart managed the recent Hartford, Conn., show.

Lakeside Show in April—The automobile dealers of the neighboring city of Auburn, N. Y., are planning for their annual show in the pavilion at Lakeside early in April. Details are now being perfected.

Harrisburg Club Elects—The Harrisburg Motor Club, Harrisburg, Pa., recently elected the following officers: W. E. Lauver, president; F. H. Bomgardner, vice-president, and J. C. Myton, secretary-treasurer.

Pope Chemical Wagons Ordered—Two chemical wagons have been ordered of the Pope Manufacturing Company, Hartford, Conn., by the Worcester, Mass., fire department. This will make three machines of this type in service.

Bus Line in Lancaster—W. A. Arnold has purchased an automobile and will operate a bus line from Lancaster, Ky., to Nicholasville, Ky. This makes the second automobile line which has been put into operation between the two cities.

Denison Advertising Manager—G. H. Denison has assumed the post of advertising manager with the Dyneto Electric Company, the factory being at Elbridge and the business and sales office at No. 200 East Genesee street, Syracuse, N. Y.

Ithaca Wants Fire Trucks—A committee headed by City Judge Daniel Crowley has requested the fire commissioners of the city of Ithaca, N. Y., to recommend to the common council of that city the purchase of a combination hose and chemical automobile.

Lageson's Anti-Skid Cover—K. J. Lageson, Benson, Minn., has patented an anti-skid cover for vehicle wheels, to prevent skidding. It is to provide a chain tread of novel construction consisting of links shaped to fit the tread of the tire and having integral loop portions on two sides of the links that form projections, engaging the road surface and preventing side slipping.

Concrete Road Proves Success—C. E. Gordon, member of American Society of Chemical Engineers and official representative of the war department, recently spent several days at Fond du Lac, Wis., to inspect and investigate concrete street pavement, of which type that city has laid thousands of square yards, being a pioneer in the use of concrete for pavements. He was able to gain valuable information as to the durability of this type of paving, for the reason that some of it has been down for more than three and one-half years.

Automobile Incorporations

AUTOMOBILES AND PARTS

Altoona, Pa.—Keystone Motor Car Company; capital, $10,000; to deal in cars, and to carry on a general automobile garage and repair business. Incorporators: Albert E. Akers, president.

Augusta, Me.—American Automatic Protective Valve Company; capital, $400,000; to manufacture, sell and deal in valves and other devices. Incorporators: R. S. Buzzell, L. J. Coleman.

Brookville, O.—Brookville Auto Company; capital, $10,000. Incorporators: J. Ward Somers, Edward S. Somers, V. T. Somers.

Buffalo, N. Y.—Conover Limousine Top Company, Inc.; capital, $125,000; to manufacture automobile bodies, limousine tops, etc. Incorporators: Rowland J. Conover, Charles E. Anglim, James T. Gilbert.

Buffalo, N. Y.—Universal Mannfacturing & Carbonator Corporation; capital, $1,000,000; to manufacture automobiles, bicycles, etc. Incorporators: Edward J. Liebetrut, Charles A. Adolff, Henry J. Rosche.

Buffalo, N. Y.—Willard Commercial Car Company, Inc.; capital, $50,000; to manufacture and deal in commercial motor vehicles, etc. Incorporators: Robert A. Willard, John F. Schsmel, Reginald F. Penton.

Chicago, Ill.—Lydon Mfg. Company; capital, $25,000; to deal in automobiles, motors and accessories. Incorporators: S. Donahue, F. M. Donahue, W. E. Lyons.

Cleveland, O.—Diebold Products Company; capital, $25,000; to manufacture machinery and motor cars. Incorporators: Charles R. Diebold, Max Friedman, Louis P. Diebold, Martin W. Sanders, Mabel M. Hummel.

Cleveland, O.—Motor Van Delivery Company; capital, $10,000. Incorporators: Elizabeth Graham Stewart, S. T. Stewart John R. Caunter.

Columbus, O.—New Columbus Automobile Company; capital, $30,000; to manufacture motor vehicles; incorporators: Jesse J. Brown.

Columbus, O.—New Columbus Automobile Company; capital, $30,000; to manufacture and deal in motor vehicles. Incorporators: Jesse J. Brown, Lillian M. Brown, William E. McCannon, Charles E. Dennis, Edson B. Dennis.

Dover, N. J.—D. & H. Auto Company; capital, $25,000. Incorporators: J. M. Deatrich, J. G. Harris, L. Harris.

Fort Wayne, Ind.—Fox & Shryock Automobile Company; capital, $10,000. Incorporators: George T. Fox, William W. Shryock, Bartlett Shryock.

Huntington, W. Va.—Jarvis-Huntington Automobile Company; capital, $100,000. Incorporators: Mrs. R. J. Hoster, G. G. Hoster, T. I. Millard, R. D. Esaman, F. C. Pifer.

Indianapolis, Ind.—Simplex Vehicle & Gear Company; capital, $15,000; to manufseture vehicles and parts. Incorporators: Theodore Sanstrom, Maurice M. Kiefer, Samuel S. Helms.

Knoxville, Pa.—Hollis Automatic Traction Company; capital, $250,000; to manufacture and deal in motor vehicles.

Morristown, N. J.—Victor A. Wiss & Brother; capital, $50,000; to do a general automobile business. Incorporators: V. A. Wiss, T. H. Wiss, V. A. Wiss.

New York, N. Y.—Gotham Sight Seeing Corporation; capital, $1,000; to deal in automobiles and sight-seeing cars. Incorporators: George Laury, Louis Brown, David Lebowitz.

New York, N. Y.—H. M. S. Motor Company, Inc.; capital, $22,500; to deal in motors, engines, etc. Incorporators: Joseph J. Myers, Charles K. Starr, George P. Harvey.

New York, N. Y.—Veerac Motor Truck Company; capital, $10,000. Incorporators: Harry B. McGinley, Edward L. Whittemore, George H. Hinnau.

New York, N. Y.—M. & S. Distributing Company of New York; capital, $3,000; to manufacture and sell motors, engines, etc. Incorporators: Oliver P. Carpenter, Albert D. Bean, George A. Williams.

New York, N. Y.—Norwalk Motor Car Company of New York; capital, $35,000. Incorporators: P. Lyndon Bryce, Alfred L. Kirby, Edward S. Murphy.

Providence, R. I.—Lister, Smith & Walsh Company; capital, $50,000; to manufscture, sell and deal in automobiles.

Strathroy, Ont.—Royal Motor Company; capital, $500,000; to manufacture automobiles.

Automobile Incorporations

WHEELING, W. VA.—Lavender Auto Supply Company; capital, $25,000; to do a general automobile and motorcycle business. Incorporators: C. E. Lavender, R. M. Lavender, A. E. Kennard, Sr., Annie Kennard, A. E. Kennard, Jr.

GARAGES AND ACCESSORIES

BOSTON, MASS.—G. I. M. Vulcanizing Company; capital, $25,000. Incorporators: M. G. Commandy, G. I. Matthews.

BROCKTON, MASS.—City Garage Company; capital, $5,000. Incorporators: Bernard B. Winslow, Daniel Winslow, Arthur W. Curtis.

BROOKLYN, N. Y.—Bensonburst Auto Renting Company, Inc.; capital, $3,000. Incorporators: Louis Flatow, Harry Harrigan, Max Levey.

BROOKLYN, N. Y.—Yale Motor Cycle Company; capital, $1,000; to do a general motor cycle business. Incorporators: Charles Winkel, Irving M. Levy, Eno M. Levy.

CHICAGO, ILL.—National Tire & Repair Company; capital, $3,000; to do a general automobile repairing business. Incorporator: William E. Eckert.

HAMILTON, O.—Hamilton Taxicab Company; capital, $5,000. Incorporators: J. A. Weigel, Carl A. Weigel, George J. Kalhier, Louise B. Weigel, Caroline Weigel.

INDIANAPOLIS, IND.—Capitol Body Company; capital, $10,000; to manufacture automobile tops and fenders. Incorporators: Elmer Hinshaw, Frederick W. Henschen, Elmer W. Hughey.

INDIANAPOLIS, IND.—Northern Auto Company; capital, $10,000; to do a general garage business. Incorporators: John J. Clements, R. M. Fleming, L. H. Van Briggle.

INDIANAPOLIS, IND.—Simplex Appliance Company; to manufacture motor car lighters. Incorporators: William C. Hamilton, W. Lee Bird, Isaac Born.

LAFAYETTE, IND.—Tippecanoe Auto Club; to encourage persons in Lafayette to obey traffic regulations. Incorporators: Robert L. Sackett, Robert L. Jacques, William P. Heath, Bennet Taylor, Charles W. Hickman.

NEWARK, N. J.—Puncture Cure Sales Company; capital, $30,000; to manufacture devices for repairing tires. Incorporators: H. F. Kirk, F. B. Stewart, C. H. Stewart.

NEW YORK, N. Y.—Auto Center, Inc.; capital, $25,000; to deal in real estate for use in the automobile business, such as garages, show rooms, etc. Incorporators: Edward W. Forrest, Charles H. Fuller, Byron C. Thomas.

NEW YORK, N. Y.—Inter State Motor Express Co., Inc.; capital, $3,000; to operate automobile trucks. Incorporators: George D. Roedels, Joseph L. McGee, Mary M. Fynes.

NEW YORK, N. Y.—John Splitdorf Corporation; capital, $350,000; to manufacture electrical devices, especially for automobiles and gasoline engines. Incorporators: John Splitdorf, P. J. W. Kelley, A. L. Kull.

NEW YORK, N. Y.—Robert Thedford Garage Company, Inc.; capital, $25,000. Incorporators: Robert Thedford, George Glynn, Jaul R. Gordon.

ROCHESTER, N. Y.—Durno Manufacturing Company, Inc.; capital, $100,000; to manufacture mechanical appliances for automobiles. Incorporators: John H. Durno, John F. Turk, Milton Noves.

SAN BENITO, TEX.—Whittlesey Garage & Machinery Company; capital, $25,000. Incorporators: C. W. Whittlesey, James T. Valentine, J. Valentine.

TOLEDO, O.—Parsons Manufacturing Company; capital, $10,000; to manufacture automobile appliances and other novelties. Incorporators: George E. Seney, Irving E. Austin, Charles W. Parsons, Henry Parsons, H. F. Kier.

UNIONTOWN, PA.—Auto Service Company; capital, $5,000. Incorporators: C. W. Johnson, Fred A. Close, F. B. Hess, R. M. Campbell, Max Hannan, E. Gadd Snyder, J. C. Donahue, G. T. Love, D. D. Haroder, A. E. Corns.

WILMINGTON, DEL.—Colonial Tire & Rubber Co.; capital, $250,000. Incorporators: F. D. Buck, G. W. Dillman, B. M. Grawl.

CHANGES OF NAME AND CAPITAL

MIDDLETOWN, O.—Miami Cycle Mfg. Company; capital increased from $1,000,000 to $2,000,000.

TOLEDO, O.—Landmann-Griffith Motor Company; capital increased from $10,000 to $20,000.

Opens Supply Store—The Universal Auto Company, which heretofore has conducted a repair business, has opened a supply store in the new motor mart, Hartford, Conn.

Colgan Goes to Milwaukee—Henry Colgan, formerly head of the Waverley Electric Company's Louisville, Ky., office, will hereafter be in charge of Waverley sales in Milwaukee, Wis.

Alabama Fees $64,489—Sale of automobile licenses in Alabama has totaled $64,489 to date. Of this sum the state receives 60 per cent. The remainder is divided between the cities and counties.

L. I. A. C. Run to Count—The informal run to be held on Washington's birthday by the Long Island Automobile Club will be counted in the competition for the trophy to be awarded to the members taking part in competitions throughout the season.

America Leads Electrical Field—Three American electric manufacturing companies did a business of more than $170,000,000 in their fiscal years ending 1912, while two German companies, their competitors, did a business of a little more than $152,000,000.

Toledo Company Organized—The Parsons Manufacturing Company has been incorporated in Toledo, O., with $10,000 capital and will soon begin the manufacture of automobile appliances and other novelties. It is intended later to build a model factory in Toledo.

To Build Trucks in Savannah—The Merchants and Miners Transportation Company, Savannah, Ga., the wharves of which were recently burned, entailing a loss of a million dollars, is preparing to build in Savannah twenty motor trucks for use on the new terminals.

Special body constructed for 5-ton White truck designed for an iron and steel company. Note brackets for extra lengths

To Build Tires on the Coast—The Panama Rubber Company has been formed to build automobile tires in a Pacific Coast factory. The new company is organized with a capital of $1,000,000 and the men identified with it are prominently associated with the automobile and financial institutions of the West.

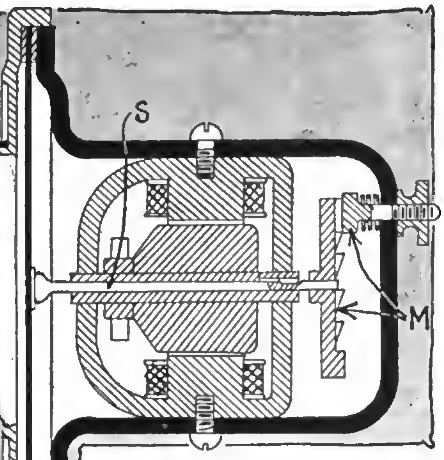
Wants Dissolution—George W. Grasser has petitioned for a dissolution of the partnership known as the Broadway Auto Shop, Toledo, O., alleging that on November 11 his partner William J. Eck abandoned the business. Grasser asks for the appointment of a receiver for the collection of accounts aggregating $732.52.

Denver Company Expands—The W. C. Hendrie Company, Denver, Col., has bought a 6-acre tract in Torrence, Cal., near Los Angeles, as a site for a $100,000 plant for the manufacture of automobile tires. The California climate is said to be especially favorable for the storage of rubber, which tends to dry out rapidly in Colorado.

Milwaukee Wants Cars—The finance committee of the Milwaukee, Wis., common council has recommended resolutions which call for the purchase of the following motor vehicles for municipal departments: Two light motor trucks for the water works department; three pleasure cars for the city engineering department; a touring car for the department of public works; a touring car for the street construction department, $1,200.

Wisconsin Roads School—The second annual good roads school of Wisconsin will be held under the direction of the Wisconsin State Highway Commission, in Madison, on February 18, 19, 20 and 21. At this time all officials connected with the expenditure of state aid for permanent highway improvement will be instructed in the administration of the state aid law, and told how the $2,500,000 to be expended in permanent highways in Wisconsin during 1913 can best be applied to produce the best results. John A. Haselwood, chairman of the commission, will act as chief instructor.

Alco motor chapel as it looks when open and ready for use, showing the altar



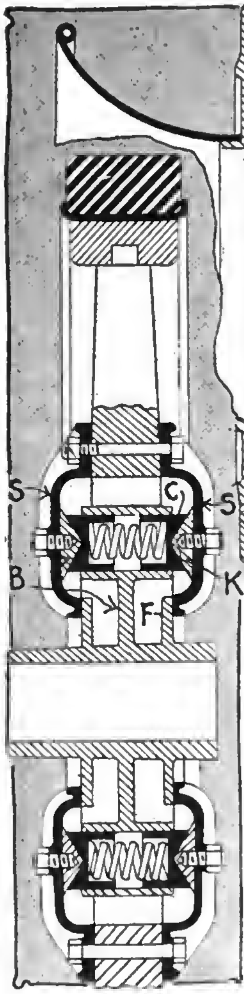


Fig. 1—Hutchison electric horn with button fitted to housing

Fig. 2—Lane mechanical wheel using cups which compress springs

ELECTRIC Diaphragm Horn—In which the vibration-producing mechanism is attached to the signal housing.

This electric horn, Fig. 1, consists of an actuating mechanism incased in a housing. The mechanism includes rotary shaft S and means for applying power to the same. In combination with this shaft is a diaphragm D and if power is properly applied by mechanism M the diaphragm is agitated, that is, vibrated.

No. 1,52,416—to Miller Reese Hutchison, Summit, N. J. Granted February 4, 1913; filed October 26, 1909.

Spring Wheel—To the hub of which parallel radial flanges are attached, between which the springs are in place.

In this wheel, Fig. 2, the hub carries two flat radial flanges F, a series of transverse bosses B extending between and radially beyond the flanges. The body of the wheel includes two side-plates S which embrace the bosses and co-operate slidably with the flanges. A series of cup pairs—cups C—are mounted for transverse slidable movement in the bosses, cones K being carried by the side-plates and co-operating with the cups. A spring between each pair of cups tends to force them apart in their co-operation with the cones.

No. 1,052,350—to Victor Edward Lane, Brooklyn, N. Y. Granted February 4, 1913; filed April 3, 1912.

Resilient Tire—Convolute springs take the place of air.

The rim R of this tire has a bracket B secured to its outer circumference, the bracket being of the cross-section shown in Fig. 3 formed with outwardly extending ends through which a pair of rods Q supporting spring bows S are laid.

No. 1,051,939—to Paul F. Wobst, Milwaukee, Wis. Granted February 4, 1913; filed August 6, 1912.

Multiple-Elliptic Spring—Consisting of several semi-independent spring units.

The spring suspension described in this patent, Fig. 4, consists of a number of sections S which are connected to a frame F and an axle A, by means of hangers H to which they are connected.

No. 1,052,233—to Phelps M. Freer, Detroit, Mich. Granted February 4, 1913; filed March 31, 1911.

Bumper Bracket—Consisting of doubly slotted members which hold on to the frame without bolts piercing the latter.

This bracket B, Fig 5, designed to support a bumper bar, is provided with a lug L adapted to engage the end of an automobile-frame side bar. A clamping member with an aperture is connected with B by a bolt E passing through that aperture.

No. 1,052,224—to Grant F. Discher, Milwaukee, Wis. Granted February 4, 1913; filed April 11, 1910.

Variable-Stroke Engine—A grooved cam varies the stroke.

The crankshaft S, Fig. 6, carries disks D on opposite sides of R. Adjacent disk faces are formed with parallel cam grooves. Disks are connected by pin P, having sliding engagement with R. Pin Q is guided by the groove and varies the piston stroke.

No. 1,051,917—to Ralph C. Root, Penlan, Va. Granted February 4, 1913; filed June 12, 1911.

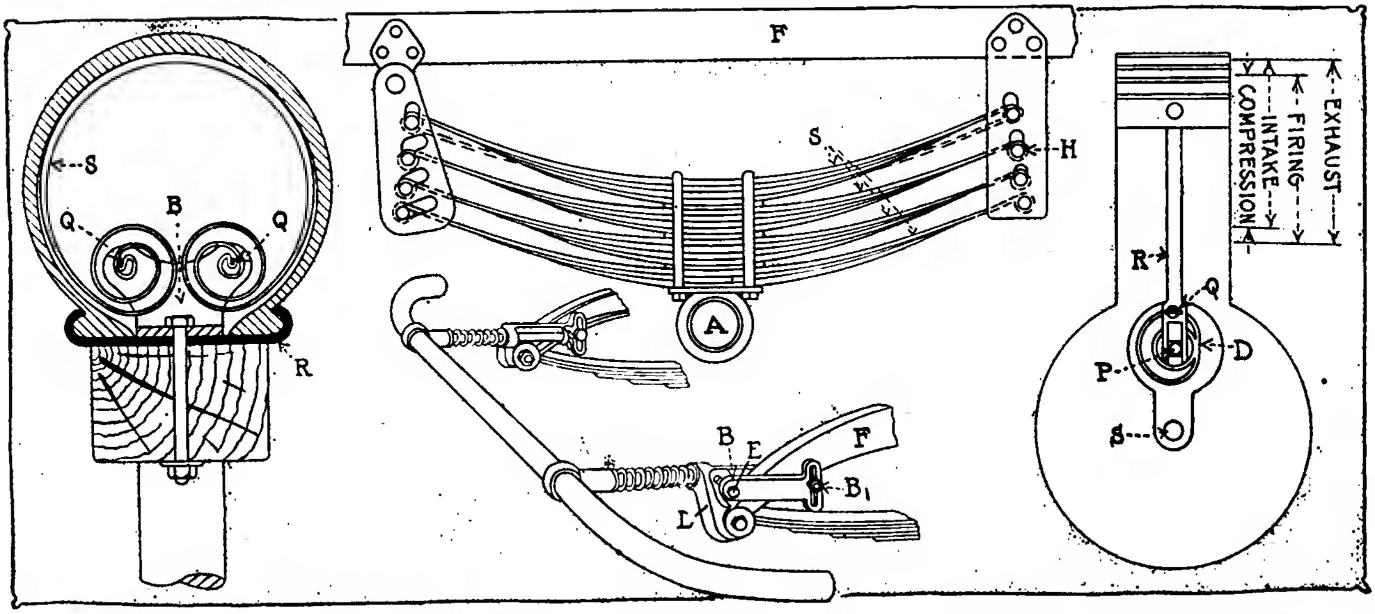

Fig. 3—Wobst resilient tire. Fig. 4—Freer spring. Fig. 5—Discher bumper bracket. Fig. 6—Root variable-stroke engine

The AUTOMOBILE

Motor Spirit To Solve Fuel Problem for the Passenger Car

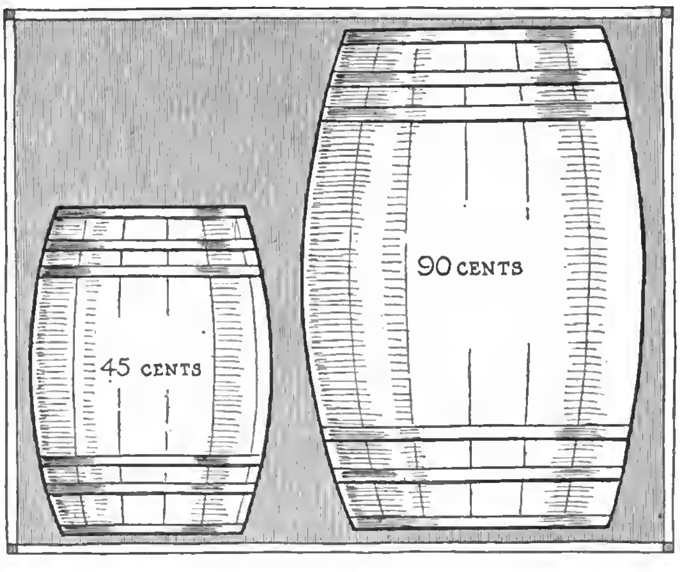
Its Substitution for Gasoline as a Fuel for Commercial Vehicles, Stationary Engines, Etc., Will Lighten the Overwhelming Demand—Present Production 15,000 Gallons a Day

CHICAGO, ILL., Feb. 24—July 3, 1912, gives promise of being recorded as an epoch-making day in automobile history. It was on this date that W. M. Burton, a director and general superintendent of the refinery of the Standard Oil Company of Indiana, made his application to the United States patent office for a patent covering a new method of manufacturing gasoline from crude oil, by which process it became possible to more than double the output of motor fuel from the crude product.

On January 7, 1913, the *Patent Gazette*, the official weekly publication of the patent office, contained a notice of issuing patent No. 1,049,667 to Dr. Burton, this patent covering in brief distilling the product at temperatures from 650 to 850 degrees Fahrenheit and under pressures of 4 to 5 atmospheres.

The process of distillation covered by this patent has been in operation since May, 1912, when the first distillate was produced. This distillate, officially labeled motor spirit, is now being produced in quantities of 15,000 gallons daily and by June it will be produced in much larger quantities.

As reported in last week's issue of THE AUTOMOBILE, motor spirit is a new product of crude oil, which is manufactured from the fuel oil residue, this being that portion remaining after gasoline, kerosene, lubricating oil and the other distillates have been taken off. This fuel oil was used by large industrial concerns instead of coal as fuel for heating their boilers. It constituted almost 50 per cent. of the crude volume. By means of Dr. Burton's new process, the Standard Oil Company of Indiana, to which the patent was assigned, is enabled to produce from the original crude oil a greater quantity of fuel for internal combustion motors. In a word, this company at its refinery at Whiting, Ind., a Chicago suburb, gets from the crude its regular 20 per cent. volume of gasoline and an additional amount of the fuel motor spirit, which spirit with a Beaumé gravity of 56 to 57 is very much the same as gasoline, excepting for a strong pungent odor.

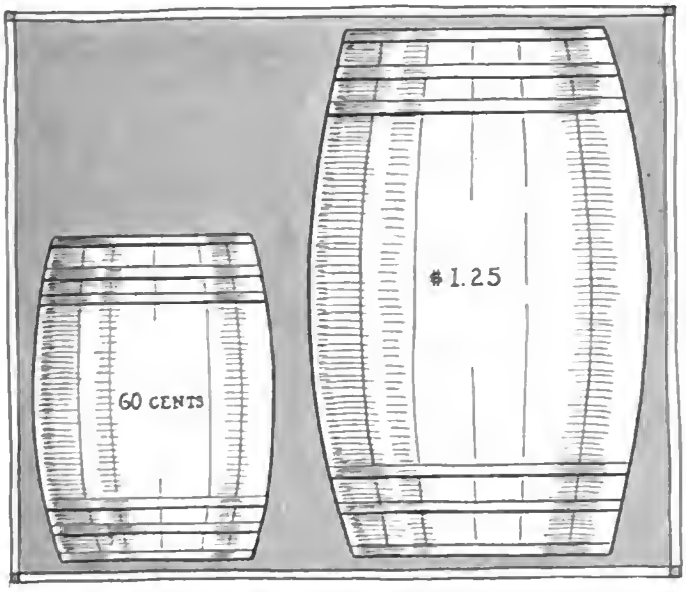


In round numbers, crude oil prices have doubled in the last 12 months. Kansas and Oklahoma crude, which a year ago sold for 45 cents a barrel at the wells, to day is selling at 90 cents

This motor spirit looks practically the same as the regular 59 Beaumé gravity gasoline which the automobilist has been buying all over the country during the past year. In color it has a slightly yellow tinge, which is not perceptible unless looked for; in fact, so closely does motor spirit resemble gasoline that if sample bottles of the two are placed side by side it calls for a careful scrutiny to distinguish one from the other when new. After the motor spirit stands for some days or weeks its yellow tint increases slightly.

The odor of motor spirit is scarcely so favorable. It is stronger and more pungent than gasoline. Once in the gasoline tank of a car a passenger cannot tell whether motor spirit or gasoline is being used, but should some be spilled on the car cushions or floor the odor might prove unpleasant until the fluid evaporates when the odor disappears. Its evaporation is much slower than that of gasoline, due to the higher boiling point of the motor spirit as compared with gasoline.

So far as carburetion is concerned, motor spirit offers few if any difficulties, not calling for additional carbureter refinements, but being adopted



Just 1 year ago Illinois crude sold at the wells for 60 cents a barrel. Today it is selling at $1.25

for the conventional gasoline carbureter by adjusting to give greater quantities of air in proportion to the fuel volume, an alteration made necessary by the higher boiling point of motor spirit and the greater number of heat units in it per volume when compared with gasoline. Cars fitted with dash controls for the auxiliary air supply are specially well suited for using this fuel.

Motor Spirit To Serve Trucks

There is a slight, light-colored smoky exhaust, not as pronounced as the bluish oil exhaust from many cars. Passenger cars using motor spirit have been traversing the Chicago boulevards for weeks without any interference from the police, who have instructions to arrest or put off the boulevard system any drivers of cars with smoky exhaust. The present grayish exhaust from motor spirit may be entirely eliminated by a better water-jacketing of the intake manifold between the carbureter and the valve chambers, this being done to prevent the condensation of the heavier parts of the motor spirit.

There is a slightly increased carbon deposit in the combustion chambers due to the use of the new fuel. This carbon, however, is of a relatively soft consistency and may be readily removed without resorting to scraping. Cars employing motor spirit continuously have experienced little more trouble from carbon deposits than those using more ordinary grades of fuel. It has been noted that scarcely as much motor lubrication is needed with the new fuel as with gasoline. Starting in cold weather is not attended with any greater difficulties than with gasoline.

Primarily motor spirit is not intended for the users of pleasure cars, but there is nothing to prevent its use by them as to many it will be attractive, being 3 cents per gallon cheaper and giving approximately 25 per cent. increased fuel efficiency. **Motor spirit is intended for motor trucks, for traction engines, for stationary engines and gas engines generally in which gasoline has been used during the past year, and due to which use the gasoline market has been so short of late. With motor spirit taking the place of gasoline for these fields, then the supply of gasoline will be obtainable for the passenger car field, and for which it will prove adequate for years to come unless unforeseen exigencies arise.**

Coming then as a substitute for gasoline in these fields the car owner should be able to rid himself of the nightmare of possible increases in the price of gasoline, such as were experienced in Europe last season, when local exigencies presented themselves. With the present supply of crude oil from the various American crude-oil fields, there is no necessity for any appreciable rise in gasoline prices during the coming season. Those who have given careful study to the subject anticipate a rise of a few cents, but should the present wild-catting in the crude oil fields result in sinking many productive wells it is certain that the price of crude may drop to the level of last year.

The phenomenal and unexpected increase in the price of crude oil has been largely responsible for the increase in the price of gasoline during the past year. In round numbers crude oil prices have doubled in the past 12 months. Kansas and Oklahoma crude which a year ago sold at 45 cents a barrel at the wells is today selling at 90 cents. One year ago Illinois crude sold at 60 cents per barrel at the wells and is today selling at $1.25.

The increase in prices of crude must not be looked upon as an exhaustion of the supply within the grounds but rather an increase of demand by the refineries beyond the producing capacities of the wells. Some years ago owners of crude oil wells were making little money. The supply was vastly in excess of the demand. With the increased demand due to increased use of automobiles, there came a drawing on the available stored crude supply, which was equal to the requirements of two seasons. Immediately the prices of the crude began rising and they have continued consistently ever since. With the increased demand and increased price there has been great activity in sinking wells in the crude territories; and this promiscuous sinking of wells, or wild-catting as it is known, may result in vast increases in crude supplies or it may not. Some experts on the supply of crude oil believe that there is not a sufficient quantity of crude west of the Rocky Mountains to meet the requirements.

That there was an embarrassing shortage in gasoline up to the present is borne out by statistics, which show that on January 1, 1912, some of the gasoline producing companies had many millions of gallons of gasoline stored for immediate use, whereas on January 1, 1913, some of these same concerns had practically exhausted their stored supplies and were furnishing fuel in a hand-to-mouth fashion. Rumors had it that the gasoline producers had failed to calculate on the gasoline consumption of motor trucks, but it is a matter of record that these producers had taken due recognition of this factor and were exerting every influence to ward off a situation, the shadow of which had been hanging over them for many months.

By traction engines, stationary engines, motor trucks, etc., using motor spirit the surplus of gasoline should begin accumulating. Statistics from a western state shows that during the past fall, the traction engines, used in threshing the grain and hauling it to market, consumed six times as much gasoline as the automobiles in the same territory; statistics further proved that stationary engines in elevators were using more gasoline than was sold direct to garages to the automobile industry. While this was true in the fall, winter brought on a different condition of affairs, one in which the consumption of gasoline by traction engines practically ceased and when they were large purchasers of gasoline, a large portion of which they retail to motor car users.

Many Possible Fuels Existing

Every shortage in fuel supply is certain to stimulate thoughts of the possible exhaustion of crude supplies, and the active brain soon becomes lost in the labyrinth of emergency possibilities. America has boundless fields of crude. Some of the better known crude oil fields are California, Texas, Kansas and Oklahoma, Missouri, Illinois, Ohio and Indiana and Pennsylvania. There is not a symptom of danger of immediate exhaustion of these, but should such be precipitated there are many foreign fields from which crude could be imported at reasonably low cost. But in the extreme if the crude oil supply were not adequate or entirely disappeared, then attention would have to be turned to the use of alcohol as fuel. Alcohol could be manufactured from corn, and the present output of gasoline could be replaced by alcohol and the amount of corn needed would not be over 3 per cent. of the annual crop.

The production of motor spirit today is entirely in the hands of the Standard Oil Company of Indiana, which owns the patent, and because of this it is very questionable if motor spirit will be marketed country-wide for a matter of a year or so. It will soon be marketed at many points in the territory between the Great Lakes and the Rockies. There are today upwards of 140 concerns producing gasoline and it will apparently be necessary for these to take out royalties if they intend to refine motor spirit.

The refining process is more difficult and costly than the refining of gasoline due to the pressure of 4 to 5 atmospheres used in the stills. At present there are a number of special motor spirit stills in operation and by June there will be many more producing, which will be a sufficient equipment to meet the expected demand. With these stills it will be possible to convert a considerable portion of the residue known as fuel oil into motor spirit, the final residue being a marketable product for other uses.

Dr. Burton has been working on the process for upwards of 3 years and has been materially assisted by Dr. R. E. Humphreys, chief chemist of the Standard Oil Company of Indiana, and other associates. Since the original product was secured many improvements have been made in it and it is certain that before another year has elapsed that others will be made. The present pungent odor could readily be eliminated, but its elimination would mean largely reducing present output, which would prove too expensive to the industry.

Motor spirit is at present being used by over a dozen different industrial concerns in Chicago, mostly in the operation of motor trucks. It has been used by some of these for a matter of 10 days in average winter weather and not the slightest difficulty has been encountered in its use.

Belgium's Status in Automobile Industry

BRUSSELS, Feb. 20—Official statistics show that there are 23 automobile factories in Belgium employing 5,217 workmen. In 1909 the Belgian production of chassis and motors was 2,171; in 1910 it was 3,020; in 1911 4,850; the returns have not yet been published for 1912. During 1912 Belgium exported automobiles and bodies to the value of $6,203,563, and during 1911 to the value of $5,108,290. Belgium is not self-sufficing in the matter of automobile construction, for in 1911 she imported French automobiles to the value of $5,495,280, and to the value of $8,660,640 in 1912.

In addition to the automobile factories there are 50 important body makers in Belgium employing 3,030 workmen. In 1909 they delivered 1,213 complete bodies; in 1910, 2,617 bodies, and in 1911, 3,496. The official returns show that in 1908 the number of automobiles registered with the police authorities was 9,840; in 1909 it was 11,500, and in 1910, 14,620. Figures have not been issued for the last two years.

New Aluminum Foundry to Open

WAUKESHA, WIS., Feb. 24—A new aluminum foundry, which will make a specialty of castings for the motor car and engine trade, is now being established at Waukesha, Wis., by Conrad Werra, of Manitowoc, Wis., a pioneer in the aluminum foundry business of Wisconsin, and until now general manager of the Aluminum Castings Company of America's Manitowoc works, formerly the Aluminum Foundry Company, which was founded and owned by Mr. Werra for 14 years. Mr. Werra has organized the Werra Aluminum Company of Waukesha and incorporated it for $110,000. With him is associated Alexander Pankratz, factory superintendent of the Manitowoc works, who resigned February 15 to become manager at Waukesha. The new company has leased the former Wisconsin Central ("Soo Line") car shops and division headquarters group at Waukesha for a long term of years and is now installing equipment which will make the plant one of the largest aluminum foundries in the Middle West, it being three times as large as the former Werra plant at Manitowoc. It will be ready for operations about March 15.

New York Merchants Want Car Factories

Merchants' Association Studying Automobile Industry with a View To Attracting Motor Vehicle Business

Freight and Labor Facilities Declared to Be Excellent—Bankers Would Support Healthy Enterprises

MERCHANTS of New York City, represented by the Merchants' Association of New York, founded to foster the trade and welfare of this city, want automobile and automobile accessory factories. Tuesday night, at an informal dinner attended by twenty of the representative automobile men of New York and vicinity, tendered by the industrial bureau of the association, the possibilities of securing factories in this line of business were discussed. Henry Morgenthau, chairman of the Industrial Committee, presided over the informal debate which took place after the dinner. Dr. E. E. Pratt introduced the discussion by giving a statement of facts which he had gathered from the leading automobile men of the city and the state bureau of labor. He pointed out the fact that skilled labor was readily obtainable in New York City in such quantities that the manufacturer was able to pick and choose. He also showed the transportation facilities to be of the best.

A point which brought out some discussion was the living facilities for the lower-paid labor. It was shown that in the Borough of Queens it is possible to secure four rooms and bath for a monthly rental of $14. This territory is within easy walking distance of excellent factory sites which could be secured at a cost in the neighborhood of $1,000 for a lot of 25 by 100 feet. This compares favorably, according to statements of those present, with other cities which have become automobile manufacturing centers in which living quarters of the laboring class are not only inadequate but are separated from the factory by transportation facilities which cannot meet the demand.

It was also stated upon the authority of men who have studied the banking situation in New York City very closely that, while the moneyed interest looked askance at investments in the automobile field during the early stages of the industry, it would now be comparatively easy for a substantial concern to secure a loan. This was stated to be particularly true of the motor truck industry. Maps were produced showing the enormous buying range of New York City, circles being laid out with New York City as the center. It was stated that within a radius of 400 miles 65 per cent. of the output of the motor vehicle factories is consumed. The association particularly dwelt upon the advantages of manufacturing trucks so that they could reach this vast market under their own power and thus save freight charges.

It was stated by several present from both the merchants' association's and the automobile men's viewpoint that New York offers unparalleled opportunities to the manufacturers of automobile tires and other accessories.

The fact that the Goodyear company has determined to distribute tires from Long Island City to help take care of the enormous consumption of the New York market was cited as an indication that these companies were beginning to realize the advantages of being close to the market.

Clifford M. Nouggy, formerly with the Stover Bicycle Company and also with the Daimler Manufacturing Company of Long Island City, is now with J. S. Bertz Company, New York City, importers of F. & S. ball bearings.

W. M. Lewis Retires

Mitchell-Lewis Motor Car Company's President and General Manager Succeeded by J. Winterbotham, Jr.

His Only Reason for Retirement Is To Give Entire Attention to Other Interests

RACINE, WIS., Feb. 24—Captain William Mitchell Lewis, president and general manager of the Mitchell-Lewis Motor Car Company, of Racine, Wis., on Wednesday, February 19, retired as active head of the company and is succeeded by J. Winterbotham, Jr. The only reason given for Captain Lewis' retirement is that he desires to give his entire attention to his other interests, which include the Racine Rubber Company, the Racine Daily Times Company, publishing the leading daily newspaper of Racine and other enterprises of equal or lesser importance. Captain Lewis established his offices in the Racine Times building immediately upon retiring from the motor works.

Reports of financial difficulties circulated in connection with the retirement of the president and general manager and since denied by company officials stated that the company had defaulted on the payment of the installment due on a loan of $2,500,000 made by the Mitchell-Lewis Motor Company 1 year ago and now due, and that Captain Lewis had been supplanted as head of the interest that the committee of bankers representing the institution which had advanced the $2,500,000 loan might take active charge of the direction of the company's affairs for the protection of the loan.

The Mitchell-Lewis Motor Company was organized and incorporated in 1910 with a capital stock of $10,000,000, being a consolidation of the Mitchell Motor Car Company and the Mitchell-Lewis Company, Ltd., the former being a manufacturer of motor cars and the latter a manufacturer of wagons. The interests of both companies had long been practically identical in a financial way. Captain William Mitchell Lewis was elected president and general manager, he having been president of the motor car company, and William T. Lewis was elected chairman of the board of directors, he having been head of Mitchell-Lewis Company, Ltd.

Hofwebers To Build Cheap Car

LACROSSE, WIS., Feb. 24—The Hoff Motor Company is being organized here by Joseph E. and August H. Hofweber, and will be incorporated with a capital stock of $1,000,000 to manufacture automobiles. The Hofwebers have gained the support of leading business and professional men in their project to build and market a pleasure car under the name Hoff, designed by them and to sell at $790 fully equipped.

Columbus Buggy Plan Not Ripe

COLUMBUS, O., Feb. 24—The committee named by the creditors of the Columbus Buggy Company of this city, which went into the hands of Daniel McLarin as receiver recently, will not formulate a plan of reorganization until after the appraisers named by the federal court will report on the assets of the corporation. It was believed that more intelligent work could be done by the committee after the appraisers' figures were made. The appraisers are expected to report in a few days.

Maxwell Plants Turning Out Cars

DETROIT, MICH., Feb. 24—The Maxwell Motor Company, Inc., is gradually getting its affairs in shape and squared away for the active manufacture of the several models which have been announced. The general offices at Warren and Woodward streets are being fitted out and will soon become the pulse of the big concern. The Brush plant is now running and will be devoted to the exclusive manufacture of the Maxwell 25. Equipment is being brushed up and machinery added here. At the Alden-Sampson plant, which has been more or less inactive since the reorganization proceedings were begun, all is activity again and trucks are being manufactured. The plant at Dayton, O., is operating at full force and is to turn out model 35. The Flanders plant is also busily engaged in the production of several models. Altogether the outlook is very favorable for a year of excellent production under the new régime in spite of the difficulties which have been handicapping the company in organization.

Findlay Plant to Original Promoter

FINDLAY, O., Feb. 24—The recent sale of the Findlay Motor Company plant to W. W. Edwards for $50,000, now turns out to be for Mrs. L. E. Ewing, of Cleveland, wife of the original promoter of the company. Mr. Ewing is on the ground attempting to dispose of the property. He announces that he is willing to take stock in the new company, of the purchaser of the plant who will buy it and reorganize the company.

Poss Company Assets To Be Sold

DETROIT, MICH., Feb. 24—Charles D. Todd has offered at private sale commencing today the entire assets of the Poss Motor Company, bankrupt, which were purchased from Referee in Bankruptcy Lee E. Joslyn at a hearing on February 21. The sale includes the good will of the Poss concern and the right to use the name. The property consists of nine finished Poss delivery trucks. ten chassis nearly completed, fifty-five various

types of bodies and other miscellaneous parts, in addition to several machine tools. The goods will be sold in parcels or as a whole if a suitable offer is made.

In purchasing the property from the referee, C. D. Todd paid $5,500 in cash and agreed to turn over 85 per cent. of the amount realized from the present sale. Assets of the Poss company amount to $37,297.86, according to the inventory.

—

Exports for 1912 Were $28,308,118

WASHINGTON, D. C., Feb. 25—(*Special Telegram*)—The exports of automobiles and parts for 12 months ending December, 1912, totalled $28,308,118. The total for December, 1912, was $2,428,176, that for the 12 months ending December, 1911, was $19,178,484. Imports for 12 months ending December, 1912, were $2,275,406, a decrease as compared with the same period for 1911.

Harroun Making Novel Carbureter

INDIANAPOLIS, IND., Feb. 24—Ray Haroun, the Memorial Day race hero of 1911, has incorporated the Ray Harroun Company for the manufacture of a heavy-fuel carbureter. The latter is a single-jet, automatic adjustment design, hot-air jacketed. The only regulation is by a dash control.

—

The Bloomfield, N. J., factory of the Simms Magneto Company which was put in operation again after the reorganization of the company in fall, 1912, is now operating at the rate of fifty magnetos a day. The product is partly being shipped and partly laid up in stock. The manufacture of S-U carbureters is also proceeding at a fair rate and it is expected that the production of this accessory will be increased materially during the year.

Market Changes of the Week

Of the few changes in the markets this week tin was the most important, a drop of $1.37 per hundred pounds occurring, due to breaks and violent fluctuations in standard contracts at London. Lead was dull but steady being called for at $4.30 per 100 pounds. Bessemer steel rose $.50 per ton. Cottonseed oil suffered a loss of $.07 per barrel owing to the recent holiday. No new features of importance appeared in the market for scrap rubber last week. According to importers, the demand for foreign rubber holds up well, the request embracing all grades, and prices are apparently firm on both sides of the water. Automobile scrap is called for at $.09 7-8. Copper was weaker in all positions, with small buying of refined either here or in Europe. Both coppers fluctuated throughout the week, closing at Wednesday's prices. There were no changes in both Pennsylvania and Kansas petroleums.

Akron Strike Is Broken

—

All the Factories Are Ready for Active Work As Result of Return of 2,000 Men

—

Goodyear To Start Work on Immense Plant—Goodrich Net Earnings for 9 Months $3,522,488

—

AKRON, O., Feb. 25—(*Special Telegram*)—The backbone of the rubber workers' strike here started by the Industrial Workers of the World, which has been on 2 weeks, broke today when nearly 2,000 of the workers returned to work. The I. W. W. leaders were no longer able to hold the men. As a result of the stampede on the part of the men to get back to work all the factories will be in full running order in 2 or 3 days. It is claimed that the I. W. W. strike agitators will now move on to Paterson, N. J. The rush of men at the Goodrich, Diamond, Firestone and Goodyear plants was so great today that it was impossible to place them. At the Firestone plant, where the strike started, H. S. Firestone, president, said:

"The men are coming back faster than we can adjust our departments to care for them."

Announcement was made today that the Goodyear Tire and Rubber Company, now that the strike is over, will start work at once on the largest building in the country for rubber manufacturing purposes. It will be over 1,000 feet long and five stories high and will be built on the site of the present group of Goodyear buildings. It will employ 2,000 additional men. Indications at this time are that every rubber plant here will be running night and day within 2 days.

The Goodrich statement to stockholders today shows that the net earnings for 9 months were $3,522,488. After the preferred dividend of $1,519,505, or three dividends at the rate of 1¾ per cent. quarterly, there was remaining $2,002,984 for the common. This is at the rate of 3 1-3 per cent. for 9 months or 4.44 for a full year. There were paid out during the period two dividends of 1 per cent. each on the common, leaving $806,235 of undivided profits for the period.

—

Studebaker Profits $2,313,245 for 1912

According to the yearly report of the Studebaker Corporation, South Bend, Ind., this company during the fiscal year ending December 31, 1912, had net earnings totalling $3,125,876.15. The interest on the companies 5 per cent. serial notes, discount and commission on the same and extraordinary expenses aggregated $812,631.01, leaving net profits of $2,313,245.14. The consolidated balance sheet of the company's affairs follows in extract:

Total capital investments	$30,402,083.75
Total current assets	24,049,796.86
Total	$54,451,880.61
Capital stock outstanding	$41,026,600.00
Minority stockholders' interests	28,300.00
Total current liabilities	11,069,728.43
Special surplus account	417,008.87
Dividends paid, etc	1,910,243.31
Total	$54,451,880.61

The automobile sales of the company showed a 10 per cent. increase over the year 1911.

—

International's Giant Service Building

An eight-story service building affording 200,000 square feet of floor space and costing $1,000,000 is now being completed for the International Motor Company, at West End avenue and Sixty-fourth street, New York City.

Counter Suit Filed in Stromberg vs. Zenith

Infringement Suit On Between Two Firms—Counter Suit by Zenith—Ready for Taking of Testimony

Stromberg Will Not Come Up Before May 1—Zenith Suit Will Follow About a Month Later

DETROIT, MICH., Feb. 22—A new, interesting point in the patent litigation between the Stromberg Motor Devices Company, Chicago, and the Zenith Carbureter Company, Detroit, the former alleging infringement of its Ahara and Richard patents by the latter, which has recently filed a counter suit against the Stromberg concern for alleged infringement of the Bavery patent, has arisen from the fact that the Zenith counter suit is practically the first patent suit to be brought under the new rules of practice in the Federal courts which went into effect February 1 and which call for much simpler phrasing of bills of complaint than was customary under the old rules.

Both the Zenith and the Stromberg suits are now about ready for the taking of testimony, which will be proceeded with just as rapidly as possible, according to V. R. Heftler, president of the Zenith company. Apparently the last obstacle to prompt progress was removed last week when Judge Tuttle in the Federal court in this city, after commenting upon the desirable changes accruing from the new rules of procedure, overruled certain formal objections which had been raised by the Stromberg company's attorneys to the Zenith bill of complaint charging the former with infringement of the Bavery patent. Mr. Heftler states that the bill of complaint sought to conform with the new rules and was a genuine attempt to get away from the lengthy, labored and verbose phraseology which has in the past made patent procedure so difficult for a layman to understand.

The following is a quotation from Judge Tuttle's opinion:

"As is well known, no part of a bill of complaint for infringement of a patent, in the form that has become settled under the old equity rules, was more verbose and reiterative than the several opening paragraphs of a bill thus drafted and it strikes me that counsel for the complainant, in adopting the language found in the opening paragraph of its bill, has conformed in a most gratifying degree to the language and intent of the new rules in simplifying and abbreviating his bill of complaint. The motion to dismiss is therefore denied, and that part of new rule 29 calling for the filing of the answer within 5 days after the denial of such a motion as this, must be observed.".

Mr. Heftler states that the Stromberg suit will not come up before May 1, while the Zenith counter suit will follow about a month later.

Findlay Case To Go to Court

On April 17 the case of Flatow, Finn & Company vs. The American Truck Company, the Findlay Motor Company and the Ewing American Motor Company will be heard in Supreme Court, special term, part 2, New York City.

Flatow, Finn & Company, or as the company is now styled, the Commercial Auto Company, alleges that the defendants have violated a contract closed between the plaintiff and the first mentioned of the defendant companies, which provided that the Flatow concern was to have exclusive selling rights for trucks and parts made by the American Truck Company in the territory of New York City, Long Island, Westchester County, as well as Fairfield and New Haven counties, Connecticut. This arrangement was made during October, 1910. It provided, furthermore, that if the American concern sold any trucks or parts thereof in the above specified territory, the Flatow company was to receive the difference between the list and the net price of the goods sold. On the strength of this arrangement the Flatow Company adopted the name Commercial Auto Company.

Some time after this contract had been made the American Motor Truck Company consolidated with the Findlay company. About that time the plaintiff devised a scheme by means of which large quantities of trucks could have been disposed of; it consisted in the purchase of the New York Mail Company which handles the U. S. mail in New York City. The plaintiff now alleges that this scheme was put into practice about May, 1911, when the Findlay and American companies consolidated with the Ewing firm, forming the Lockport Stamping Company. Shortly after this had taken place the Lockport concern gave notice to the plaintiff that it cancelled the contract of 1910, on the grounds that other agencies in the metropolitan territory could give it better and more profitable representation. The Commercial Auto Company now claims that the deal with the New York Mail Company was put into practice by the Lockport concern and that this company made considerable money on the deal, which would have been due to the Commercial Auto Company according to its contract.

Prest-O-Lite Tests Trade Mark

SYRACUSE, N. Y., Feb. 22—The Prest-O-Lite Company has brought a test case in Municipal Court in this city in an attempt to stop the re-use of its tanks by automobile supply dealers. The action is against the Central City Rubber Company to recover a penalty of $100, under section 367, article 24, chapter 20 of the general business laws of the State. The Prest-O-Lite Company claims to have sole use of the trade-mark name Prest-O-Lite, filed with the secretary of state last December. The name is stamped on every tank sold, and the company contends that the tanks are never sold for the purpose of allowing them to be used again.

The complaint states that the Central City Rubber Company sold Frank J. Slattery a Prest-O-Lite tank February 4 and that it was filled with acetylene different from the original contents. The case will be called February 28.

Mezger Claims Red Head Infringement

Charles A. Mezger, New York City, maker of the Sootproof spark-plug, has filed suit against the Emil Grossman Company for alleged infringement of his patent, No. 700,147, dated May 13, 1902. Following are the claims which are alleged to be infringed upon by the Red Head plug design:

1. The combination of a chambered plug having a sparking point thereon and elongated conducting member forming the second sparking point and projected through the chamber and extending adjacent to the sparking point and a tubular shell arranged in the chamber of the plug and spaced from the walls thereof and from the sides of said elongated member, forming the second sparking point.

2. The combination of a chambered plug having a sparking point thereon, and elongated conducting member projected through the chamber and extending adjacent to the sparking point, a tubular insulation shell arranged in the chamber of the plug and spaced from the walls thereof and from the sides of said elongated member forming a second sparking point, an insulating tube at the base of the insulating shell, a means for holding the said elongated conducting member snugly within the shell and tube.

4. An electric igniter, comprising an elongated member forming a sparking point, and insulating tube inclosing the major portion of the exposed part of said elongated member, and said shell having an open space around its outer side and between its inner side and the said elongated member.

5. The combination of a plug proper having a chamber therein and a reduced passage leading therefrom, an insulating tube placed in the said passage and having a shell-like extension projected into the chamber of the plug and spaced from the interior walls thereof, and a rod projected through the tube and through the shell, said rod being spaced from the inner walls of the shell.

6. The combination of a plug proper having a chamber therein and a reduced passage leading therefrom, an insulating tube placed in the said passage and having a shell-like extension projected into the chamber of the plug and spaced from the interior walls thereof, a rod projected through the tube and through the shell, said rod being spaced from the inner walls of the shell, and being formed with an enlargement engaging a shoulder at the outer end of the shell, and means for exerting an outward pressure on the rod to hold the parts snugly engaged.

Railways Killed 9,387 in 1 Year

A bulletin published by the Special Committee on Relations of Railway Operation to Legislation on railroad accidents states that according to a report of the Interstate Commerce Commission, 3,953 persons were killed on railways during the year ending June 30, 1912; of these 318 were passengers and 3,635 employees of the railroads. Besides 5,434 trespassers were killed, bringing the total of fatal railroad accidents to 9,387.

While among the persons killed there were undoubtedly a high percentage of vagrants—it is estimated that in the United States some 500,000 tramps wander around—a large number of the people killed were farmers, workers and other decent citizens—in short, people about which society cares.

Another important point brought out in the bulletin is the fact that out of 50,000 persons killed and 53,000 injured on American railroads for the years from 1901 to 1910, inclusively, 33,000 were less than 21 years old.

The death accidents, together with the general loss caused by hoboes, could be materially reduced by the railroads' policing their tracks, and the state governments assuming the conviction and maintenance of tramps. The Bulletin, the number of which is 46, contains many interesting details and may be obtained by applying to the committee mentioned above, whose address is 1972 Trasportation Building, Chicago, Ill.

Three Score Motor Deaths a Week

OMAHA, NEB., Feb. 21—According to Chief Dunn, of the police of this city, an average of from fifty to seventy-five accidents a week are due to the automobiles operating in various cities of the United States. During the 5 weeks ending January 23, according to the chief, 1,230 persons were injured and 208 killed, among these sixty-two in New York.

Chief Dunn expects to submit his statistics to the National Association of Police Chiefs, which is active in reducing automobile accidents.

Congressmen Oppose Oldfield Bill

WASHINGTON, D. C., Feb. 26—(*Special Telegram*)—Representative Bulkley, of Ohio, of the House Committee on Patents will submit his report tomorrow, Thursday, signed by one-half of the committee members, strongly opposing main features of the Oldfield bill amending the patent laws. Mr. Bulkley's report attacks establishment of compulsory license system, the extinction of the right of the owner of a patent to treat license violations as infringements and the amendment of Sherman antitrust law as applied to those doing business under the protection of patents.

Smith Strike Is Short-Lived

MILWAUKEE, WIS., Feb. 24—After 3 days of negotiation, the strike of machine hands at the plant of the A. O. Smith Company was settled on Sunday, and on Monday morning every man who had walked out since the strike was called on February 19 was back at work. The retirement of a new foreman in the department in which the walk-out arose and whose personality was the sole reason for the trouble, resulted in a speedy settlement of the difficulty.

Changes to Hans Equipment Company

LA CROSSE, WIS., Feb. 24—The National Gauge & Register Company, La Crosse, Wis., has been reorganized, recapitalized and the corporate style changed to Hans Motor Equipment Company. A $50,000 factory building is now being erected at La Crosse to serve present needs and form the nucleus of a group of buildings to be established as needed. The Hans Equipment Company, manufacturing gasoline and oil gauges, crank case gauges, gasoline separators and strainers, air pressure pumps, oil sight-feed registers, gasoline and radiator tank filler caps and similar articles for automobiles, was organized at the National Gauge & Register Company by Edmund E. Hans at Minneapolis 2 years ago.

Monarch Motor Car Co. Incorporated in Detroit

L. G. Hupp Is President; Occupies Temporary Plant—Deliveries To Commence About May 1 Is Plan

Five-Passenger Touring Car of 30 Horsepower Will Be Built—Limbach Chief Engineer

DETROIT, MICH., Feb. 25—*Special Telegram*—The latest addition to Detroit's growing list of automobile manufacturers is the Monarch Motor Car Company, the articles of incorporation of which were filed with the Secretary of State on February 22. L. G. Hupp, who until recently was secretary and treasurer of the R-C-H Corporation, is president of the new concern. The other officers are understood to be well-known business men of this city, but announcement of the complete personnel of the organization is not yet made public. Mr. Hupp stated last night that a complete announcement of the plans of the company would be made on March 1 and that the temporary quarters are located on Scotten avenue in a plant formerly occupied by the Acme Electric Company, the latter concern having moved to another location. The chief engineer of the Monarch company is H. C. Limbach, who has been identified with both the engineering departments of the Studebaker Corporation and Cadillac Motor Car Company. Under his direction a five-passenger, 30-horsepower touring car will be built, to sell at about $1,000 fully equipped. According to present plans, deliveries to dealers will commence about May 1. A complete factory is to be built, which may possibly be ready for occupancy next fall, if all goes well. Mr. Hupp is a veteran manufacturer of the Motor Car Company and the R-C-H Corporation, although no longer connected with either of these enterprises. After leaving the Hupp Motor Car Company the Hupps, about 1 year ago, merged the Hupp Turner Machine Company, the Hupp Johnson Forge Company and the Hupp James Geyman Foundry Company, in all of which they were interested, and called the combination the R-C-H Corporation.

Aetna to Handle Motor Insurance

HARTFORD, CONN., Feb. 24—Morgan G. Bulkeley, president of the Aetna Insurance Company, appeared last week before the joint insurance committee to advocate amending the charter of his company for the writing of straight automobile policies, in addition to the liability and accident insurance for automobiles now handled by the liability department of his company. The Aetna company took up automobile insurance some time ago.

Twin City Cars Worth $12,400,000

MINNEAPOLIS, MINN., Feb. 24—Statistics prepared by H. A. Stuart, statistician for Minneapolis, show comparative automobile figures for the Twin City for final reports ending Dec. 3, 1912. Owned by private individuals and business concerns in Minneapolis there were 5,939 automobiles, or an average of one machine for every fifty-four persons. In St. Paul there were 2,251 automobiles, or an average of one to every 101 persons. At an average valuation of $1,500 for each machine the Minneapolis investment was $9,000,000 and the St. Paul figures $3,400,000. Allowing traveling space of 100 feet to each car, Mr. Stuart figures the Minneapolis machines would form a procession of 112 miles in length and the St. Paul cars of 42 miles. The city assessor's record showed 4,719 automobiles in Minneapolis May 1, 1912.

Oppose Increased Taxes

New York and New Jersey Organizations Active To Nullify Efforts of Anti-Motor Factions

Dealers Taking Up Legislation—Ohio Legislature Is Active—Pennsylvania To Buy Toll Bridges

THE New York State Automobile Association, through its legislative committee, of which Alvin A. Bender is chairman, is conducting a campaign against the increase of automobile registration fees advocated by Secretary of State Mitchell May of New York. The association maintains that the proposed increase is unjust, and while Empire State motorists are willing to submit to fair taxation, they are determined to oppose the proposed increase as outlined some time ago in THE AUTOMOBILE. If the proposed measure goes through a test case will be taken through the courts.

Incidentally, the Associated Automobile Clubs of New Jersey, the state association there, is opposing a similar increase of automobile fees. A bill has been brought in at the Trenton Legislature, advocating a wheel tax for all road vehicles, in order to offset the anti-automobile spirit now in evidence in Jersey politics. The present registration law of New Jersey has been taken through all state courts and been upheld on the reasoning that the state has the right to tax whoever and for whatever it chooses. A test case will be taken, in the near future, to the Federal courts to determine this matter.

Mitchell May, Secretary of State of New York, suggested that in order to effectively protect the public against irresponsible chauffeurs, that statutes relating to the examination and licensing of drivers be modified as follows: Every man applying for a chauffeur's license must file his application 10 days before he is examined, and his name and application is to be published conspicuously in the leading papers of the state so that parties in possession of such information as would cause the license not to be granted have an opporunity to turn that information over to the Secretary. Upon having passed his examination, the chauffeur is to be given a book, with his name, description and photograph, and space for immediate recording of every arrest for violation of the state motor law.

The Secretary has also suggested that no automobile should be taxed less than $10 a year, whereas now the minimum tax is $5; furthermore, that high-powered cars be charged more than the present maximum rate of $25. Truck licenses should be charged for from $5 to $50, depending on the weight of the vehicle. Secretary May claims that the income derived by the State of Massachusetts last year was almost twice that of New York State, and that if the same regulations were used in the Empire State as are in use in the Bay State $4,000,000 a year could be realized instead of $1,000,000, the total of the automobile taxes of 1912 for New York. Remembering that the $50,000,000 appropriation for state highways was largely due to the requirements of automobile traffic, Secretary May considers that automobilists should do their share in helping the state.

Unfortunately, it is easily foreseen, that this statute, even if passed, cannot perfectly solve the problem of the irresponsible chauffeur as it would in Germany or France. The reason is that in those countries there is a system of announcement by which the police authorities of the land are kept informed of the identity of every resident and citizen. Every man being required to have credentials must therefore prove his identity and cannot assume a false name as easily as here, if his purposes make such a course desirable.

The Automobile Dealers' Association, New York City, has arranged a meeting for February 26, 8 p. m., in the Hotel Woodward, in order to consider the present campaign of state officials to increase automobile taxation and to adopt resolutions on the proper course to be taken.

Live Automobile Legislation in Ohio

COLUMBUS, O., Feb. 24—The Ohio senate has passed three bills which were introduced by Senator Lloyd, which affect the driving of automobiles. The object of the bills is to protect automobile owners from joy riders. Penalties of 30 days to 6 months imprisonment and fines of $200 to $500 are provided for any person who refuses to render aid to any one after running them down with his motor car. A statute provides for the suspension of chauffeurs for drunkenness.

Workhouse sentences of 4 months and fines of from $100 to $500 are provided for any one convicted of taking an automobile without the consent of the owner. For removing any part of the necessary equipment of a car sentences of from 3 to 6 months and heavy fines are provided. For mutilating any part of a car heavy sentences and fines are provided.

A bill has been introduced in the Ohio General Assembly by Representative Tetlow making it a misdemeanor for any one to blow his horn and ring his bell in a loud and unnecessary manner in the residence districts of the cities.

A meeting of all of the automobile organizations of Ohio was held here February 19 for the purpose of taking part in pending legislation before the Ohio General Assembly. The meeting was held at the rooms of the Columbus Automobile Club where luncheon was served. After the meeting a legislative committee visited the governor who said he was for the bill now pending in the legislature basing the registration fees for automobiles on their horsepower. The governor said, however, that he was in favor of leaving the matter to a referendum vote of the automobile owners of the state. It was urged that the payment of registration fees to $30 or $35 on a car was double taxation and opposed to the spirit of the constitution.

Pennsylvania to Abolish Tolls

HARRISBURG, PA., Feb. 24—A number of bills were introduced in the Pennsylvania legislature this week. One was for the appropriating of $3,000,000 for aid of township road building and maintenance for 2 years. The senate has finally passed the bill turning over to the state highway department the $1,800,000 collected from automobile licenses for the past 2 years.

Senator Beidleman introduced a bill designed to rid the state of toll bridges. It authorizes the state to purchase by regular condemnation proceedings bridges over 1,000 feet in length erected over streams by corporations organized under general or special law for the use of which toll fees are charged. Senator Beidleman also presented another bill, authorizing the state highway department to erect wherever the need exists, free bridges in connection with the development of the state system of highways.

International Elects Directors

At the annual meeting of the Internal Motor Company, New York, held last week, the following directors were elected:

Edmund C. Converse, chairman, U. S. Steel Corporation; T. L. Chadbourne, Jr.; C. P. Coleman, William E. Corey, U. S. Steel Corporation; Otis H. Cutler, American Brake Shoe & Foundry Company; Harry W. Davis, Delaware Trust Company; Herbert H. Dean, Edward B. Smith & Company; William G. Dickerman, American Car & Foundry Company; Frederick H. Eaton, American Car & Foundry Company; W. T. Graham, Montgomery Hare, Arthur H. Lockett, Pomroy Brothers; Hunter Marston, Blair & Company; Ambrose Monell, International Nickel Company; Thomas E. Rush, Charles H. Sabin, Guaranty Trust Company; W. D. Sargent, Reading-Bayonne Steel Casting Company; Warren A. Wilbur, E. P. Wilbur Trust Company.

The officers elected after the directors are:

C. Phillip Coleman, president; William G. Dickerman, chairman of the executive committee; E. C. Converse, chairman of the board of directors; F. C. Richardson, treasurer; Vernon Munroe, secretary.

System Provokes Strike

Lockout in Renault Factory Due To Opposition of Workmen Against Stop-Watch Methods

Block Makes 5,000 Men Idle—Hudson Gives $100,000 for Transcontinental Road

PARIS, Feb. 15—Objecting to a system of timing factory operations with a view to higher efficiency, most of the men employed in the Renault automobile factory went on strike this week. The drawing office staff and sales department remained at work, and this so exasperated the strikers that they invaded the factory, drove out the men found there and caused considerable damage to machinery and fittings. At this turn of affairs Louis Renault gave the order for the entire factory to be closed, thus throwing 5,000 men idle. It is declared that thoroughly disgusted at the violence shown by his workpeople, Louis Renault has left Paris for Nice and is resolved not to return until his workpeople have adopted a more sensible attitude. Meanwhile, no work whatever is being done at the Renault factory, but building operations on the new factory now being erected by the river are continuing without interruption. The buildings are being guarded by police and gendarmes.

Knox Liabilities Are $1,286,409

SPRINGFIELD, MASS., Feb. 25—A schedule in bankruptcy was given out today by the receivers of the Knox Automobile Company, showing total liabilities aggregating $1,286,409, total assets, $1,380,386 and total unsecured liabilities, $1,261,907.

Hudson Gives $100,000 for Stone Road

DETROIT, MICH., Feb. 25—The Hudson Motor Car Company has agreed to donate $100,000 for the construction of the transcontinental stone road, the conditions being the same as in the case of the Packard and Willys donations.

E. V. A. A. Holds Monthly Meeting

The Electric Vehicle Association of America held its monthly meeting on February 25 at the United Engineering Societies Building, New York City. The principal speaker was James M. Skinner, whose subject was the Philadelphia thin plate battery, illustrated with lantern slides. An excellent description of the thin plates for battery uses was given. Extemporaneous talks were given by the different members of the association on subjects relating to the progress of the electric vehicles in the commercial field. Special interest was given the distribution of electric service stations throughout the country.

Schimpf to Visit Western A. A.

William Schimpf, chairman of the Contest board of the A. A. A., will leave New York for Los Angeles next week, in order to take up with the Western A. A. the situation of contest regulations in the West under the jurisdiction of the national body.

Automobile Dealers Hold Elections

At a meeting of the recently elected Board of Directors of the Automobile Dealers' Association, Inc., held in its rooms in the Hotel Woodward, on Thursday, February 20, 1913, Harry M. Bronner of the Edwards Motor Car Company was elected president, Arthur M. Day of the A. Elliott Ranney Company, vice-president, and Frank Eveland, of A. G. Spalding & Brothers, secretary and treasurer. The new board of directors of the association follows: Frank Eveland, N. J. Budlong, Arthur M. Day, Charles M. Brown, Harry M. Bronner, I. N. Uppercu, C. H. Larson, H. L. Stratton, Wm. C. Poertner, and W. Arthur Lesser. Charles A. Stewart continues as general manager.

Ths association appointed a special committee to look after the increasing legislative work. This committee consists of Arthur M. Day, Wm. C. Poertner and R. H. Johnston.

Two new members were elected: the Pope Motor Car Company to be represented by G. M. Stratton, and the Edwards Motor Car Company, to be represented by Harry M. Bronner.

Motor Truck Club Talks Shows

In a meeting held by the Motor Truck Club, New York City, on February 19, the members discussed the questions as to whether shows pay. Opinions were divided. Nevertheless, several members reported that the show time caused a more or less general disorganization of the factory and selling forces. The practice of giving away tickets to prospective customers, etc., also helps to make shows more expensive than they would be naturally. The consensus of opinion seemed to be, at any rate, that while truck shows had merits, undoubtedly their cost is high.

Joy Riding Not a Larceny

MILWAUKEE, WIS., Feb. 24—That joy-riding does not constitute larceny or theft of a motor car and theft insurance does not cover the damages arising from joy-riding, was the decision of Judge Cordes in Civil Court at Milwaukee in the case of William K. Murphy against the Hartford Fire Insurance Company to recover $400 damages.

Mr. Murphy gave his car into the hands of one George Murray to be taken to Beaver Dam, Wis., for overhauling. While the car was in Beaver Dam, it was alleged that two of Murray's friends took the car one evening and after a wild joy-ride damaged the machine $400 worth and abandoned it at the roadside. Mr. Murphy carried theft insurance, as well as fire protection, in the Hartford, and demanded restitution in the amount of $400. The insurance company denied his request, on the ground that the action of the joy riders does not constitute theft and that the car had not been stolen within the intent of the law.

Johnson Enforcing Anti-Smoking Ordinance

Fire Commissioner Johnson of New York City has taken active steps to enforce the rule which forbids smoking in garages. This rule, which had been issued some time ago, has hardly been enforced heretofore; but, as the commissioner's investigations show that during the first two weeks of February five garage fires took place in New York.

Chauffeurs Against Law Breakers

The Gasoline Engineers Protective Association of New York City, which is a chauffeurs' organization, has decided to take whatever steps tend to reduce the public evil produced by irresponsible chauffeurs. A letter published by the organization a few days ago contains the following passages.

"The object of this association is to eliminate joy riding and drunkenness and uncalled-for violation of city ordinances, to oppose and try to have repealed unjust laws, try and prevent unjust newspaper criticisms, to put the profession on a high plane, so that a chauffeur will not be discriminated against because of his calling. Any chauffeur is eligible to membership who can furnish bonafide references covering a period of not less than 2 years and can fill the requirements as prescribed by our constitution and by-laws in regard to character. Character is the most essential requisite in gaining admission to this order."

Brooklyn Show Opens With 300 Automobiles

Small Shows Throughout the Country Now On—Some of the Cities Have Their First Shows

Fine Attendances and Good Sales Are Reports From the Different Exhibitions

WITH more than 300 automobiles arranged on the main floor of the Twenty-Third Regiment Armory, the Third Annual Brooklyn Automobile Show opened on February 22, in the evening. This show, which will fill the armory for one week, is a local show in a way inasmuch as the Brooklyn Motor Vehicle Dealers Association consists of automobile dealers handling motor cars in the Long Island territory, including in several cases part of Connecticut and New Jersey. The magnitude of the show, however, gives it greater significance than the ordinary local show. The armory, which is fully as large if not larger than Madison Square Garden, is entirely filled up by the pleasure cars and trucks which are arranged in two blocks extending from one end of the armory to the other, and which are separated from each other and from the wall exhibits by two aisles. A number of automobiles are also exhibited in the entrance hall and several along the further end of the building. Along the length walls of the armory accessories and other minor exhibits have found space.

The attendance to the show exceeds all former records, the opening night saw 12,000 visitors and the following days approximately 7,000 each.

As before the decorations are simple but tasteful, consisting of white fabric arranged under the roof and bunting mounted on it in several places to heighten the effect of the white. The armory, this year, was almost too small to house the exhibits which were arranged quite closely, in fact, much more so than last year. It was on this account that several of the Brooklyn dealers did not take space at the show but had their own exhibitions at their stores along automobile row, one block from the armory, where the stores were attractively decorated.

Davenport Attendance Was 6,000

DAVENPORT, IA., Feb. 23—With a total attendance of 6,000 the 5-day exhibit of the fourth annual Tri-City Automobile Show came to a close tonight. There were fifty-nine cars in all, placed by twenty-five dealers of Davenport, Rock Island and Moline. Electrics were one of the most popular of the exhibits this year, five makes being represented. High and medium-priced cars appeared to attract the most attention and it was in these classes that the most sales were made. There was a good line of accessories on exhibit. This year every available square foot of exhibit space was taken up and several dealers were unable to secure show room. The booths were cut down in size to allow as many exhibits as possible. Owing to lack of room no trucks or factory exhibits were allowed. Dealers reported that the largest percentage of buyers were farmers or residents of small towns adjoining the tri-cities.

Syracuse Show Is Biggest Ever

SYRACUSE, N. Y., Feb. 25—(*Special Telegram*)—The largest automobile show in Syracuse history was opened tonight, at the Armory, by Mayor Schoeneck, with the record-breaking attendance of 9,000. There are forty-two pleasure car exhibits representing fifty-five makes and ninety-five machines. There are eighteen exhibitors of trucks with twenty-two makes and seventy machines. There are also thirty-two exhibits of accessories and aeroplanes. Every inch of exhibition space is utilized. For the first time since the annual shows were started here there is space taken by every Syracuse dealer. The prospect for a successful selling campaign is excellent; several sales were made tonight and large numbers of promising prospects were reported. A feature is the large number of visitors from suburban districts who intend buying cars. The sales of trucks bid fair to break all previous records especially for light delivery vehicles. In the pleasure vehicles the demand seems largely for medium-priced cars. Th show lasts the rest of the week. Harry T. Gardner is manager.

RICHMOND, VA., Feb. 24—The first automobile show held in the Horseshow building this week proved a success and many cars were disposed of. The display embraced thirty-one exhibitors who showed sixty-eight pleasure cars, and seven trucks and wagons. The cost of the exhibits was estimated at $750,000. The exhibitors used 14,000 square feet, and 70 per cent. of the cars exhibited had electric starting and lighting systems.

Baltimore Show Seen by 35,000

BALTIMORE, IND., Feb. 24—When the doors of the Fifth Regiment Armory closed Saturday night it was found that in round numbers 35,000 persons had paid for admission to see the exhibition during the five nights.

There were forty-three exhibitors at the show and more than 200 cars and trucks on the floor of the Armory. All of the dealers report a large number of sales but the record seems to have been carried off by the Ford Automobile Company, which reports the sale of 143 cars.

Many Sales at New Orleans Show

NEW ORLEANS, LA., Feb. 24—Attendance at the automobile show, which closed yesterday, was 20,000. This is somewhat less than on previous years, but is accounted for by the fact that previous shows have been held during the Mardi Gras season, when many visitors were attracted only by idle curiosity. This year, with the show being held during Lent, it is certain that the greater part of those who paid admission had some active interest in motoring. Actual sales made during the show were larger than during any of the previous shows. Another feature that was brought out plainly during the exhibition was the interest taken by residents of the smaller towns and country districts.

Seattle's First Show Success

The Seattle, Wash., show has been declared a thorough success. There was an average daily attendance of 4,500 to see the twenty-one different makes. During the week there were more than 100 actual sales made from the floor of the Armory. Among the distinctive exhibits was the Oakland, on a platform elevated just enough to give it prominence.

HARTFORD, CONN., Feb. 22—What promises to be the best automobile show ever held in New Haven opened this evening at the Second Regiment Armory. Attendance was good. A total of 125 pleasure cars and trucks are displayed. Dealers assert that they are doing a good business and all indications point to a very successful week.

During the first week of coming September the forty-first annual convention of the International Association of Fire Engineers will be held. A most complete exhibition of fire-fighting equipment is planned, and Commissioner Joseph Johnson, of the New York Fire Department, is the chairman of the convention committee.

French Grand Prix To Start on July 12

Remy Electric Company Offers Remy Brassard and Trophy for Winner in 200-Mile Race at Indianapolis

N. H. Van Sicklen To Be Connected with the Savannah Automobile Club in Official Capacity at Races

PARIS, Feb. 15—It has now been definitely decided that the French Grand Prix race shall be a 2-day event on Saturday, July 12, and Sunday, July 13. The first day shall be devoted to the 560-mile big-car race on a fuel consumption basis equaling 14.1 miles to the gallon, and for which eighteen cars are now regularly entered. On the second day there will be two races, one in the morning being for motorcycles of 350 and 500 cc. cylinder capacity, and one in the afternoon for cyclecars and motorcycles having a sidecar attached.

As a result of a visit to the course, it has been decided to abandon the proposed scientifically banked cross-road. The two main legs of the course run almost parallel and only 120 yards apart for a distance of over a mile before they unite at a point known as La Fourche. Instead of taking the cars round the existing hairpin, it was proposed to build a cross-road a quarter of a mile from the present turn, with such a banking that high speeds could be maintained. A close examination shows that, owing to the difference of level of the two roads to be united, this task would be both difficult and costly. In consequence, an ordinary cross-road with the angles rounded off and a slight amount of banking at the inlet and the outlet will be built. This road will have a cement surface. The original plan of building the grandstands around this cross-road will be adhered to, with the pits on the inside of the bend. Work has already begun on the course and it is expected that it will be in fine condition by July.

Minneapolis After A. A. A. Run

MINNEAPOLIS, MINN., Feb. 24—The trustees of the Automobile Club of Minneapolis met Tuesday noon to consider ways and means to obtain a guarantee fund with which to back an invitation to be extended by the Minneapolis Civic and Commerce Association for the 1913 national reliability tour of the A. A. A. to start from Minneapolis and run west, preferably over the northern transcontinental route laid out last summer by A. L. Westgard as far as Glacier. It is understood that the Great Northern road will operate one or two complete hotel trains to run along the route for three meals a day and night lodging if this route is followed. This route is similar to that of the 1911 tour of the Minnesota State Automobile Association as far as Helena. The proposed A. A. A. route would turn from Havre and run westward 180 miles. Satisfactory return freight rates on the automobiles is to be made and entertainment at the park which will make the occasion long to be remembered is promised if the proposed schedule is carried out. Dr. C. E. Dutton is chairman of the committee to arrange for a tour. Asa Paine, fifth vice president of the A. A. A., is vice chairman and E. C. Hillweg is secretary.

Van Sicklen to Work for Savannah Races

SAVANNAH, GA., Feb. 24—N. H. Van Sicklen, president of the Chicago Motor Club and of the Chicago Automobile Trade Association, will be connected with the Savannah Automobile Club in an official capacity when the Grand Prize and Vanderbilt Cup races are run over the Chatham County course during Thanksgiving week, according to an announcement authorized by Harvey Granger, president of the Savannah Automobile Club.

President Granger has written to the Chatham County commissioners requesting that they give their aid from this time forward to perfecting the automobile course, as they have done in the past. There is no doubt about the desired co-operation being granted. The commissioners have already announced to this effect. The course will be shortened to 12 miles, and will be made as nearly perfect as possible.

As soon as the accurate measurements of the course are received, the question of the piston displacement of the cars to be entered in the Vanderbilt Cup race will be considered. It is hoped to change this displacement from 600 to 450. In order to do this it will be necessary to secure the consent of William K. Vanderbilt. As soon as Mr. Vanderbilt is heard from the entry blanks for the races will be distributed. While the reduction in piston displacement would bar out of the Vanderbilt Cup race one or two high-powered cars, it would permit them to enter the Grand Prize race and would make the field in the Vanderbilt much greater than under the present rules.

Only one curve of the several that will be a part of the completed course will have to be banked. The other turns were banked for the previous races. The whole committee on course has met and determined upon the report of the sub-committee, which recommended a 12-mile course.

Remy Brassard for Memorial Day

INDIANAPOIS, IND., Feb. 24—The Remy Electric Company, Anderson, Ind., has consented to offer the Remy Brassard and Trophy as the prize to be awarded the car and driver which first completes 200 miles in the next 500-mile race on the Indianapolis Motor Speedway, on Memorial Day.

INDIANAPOLIS, IND.—Frank P. Fox, of the Frank P. Fox Company, has formally entered a Fox Special in the 500-mile race, nominating Howard Wilcox as driver. It will have a four-cylinder motor, 4.75 inches bore by 5.5 inches stroke, with a piston displacement of 389.9 cubic inches.

It is announced that a special prize will be given to the driver leading at 100 miles. This will be the Red Head trophy, offered by Emil Grossman, manufacturer of Red Head spark plugs. If the driver uses Red Head spark plugs he will receive from Grossman $10 a week for 50 consecutive weeks, in addition to the trophy.

Washington 300-Mile Truck Run

WASHINGTON, D. C., Feb. 24—A 4-days' motor truck reliability run will be held May 5-8 under the auspices of the *Washington Post*. The route, which will cover about 300 miles, has not been definitely determined, but will be over a section of the country which will give a diversity to the test. The classification will run from the smallest delivery wagon to the heaviest trucks. It is intended to interest government officials in the test run and to this end invitations have been extended to various officials to participate. Already a number of acceptances have been received, particularly from members of the general supply committee, which frames all the specifications for motor trucks and every other commodity purchased by the government. The run will be conducted under the rules of the A. A. A.

The initial 1913 run of the L. I. A. C. was held on February 22, from the home of the club to Finlayson's Hotel, Rockville Center. There were thirteen cars in the run, and fifty members participated. After returning to town in the evening the party started for the automobile show.

The Long Island Automobile Club plans a large number of contests for the coming season, and so far nineteen trophies have been received from various donors. The first competition will be held on April 5 and the second on April 20.

Digest of the Leading Foreign Journals

Silent Cam and Gear Action and Simple Oiling in Hotchkiss Motors—Cost of Tires and Fuel for Omnibuses—The Fuel Feed in Automobile Diesel Motors as Proposed by Malms—Improved Reciprocating Piston Pump for Fire Engines

FEATURES of Hotchkiss Motor—While the 18-horsepower Hotchkiss car, made by the arms company of the same name, is of very conservative design in the matter of following popular tendencies, some exclusive features are found in it. They relate mostly to the motor, though it is also noted that a special differential gear is employed to equalize the action of the wheel brakes. The motor has four cylinders, 95 by 130 millimeters, cast in one piece but with each cylinder completely surrounded by the cooling water. Silence of the valve mechanism is effected by the construction shown in Fig. 1. The tappet rods are in two tubular pieces, P and M, held apart and in continuous contact with the cam K below and the valve stem S above by means of the coil spring R, and the tubular space is nearly full of oil. When the cam K raises the roller G the two parts of the tubular tappet thus come together inside of the guide T. The construction permits an easy adjustment of valve lift by means of the thin washers L. The customary valve housing is also employed.

The camshaft is driven by mitre gear pinions from the crankshaft and drives in turn the pump and the magneto through similar pinions. To avoid vibration in this drive, the mitre gear wheel on the camshaft has its crown mounted upon the spider with a capacity for a slight elastic yield between these two parts, the mounting being effected by means of four small leaf springs secured radially to lugs on the spider and lugs on the crown.

The principle of the motor lubrication is that a force pump drives an excess of oil through a very large bore extending throughout the crankshaft with relatively very small lateral bores to the bearing surfaces, this arrangement having been found sufficient for obviating all chance of the first bearings in the circuit robbing the last ones of their quota of the oil. The pump is of the oscillating type, the piston being actuated by an eccentric on the flywheel-end of the crankshaft, immediately inside of the end-bearing. Its construction is shown in Fig. 2. The pump cylinder is pivoted by means of shaft G to a plate which is secured by eight bolts to the outside of the bottom of the crankcasing covering a hole in the latter, and the whole mechanism, excepting the plunger piston which remains suspended from the crankshaft, can be pulled out and cleaned if necessary after undoing these bolts. A sheet metal bell O is secured to the cylinder body and contains a filter P through which the oil must pass to reach the entrance ports H which are uncovered when the plunger D is raised. When the plunger goes down and has passed these ports, the oil is forced up through the bore I in the plunger, having no other exit, and at a certain point in the stroke passes into canals J and K in the eccentric and to the central bore L in the crankshaft. From the last crankshaft bearing a column of oil is piped to a pressure gauge on the dashboard. The excess oil forced out of the crankshaft bearings and the connecting-rod bearings serves for the splash lubrication of the cylinder walls, piston pin and camshaft. A safety valve Q in the pump barrel limits the pressures in this body. The amount of oil in the crankcase is ascertained by the old means of high-level and low-level trial cocks.—From *La Vie Automobile*, February 8.

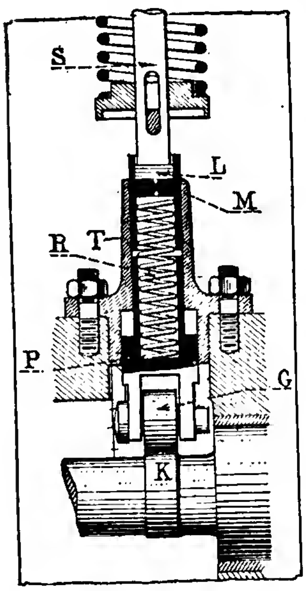

Fig. 1—Hotchkiss valve action

Spring Suspension—It is mentioned as a fact verified by experience that the front springs of an automobile affect the comfort of those sitting over the rear springs. For example, in a certain car an intolerable galloping motion developed over the rear axle whenever the vehicle was driven at medium or high speed over a lumpy road, and this trouble was remedied completely by adding two leaves to the front springs, stiffening them.—From *La Pratique Automobile*, January 10.

TIRE Cost Down, Fuel Cost Up—When the General Omnibus Company of Paris received its franchise, the estimate which was furnished the municipal council called for a little more than 1 franc of receipts and expenditures for one omnibus per kilometer, everything included. The results of operation fell a little below this estimate, and the expense per vehicle-kilometer is in fact at the present time slightly below 1 franc. Included in this estimate 0.20 franc had been allowed for tires and 0.12 franc for the fuel. In the actual operation these figures have now been reversed. The fuel cost exceeds 0.15 franc at a market price of 34 francs for 100 kilograms of benzol, a price which will soon be left far behind. [In Germany the consolidated benzol manufacturers have, on the other hand, agreed to keep the price of benzol at what it is now for a series of years.—Ed.] In contrast herewith the cost of tire maintenance, including first cost and renewals, has gradually gone down to 0.10 franc and should, it seems, not exceed 0.09 in the future. This result is greatly to the credit of the tire makers, who in two or three years have succeeded in raising the durability of the tires from an average of 12,500 kilometers of service, as it was during the first years of omnibus traffic, to 40,000 or 45,000 kilometers. Certain Bergougnan tires have even lasted for 68,000 kilometers. But it is to be noted that the first cost of these more durable tires is also considerably higher than that of the tires used at first. [The advancement in the economical results is perhaps, to a great extent, to be ascribed to a better understanding in suiting the tire dimensions to the work demanded of them.—Ed.] It is plain what a deficit the General Omnibus Company would have had to face if the tire makers had not come to its rescue. But the last word has not yet been said. The fuel prices continue to rise, and the economical difficulties are going to set in again without any hope this time of being able to offset the increasing fuel prices by a corresponding reduction in the tire maintenance cost.—From *Poids Lourd*, January 24.

Error in Chain Length Formula.—In the formula given in the issue of January 30 for calculating the length of a silent camshaft chain from the distance between crankshaft and camshaft, or vice versa, read π^2 (pi square) instead of the meaningless η^2 (eta square).

THE Adapting of Diesel Motors to Automobiles—An account was given in THE AUTOMOBILE of Jan. 16 and 23 of the difficulties which are met when an attempt is made to apply the Diesel principle and Diesel motor fuels to such relatively small and light high-speed motors as are required for automobile purposes and of the mechanical ways and means proposed by Engineer Otto Malms of Mannheim, Germany, for overcoming these difficulties—all of this being taken from an article in a German automobile journal. A doubt was expressed as to the complete efficacy of the fuel feed recommended by him and in consequence hereof a letter has now been received from Mr. Malms showing that the doubt was based on an incomplete understanding of his proposition. As the subject matter is of the deepest interest for the development of the automobile and its allied industries and for a final settlement of the mooted fuel and fuel-price question which is convulsing Europe and agitating America, the letter is translated herewith, while the reader is referred to the previous articles with regard to the details of the proposed construction. Mr. Malms writes in substance:

Editor THE AUTOMOBILE—I have read with interest your account of my treatise on "automobile Diesel motors." Your exposition of the subject shows that you have throughout understood everything as I meant to convey it, and I thank you for the pains you have taken in rendering it in English. Only with regard to the control of the fuel valves leading to the fuel nozzles has a small and easily pardonable error slipped in. If you read once more the passages in my original article which deal with this point you will find that in describing the fuel pump I said that a fuel valve arrangement must here be employed similar to that shown in Fig. 1 [Fig. 4 in THE AUTOMOBILE, Jan. 16], but that the valves must be operated with an invariable stroke and invariable timing, also that the period during which the valves remain open must be so extended that the four periods of the four valves in a four-cylinder motor will overlap, to the effect of producing a continuous fuel feed from the valves, corresponding to the continuous fuel supply from the pump. In other words, the fuel valve of each cylinder must not only remain open during the entire suction stroke, but also during a portion of either the compression stroke or the exhaust stroke.

As the pump at any given cam adjustment always delivers the same amount of fuel for each revolution and the fuel valves to the nozzles have unvarying periods of opening and closing, the amount of fuel fed to each of the cylinders MUST also remain invariable. In order to regulate this amount, the oblique cams are displaced and the amount of fuel supplied by the pump in a time unit is thereby increased or reduced. The same effect can be obtained by changing the gear ratio between the motor shaft and the pump shaft, for example by means of a friction gear. No difficulties can arise by this system, and it looks as if the described arrangement might be the only practical one for feeding strictly measured quantities of liquid fuel in the very small doses required.

I must add that a patent for this fuel feeding system has been applied for.

Thanking you in advance for correcting the little error by means of these explanatory remarks, I remain (*Signature.*)

The correction asked for by Mr. Malms is cheerfully conceded, although the necessity for it is due mainly to the ambiguous explanation of the feature referred to given by himself in his original treatise. What he said was, literally translated, as follows: "The distribution to the four nozzles of a four-cylinder motor is also in this case effected in the previously described manner as illustrated in Fig. 1 [Fig. 4 in THE AUTOMOBILE, Jan. 16] by means of a mechanically controlled fuel valve with equal stroke and equal period of opening for each nozzle, and with the open-periods of the valves somewhat overlapping."

This doubtful passage has now been explained by its author, and the explanation is so much more interesting as it shows that the proposed system is applicable only to motors having a sufficient number of cylinders to admit of keeping one or another of the fuel valves open all the time, and that the system therefore presumably is still better applicable to a six-cylinder motor than to a four.

With this explanation a highly important feature in the construction proposed by Mr. Malms remains undisclosed, however. The mechanical means by which the opening and closing of the fuel valves are synchronized properly with the cycle of the motor, whether the motor is running fast or slowly under variations of its load, and yet so adjusted that the open-period does not vary, are not at all described. And yet, a fuel valve motion of this nature can scarcely be characterized as obviously simple. Perhaps it might be effected by placing the needle of the fuel valve—each of them—under the influence of two springs, one stronger than the other, and having the opening of the valve effected by releasing the stronger spring of the two, so as to push back the weaker spring at a certain speed, determined by the difference in the springs, and raising the needle from its seat during the time required for this differential spring action.

But Mr. Malms does not say that this or any other definite method is the one which he proposes, and his proposition therefore remains mechanically incomplete at a very important feature, with regard to which, it may be inferred, information is for the present withheld for reasons connected with the patent protection which he desires to obtain. Assuming, on the other hand, that this important feature has in some manner been covered by the inventor, although it is not disclosed, and that no serious objections exist against feeding the fuel into the nozzles of the motor cylinders during periods bearing a very different relation to the strokes of the motor than that which is

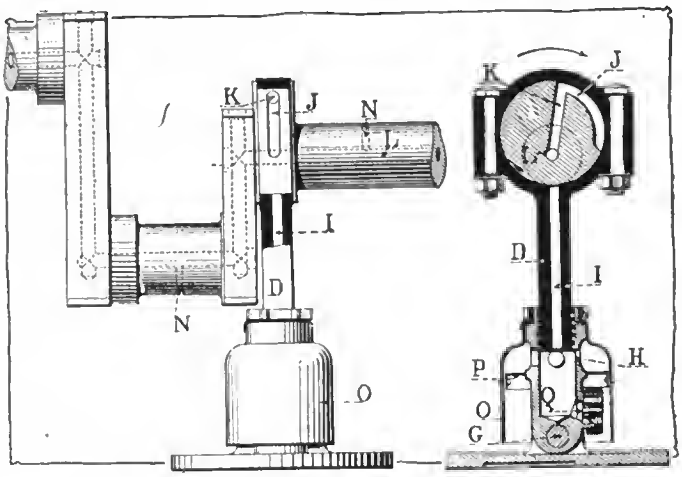

Fig. 2—Oil pump in crankcase of Hotchkiss 18-hp motor

observed in ordinary Diesel motors, the general mechanical scheme set forth by Mr. Malms must be admitted to be not only interesting and suggestive but of the greatest practical importance. But its value hinges perhaps on the undisclosed features.

IMPROVED Piston Pump for Automobile Fire Engines—The manufacture of fire engines is knocking at the doors of the automobile industry, claiming admission as a branch of production in which great progress may be effected, both mechanically and economically, by the same methods which have improved and cheapened automobiles. Closely studied this line promises perhaps better profits for a while than the manufacture of heavy trucks, since the competition in the fire engine line is with larger and heavier engines of greater complication and higher cost while in the truck line it is with a mode of transportation, by horses, usually calling for a smaller initial investment.

While it is the simple centrifugal pump driven from the automobile transportation motor which is responsible for moving fire engines into the automobile domain, it is noticed that the advantages of these pumps are now reacting to bring about improvements in other types of pumps, so that those, too, may be mounted upon ordinary light truck chassis or heavy automobile chassis with very few changes in details of construction. In this respect the Drouville four-cylinder piston pump, made at Nancy, France, must engage the attention of those interested in the movement. Many of the technical shortcomings of old-style piston pumps, as these have been used in fire engines drawn by horses or propelled by storage batteries, have been overcome or reduced in this construction. It discharges a stream of water with almost the same regularity as a rotary pump, moving the water continuously in the same direction. The construction is shown in two sectional views in Figs. 3 and 4, the latter being a section on the line XY of Fig. 4.

The four single-acting cylinders are placed in the form of a cross and are secured to a double bronze drum forming two concentric annular chambers in the outer one of which, *b*, the water is received from the supply hose attached at B, while the inner one, *c*, is the pressure chamber from which the streams are sent forth through hose attachments at CCC. The pistons F have two opposite leather facings securing water-tightness in both directions of movement. The bottoms of the cylinders are closed by the suction and pressure valves L and M, which are thus of maximum dimensions; they are made of molded rubber stout enough to resist the pressures. Opposite to the end of each cylinder and opening into the annular chamber *b*, a screening O is secured by gudgeons and screwbolts, and a bolt running through the axis of this cylindrical screening holds against the inner end of its frame a perforated metal plate which serves as a seat for the rubber valves.

The rods of each pair of opposed pistons are rigidly assembled and journaled upon a square frame mounted by means of two ball bearings on the crankpin of a central shaft which receives its motion from the motor shaft or the gear-box of the vehicle. The two middle ball bearings correspond to one pair of pistons and the two outer ones to the other pair, and the piston rods of the latter pair are forked so as to allow those of the other pair to pass them in the rotary movement of the crankshaft by which the pistons are actuated.

As the reciprocating movements of the four pistons take place successively and in the order of rotation, the current of water produced in the annular pressure chamber *c* always follows the same direction and is practically continuous. Nevertheless an air bottle, not shown in the illustration, is connected with the pressure chamber at the top of the drum and serves the more complete equalization of the water pressure in the fire hose, as in other less well balanced fire engine pumps of the reciprocating piston type. Usually provisions are made, as indicated in the illustration, for attaching three hose to each pump and the whole mechanism is mounted at the rear of the automobile frame with the drum in a vertical position and the hose nipples extending directly to the rear at the points marked C. A bypass valve, regulated by hand admits of ready reduction of pressures, so that the pump and the motor may continue to operate even if the hose nozzles are frozen up or otherwise clogged, but the safety offered in this respect is of course not quite equal to that which the centrifugal pump automatically affords. Still, the worst that can happen if hose does not burst and the Drouville pump is sufficiently robust to withstand the pressures which may arise when the motor is coupled to the low gear and the motor is running full tilt, is the stopping of the automobile motor.

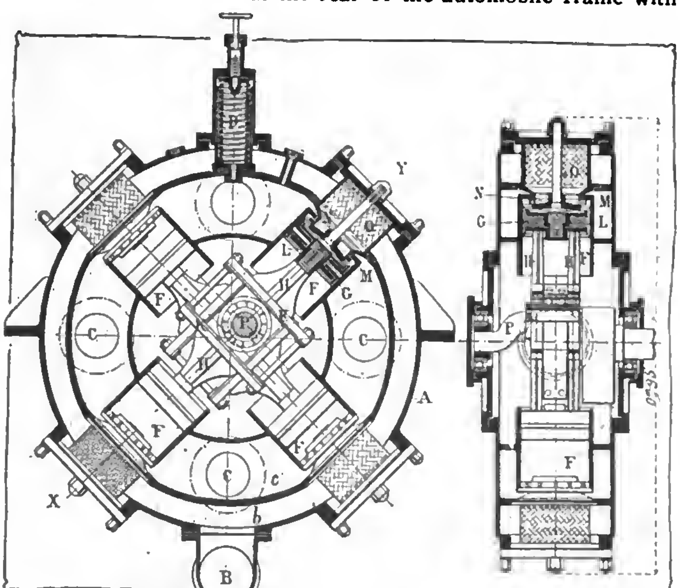

Fig. 3—Vertical section of Drouville, four-barrel piston pump for fire engines. Fig. 4—Section on line XY of Fig. 3

In comparison with other fire pumps of the reciprocating piston type, the Drouville construction presents improvements which are best realized by a summary of the requirements. There should be as little dead space as possible; the valves should be light and should have a minimum overlap on their seats, so as to reduce the difference between the resisting-pressure which acts on their largest diameter and the working-pressure which acts on the area of the aperture in the valve seat. These requirements apply to all water pumps depending on suction. For fire engine purposes additional ones are to be considered. A short stroke is bad, because it multiples the shocks which always accompany the reversal of the piston movement; and the average rotary speed should preferably be small to reduce the irregularity resulting from the transformation of a rotary into a straight-line movement. Finally, it is necessary for efficiency to avoid all narrow water passages, as the strangulation of the fluid involves a considerable loss of power which makes itself felt in a reduction of the working-pressure and a shorter reach of the stream.

Usually these requirements are very imperfectly met in fire engine pumps. In the Drouville construction, on the other hand, dead space is greatly reduced; the large valves minimize strangulation; their small weight, due to the material of which they are made, quickens opening and closing; the rotary course of the water in the annular channels counteracts eddies and shocks; and these good points make it practicable to use relatively small cylinders with a short stroke without experiencing the usual inconveniences from these technical shortcomings—which it is difficult to overcome without making the whole machine too cumbersome and heavy.

In practice the current type of this fire engine pump has cylinders of 140 millimeters bore and 80 millimeters stroke, and the speed corresponds to 300 to 400 revolutions per minute of the pump shaft, so that it may be operated with a gear reduction from a normal automobile motor of moderate power. In these dimensions the pump can handle 90 to 120 cubic meters of water per hour when used as a mere excavating pump and registers a manometer pressure of 80 meters of water (10 atmospheres). The depth from which it can draw the water can reach 8 1-2 meters [the theoretical maximum for a suction pump being 10 meters, corresponding to one atmospheric pressure], and it can throw a stream 50 to 60 meters horizontally and 35 to 40 meters vertically [presumably with the most favorable diameters of hose and hose nozzle, these dimensions not being specified in the account].—From *Le Génie Civil*, February 1.

INNER Tubes Improved by Glycerine.—The French firm making "Sparklets" tubes containing highly compressed carbonic acid gas to be used for the inflation of automobile tires now offers a small special can full of "Glysoto"—which is a liquid made from glycerine as a base—to be used once a year together with the "Sparklets" tube for the purpose of preventing the carbonic gas from escaping by exosmosis through the rubber wall of the inner tire tube. It has been found that this gas escapes more rapidly than common air at the pressures required for tires and that consequently the tire goes soft in quick order unless this new precaution is taken, and it has been found, on the other hand, that glycerine, of all viscous liquids, is one which does not injure rubber but on the contrary improves it and preserves it.—From *Omnia*, February 1.

Efficiency and Its Ends

Principles Applied Must Eliminate Waste of Energy Growing Out of Many Reasons

Co-operation of All Parties Involved in a Business an Essential of Success

THERE is a widely prevalent idea that scientific management as applied to garages, repair shops, stock rooms and so forth consists merely in the introduction of recording systems, principally composed of a number of blanks; on each of which as many details as possible are recorded. Take, for instance, the example of a repair shop; there, some forms are used to note the exact time spent by each man in the shop and on what individual jobs and other forms for recording the parts and tools used on the jobs, etc. This information is, of course, important; but frequently is taken for the end instead of the means to a higher end. This higher end is the constantly increased approximation of ideal establishment efficiency.

The word efficiency, which is now in the mouths of everybody, has been used and abused so much of late, that it should be worth while to make clear and definite the idea for which it stands. Making use of an analogy, it appears at once that efficiency in industrial and commercial operations means the ratio between the individual energy spent by a worker or a set of workers, independent of what their standing is, and the useful work accomplished. It is only the useful work which interests us directly, the remaining quantity of the individual effort spent being negative from an economic viewpoint. The ratio is therefore, akin to that proportion between latent heat of combustion of a fuel and the useful work delivered at the point where it is finally used, that is, crankshaft or roadbed.

The question of efficiency, looking on it from the point of vantage of the Business Man, resolves itself, then, into that of obtaining a maximum of useful work from a fixed quantity of effort exerted by a worker. Let us say that the energy spent by an average man in his daily work corresponds to the energy contained in .6 pound of carbon, or 8,400 British thermal units. This energy is spent during, say, 8 hours. The rate of energy expenditure may vary, but as a rule is fairly such as to be representable by a straight line, excepting a maximum at the start in the morning and a depression about noon. The average energy expense is therefore 1,050 British thermal units an hour. This expenditure is identical with the worker's effort, namely, action, accompanied by consciousness of a variable nature on the part of the worker. **The effort, however, which results in the expenditure of 1,050 British thermal units an hour is fixed. The variable nature of individual consciousness depends largely on the rate of energy expenditure, the nature of the work and the individual constitution—including in this term all the personal qualities—of the worker.** Consciousness includes, of course, all agreeable and disagreeable sensations, being both of a physical (bodily) and mental nature.

Exact Study of Workers Essential

Following is a truth, carrying conviction to every student of man and his work: The most advantageous state of individual consciousness, that is, to the individual himself, during work, obtains when the work is that best suited to a person's constitution—in the widest sense of the word—done at the rate best suited to his constitution; which latter is therefore the fundamental factor determining the result of a man's work. In other words, a man working—not loafing—at the rate and at the work which best suit his natural individuality will, under these conditions, turn out work of the highest efficiency within his possibilities. That is to say, under these conditions, the greatest possible quantity of the energy spent by him will be translated into useful work.

The problem which the scientific manager faces consists therefore in the finding of the best conditions under which the men directed by him should operate. A number of general experiences in this regard are, of course, widely recognized. Everyone knows that writing, typewriting and kindred work is easier and better done seated before a suitably built desk than standing. Again, the height of the worker and the desk introduce a number of possibilities determining the various results. Likewise, everyone knows that the average individual works easier in the early morning than in the afternoon or late evening, provided he had a normal amount of sleep before starting work, and for this reason the hardest work should always be done in the morning, when the worker's mind and body are in best condition to execute their tasks. It is further known that certain physical work such as marching is made much easier than otherwise by following a rhythm played or sung. Likewise reading, writing and calculating are made difficult by exactly the same expedients. But who knows exactly what and how much food is best taken for breakfast, lunch and dinner, to develop a person of greatest working efficiency? Or in which cases a man's efficiency is increased or decreased, by stimulating him in a friendly, severe or contemptuous way? Dozens of similar questions must suggest themselves to the man fit to be a scientific manager.

Great Managers Need Big Brains

Managers there are a-plenty, but few are scientific. Science, that is to say, knowledge, is the difference between the modern and efficient manager and the old-fashioned and unefficient one. To be a great manager, it is not only necessary to know how to give orders, but also what orders to give, to whom and when. The great, scientific manager must not only understand the requirements of business in general and his specific business in particular, but he must also have a fundamental understanding of economics, psychology, physiology and anatomy; not too much and not too little; he must be a specialist and a man of widely varied knowledge at the same time; and he must have the ability of forming original trains of thought and of understanding, criticizing and improving upon the thoughts of others. It is because of these manifold requirements, that the number of scientific managers of magnitude is small today; as in every other field of endeavor, many are called but few are chosen.

Truly scientific management is distinct from all other activities formerly known, in one way. As indicated in the above remarks, it recognizes that maximum industrial success and individual happiness are capable of being harmonized. Thus it makes possible the solution of the greatest problem which the world has known for the past forty centuries.

Coming back to the original subject of record systems and their importance, it stands to reason that unexact records are of no more value than none. It must, therefore, be impressed upon the men in charge of the system, that the exactness and truth of all records is of first importance. They must not only be convinced of this but also of the fact that the records benefit them as well as the business. They must see that their interests and those of the business are parallel. And there is no way of convincing them of this but by the truth. If scientific management is made a means for increased business and profit only, if it is thus fashioned into a hollow mockery of a splendid idea, it must not only accentuate industrial difficulties, but result in less business returns than could be obtained if the idea were taken up honestly.

Business, the sum total of great activity of today, needs men, men of the biggest caliber. Men of great conceptions, great power and, above all, men of immense courage. It takes less courage to accentuate than to annihilate differences. The business man of yesterday's every action did the first and nothing else; the business man of tomorrow will do the second thing.

A Brewery System

With Few Blanks, Complete Records of Full Truck-Operating Cost Are Being Obtained

All Records Are Made Out by People Other Than the Drivers

THE following record system used by the Lion Brewery, New York City, for keeping track of the work done by its automobile trucks and the cost of this work is a good illustration of how a truck fleet of medium size may be handled efficiently. The above-named brewing concern uses twenty-seven trucks, eighteen of which are of the gasoline type and nine electrics. Among the gasoline trucks, ten are 5-ton, five 3-ton and three 7-ton models. The electrics are all of the 3-ton type. This firm, which is gradually motorizing its entire delivery system, uses electrics for local deliveries and gasoline trucks for long-distance hauls, the average traveling capacities of gasoline vehicles being from 50 to 58 miles a day, and that of electrics from 20 to 25 miles, according to the company's records.

In considering the system of the Lion firm, one fact stands out strikingly and apparently advantageous. This is, that the drivers of the trucks are not troubled by attendance to the system. The latter covers travel reports, gasoline, oil and current consumption reports, repair reports and accounts of cost. In every case, the records are kept by the other party; gasoline-and-oil or current attendant, repair shop foreman, Jones recorder and accountant. This permits the driver to concentrate on his work proper without being bothered by details which really should be up to other people to attend to.

The principal forms of the system are: (1) the daily Jones recorder card; (2) the daily gasoline and work report; (3) the monthly record of weight carried and fuel used; (4) repair record; (5) yearly cost record, giving fuel, oil and weight carried, cost of repairs, etc., for every month and the whole year. Finally, a still more detailed cost sheet covering this information, together with averages calculated on their basis.

(1) The recorder card, Fig. 2, is used in connection with the well-known Jones recorder, being a blank of 4.13 inches diameter. In the case of the Lion Brewery, the blank is printed red on heliotrope paper, and the reverse side, not shown here, has spaces on which the date, truck number, driver number, route, number of miles traveled during the day, time of the truck being out of the garage, number of stops, gasoline used during the day, actual running time, time spent standing, weight carried during the day and special remarks are entered. When the truck starts out in the morning, the first three points of information mentioned are written on the back of the recorder blank. After the day's run is complete, the other data are entered, being obtained partly from the line made by the recorder pencil and partly from the data appearing on

(2) The daily gasoline and work record, Fig. 5. This form consists of a blank, 6 by 3.75 inches, printed black on thin yellow cardboard. The details which are required to form totals entered on the reverse of the recorder card are first entered on this card. The card is held by the checker in the garage who takes notations when the truck leaves and arrives. The weight is determined by the number of kegs of beer bottle boxes carried, which are of standard weight. The card provides for three trips a day, and this is ample. When the card is complete, the checker gets the gasoline report by seeing the entry in the book of the gasoline-and-oil man. This information being entered, the card is sent to the office, together with the recorder card where it is held in a reference file until the end of the month.

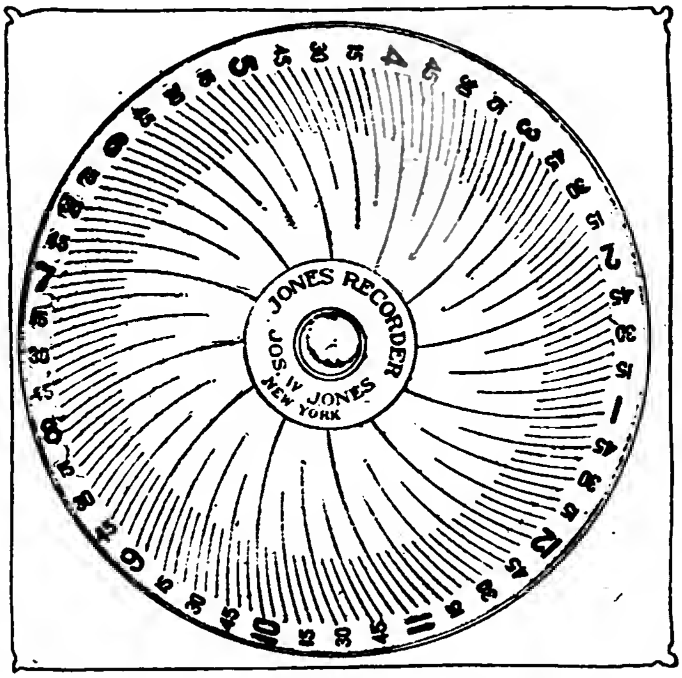

Fig. 2—Blank card used in Jones recorder

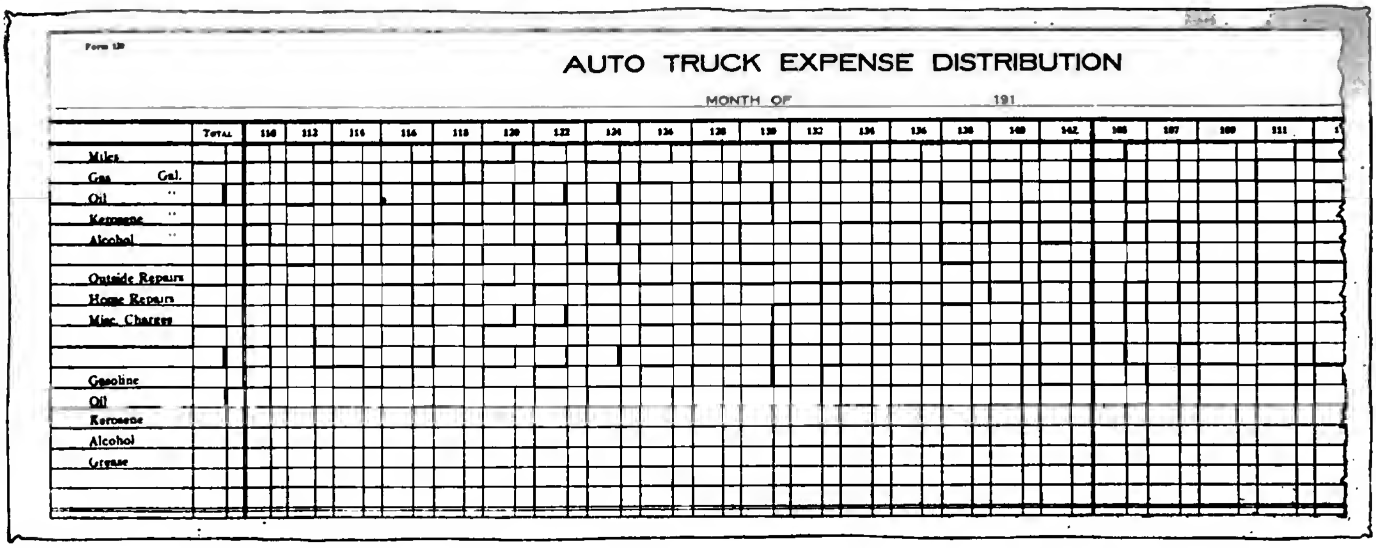

Fig. 1—Blank for keeping monthly records of full truck cost and all its individual items

(3) At that time, all the records are segregated and grouped by the trucks to which they refer, and the monthly report, Fig. 1, is made out. This form is printed on yellow paper, 17 by 5.25 inches, ruled red and blue and printed in black and all the various data are entered, for which space is provided.

(4) Repairs which are made in the shop of the Lion company are recorded on the repair form, Fig. 3. This form is 4.25 inches square, printed on thin white paper and lined blue and red. All that is entered on the form is the date on which the repair work was done, the number of the automobile repaired, the number of the workman in the shop who did the work and the hours spent by him on the job, together with the total cost of the repair which includes the labor and the cost of the material used for the work. These repair records are made out by the foreman of the repair shop, and when completed are signed by him and sent to the office of the company. Whatever repair work is done outside of the company's shop, is of course charged to the company and the office charges the various truck accounts with the total repair costs of each individual truck.

(5) At the end of the year the accounting department computes the records of each truck for mileage made, weight carried and gasoline used during the entire year. The form, Fig. 4, is used for this purpose and it is printed on both sides, giving

space for 6 months entries on each. The figures referring to the three kinds of data are entered on this form for every day of the year, so that it is easy to figure up the total weight carried and gasoline consumed during the year and to calculate averages on the basis of the mileage, both for the entire year and for periods of 1, 2, 3 or 6 months.

There is another form in use by the Lion company. This, however, does not appear on a specially prepared blank, but is made up after the end of the year and contains all the information summed up from the various forms described above. This general sumup is designed with thirteen columns, one for every month and a column for the total amounts of the year. The total amount of gasoline, oil and tires used by the company during each month are noted on this blank as are the weight carried, the mileage made, the hours run, the amount of repair work done, and the costs of tires used. All amounts of one kind appear in one line and in the thirteenth column are footed to a total. A second section of the report appears under these data and contains the monthly and yearly averages such as gasoline, oil, repair and tire cost per mile traveled and the weight carried per mile. Furthermore the average running cost per mile and the cost per ton are given on this report.

A special report form is used to keep record of the tires used by the trucks. One blank is used for every truck being marked with its number and on it spaces are provided for entering the following information relative to the tire on each of the four wheels of the truck. The date on which the tire was mounted on the wheel, the mileage for which it was used and its make and cost are entered on this form so that the company is in a position to get the most detailed information on tire cost on its trucks.

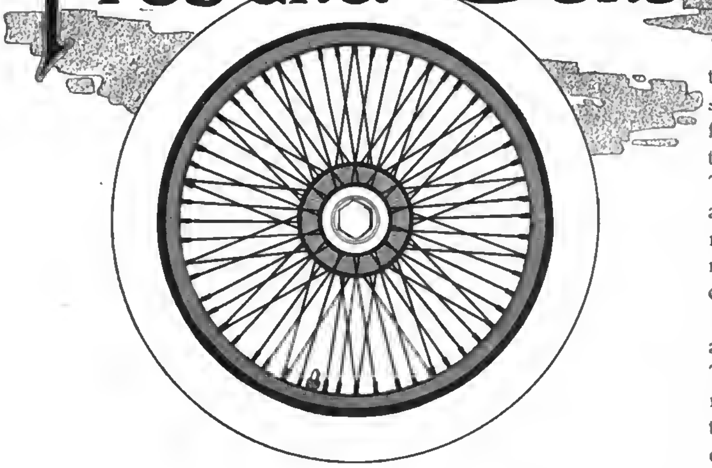
Pros and Cons of Wire Wheels



Triple Spoke Wheels Designed To Take Great Lateral and Driving Strains—Method of Carrying Spares

—

WIRE wheels were in use in the early days of the automobile. But the constructional methods of that time were not along lines that adapted this type of wheel to the peculiar road conditions required by the new vehicle. The wire wheel was therefore soon dropped on the superior showing of the wood artillery wheel, which continued to hold its position unchallenged until the introduction of the Rudge-Whitworth design in England.

Besides greatly improved construction, perhaps the feature which has contributed most to success of the modern wire wheel for automobiles is the invention of the triple spoke type, and it may be of interest here to outline the various functions of the three sets of spokes constituting the triple spoke wheel.

The vertical section, Fig. 1, shows the arrangement of spokes usually followed. It will be noticed that the outside set of spokes A is considerably dished, while the inner set C lies practically in a vertical plane. There are two reasons for this disposition of the spokes. First, the plane of tread is brought well over the inner end of the hub, thus keeping the wheel track small, and in the case of the front wheels preventing the dangerous strains that would follow on a large overhang of the steering knuckles; and second, the wheel itself is thereby rendered capable of resisting a great lateral shock. This latter point is brought in Fig. 2. Supposing the lower part of the rim to be subjected to a blow in the direction of the arrow, as when the car is brought up abruptly against the curb, practically the whole of the shock is taken in tension by the outer set of spokes A, the dished position of which render them peculiarly fitted to receive it. The spokes B and C, owing to their position are incapable of resisting such a blow to any great extent. Their function is almost wholly confined to driving and braking, although the slightly oblique position of the spokes B also offers resistance to lateral shock in the opposite direction. In automobile driving, however, a blow from the inside is rarely encountered.

All three sets of spokes radiate tangentially from the hub, but at different degrees corresponding to their respective functions. Thus the outer spokes A depart only slightly from a strictly radial lay-out, Fig. 1, and are not intended therefore to contribute to the drive from hub to rim. The spokes B and C are, on the other hand, arranged tangential to a circle almost as large as the hub flange to which they are attached. By this arrangement half of each set are in the best tensional position to take the driving strains, while the other half, issuing in the opposite direction from the hub, deal in a similar manner with the braking strains. This point is illustrated in the right-hand view, Fig. 1, in which the upper half of the wheel is shown only partially assembled, the spokes issuing in one direction not being shown.

The strains to which tangential spokes are subjected in practice is indicated in the diagram, Fig. 2. Here, two spokes are shown in the position they occupy in the wheel. When driving the hub in the direction indicated the existing tension of the right hand spoke is increased by a pull in the direction of the arrow, while the same turning force produces an opposite effect in the case of the other spoke, reducing its tension by the same amount. One of these spokes transmits the drive and the other offers the necessary resistance to braking strains. The function of each is quite distinct, one of them being out of action at all times.

—

Carrying Spare Wire Wheels

The means of carrying the spare wheels on a car equipped with the wire type is a similar problem to that met in the case of demountable rims. But there is this difference: The wire wheel, being complete with its hub, permits an easier solution owing to the fact that a simple stub or dummy hub is all that is necessary for a firm support. With the demountable rim

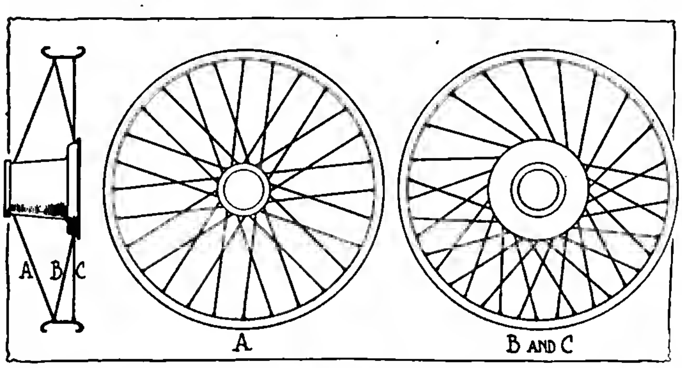


Fig. 1—Constructional diagrams of the triple spoke wire wheel, showing layout of spokes

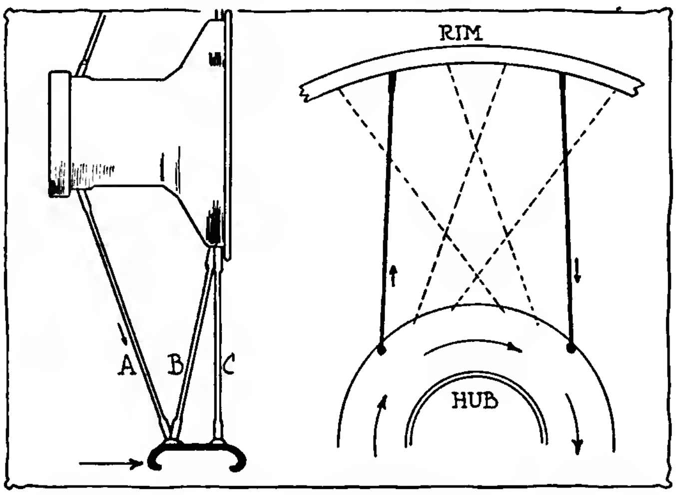

Fig. 2—Diagrams showing the lateral and tangential stresses imposed on wire wheels

the same rigidity of attachment can be secured only by the use of a framework or series of clips attached to a strong bracket. In either method, the difficulty of combining structural strength with sightliness is apparent.

It is true that although the dummy hub fixture has shown points of undoubted superiority in many European cars so fitted there are still large numbers of cars fitted with wire wheels in which the spare is carried in brackets of the type associated with spare tire carrying. The former method, usually applied in the running board position, has proved entirely satisfactory as far as the actual fixing is concerned. The dummy hub was arranged on a bracket mounted on the running board in such a manner that the tire did not come into contact with any part of the car.

The running board position for spare tire carrying, however, is rightly passing out of favor. The motorist is becoming more critical of the beauty of line in the appearance of his car and he wants also to be able to enter the car from either side. Carrying the tire in the position referred to offends in both these particulars.

An interesting method of surmounting these objections is that shown in Figs. 5 and 6. This consists of a dummy hub capable of taking two Rudge-Whitworth wheels, mounted at the back of a Lanchester car. A section is given in Fig. 4 in which the hub itself will be seen to consist of a plain hollow cylindrical stub, flanged at its inner end where it is bolted direct to the body of the car. Another flange, turned on the shaft provides an abutment against which the wheel hubs are tightened by means of a conical locknut exactly similar to those used in fitting the wheels to the axles. A distance ring, also conically faced is interposed between the two hubs, so that when tightened up both wheels are firmly centered and there is no possibility of moisture entering the interior of the hubs.

White Special Wire Wheel Hub

Fig. 3 illustrates a type of detachable wheel hub which is the subject of a patent application by J. M. White, Philadelphia. The special feature of this design is that it provides for both wire and wood wheels. The inner hub H, mounted on ball bearings, has eight splines S machined on its outer surface which transmit the drive to one or other of the alternative wheel hubs W and A. The wheels are centered and carried on the conical surfacs C, but the means of locking to the inner hub is not shown in the drawings. It is intended that both front and rear wheels have the same size hubs so that the wheels are interchangeable.

Finding the Gear Ratio of the Car—Cutting Off Intake—Recharging Magneto Magnets—Specifications of Cylinder Oil—Putting on Electric Light—Wiring for Reduced Voltage—Inclosing Valve Action—New Lamps

Determining Gear Reduction

EDITOR THE AUTOMOBILE:—Will you tell me some simple way to find out the gear ratio of our Pope-Hartford car?

2—What would be the increase horsepower if gear ratio was raised from 2 to 1 to 3 to 1 and also if raised to 3 1-2 to 1.

We do not care to exact figures only approximately. This car has 36-inch wheels.

We have tested our car this way after being told it was geared too high. When turning flywheel around twice it turns rear wheel around 1 1-8 revolutions.

Danby Four Corners, Vt. W. F. OTIS & SONS.

—You may find the gear ratio by jacking up one of the rear wheels and turning the crankshaft over once. Put a chalk mark on the wheel jacked up and have a man note the rotation of this wheel while the crank is being turned as in Fig. 1. The wheel will turn twice as far as it would if both wheels were in operation owing to the action of the differential. It is therefore, necessary to divide the number of revolutions made by the rear wheel by 2. The number of revolutions of the motor required to revolve rear wheels once can then be readily found. If the rear wheel turns 1 1-8 times to one revolution of the crank the gear ratio can be found as follows: One-half of 1 1-8 is 9-16. We then have the proportion 9-16 revolution of wheel is to 1 revolution of wheel as 1 revolution of crankshaft is to number of crankshaft revolutions to revolve wheel once, or:

9-16 : 1 :: 1 : X or, $9X = 16$ and $X = 1$ 7-9.

This gives a gear ratio of 1 7-9 to 1. You have probably erred in your observation and ratio is 2 to 1. This would mean that your wheel revolves once to a revolution of the crankshaft instead of 1 1-8.

2—A change in gear ratio would not affect horsepower delivered by motor. When the gear ratio is made lower you will not have to shift as often.

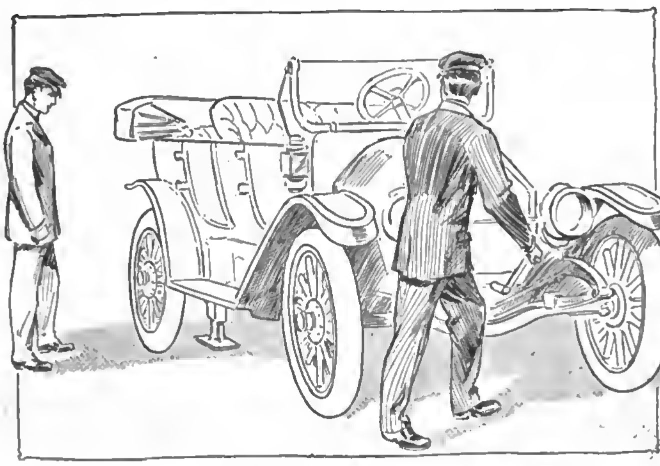

Fig. 1—Determining the gear ratio with one wheel jacked up. Differential causes the wheel to revolve twice as fast as if both wheels were jacked up

Changing Manifold Design

Editor THE AUTOMOBILE:—I have a 1913 five-passenger car, four cylinders, bore 3.25 inches, stroke 5 inches and it does not seem to have the power it should have, especially on an upgrade. I have changed the style carbureter to an old standard make and that made a great improvement, but I still have to drop to a lower gear on an upgrade. I thought of shortening the intake manifold, which is 11.75 inches almost straight up, about 1.5 inches, this I think is quite a draw. Would you advise this shortening? It will not interfere with the gravity feed to the carbureter.

Bayonne, N. J. OLD SUBSCRIBER.

—If you can change the manifold of your car without affecting the feed of the gasoline to the carbureter it would be a good idea to do so. It is an advantage to have the carbureter as near the engine intake as possible because it cuts down the recondensation of the gasoline in the upper part of the manifold. This is great source of power loss and hence should be avoided if possible. If the gasoline tank is carried fairly low however, it will be impossible to make the change in the manifold length because it will lift the carbureter to such a height that when the gasoline supply is low and the car is on a stiff upgrade it will be impossible for the gasoline to flow from the tank to the carbureter. You can get around this by changing the location of the tank also if so desired. If the tank is swung on the rear of the car as in some makes that are still using gravity feed it would be well to change the location to a point beneath the front seat or under the cowl. Generally when the tank is carried on the rear of the car the gasoline is fed to the carbureter by a pressure system of air taken from the exhaust pressure or from the compression pressure in the cylinders.

When the gasoline leaves the carbureter it is atomized and is in such a condition that it is very readily vaporized. When it comes in contact with the walls of the manifold, however, there is a marked tendency for the gasoline to go back to a globular state. This means that the gasoline will enter the cylinders in a condition that is very bad as far as securing the maximum power is concerned. The evils of gasoline in globular form may be readily determined by analysis of the exhaust gas products. It will be seen from this that the unburnt products thrown out of the cylinder are higher in percentage than when the gasoline is fully vaporized.

Had Hot Engine, No Spark

Editor THE AUTOMOBILE:—After a 20-mile run with a Ford T, I had much difficulty in starting. Could find nothing wrong, but had no spark. A bystander said that was a frequent occurrence with a hot engine. Was he right? In that event would the use of batteries be advisable?

Dixon, Cal. A SUBSCRIBER.

—The bystander was wrong. It is much easier to start a hot engine than a cool one. The trouble was probably that the spark-plugs were full of soot or that the magneto needs recharging. The plugs should be cleaned regularly or else they will become foul and it will be impossible for the spark to jump the gap across the points. After a time the magnets in a permanent magnet machine become weak. When this occurs the current generated at low speed is so slight that it does not furnish a hot spark. It would be best for you to take the car to the nearest Ford service station and have the magneto examined with a view of finding out whether the magnets need recharging. It would also be a good idea to go over all the wiring to see if there are not some terminals which are fastened so loosely as to be a source of loss of the electric current.

Good Oil for Northway Motor

Editor The Automobile:—What are proper specifications for oil to be used on 40 horsepower Northway motors? We have been very much interested in your oil tests and before giving our contract for this year would like your advice on an oil suitable for our use as we use quite a little and have had trouble with some makes of oil running uniform one barrel good and next barrel no good.

2—Kindly tell me the difference between a three-quarter floating and a floating rear axle?

Coatesville, Pa. W. G. Y.

1—Specifications for a good cylinder oil such as laid down by the Society of Automobile Engineers are as follows:

Specific gravity ....28 to 32 Baumé
Flash point above ....400 degrees
Fire test not less than............450 degrees F.
Viscosity at 100 degrees F. Sayboldt meter not over 300 seconds.
Viscosity at 210 degrees F. Sayboldt meter between 40 and 50 seconds.
Carbon residue not over ....50 per cent.

2—As far as actual performance and working stresses are concerned the three-quarter floating axle is the same as the floating. In the floating axle the end is free from the wheel and by simply removing the hub cap the axle can be withdrawn while in the three-quarter floating axle, the axle shaft is keyed to wheel. In the latter axle the wheel and axle shaft can be pulled out together. The weight of the vehicle is carried in both cases by the axle housing.

Suggests Revolution Counter

Editor The Automobile:—Engines are designed to get best results, power, economy, wear, etc., at what may be called a normal speed or revolutions per minute. So why not have an indicator on dash or somewhere in sight, showing what the engine is making as to revolutions, just as on a steamboat? Most amateur drivers have no idea of the speed at which the engine is turning.

New York City, N. Y. F. H. Hobbs.

Wants Electric Light on Car

Editor The Automobile:—What are some of the best independent electric lighting systems which can be installed on a motor? My car is a 1912 Overland, Model 60 F.

2—What candlepower globes are best for the headlights? I expect to do some country-road work. What power globes for side and tail lights, also for small dash lights?

3—What will be the current consumption of the lights you suggest?

4—What style and size of lights would you suggest?

5—What will be the approximate cost of this system?

6—What should it cost to have an 80 or 100 ampere-hour storage battery charged?

7—Would it be possible to charge such a battery off a 200-volt D. C., and how would one go about it to cut down the current?

Lincoln, Neb. C. J. F.

—1—Any of the independent generators which are now on the market will render sufficient current to operate a lighting system for your car. It should be installed by an expert, however, as it is necessary to fit a regulating device in order that the

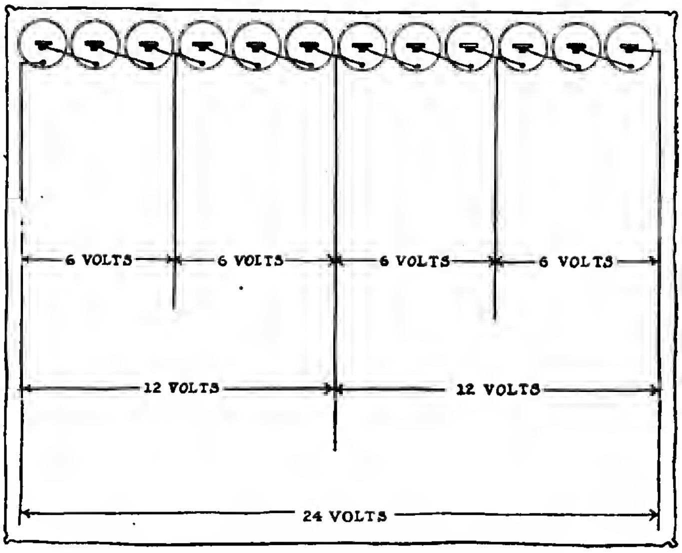

Fig. 2—Wiring twelve 2-volt cells for reduced voltage

voltage delivered by the generator will be practically constant at all speeds. This is an absolute necessity in order that the charging rate of the storage battery be correct or in order that the filaments of the light will be protected against the possibilities of blowing out on account of excessive electric pressure. In case you desire to fit a storage battery and lamps without a generator this is also possible and may be done by yourself. This will avoid the necessity of fitting any extra parts to the car or motor in order to drive the generator but will involve the trouble of charging frequently.

2—The headlights could be 21 candlepower each, the sidelights 3 candlepower and the tail light 2 candlepower. The dash lamp could also be 2 candlepower.

3—With the head and tail lights lit, 44 candlepower would be produced with a 6-volt current at 7.42 amperes. With side and tail lights 8 candlepower would be produced at a current consumption of 1.68 amperes. With all lights lit 50 candlepower would be produced at 8.68 amperes.

4—Six-volt lamps of the above candlepower would be good because they are standard and can be secured anywhere.

5—The cost would vary according to the battery and fittings. It is impossible to state a definite figure without knowing details.

6—The cost for charging an 80-ampere hour battery is 50 cents.

The cost for charging a 100 ampere-hour battery is also 50 cents In either case 25 cents is charged should it be necessary to add water.

7—You could use the current supply you mention very well by simply inserting a rheostat in the line to reduce your voltage to about 12 at an ampere flow of about 16 in the case of one type of well-known battery. It will be necessary to follow the maker's instructions exactly as regards charging rate. The rheostat to take care of this work would cost about $25.00.

Fuel for Racing Cars

Editor The Automobile:—What ingredients and what proportion do racers use for fuel in racing? Is it injurious to the motor? Where on a Ford car should open ports be put in? What are the advantages of open ports in racing? How could the holes be plugged? What is a good make of carbureter to use in speed work?

Carsonville, Mich. R. A. McGregor.

—Racers with rare exceptions are using ordinary gasoline of about 65 test. The days of doped fuel are past and discountenanced in racing circles. Open ports act as an auxiliary exhaust valve to clear the cylinder much quicker than would be possible with the one exhaust valve. The open port valve has also been practically abandoned. The port is placed in the cylinder at the bottom of the stroke so that when the piston reaches the bottom of the stroke it uncovers the port and allows the gases to escape quickly. The area of this port should be about the same as the area of the exhaust valve. The height of the port in the cylinder wall should be such that the piston uncovers the port simultaneously to opening the regular exhaust valve.

Wiring for Reduced Voltage

Editor THE AUTOMOBILE:—Is it possible, and if so, how are the connections made for a storage battery of 12 cells to be at the same time:

Connected in 1 group, 12 cells in series, giving say 24 volts.

Connected in 2 groups in parallel, 6 cells in series in each group giving, say 12 volts.

Connected in 4 groups in parallel, 3 cells in series in each group, giving, say 6 volts.

Several of the wiring diagrams in connection with self-starters you have recently published seem to call for this arrangement in whole or in part. To the amateur it seems an impossibility to be done without the aid of a pair of wires from each cell to a controller and I see no mention of that. It would seem in the absence of further explanation that once connected as above in four groups in parallel that the addition of other connections to put these groups in series would be useless; that current would continue to take the shortest path and only give the 6 volts.

New York City. D. W. SEAVER.

—The arrangement of the wires is that shown diagrammatically in Fig. 2. In a 24-volt storage battery all that is necessary where a current of 12 volts is required is to wire in such a manner that half the cells are in use. In the illustration the cells are shown as if they were ordinary dry cells. The same rule applies to the storage battery, however, the wiring being taken off half the cells to secure two 12-volt lines. When 6-volt lines are required the 12-volt lines are divided in the same manner as the 24-volt line is divided by taking one wire from the center of the cells making up the voltage to be divided. In the same way any dry battery may be subdivided.

Grease Leaks Into Crankcase

Editor THE AUTOMOBILE:—Will you please tell me how to prevent heavy oil or grease working from timing gear case into crankcase on a model K Pullman motor? I am sure there is no way except through front crankshaft bearing. The cases are packed with a fibre paper packing, the front bearing cap has felt packing between that and case. Therefore it must work through bearing. This causes the motor to be plugged full of carbon about every 500 miles.

Hammondsport, N. Y. I. J. BRUNDAGE.

—It is practically impossible to prevent a leakage of grease from the timing gears into the crankcase. As you state, it works through the bearing and therefore no amount of packing will help the situation. The only answer to the problem is to lubricate the timing gears with the same lubricant that you use in the cylinder. If you are troubled perpetually by the leakage of the grease into the crankcase the best thing to do would be to tap a lead into your oil pump line and allow the lubricating oil to circulate into the timing gear case. The overflow of the oil from the timing gear case should take place from a spot above the line of mesh with the gears so that they run submerged. The overflow of oil passes into the crankcase and mingles with the oil there.

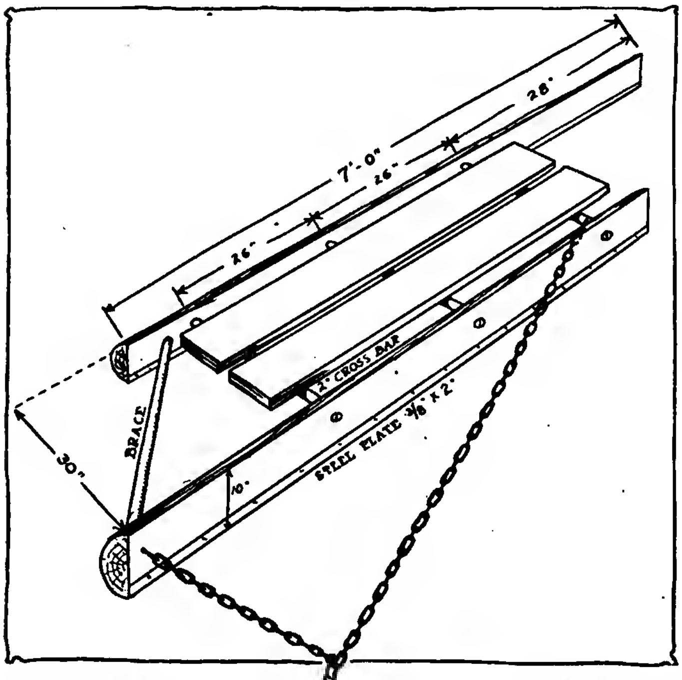

Fig. 3—Correct dimensions for split-log drag, showing construction

How to Inclose Valve Action

Editor THE AUTOMOBILE:—May the following be classed as a new one? The writer thinks there are many owners of old cars without inclosed valve stems, who would be glad to know a simple, cheap and quick method of silencing valve action and keeping out dust and dirt. See Fig. 5.

Take an ordinary paper tube such as is used for mailing drawings, blueprints, or calendars, and cut to proper length, make tight fit lengthwise, split tube its full length and spring it around the valve stem and spring, close with a wire or better a light hose clamp. Paint the tube black or aluminum and there you are, dust proof and sound proof. Cost about 10 cents, labor one hour. To keep tube from becoming oil soaked shellac or varnish inside and outside before putting in place.

New York City, N. Y. OLD TIMER.

—This is not only a new one, but if carefully done should be a very useful tip.

Split-Log and Plank Drags

Editor THE AUTOMOBILE:—Would you kindly tell me the difference between the split log and the plank drags? I understand that both of these are used with great success on dirt roads and as there is a stretch of bad road in this vicinity that we would like to smooth out, I would like to see an illustration of both these drags in order to determine which would be easier to construct. It would also help if you could furnish the dimensions recommended by the best makers of these devices.

Danville, Va. READER.

—The two forms of drag are very much alike except that, as the names imply, one is made from planks and the other from a split log. The two devices are shown in Figs. 3 and 4. The details of their construction can be gathered better from these illustrations than by any other means. They are very useful for dirt road work and when frequently run over the road render it superior to many of the artificial surfaces.

Installing Lighting System

Editor THE AUTOMOBILE:—I would like to equip my 1910 model 17 Buick with electric lights, two 16-candlepower headlights, one 2-candlepower for rear. Could I light them from an 80-ampere, 6-volt battery? If so, how long would it light without having to be recharged? I am using a magneto on a stationary engine which puts out 14 volts. Would it charge the battery? How long would it take? What is the life of a battery?

Sutherland, Iowa. LAWRENCE FLINDERS.

—It would be possible and practical to run your lighting system from an 80-ampere-hour storage battery and light your head and tail lights. That is provided you have some source handy from which to recharge the battery. The battery would last approximately 14 hours with the tail and headlights burning and 225 hours with just the tail light.

The magneto of which you speak cannot be used to store the battery. A magneto generates an alternating current and therefore cannot be used for storing the battery. A study of the four articles on electric lighting and cranking appearing in issues of January 16, 23, 30 and February 6 will make this matter clear.

The life of a storage battery is indefinite. It will last as long as you give it proper care.

New Carbureter on Hupmobile

Editor THE AUTOMOBILE:—I have a Breeze carbureter on Hupmobile. Will another make carbureter do better? If so, what make?

2—Will a fan be an improvement on the machine?

Jamestown, N. Y. CHAS. J. NORQUIST.

—1—The Breeze carbureter should give you entire satisfaction with the Hupmobile car. There is no necessity of changing unless you wish to experiment.

2—The fan in the Hupmobile is contained in the flywheel and is sufficiently efficient unless you have some extraordinary work to do. If it is necessary to be perpetually climbing on low gear, the addition of another fan would help to keep the motor cool.

Use of Condensed Gasoline

Editor THE AUTOMOBILE:—Kindly inform me what difference there is between gasoline refined from crude oil and that condensed from natural gas, as applied to its use in motor cars?

I can buy 76 actual test gasoline, condensed from the natural gas at the wells, for about the same price as I am now paying for 54 gasoline refined from crude oil.

What changes, if any, should be made in the carbureter. Will this condensed gasoline be in any way harmful to the cylinders or other parts of the engine? In fact, I should like your opinion as to the apparent benefits to be derived from this condensed gasoline.

Is gasoline distilled from natural gas more dangerous to handle or use in an automobile engine than the same test gasoline refined from crude oil, and why?

Chicao, New Mexico. W. H. DAVIS.

—Any hydro-carbon that you can burn will be good to use in your carbureter. The lower the gravity of the gasoline that you can burn, the more power your motor will develop because there are more heat units in the heavier gasoline. The refined gasoline would be better because there is more power in it. There is no danger in handling the condensed fuel as it is not brought into actual contact with flame. It is very volatile and hence must not be brought into a room with any other artificial light than electricity. The condensed fuel would not harm the engine or the carbureter.

It would not be wise to mix the two fuels because they are so different that the more volatile condensed fuel would be evaporated quicker and would leave the other fuel behind. The whole matter lies in the one rule of handling the lowest gravity fuel that you can successfully run through your carbureter.

Has No Cylinder Compression

Editor THE AUTOMOBILE:—I ground all my valves and timed same properly, decarbonized the cylinders with Presto-carbon remover, let each cylinder application stay in one hour and noticed there was no apparent leakage either at valves or around the piston, so I took it for granted that my rings must be all right. I tried all cylinders one at a time with a compresso-meter gauge, three cylinders had only 15 pounds, two had 40 and one absolutely none.

The engine is of the Premier make 6-60 and runs only 900 miles. The only trouble I have had is that one of the pistons seized and I think possibly it may have been the very one that now has no compression.

Bangor, Me. P. R. WILEY.

—It is very possible that the cylinder in which the piston seized has been spoiled. It might be that it will require reboring in order to restore it to proper condition. It is stated by those using liquid carbon removers that compression is generally low for a short time until the motor has been run for awhile.

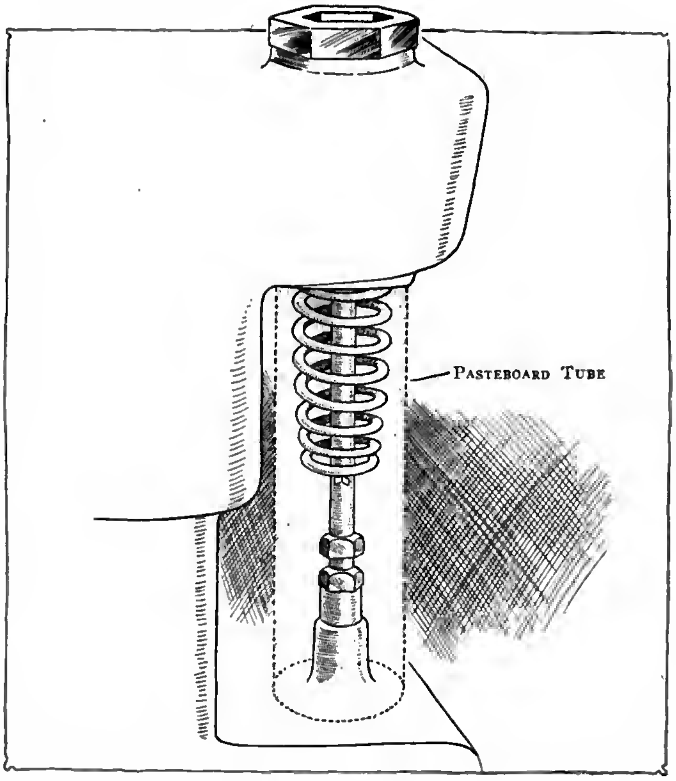

Fig. 5—Inclosing valve action by means of pasteboard tube

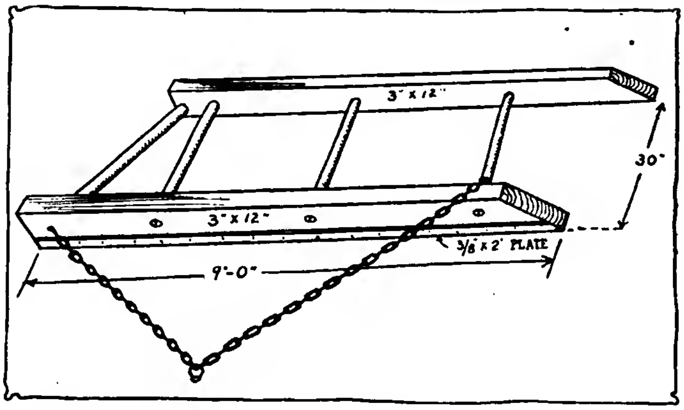

Fig. 4—The plank drag, a parallel to the split-log drag

It then improves. You should have the defective cylinder examined after running for 200 or 300 miles and seizing if conditions did not improve at the end of that time. The rings may possibly have become lined up so that the slots are opposite each other, allowing the compression to leak through the resulting groove.

Roads from Florida to D. C.

Editor THE AUTOMOBILE:—Being a reader of THE AUTOMOBILE, I take the liberty of asking you to send me any data you may have regarding the roads between Florida and Washington, D. C., as I am now touring in Florida and wish to drive there on my way home to Rochester, N. Y.

Daytona, Fla. WILLIS N. BRITTON.

—The roads along this route are better than they ever have been but it must be particularly emphasized that this statement does not mean very much. There are some very bad stretches of sand through Georgia in the neighborhood of Atlanta and Augusta. In Florida also there is much sand. The first part of the trip fair roads may be expected. At this time of the year the best course lies through Richmond, Raleigh, Pinehurst and Condon. Between Raleigh and Pinehurst some good stretches may be expected.

Demountable and Quick Detachable Rims

Interest in These Types of Rim Has Grown to an Unprecedented Extent During the Past Year and the Various Makes Were Very Much in Evidence at the Recent New York and Chicago Shows

ONE of the developments of the past year sufficiently noteworthy to be dignified as a tendency in automobile construction is the use of rims specially designed to facilitate the removal and application of tires, or, in other words to minimize the roadside troubles of the automobilist. These devices may be classified under three heads: First, the detachable type, in which the rim is arranged permits of removal of the tire without the physical effort required by the old style clincher rim; second, the quick detachable, in which the inner bead ring is secured in place by means of a locking ring, and third, the demountable type, in which the rim may be removed from the wheel.

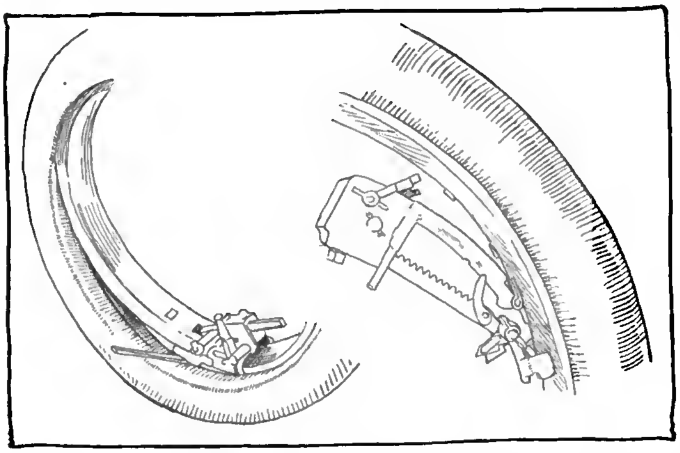
There are three classes of detachable rims—those in which two sections separate and allow the tire to be removed; those in which one side ring of the rim may be expanded and removed, as distinguished from the quick detachable type with its locking ring; and those of the expanding type which may be contracted to allow the tire to slip over the side rings. Specific advantages are being claimed for each of the three types.

Quick detachable rims may be classified as of three types, straight-sided, clincher and universal, which will take either straight or clincher tires, though there are a few special types such as the old-style clincher, in which inner lugs secure the tire to the rim, and the Fisk bolted-on type, which is fastened by bolts through the heavy tire base. Each of the latter types is used on demountable rims.

The most common variety of demountable rim is that in which bolts hold the rim in place on the wheel, the number of bolts used varying with the different makes of rim. Sliding lugs held in place by the bolts are sometimes employed to secure the rim, while in some the bolts hold wedges which, besides preventing side motion of the tire, expand it to set firmly.

In some rims the wedges are short and correspond with the bolts in number. In others the wedge is in the form of a single ring which it is necessary to remove before demounting the rim. In some cases, the wedge or wedges engage only one side of the rim while in other constructions they act on faces on both sides of the rim.

At the automobile shows an unusual amount of interest was shown this year regarding the various types of rims, in how little time they could be removed and replaced and in the principles of operation. In fact, so pronounced has been the demand for something of this sort to lighten the burdens of the puncture-provoked automobilist. Some of the leading devices for 1913 are briefly reviewed herewith, being taken up in alphabetical order for the most part throughout the descriptions, although for various reasons it was not practicable to do so in every single instance.



Segments of Booth demountable rim, showing the new power tool, which is a development of the past year

Alpha—Unusual Ring Operation

The demountable rims made by the Alpha Rim Company, New York City, consist of but three parts, the rim proper, the felloe band and the expanding flange ring. The felloe band is permanently fastened to the felloe and its back face is beveled while there is an annular channel on the front. This channel contains an expanding ring, which, contrary to usual practice, contracts to permit the removal of the rim from the wheel and expands to lock it in position. The rim is of the split type and is provided with two lugs which pass through the felloe band, being permanently connected by two toggle levers which are jointed together, the smaller having a square socket. The device is operated by inserting a special tool of simple design in this aperture. When the toggle is expanded it lies close to the rim where it is out of the way and self-retaining. It is the off-center position of the toggle when locked which comprises the locking feature, the tightness of the levers increasing in proportion to the increase in the strain on the locking ring.

The rim is of the ordinary clincher type and is provided with two bevels on its inner surface, one to correspond with the back bevel of the felloe band and the other to engage with the locking ring. To dismount the rim, the tool is inserted in the square socket and turned down. This contracts the ring, permitting the rim to be removed from the wheel.

Ashley—Novel Locking Attachment

The Ashley wire wheel has a demountable rim which is carried upon a felloe band, the principal novelty of the device consisting of the locking attachment. The rim is pushed onto the felloe band where it rests on a raised bead at the back. The front side of the rim contains a groove and in the felloe band, fitting into this groove, there is a split ring which is contracted or expanded by turning a toggle nut. By tightening the nut the two small lever arms, which are seen in the illustration, cause the ring to move laterally.

Baker—Adds a Bolt for 1913

The Baker bolted-on demountable rim consists of a permanent rim shrunk onto the felloe and a split rim which is held in position on the permanent rim by means of six bolts and wedges. Last year only five bolts were used per wheel. Five are still used for wheels under 36 inches but most of the wheels fitted with demountable rims are no smaller. The rim cannot stick to the wheel after the bolts are backed out and the wedges are turned out of the way. A sleeve forces the wedge out when the bolt is backed off which prevents sticking of the wedge. There is also a space of .192 inch between the rim and the wheel band which keeps the rim from sticking on the wheel. The inner tube is passed through the split ring, the split occurring close to the valve. On either side of the split there are two bosses and the rim is held rigid by means of an anchor plate.

Booth—New Power Tool for 1913

Booth rims are continued for 1913 by the Kelsey Wheel Company, Detroit, Mich. With the exception of the development of a new power tool for removal of the tire from the rim, no changes distinguish this year's product from that of 1912. With each set of rims are furnished an extra joint pin and drift pin and a brace wrench. The demounting feature of the Booth rim is as follows: Lugs passing through slots in the felloe band secure the rim to the wheel. Two gears, driven by an irreversible worm, spread the lugs so as to hold the rim firmly in place. In removing the rim the worm is turned in the opposite direction, contracting the lugs so that they may be drawn through the slots. Booth rims are made for either wood or wire wheels and with both clincher and straight-side quick detachable rims.

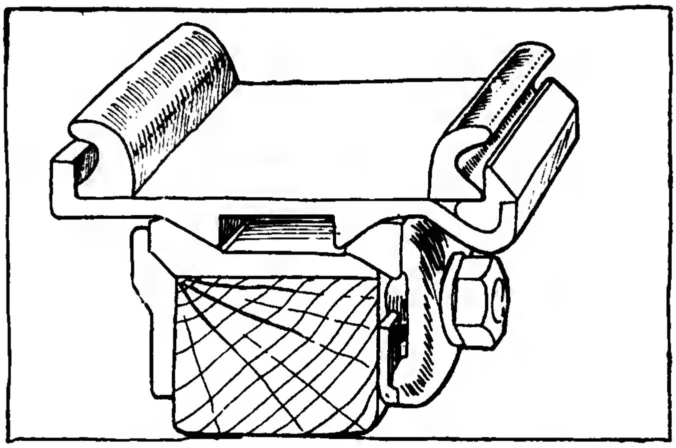
Detroit—Many Improvements This Year

For 1913 many improvements are apparent on the Detroit demountable rims which are manufactured for the Detroit Demountable Rim Company in the plant of the Weston-Mott Company, Flint, Mich. The wedges have been made smaller and more compact than formerly and the number of nuts which it is necessary to loosen before removing the rim has been reduced to four. The bolt has also been turned about so that now it is a part of the rim base while the nut only is operated. When the nuts have been loosened the short wedge members may be pulled outward, permitting the rim to slip over them.

A special type of expanding ring is employed in the construction of the detachable rim. This is locked by a cross-tree which turns to engage two buttons on the inside of the rim. The openings for the buttons are cut at an angle so that as the cross-tree is turned the rim is expanded. Dirt and water are prevented from entering the casing by a small filler segment of the rim which is secured to the locking cross-tree. For contracting the rim if it should become rusted, a special tool is furnished.

Firestone—Q-D Demountable

These rims are of the quick detachable demountable type. The permanent rim is shrunk on to the wooden felloe and is beveled at both sides. The demountable rim is also beveled, one side resting upon the inner bevel of the rim, while the outer bearing is formed by a V-shaped clamping ring being placed in position and held by six clamps and nuts. By removing the nuts and clamps the clamping ring can be removed and the rim with the tire on it changed. The detachable feature consists of two concentric rings, one overlapping the other. The outer ring is split and fits into a depression in the rim. After the tire has been deflated and it is desired to remove the shoe, by pressing the inner ring against the tire, the split ring can be taken away, allowing the clincher side ring to be removed.



Section through Firestone quick detachable, demountable rim, showing bevel feature on permanent and demountable rims

Fisk—Only Three Parts

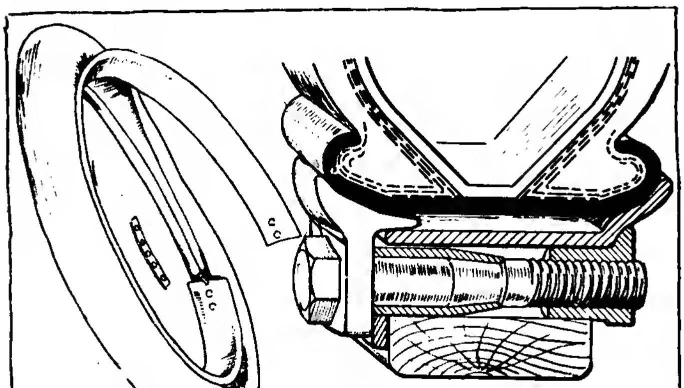
A special rim is necessary for use with Fisk bolted-on tires made by the Fisk Rubber Company, Chicopee Falls, Mass. This consists of but three parts, a felloe band with a wide outside bevel, the flat tire rim to which the tire is bolted and an expanding ring. The latter is of the wedge-shaped type secured by means of bolts through the wheel felloe. A dowel pin, .5 inch in diameter, engages a hole in the felloe band, preventing creeping. An angle valve makes it unnecessary to insert the valve on applying the rim and acts as a protection for the valve.

Funk—Bolted-On Demountable

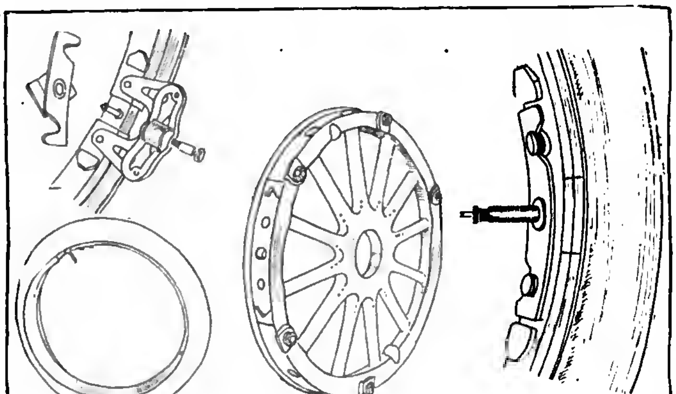
Manufactured by the Englebert Tire Company, New York City, the Funk rim is of the bolted-on demountable type used in connection with the contracting type of quick detachable rim. No filler segments are necessary with this rim as it is of the overlapping contracting variety which, when expanded, forms a complete ring. The rim is secured to the wheel by five bolts and locking lugs, the removal of three of these permitting the demounting of the rim. For removing the tire from the rim a special breaking tool for overlapping and contracting the rim is provided.

Healy—No Felloes Are Used

Rims from the factory of the Healy Rim Company, Brooklyn, N. Y., are distinguished from practically all others in the field by the fact that no felloes are used on the wheel to which they are fitted. They are of the straight-sided, or clincher type, the steel rims being secured to the spokes by means of steel yokes which inclose the ends of the spokes. There are two parts to these yokes, one of the legs being fastened by a bolt and lock washer. Loosening all but a few of the bolts permits of turning the loose



Section through the Baker bolted-on demountable rim, together with view showing removal of tire



Details of the Detroit rim, the view at the upper left giving an idea of the cross-tree used on the expanding ring this year. Turning the cross-tree expands the ring legs of the yokes out of the way and removing the rim.

J-M

The Johns-Manville Company, New York City, has combined demountable and quick detachable features in the J-M rim. The rim and the felloe band are the principal factors in the demountable element. There is a bevel on the back of the felloe band against which the rim is jammed, being locked in position by six retaining lugs on the front of the band. When the nuts on top are loosened and the wheel revolved three of the six lugs drop clear of the rim. Then the nuts are tightened to keep them so and the wheel is turned in the opposite direction. The remaining lugs drop in a similar manner and then the rim may be removed.

There are two parts to the rim proper, the outer being rigid and the inner split. These parts overlap, being held together by dowel pins in the outer ring engaging holes in the inner ring. The tire is removed from the rim by prying up the ends of the inner ring so that it may be slipped off the dowels and the two parts of the rim separated. Among the special features of this type of demountable rims is its light weight.

Lambert

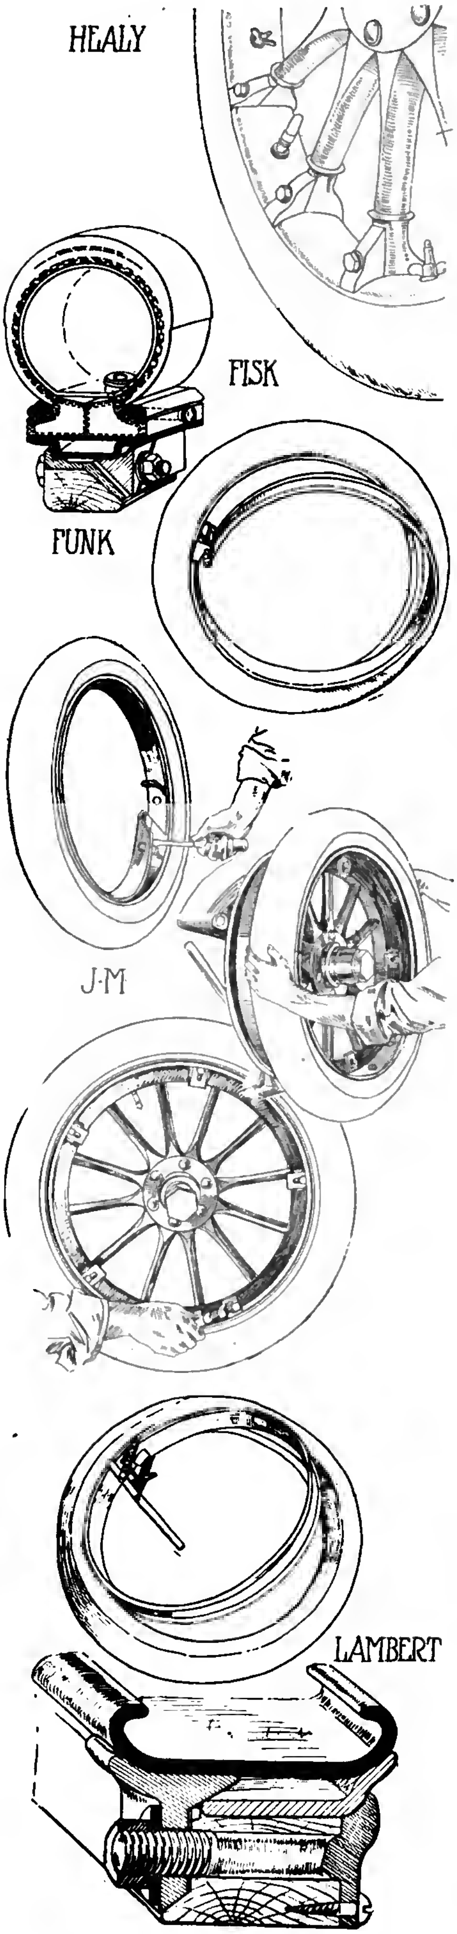
The Lambert rim, manufactured by the American Rim Company, Detroit, Mich., is composed of a felloe band secured to the wheel felloe with a bevel seat for the rim at the back. The operation of demounting is extremely simple, a single nut removed by a socket brace permitting the rim to be lifted from the wheel.

The rim is secured to the wheel at six points, the first being the adjusting wedge which is fastened to the felloe by a bolt. The mounting and dismounting lug is opposite this, being different from the adjusting wedge in that the bolt has a special locking device. This is released by means of the socket brace and automatically locks the bolt on the withdrawal of the tool. Of the four other securing pads, two are fastened to the rim and two to the felloe band.

The dismounting lug is locked by means of a ratchet disk, integral with the bolt head, which is engaged by a spring-actuated pawl on the wedge. There is a flange on the locking bolt which positively forces the rim from its place when the bolt is unscrewed. This is an advantage when the rim becomes rusted. A special tool is used to contract the rim in detaching the tire.

National

This rim is of the quick detachable type and is simple in construction. The main body of the rim is shrunk onto the wood felloe and two endless steel rings are employed. The outer edge of the rim is beveled, thereby facilitating the fitting of a tight tire. The endless rings are reversible and permit the use of clincher or straight-sided type tires. No tools are required in connection with this rim. The rim is punched with ten holes beneath which there are a series of lugs attached to ten pieces of spring steel, which in turn are riveted to the inside of the rim. It is claimed that the internal pressure in the tire forces the outer rim against the lugs, thereby preventing these from moving while the tire is inflated. Upon deflating the tire it is possible to press the lugs back with the thumb and after these have been disengaged the outer rim can be removed from the tire.



Newmastic

The Newmastic rim, manufactured by the Newmastic Company, New York City, was one of the new things brought out at last year's show and was described in THE AUTOMOBILE at that time. It is of the no-felloe type, steel castings on the ends of the spokes directly supporting the rim, being secured to the latter by means of clamps controlled by means of bolts. The great decrease in weight due to the elimination of the felloe is one of the principal advantages claimed for this type of rim, another being that the wheel is automatically reset every time the rim is changed. Either quick detachable or clincher rim may be used. The Newmastic company is now getting ready a new design of rim, specially adapted for tires filled with Newmastic. The purpose of this new rim, which is of the demountable type, is to permit of varying the pressure in the filler. This end is obtained by constructing the rim of two sections or rings which are in wedge engagement with one another and which may be so positioned by manipulating a bolt mechanism that the width of the rim becomes variable. As the width is decreased, the tire filler is thereby put under increased pressure, and vice versa.

Presto

Presto demountable rims, manufactured by the Presto Inter Rim Company, of Boston, Mass., operate by simply pulling down a lever, which expands the locking ring and forces it off. The rim is made in all standard sizes and will fit all straight-side clincher or solid tires. A spare tire is carried upon a rim which fits over the permanent rim attached to the felloe band. In order to hold the demountable rim in position a split rim is employed which fits into a groove and by the aid of a toggle lever, the lugs at the points where the ring is split are drawn together or released, according to whether it is pushed up or down.

Stanweld

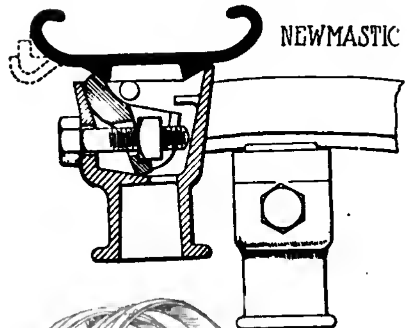
These rims are manufactured by the Standard Welding Company, of Cleveland, O., either in the quick detachable or demountable types for wood or wire wheels. The principle on which the quick detachable operates is as follows: The body of the rim is permanently shrunk onto the wheel felloe and the latest type has two floating rings, having concave and convex sides, making it possible to use either straight-side or clincher tires. The inner side ring is endless, the outer side ring is split transversely and is tongued and grooved into the rim base. The ends on this ring have L-shaped lugs which protrude through holes made in the rim base. The lugs are locked by means of a cam which operates with a lever. The lever forms a latch and is made of spring steel; by removing the latch with the aid of a screw-driver the split ring can be pried off and the tire removed.

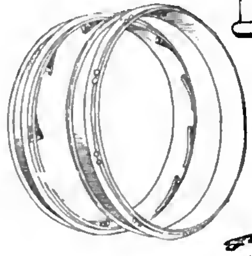
The demountable rim manufactured by this company consists of a rim the base of which is split circumferentially, each section having a series of lugs which are locked together by two semicircular slotted spring rings. One end of each ring is securely riveted to the wider section of the base and the free ends of both rings are locked by means of a swinging latch which in turn is securely fastened by a smaller cam latch. In order to remove a tire from the rim it suffices to press the catch back when the half locking rings can easily be pried away from the main body of the rim. The rim slides over a metal base which is shrunken to the felloe band and securely retained in position by six wedges giving radial and lateral support to the rim.

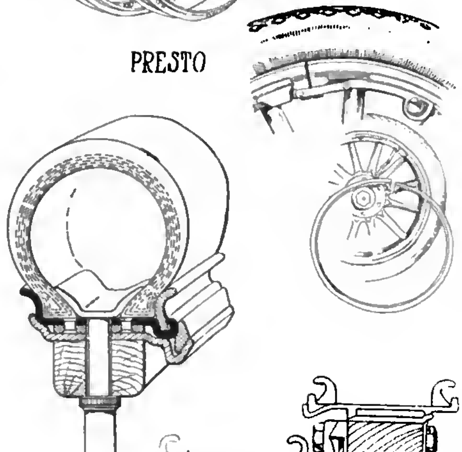
The number 40 Stanweld demountable rim is what is known as quick detachable demountable, it being possible to remove the tire without removing the entire rim as well as to remove the rim with the tire on it. The inner and outer ring can be made to serve for either the clincher or straight-bead type.

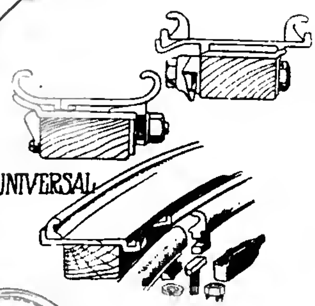
Standard Universal

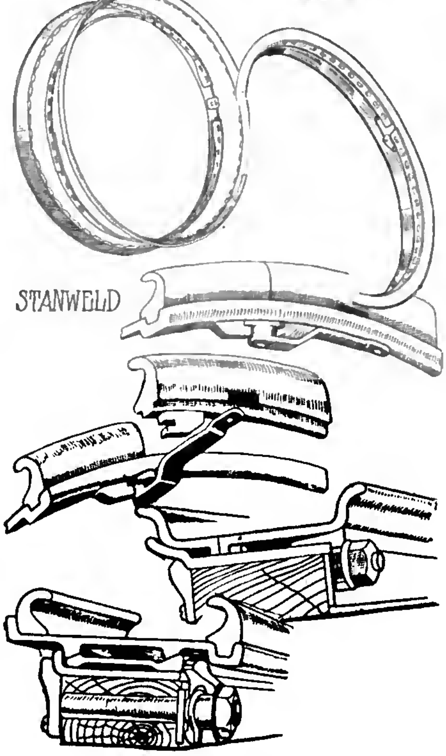
Standard Universal rims are manufactured by the United Rim Company, of Akron, O., in both quick detachable and quick demountable forms. The body of the rim is shrunk permanently on to the felloe of the wheel. The inner ring is continuous. The front side ring is split transversely and is tongued and grooved to the rim body, the ends being held together by means of two L-shaped lugs, a cap and a tee-bolt, all notched into the rim, forming a positive lock. To protect the threads of the tee-bolt, an acorn nut is used in connection with it. The Number 3 quick detachable rim is split circumferentially and the two parts are held together by a series of bayonet hooks on one side with corresponding lugs on the other. In order to prevent rotary motion in opposite directions of the two parts a safety latch is provided and a special tool is used to lock and unlock the rims.











The quick detachable demountable type of rim consists of a felloe band shrunk permanently onto the wooden felloe of the wheel and has at each outer edge a concentric cone section or frustrum which gives continuous support to similar frustrums, on the inner surface of the rim body. The securing device consists of six rotary clamps so designed that two turns of each clamp nut automatically forces the rim home, centers it laterally and locks in position.

Changing to Demountables

Many automobilists who appreciate the convenience of carrying an inflated tire ready to place on the wheel at a moment's notice are changing to demountable rims. These represent not only those who are using the old form of clincher tire but also those who use the more modern quick-detachable rim. The cost of making the change is not very high and amounts generally to only $15 above the cost of the demountable rim.

When the wheelwright gets the order for the change he has to set about preparing a new felloe which will accommodate the demountable form of rim. The felloe for this style of wheel is thicker than the felloe used with the quick-detachable, and, in order to prepare a given diameter wheel for the thicker felloe the spokes have to be cut off all around. It is for this work that the charge is made.

The inflated tire is placed on the spare rim and carried in most cars on a rigid frame fastened to the rear of the chassis. In order to secure a stiff connection and to prevent the tire from wobbling and disturbing the steering of the car, the bracket used for holding the tires is made in a unit with the side frame members. In case of a blowout or other tire disaster it is not necessary to take the tire off the rim or to spend time in fitting on a new tire. The old rim with the damaged tire is simply slipped off and the rim with the inflated tire put in its place. The time of a tire change is reduced from 15 minutes or more, to 5 minutes.

The arduous labor of removing and repumping a tire even on the simplest form of quick-detachable rim will no doubt prompt many to make the change during the coming season. There are many who have wanted the demountable rim which has most of the good features of a spare wheel, but who have not known that it was not only a possible, but a very cheap job, to change over from one type to the other. On cars using smaller tires than the 34 by 4 inch, there is no doubt that the cost would be correspondingly less.

One of the worst features of oversize tires has been the difficulty of changing them. In the demountable rim, however, this work can be done in the garage and not on the roadside under a broiling sun or a pelting rain.

Among the New Books

Many New Technical Books of Interest To Motorists and Others—Good Fiction Also Available

Annual Report of the Smithsonian Institute Contains Many Contributions of Value to Science and Literature

WITH the approach of the delightful spring touring season, which in spite of muddy roads is always one of the most enjoyable of the year, the motorist who takes care of his own car is prone to devour what literature he can lay hands on before starting actual work in preparation for many miles of traveling through the budding country.

The following works which are at the disposal of those inclined to remain in the rocking chair fleet for just a little while longer embrace almost every field from the engineers' handbook to the fascinating fiction which uses the motor car as the basis of its plot.

ANNUAL REPORT OF THE BOARD OF REGENTS OF THE SMITHSONIAN INSTITUTION, showing the operation, expenditure and condition of the institution for the year ending June 30, 1911. Printed at the Government Printing Office, 1912.

This report contains the annual letter from secretary of the Smithsonian Institution, as well as that of the Board of Regents. An outline of the studies taken up through the year is given. A report of the different bureaus showing the progress of researches in the various arts and sciences is also given. Among the interesting papers contained in the report are: The Age of the Earth, Organic Evolution, and Traveling of High Speeds. The latter article being by Hele-Shaw should be of especial interest to automobile enthusiasts.

CHANGE GEAR DEVICES. By Oscar E. Perrigo. Published by the Locomotive Publishing Company, of London. 81 pages, 5 by 8 inches; illustrated by numerous explanatory line cuts. Price, $1.

This booklet deals with the change gear devices employed in driving a lathe or other cutting tool at speeds suitable for the work in hand. The early part of the work gives a history of lathes and lathe development and also a résumé of the more important change gear patents applied for in the early days of lathe history. Different methods are described in full and illustrated by simple diagrammatic drawings.

PETROL AIR GAS. By Henry O'Connor. Published by Crosby, Lockwood & Sons, London. Second edition. 100 pages, with numerous tables, illustrated by electrotypes. Price, 1 shilling, 6 pence.

This work consists of seven chapters and deals on the use of petrol or gasoline gas for lighting and cooking. It is useful from an automobile standpoint in that it gives valuable data on the combustion of gasoline gas, which has come into extensive use for country house lighting.

THE MECHANICAL WORLD POCKET DIARY AND YEAR BOOK FOR 1913. Published by Mechanical World, Emmott & Company, Ltd., 65 King street, Manchester, England. 530 3.5 by 6-inch pages. 6 pence net.

The primary aim of this work is to fill the gap which is bound to occur in the memory of the best of us after leaving college. Various formulæ and tables are given which will be of interest to all those concerned in mechanical engineering. A chapter on gas engines is of interest to those in this line of work. In this chapter are given the different formulæ for the design of crankshafts, bearings, flywheels, connecting-rods, etc.

TEXT-BOOK ON MOTOR CAR ENGINEERING, in two volumes. By A. Graham Clark. Published by D. Van Nostrand & Company, New York. 437 5 by 8.7-inch pages. Cloth, $3.

Taking up the principles and construction of the gas engine in the first four chapters of the book, the author proceeds to give an outline of the entire designing problem of the gasoline engine. The fifth and sixth chapters are devoted to fuels and carburetion, while the seventh chapter deals with thermodynamics of the gas engine. After concluding the general discussion on gas engines and the theories which are an important factor in the design of the gas engine, the author proceeds to take into consideration the construction of such essential parts as the magneto, control system, cooling system, brakes, bearings, etc. The final chapter is devoted to a study of the electric car, taking up especially the suspension of the motors, the construction of the various types of motor and the methods of controlling the various speeds.

THE GASOLINE MOTOR. By P. M. Heldt. Published by the Horseless Age Company, New York City. 506 5 by 8-inch pages; illustrated by more than 300 zinc etchings and several half-tones. Price, cloth, $4, with supplement.

This work is in twenty-one chapters and an appendix. The early chapters of the book are devoted to a theoretical discussion of the fuel and the cycle upon which the motor operates. A chapter is also given on the conversion of reciprocating intro-rotary motion. The balance of motors is also discussed at length. The remainder of the book is devoted to the design of each specific part of the automobile engine and is so arranged that the student may cover the ground at home or the designer may use the work for a handbook in the office. Another volume dealing with the chassis, etc., is to come soon.

FROM THE CAR BEHIND, by Eleanor M. Ingram. Published by the J. B. Lippincott Company, of Philadelphia. 306 pages, with illustrations in color by James Montgomery Flagg. Cloth, $1.50.

A delightful piece of fiction wound around an improbable plot. For summer reading it should be acceptable anywhere. The hero of the story is a wealthy young amateur racing driver who, through a combination of circumstances for which his cousin is really at fault, is forced to leave home in disgrace. At the end of the story, however, his vindication is complete and in the final triumph a very exciting cup race figures in which the Mercury, driven by the hero, Corrie Rose, proves the winner.

A TEXT-BOOK OF PHYSICS. Edited by A. Wilbur Duff; Contributed to by A. Wilbur Duff, E. Percival Lewis, Charles E. Mendenhall, Albert P. Carman, R. K. McClung and William Hallock. Published by P. Blakinston's Son & Company. 680 5 by 8-inch pages; illustrated by 600 line cuts. Cloth, $2.75.

As a text-book this work should be of great use where the more advanced study of physics is carried out. The book is divided into six sections. The first section of the book is given over to mechanics and the properties of matter, second to heat, third to electricity and magnetism, fourth to radioactive developments, fifth to sound and sixth to light. No new theories have been advanced in this work, which is a text-book in all senses of the word. The book is complete in all departments and forms an excellent basis of study to the subject taken up.

BEVEL GEAR TABLES. By D. Ag. Engstrom. Published by the Norman W. Henley Publishing Company, of New York. 65 5 by 8-inch pages of tables and explanatory matter. Price, $1.

The first few pages are given over to a discussion of tooth elements, for both circular and diametric pitches. Construction of bevel gears and a calculation are also given. The main tables, which take up thirty-seven pages, are devoted to the outside diameter, a placing distance outside cone radius, face angle, edge angle, cutting angle and number of cutter.

NATIONAL TUBE COMPANY'S BOOK OF STANDARDS. Published by the National Tube Company, Pittsburgh, Pa., under date of 1913. 558 4 by 7-inch pages. Price, in flexible leather binding, $2.

In this edition of the handbook, which is much larger than those issued by the National Tube Company, all the dimensions and data pertaining to tubular goods are given. A glossary of terms, which covers thirty-eight pages, is also given. The data secured in the work has been taken from reliable engineering sources and should be exact.

Motor Fuel Engages Attention of Indiana S. A. E.

INDIANAPOLIS, Ind., Feb. 24.—One of the most interesting meetings the Indiana branch of the Society of Automobile Engineers has held in many months was that at the Claypool Hotel in this city last Tuesday night. There was a large attendance and the subject was Motor Fuel. The principal speaker was John A. Secor, expert with the M. Rumely Company, Laporte, Ind., manufacturers of an oil tractor.

William G. Wall of the National Motor Vehicle Company arranged the program and to him is due the credit of obtaining Mr. Secor to address the meeting. Mr. Secor's subject was Kerosene Engines, and he spoke in part as follows:

The power-driven vehicle can no longer depend on its present fuel. The demand for gasoline has overtaken production. During the last decade the oil market has been readjusting itself to radically new conditions. This has been brought about by many new applications of oil products for developing heat and power. Crude oil was formerly looked upon simply as the raw material for the production of illuminating and lubricating oils.

The introduction of the Daimler motor opened up an entirely new market for the lighter oils, gasoline and naptha, which developed within the short period of 10 years into larger proportions than the most optimistic oil man ever dreamed of. Under these conditions the inexorable law of supply and demand brought about a price level for the volatile distillates far in excess of former values.

Advance Due to Inevitable Law

United States government reports show that the advancing price of gasoline is due solely to the laws of supply and demand. No corporation or combination of corporations is responsible for the fact that demand has overtaken production, and that further increases in price are now impending.

American gasoline and naptha were formerly obtained solely from high grade paraffine crudes of Pennsylvania and Ohio. These are the most valuable oils in the world, and highest grade Pennsylvania crude now actually brings the same price as refined kerosene in bulk.

But unfortunately Pennsylvania production has fallen from 33,000,000 barrels in 1891 to about 9,000,000 barrels at the present time. However, at present prices even this decreased production represents over $18,000,000.

Ohio has decreased in production from 24,000,000 barrels in 1896 to less than 9,000,000 barrels during the year last past.

Again, the zenith production of Indiana was in 1904 over 11,000,000 barrels but the present yield shows a shrinkage of nearly 90 per cent. from maximum.

The United States Geological Survey states that the general decline in production "would doubtless have been much greater but for the effort to apply laws of supply and demand by increases in prices. Prices advanced so greatly during the year as to stimulate drilling, even in the old New York and Pennsylvania pools, and so checked the decline. Formerly this plan has not been so successful. In the mid-continent fields also it checked the decline, so that the product will come within 4,000,000 barrels of the maximum output.

Canada also has fallen off one-third from her highest production of 5 years ago, and the only new field in sight is Tampico, in Mexico, which has grown from nothing 3 years ago to 6,000,000 barrels in 1912.

About the only home fields not showing decreased output are in California and Oklahoma. Three-fifths of the total yield now comes from these two states. And even the increased output of Oklahoma was insufficient to prevent a continuous reduction of stock on hand in 1912. Ninety per cent. of the entire output of more than 220,000,000 barrels were crudes which yield a very low percentage of gasoline.

The following market prices of Eastern, Mid-Continent and Western crudes are fairly indicative of their relative gasoline content:

State	Per Barrel
Pennsylvania	$2.05
Indiana	1.23
Oklahoma and Kansas	.83
California	.35

These prices of crude oil were correct as of January 25, 1913. Since that time Pennsylvania crude oil advanced 7 cents a barrel on each of 3 successive days, standing now at $2.50, and $3 oil is freely predicted.

In order to obtain a single gallon of gasoline from refinable California petroleum, it is necessary to produce as by-products 9 gallons of kerosene and 30 gallons of residual oils. Notwithstanding the steadily increasing output of Western oil the price of gasoline on the coast continues to advance. It is now 30 cents per gallon at retail.

There are five different methods of increasing the normal visible supply of gasoline.

One is importation. The Standard Oil Company has imported some Russian naptha, but Russia has no more to spare, as her own soil output is diminishing to such an extent as to increase the price 100 per cent. in the last 2 years, and to warrant the Russian Government in the promotion of alcohol production.

Another and more promising means of obtaining gasoline is by increasing the total yield of American crudes. A yearly production of 300,000,000 barrels in the United States is probably being approached faster than even oil men generally believe. But the largest increase in the production of gasoline in one year has never been more than 5 per cent. while the production of power-driven vehicles will, in all probabilities, represent an increase this year of around 100 per cent. Furthermore, as already shown, the supply of gasoline yielding crudes is rapidly decreasing and the increased crude output will consist of Oklahoma and California asphalt oils, having insufficient gasoline for existing requirements.

The third means of supplementing the gasoline supply is the production of gasoline from kerosene. Chemists have known for some time that it was entirely feasible to extract gasoline from the chemically complex kerosene; as well as from coal, coal tar and even wood; it is simply a question of cost and of the profitable disposal of resultant by-products. Gasoline is now being made from kerosene in increasing quantities.

A fourth source of gasoline supply is its manufacture from natural gas by compression, and its subsequent condensation to a liquid form. It is claimed that this process produced 13,000 gallons in 1910, which was increased to 50,000 gallons in 1911 and about twice as much in 1912. Some of the richer gases produce as much as 8 gallons per 1,000 cubic feet but the average is from 3 to 5.5 gallons. By triple and quadruple compression up to pressures as high as 400 pounds, very light liquids up to 85 degrees Beaumé are produced, these being slightly more stable than the products of fractional distillation.

Lowering the Beaume Gravity

The fifth and last means of increasing the available gasoline supply is by lowering its Beaumé gravity. It is probable that the specific gravity of commercial gasoline will be dropped another notch by next summer. Much of the liquined-gas gasoline is used for blending with heavier distillates, and it naturally requires other than gravity tests to determine the characteristics of such blended gasolines.

Mexico a Source of Fuel

During 1912 Mexican Oil Fields Produced 15,200,000 Barrels of Oil—One-Sixth Available Output

TAMPICO, MEX., Feb. 24.—In view of the enormous increase in the consumption of gasoline as a result of the automobile industry and the general development of the uses to which gasoline engines are being put, a review of the possible sources of supply of the crude oil is probably of interest at this time.

Much of the Mexico oil is not of a refining grade, but it is a fact that at least three of the greatest producing fields in the Tampico region are now gushing forth oil of 20.5 degrees Baumé and that the oil of another one of the fields is 28 degree Baumé, while that of the Isthmus of Tehauntepec is 40 degree Baumé. All of these are oils that can be refined.

Only Part of Possible Production

During the year 1912 the Mexico fields produced approximately 15,200,000 barrels of oil, which was about one-sixth of the available output of the wells. This production may be regarded as remarkable in view of the fact that the transportation and marketing facilities are as yet very limited and the known oil-producing territory in a comparatively small state of development. The production for the year was confined practically to two of the larger companies and their allied interests. These are the Mexican Petroleum Company and its subsidiary, the Hausteca Petroleum Company, and what is known as the Pearson interests, comprising the English firm of S. Pearson & Son, Ltd., and the Mexican Eagle Oil Company. While there are more than forty companies, firms and individuals now operating in the East coast territory situated within a range of 160 miles of the port of Tampico, only a few of these concerns are on a producing basis so far as the actual marketing of their product is concerned. While the output of the different fields in the Tampico region for 1912 aggregated approximately 15,200,000 barrels, this production only represents a comparatively small part of what is now available.

It is claimed that there are enough producing wells capped, owing to the fact that there is not at this time a means of transporting the oil to market, to have brought up the yield for the year to perhaps six times what it was. In proof of this statement it may be cited that two of the wells which afforded, during the year, the bulk of the total yield were only permitted to flow a small portion of their capacity and that had these two wells alone been thrown wide open they would have given a total output aggregating, it is said, probably fully 90,000,000 barrels of oil. Of course, this is not taking into consideration the possibility that their flow might have been exhausted had this been done. One of these wells is that of the Mexican Eagle Oil Company situated in the Potrero del Llano field, State of Vera Cruz. While it has a proved flow of 110,000 barrels per day, it was kept throttled down during the year to a production of only about 15,000 barrels per day and difficulty was experienced in taking care of this quantity of the fluid. The other phenomenal well is that of the Hausteca Petroleum Company situated in the Juan Casiano district and having an available daily output of about 100,000 barrels, it is claimed, but which was held down to a flow of 28,500 barrels daily. This latter well has been flowing at that rate for nearly 3 years without a single day of interruption.

In the Juan Casiano field the Hausteca Petroleum Company has eight capped wells which have an aggregate capacity, it is pronounced, of more than 16,000 barrels daily. It is now drilling several other wells in that field. This company and the Mexican Petroleum Company had in storage on January 1, 1913, approximately 7,000,000 barrels of oil. Their contracts during 1912 called for a daily delivery of 30,000 barrels and the two companies entered the new year with outstanding contracts aggregating 60,000,000 barerls, of which 35,000,000 barrels are for consumption in Mexico and 25,000,000 barrels for consumption in the United States. The average selling price of the product is 50 cents gold per barrel. During 1912 the sales of these two companies were approximately 8,700,000 barrels, or about 700,000 barrels per month. This is just double the sales of the two companies for the year 1911.

The Mexican Petroleum Company is having constructed and will place in service during the first 6 months of 1913 six oil-tank steamers, two tugs, two barges and other floating equipment. The cost of providing this fleet of oil-carrying vessels, which will have an aggregate capacity of about 275,000 barrels, will be about $2,000,000. The company has also adopted plans for erecting a refinery at Tampico for the production of naphtha and light gasoline distillate at a cost of about $300,000.

During the year 1912 the Hausteca Petroleum Company completed the construction of an additional oil pipe line from Juan Casiano to the loading racks at its deepwater shipping point. It also finished the construction of a private narrow-gauge railroad giving the oil field a transportation outlet of this character. It is now constructing a railroad from Cerro San Geronimo to Cerro Azul, and is laying pipe lines from Juan Casiano to Cerro Azul and to Tres Hermanos.

The Mexican Petroleum Company was also active during the year in exploiting other localities and it carried on some small development work in its original field at Ebano, where it has a small refining plant that is devoted chiefly to the production of asphaltum residue that is used largely in street paving in Mexico.

The Pearson interests brought in eight wells in the Potrero del Llano field during the year, but they are all, with the exception of the so-called 110,000-barrel gusher, tightly capped pending the establishment of additional transportation facilities.

The Mexican Eagle Oil Company has also contracted for a large fleet of oil-carrying vessels and will place it in service during the present year.

Next to the Potrero del Llano and the Juan Casiano fields the most activity during the year was in the Panuco and Topila fields, which are situated adjacent to the Panuco River, a short distance above Tampico. In these two last-named fields the East Coast Oil Company, which is owned by the Southern Pacific Railway interests, led in development operations. It has a number of producing wells in those two fields and they are connected with loading racks on the Panuco River by means of pipe lines.

300,000 Acres Added in 1912

The Texas Company, which has its headquarters at Houston, Tex., the Gulf Refining Company and several other of the large oil-producing and pipe line concerns of the United States acquired oil land holdings in different districts around Tampico during the year and are actively engaged in the preliminary exploitation of same. Some of these companies have already established lines of vessels between Tampico and ports in the United States and are engaged in the regular business of transporting the crude oil to those foreign markets.

There was added approximately 300,000 acres to the oil-producing territory in the Tampico region during the year 1912. The gravity of the oil of the different fields is as follows:

Ebano, 11 degrees, Baumé; Panuco, 12.5; Caracol, 12.5; Topila, 15; Juan Casiano, 20.5; Potrero del Llano, 20.5; Tanghuijo, 20.5; Furbero, 28; Isthmus of Tehauntepec, 40.

Shipments of oil during the closing months of 1912 from all the oil fields were at the rate of about 1,500,000 barrels per month.

The Mexican Eagle Oil Company is now shipping oil through the port of Tuxpam at the rate of about 600,000 harrels per month.

200,000 Cars Per Year

N. A. Hawkins, General Sales Manager of the Ford Motor Company, Tells The Company's Story

DETROIT, MICH., Feb. 21—Just what it means to manufacture 200,000 complete automobiles in 12 months was told by N. A. Hawkins, general sales manager of the Ford Motor Company, at the dinner of the Adcraft Club and the Board of Commerce at the Cadillac Hotel last night. In a story bristling with big figures and full of the romance of business Mr. Hawkins touched upon the marvelous growth of the Ford plant from a pigmy to a giant. Ten years ago the company was capitalized at $28,000 and did an annual business of $200,000. Today it is the largest automobile factory in the world; has a capitalization of $30,000,000 and sells annually $200,000,000 worth of automobiles in all parts of the world.

"Ford profits," said Mr. Hawkins, "are equivalent to maximum industrial earnings on a capitalization of $200,000,000 and on this basis could probably, before its twentieth anniversary, return the equivalent of this amount to its shareholders. The January sales of Ford cars were nearly $9,000,000 or more than twice the gross receipts of the Grand Trunk railway system for the same month. In the last four months we did a business of nearly $30,000,000 and 2 of those 4 months were not very good ones.

Highly Efficient Organization

"The Ford company has all the elements of a successful enterprise. It manufactures a useful article; its company is properly organized; it is amply financed, entirely within itself, to successfully carry on its operations; its business policy is clear and well defined; its management is capable, tactful and honest; its factory is well designed, fully equipped and suitably located; its product is perfect in design and quality; its selling force is efficient, the largest of its kind in the world, and backed by plain, honest advertising, with complete service to owners.

"The Ford is an organization of all young men. Not an executive head has been added to a single department of the business in more than 6 years, during which period the output of cars and annual sales have nearly doubled each year. All this great business has been built up from an original cash capital of only $28,000 and without ever borrowing a dollar or issuing any paper. We used banks only as depositories to lock up money and earn interest, and this season in planning a production of 200,000 cars we never consulted with a banker.

"We are at present employing in our factories and at our branch houses 18,061 men, and all day workers, not a piece worker in the plants, and disbursing monthly about $700,000 for payrolls. Every day, except Saturday, is pay day, and our average runs between $30,000 and $35,000 daily.

"Our factory, which now covers practically 65 acres, is about as complete and up-to-the-minute as modern architecture and latest machinery and labor-saving appliances can make it.

"Our going inventories of raw materials, parts, accessories, etc., are running along now at an average of about $7,000,000, and, mind you, every car that we build each day is shipped the same day, so none of this amount is for finished cars. Our total net assets are close to $25,000,000.

"June 24 last a schedule of manufacturing our 1913 output was decided upon. To handle this production we require 1,000,000 lamps, 800,000 wheels, 800,000 tires, 90,000 tons of steel, the hides of 400,000 cattle to furnish the leather for upholstering the bodies, the hair or bristles from 6,000,000 hogs to stuff into the upholstering, 12,000,000 hickory billets for wheel spokes, nearly 2,000,000 square feet of glass for the windshields, 750,000 pounds of soft soap, 15,000 tons of molding sand to make our castings, 2,000,000 cubic feet of gas per day for heat-treating, etc.

"January 13 last we built and shipped 1,336 finished model T's—a business for one day amounting to nearly $700,000 and requiring more than 200 freight cars to handle the shipments, or five full train loads of more than forty cars to the train.

"On the basis of the mileage from Detroit to New York City—if we had delivered this day's output to our New York branch by driving the cars overland, we would have had a procession of model T's—just a half a mile apart—and when the first car was coming into New York the last one would be leaving the factory.

"During January we built and shipped 17,601 finished cars—a net volume in dollars and cents of nearly $9,000,000—more cars than we built and shipped during the first 5 months of last season. By the end of February the close of our first 5 months for 1913—we will have shipped more than 56,000 cars as against 17,555 for the same period a year ago.

"In spite of our increased facilities for producing, our daily orders are in excess of our daily output as evidenced by the fact that in spite of all the great shipments we have made we still have on file for immediate attention 38,326 orders or a sufficient quantity to take us through to April 10, at the rate of 1,000 cars a day.

"Our traffic manager recently advised that we would require 35,000 freight cars to move our 1913 output.

"According to our output this season and according to the most authentic estimates of other car makers, we will produce every other car that is built in this country during 1913.

"One day last week we gave one tire concern our check for a little less than $2,000,000 and every other single part that goes into the construction of our cars bears a similar comparison to the completed job—from cotter pins and lamps to springs and tops—so that you can get some idea of quantity production.

"By September 30 we hope to have at least 400,000 satisfied users voicing our sentiments. Four hundred thousand Ford owners means 400,000 voters for good roads, because most Ford owners are their own drivers—and when good roads are linked up all over the country, I hate to think about our annual production to supply the demand for these individual Ford transportation lines.

"The great demand for Ford cars has not heen brought about without a fair amount of advertising and careful study of the selling problems."

Cost of Fire Chief's Runabout

YONKERS, N. Y., Feb. 21—The Yonkers fire chief and the 1st and 2nd assistant chiefs, or deputies, have been given three 4-cylinder, 28-30 horsepower gasoline runabouts, equipped with electric cranking, electric lights, electric horn, fire gong, buggy-top, etc. These were installed in October, 1912, and since that time enough data have been gathered to warrant a comparison between the horse and the automobile in this particular capacity.

First assistant Chief Baker furnished the following data to a representative of THE AUTOMOBILE. The figures are arranged in tabular form below. As may be seen, the result in actual cash saving per month, speaks well for the automobile.

MONTHLY SAVING ON CHIEF'S RIG-HORSE VS. MOTOR

HORSE		MOTOR
Feed ....$.33 per day		Gasoline ...$.17 per day
Shoeing ..... .26 per day		Oil .... .05
—		Grease .... .03
Total ...... .59		—
Total motor. .25	$.34 daily saving	Total .....$.25
—	30 days	
$.34. daily saving	—	
	$10.20	
	Saving per month	

Gasoline....$.17	per gal.,	1 gal per day
Oil......... .60	per gal.,	2 gal per month
Grease...... .15	per pound,	3 oz. per day

Two other points in favor of the machine, mentioned by Chief Baker, are first: the hill climbing power of the runabouts. In a city having the seven hills of Rome, the value of this point cannot be over estimated. The second point is the speed with which they enable the executive to reach the scene of the fire.

Schermack Spring Wheel Acts on New Principle

Road Shocks Are Absorbed By Lateral Movement of Flat Steel Springs Held Under Tension and Oppositely Aligned—Vibration Absorbing Qualities Tested By Schermack Resiliograph

AN entirely new spring wheel design is that of the Schermack resilient wheel, the general construction of which is shown in Figs. 1 and 2. This new type of spring wheel consists of a hub section or inner wheel A, and a rim section or outer wheel B. The latter carries a standard rim on which a solid rubber tire is mounted. The two sections are provided circumferentially with aligned projecting flat steel springs or brackets C, bolted with two bolts each on alternately opposite sides of the two rims A and B. These springs are mounted in such a manner that each spring on one rim is under tension and is oppositely aligned with one on the other rim and on the opposite side thereof. These flat radial springs C acting horizontally are connected in pairs to the outer and inner rims by laterally-arranged steel bars or bolts D, the ends of which are provided with steel balls working in socket connections E, which are fixed to the flat springs C. These cross bars, together with their ball and socket connections, take up throughout the circumference of the wheel any load either vertically or sidewise which may be placed upon them. It follows from the construction of the wheel that side loads are more easily carried than vertical loads, since the lateral strength of the wheel is seen to be greater than the vertical.

The principle of the Schermack wheel may be gained from inspection of the two sections in Fig. 1. That on the left shows the normal condition of the device when no vertical load is applied to the hub. It will be seen that the bar connections D are horizontal when the wheel is in its normal position, and that when under load they are inclined throughout the circumference of the wheel, as shown in the right hand section. When under load the bars work up or down, depending on their temporary location as referred to the road surface. Under load the horizontal distance between the bar ends is less, since any inclined line is greater than the perpendicular distance between the vertical planes of these bar ends. It is therefore evident that any motion of the ends of the bars means a horizontal pull on the flat springs and their consequent bending in.

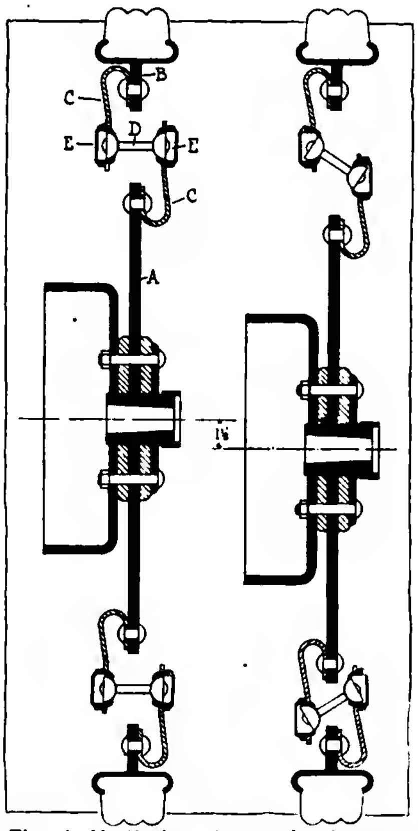


Fig. 1—Vertical sections, showing the wheel in free position and under load

Fig. 2—View of the Schermack spring wheel fitted to car, showing how the flat steel springs are disposed

The ball and socket joints which are packed with grease are used for preventing the bars D from being cramped or from having any other pull acting upon them except that in the direction of their axes. The springs C are designed to be under tension even when there is no load upon the wheel, and they have sufficient strength to react under any imposed stress.

It will be seen that when there is a starting load imposed upon the wheel there is a tendency for the inner wheel to revolve within the outer portion. But since the connected springs C are mounted alternately on the two portions of the complete wheel, it is evident that when the inner wheel is revolved, one bar pulls in one direction while the next one pulls in the opposite direction. Thus each two pairs of interconnected springs pull against one another, nullifying their action and causing the outer and inner wheels to move together, with only a slight give, much the same as that of a wire wheel construction under the same conditions.

A feature of the Schermack construction which is commendable is that the flat springs C are always under tension. There is, therefore, no possibility of any rattle of the parts or of their working loose under ordinary conditions of travel. Further, the construction makes it impossible for any spring or set of springs to carry more of a load than any other set. There are eighteen sets of springs around the circumference of a wheel, hence each set carries .055 of the total load under all sorts of circumstances.

The Resiliograph

For the purpose of proving that its steel spring wheels when equipped with solid rubber tires have the proper vibration absorbing qualities the

Schermack Wheel Company has devised an ingenious apparatus which is called the resiliograph, and which is shown in Fig. 5. Fig. 3 also gives a view of the device, as attached to a motor car equipped with the Schermack wheels.

It has already been explained that the Schermack wheel consists of two circular sections, an inner wheel attached to the hub and an outer one which carries the rim and tire. It is evident that when revolved without load in some way (by jacking up the wheel) the two sections have a common center. But when a load is applied, the center of the inner member drops below the normal center, which is the true center of the outer wheel and which is always fixed. The actual working or live center of the wheel being the center of the inner wheel, it fluctuates continually in relation to the true or dead center of the outer wheel, as already mentioned, in an amount in proportion to the car's weight, or as the roadbed varies.

This is what the resiliograph was designed to do. A cross bar CB, Fig. 5, is attached to the outer rim of the wheel, as shown in Fig. 3, bolting to it at N_1 and N_2. This bar has a bearing at its center, which bearing is also at the exact or dead center of the wheel. This bar supports the sleeve end of the long bar S, the front end of which is supported on the running board in a spring buffer. See Fig. 3. This bar S carries the two drums X and Y on which the paper record is made by means of the pencils shown. When the wheel revolves, the cross bar CB also revolves, but the bar S remains stationary, it, together with the recording mechanism, being in fixed relation to the dead center of the wheel. The bar CB in turning drives the integral pulley V, a belt from which passes the motion to P_1. Another belt from the shaft of P_1 conveys the power to pulley P_2, which is on the shaft of the driving drum X. Thus, the revolution of the wheel causes the paper to move horizontally from one drum to the other.

A shaft passing through the sleeve V attaches to a short lever V_1 on the inside of the wheel. To this lever, an arm W is pivoted as shown. This arm is slotted at its lower end to receive a pin which is fixed in the center of the hub. This pin, which is also in the exact center of the inner portion of the wheel, represents the live working center of the wheel, and it is continually moving up and down, as explained above. Its movements are transferred to the slotted end of arm W, which in turn transfers them to the other end of the shaft and to arm W_1 on the outside of bar S. Arm W_1 connects with the recording pencil through the rod R. It is now seen that when the wheel revolves the drum X winds up the paper, while the pencil traces the vertical movements of the inner portion of the wheel. The pencil Z is stationary and is used to trace the dead center of the wheel, which point becomes a horizontal line when drawn out, and which can be used as a reference line or base line.

By the use of the instrument, many interesting diagrams showing the fluctuations of the inner portion of the wheel under various road conditions have been taken, appearing as shown in Fig. 4. These indicate that the wheel absorbs jars, shocks and vibrations in much the same way as does the pneumatic tire.

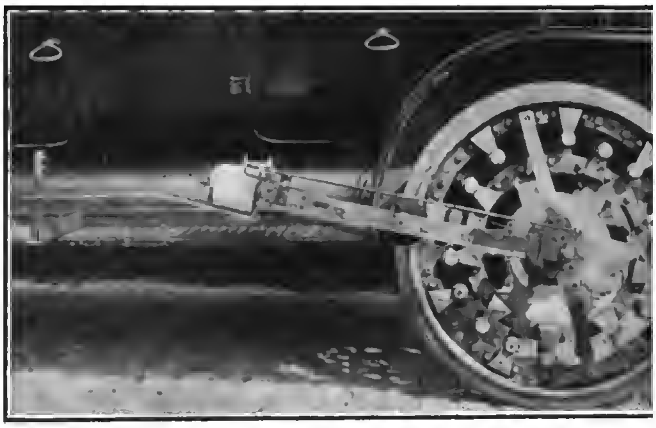

Fig. 3—Schermack resiliograph in position for testing the vibratic absorbing properties of spring wheel

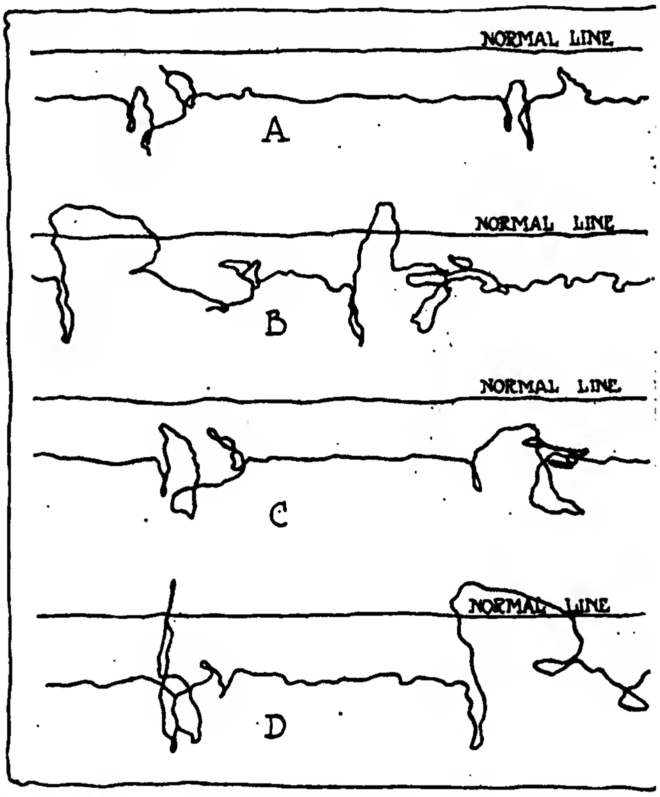

Fig. 4—Series of test charts obtained by the use of the resiliograp under the following conditions:

A and B—Empty car over 1 inch blocks 12 feet apart at speeds 8 and 15 miles per hour respectively

C and D—Loaded car over 1 inch blocks 12 feet apart at speeds 8 and 15 miles per hour respectively

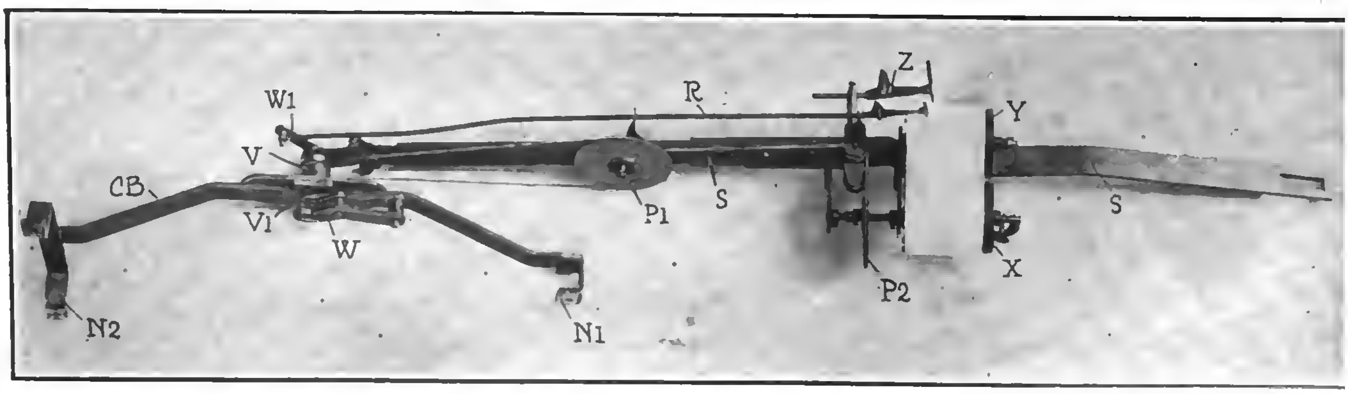

Fig. 5—Detail of Schermack resiliograph showing pencils and strip of paper on which the records are taken

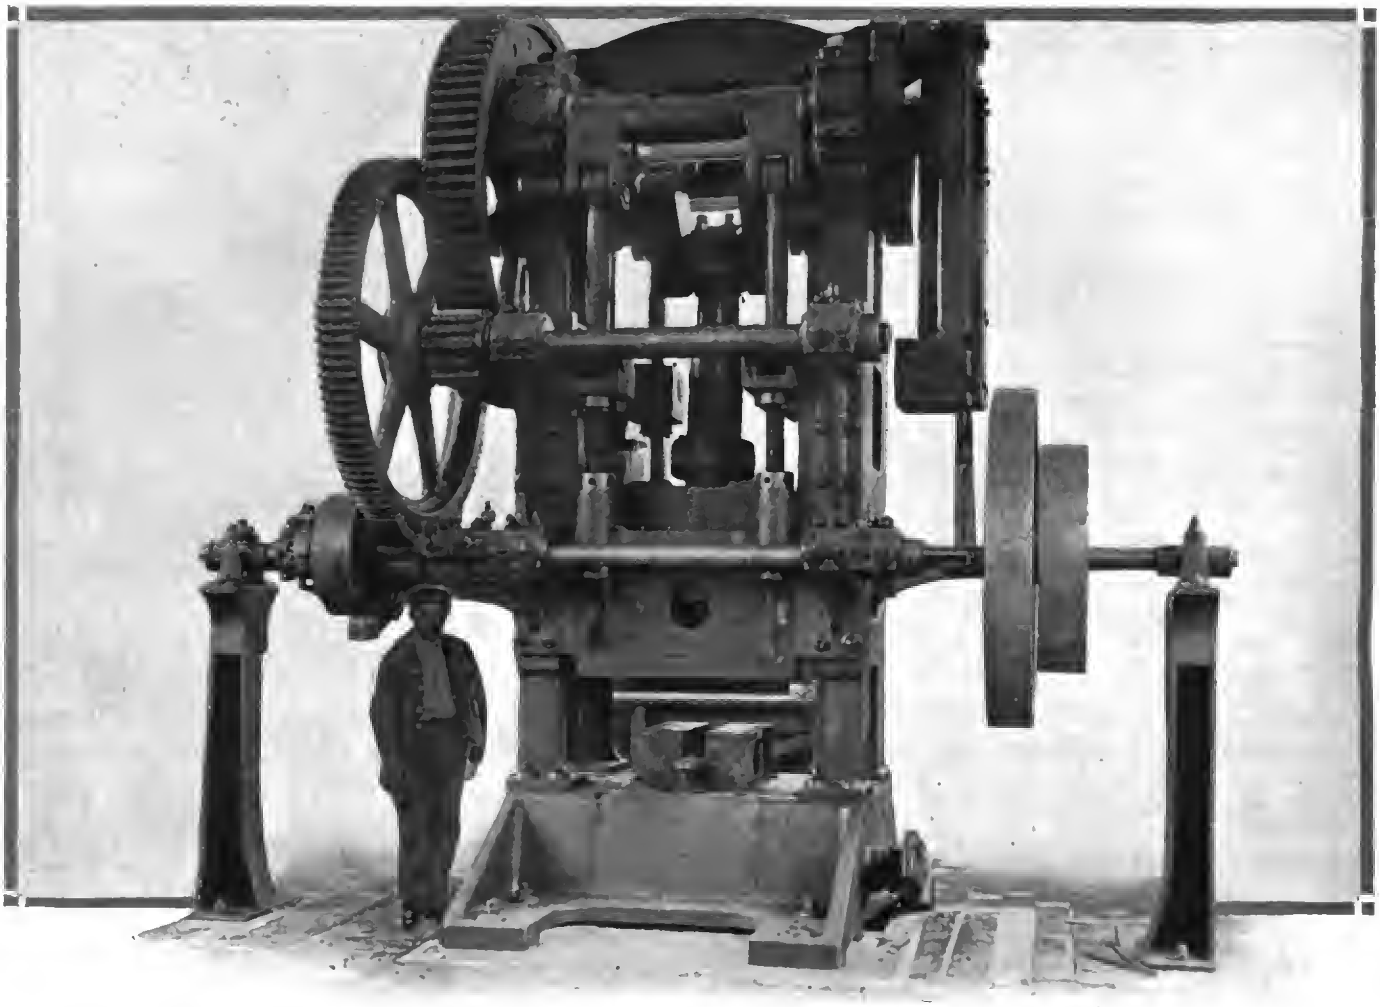
Factory Miscellany



Largest power press in the factory of the Ford Motor Company, Detroit, Mich. It is used in making magneto coil supports

THE machine shown herewith is used in the manufacture of the magneto coil support for Ford cars. The Ford magneto is housed within the flywheel, and is of peculiar shape and heavy design. The services of this huge die are required in its manufacture. As may be seen in the illustration, the machine is more than 2.5 times the height of a man of ordinary stature and is about as long as it is high. The instrument converts rotating into reciprocating motion of a heavy crank and connecting-rod. The lower end of the connecting-rod holds the hammer which acts upon guides in the same manner that the piston in the motor cylinder is actuated. As may be seen, drive is by means of heavy gear wheels and a horizontal shaft which is carried by bearings supported on two posts which render the shafting independent of hammering shocks. This power press is the largest employed in the Ford factory and is one of the main factors in the quantity production scheme of this concern. It is said that one Ford car passes through the assembly department of the plant every fifty seconds and it is by the aid of such machines as these that the speed of the output is maintained.

OVERLAND'S Building Plans—The Willys-Overland Company, Toledo, O., is arranging for the erection of a new five-story administration and general office building in that city at an approximate cost of $150,000. Specifications call for a five-story building with basement 200 feet by 80 feet in dimensions. It will be constructed of brick, steel and hollow tile and will be fireproof throughout. Another small factory addition is soon to be made at a cost of $2,500, a permit having already been issued for the work.

Ford's Mammoth Boston Building—The Ford Motor Car Company, Detroit, Mich., intends to erect a building with something over 100,000 square feet of floor area in Boston, Mass., for the assembling of its cars, and will begin work in the near future.

Motor Trucks for Maxwell—It is rumored that the Maxwell Motor Car Company, Detroit, Mich., has put out some tentative inquiries in New York City for machine tools to be used in refitting the old Brush plant in Detroit. It is understood commercial trucks will be manufactured.

New Plant for Batavia—The Baker Gun & Forging Company, Batavia, N. Y., recently entered into a contract by which the Jamesville Manufacturing Company's business will be brought to that city. It is expected that plans will be considered for the removal of the Jamesville plant to Batavia and provisions for the big changes in the present plant are now under discussion. The Baker concern manufactures automobile electric starters as well as guns.

Nyberg to Increase Capacity—At the annual meeting of the board of directors of the Nyberg Automobile Works, Chattanooga, Tenn., held recently, plans were made to increase the capacity of the plant to meet the demand for the Nyberg cars. It is probable that a new site will be selected and new buildings erected. Another decision was made at the meeting, this being to manufacture in the future nothing but high-grade, six-cylindered cars.

The Automobile Calendar

Shows, Conventions, Etc.

Feb. 24-27.........Kansas City, Mo., Truck Show.
Feb. 22-Mar. 1.....Brooklyn, N. Y., Annual Show, 23rd Regiment Armory.
Feb. 24-Mar. 1.....St. Louis, Mo., Annual Show.
Feb. 24-Mar. 1.....Memphis, Tenn., Annual Show.
Feb. 24-Mar. 1.....Omaha, Neb., Annual Automobile Show.
Feb. 24-Mar. 1.....Paterson, N. J., Annual Show, Paterson Automobile Trade Association.
Feb. 24-Mar. 5.....Cincinnati, O., Annual Show, Music Hall, Cincinnati Automobile Dealers' Association.
Feb. 25-28.........Eau Claire, Wis., Annual Show, Armory, Dealers' Association.
Feb. 25-Mar. 1.....Syracuse, N. Y., Annual Show, Syracuse A. D. A.
Feb. 26-Mar. 1.....Fort Dodge, Ia., Annual Show.
Feb. 26-Mar. 1.....Glens Falls, N. Y., Automobile Show, Louis Blumenstein, Manager.

July 27-28.........Tacoma, Wash., Tacoma Road Races.
Nov. 24...........Savannah, Ga., Vanderbilt Cup Race, Motor Cups Holding Company.
Nov. 26...........Savannah, Ga., Grand Prize Race, Automobile Club of America.

Foreign

March.............France, Sealed Bonnet, 3000-Mile Run.
March 31.........Montevideo, Uruguay, International Competition of Agricultural Motor Vehicles.
April.............Barcelona, Spain, International Exhibition.
May..............St. Petersburg, Russia, International Automobile Exposition, building of Michael Maneze, Imperial Automobile Club of Russia.
July 12...........Amiens, France, Grand Prix Race.

Marathon Factory Completed—The factory of the Marathon Tire & Rubber Company, Cuyahoga Falls, O., is completed.

Pilot's Addition—The Pilot Motor Car Company, Richmond, Ind., has awarded plans for an addition which will be 46 feet by 120 feet and two stories high.

Fiat Will Increase Factory—The F.I.A.T. Company, Poughkeepsie, N. Y., will increase the size of its automobile factory with 30,000 square feet of additional floor space.

Reorganize Automobile Works—J. G. Cleary, of Milwaukee, Wis., who recently purchased the Findlay Motor Works, will probably reorganize the company and put it in operation at once.

Chandler Selects Site—It is announced that the Chandler Motor Company, in which Detroit, Mich., men are interested and which has recently been organized, will build a plant in Cleveland, O., the site having been secured along the Belt Line Railroad.

Scharf Gearless Building—The Scharf Gearless Motor Company, Richmond, O., which was recently incorporated with a capital of $10,000 by G. W. Worden and others, is planning the erection of a plant for the manufacture of a new gearless motor.

Overland Buys Toledo Land—The Willys-Overland Company, Toledo, O., by a recent purchase of $10,000 worth of land has secured complete control of all property between West Central avenue, where the large factory is located to the boulevard. The land was purchased with a view to future expansion of the factory.

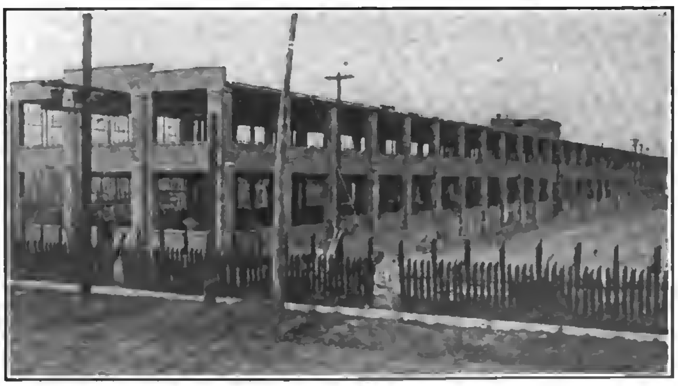
Wilboken Establishes Quarters—The Wilboken Manufacturing Company, Milwaukee, Wis., recently incorporated for $50,000, has established headquarters and a factory at 248 Reed street for the manufacture of air compressors for automobiles, electric air compressors for garages and other purposes and a line of mechanical specialties. G. C. Knaak is president and general manager.

Garage Equipment to Build—The Garage Equipment Manufacturing Company, Milwaukee, Wis., has been granted a permit to build a $7,500 addition to its works. The company is just getting back into its normal stride after the fire early in January. The addition will make possible more nearly an approximation of production in relation to orders on hand.

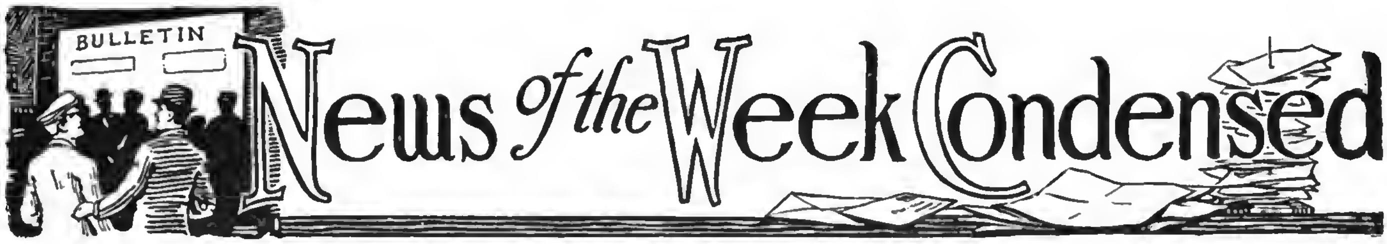
Ford's St. Paul Plant—Factory architect Graham of the Ford Motor Car Company, Detroit, Mich., recently went to St. Paul, Minn., to look over the site purchased by that firm. It was originally planned to hold a large retail store on a site in Minneapolis and to erect a big assembling plant also there, but a difference of opinion arose and so the Ford people are now thinking of building the factory in St. Paul.

Maxwell Offices Moved—The offices of the Maxwell Motor Car Company, Dayton, O., will be removed to the North Dayton, O., plant. Additional employees are being taken on at the plant and President Walter Flanders states that the output this year will be between 20,000 and 25,000 cars. The Maxwell company will use $500,000 worth of drop forgings a year and plans are being made for opening up a foundry to furnish them.

Erie to Have Plant—George McLaughlin, of Erie, Pa., has organized a company, capitalized at $100,000, to manufacture motor trucks, ranging in capacity from 1 to 4 tons. Twelve carloads of material, which will arrive in the near future, have been purchased and manufacturing will commence as soon as the necessary machinery arrives and can be installed. Until a larger and more suitable building can be obtained, the present plant occupied by Mr. McLaughlin will be used.



One of the recent additions to the plant of the Motor Car Manufacturing Company, Indianapolis, Ind.



AGAINST Reckless Driving—The Legislative Committee of the St. Louis, Mo., Automobile Club has presented to the House of Delegates the views of 750 of its members on the proposed new ordinances which affect the automobile user. The letters all expressed a sentiment against reckless driving. The club wants better traffic conditions.

Perry Has Club—Fifty motorists of Perry, N. Y., have formed the Perry Automobile Club.

Millikin Sales Manager—J. F. Millikin has joined the Spokane, Wash., Auto-Truck Company in the capacity of sales manager.

Ridler Pope Sales Manager—F. M. Ridler has been appointed sales manager of the Pope Manufacturing Company, Hartford, Conn.

Lyons Manager Capitol Body—W. A. Lyons has been made general manager of the Capitol Body Company, recently organized in Indianapolis, Ind.

They Certainly Need Them—Automobiles that are bullet-proof are being advertised by a dealer in Mexico City, Mexico, who knows what the public wants.

Washington Franklin Firm Moves—S. S. Smith & Company, Franklin's dealers in Washington, Ia., recently moved into new quarters on South Marion avenue.

Diefenderfer Manager N. Y. Lozier—A. G. Diefenderfer's appointment as manager of the New York City branch of the Lozier Motor Company, has been announced.

Little Sales Manager Borland—W. C. Little, assistant sales manager of the Lozier Motor Company, Detroit, Mich., goes to the Borland-Grannis Company, Chicago, Ill., on March 1. His new position will be that of sales manager.

Cross Holly Sales Manager—The Holly Brothers Company, Detroit, Mich., carbureter maker, announces the appointment of C. W. Cross as sales manager. Mr. Cross was formerly with the General Motors Truck Company.

Brady General Manager—The Aluminum Castings Company, Cleveland, O., announces the appointment of Charles Brady as general manager of the aluminum foundries.

Baldwin with Stewart-Warner—R. H. Baldwin, formerly with the Standard Speedometer Company, has joined the Stewart-Warner Speedometer Corporation's forces, Chicago, Ill. He will be connected with the Detroit, Mich., office.

Want Roads Cleared—The Connecticut Automobile Association, Hartford, Conn., will lend all effort for the enactment of a bill providing that road side brush, small trees, vines and low-lying branches at corners, intersections, curves and the like be removed to provide a clear vision.

Newark License Office to Move—On May 1 the Newark, N. J., office of the New Jersey State Motor Vehicle Department will move with the N. J. Automobile and Motor Club to the corner of Central avenue and Halsey street.

Motors in Railway Coaches—Railway coaches propelled by gasoline motors will be placed in service by the Chicago, Milwaukee & St. Paul Railway Company on March 1 between Milwaukee, Pewaukee and Waukesha, Wis. Five coaches will comprise the initial equipment of the division.

Martin from Firestone to Stewart—F. H. Martin, recently with the Firestone Tire & Rubber Company, has accepted the position of Eastern sales manager of the Stewart-Warner Speedometer Corporation, Chicago, Ill., and will assume his new duties on March 1, with headquarters in New York City.

Chauffeurs' Bureau in Hartford—The establishment of a chauffeurs' bureau is under advisement by the Automobile Club of Hartford, Conn. It is the intention to keep a file of complete data which would have a tendency to weed out the undesirable sort.

Jacksonville to Atlanta Tour—A representative of the Board of Trade of Jacksonville, Fla., is authority for the statement that arrangements are almost perfected for a tour from Jacksonville to Atlanta for the grand opera week in April. The tour will be made by 100 cars. The scout car for the tour will leave Jacksonville some time in the near future.

A three-seater torpedo on Bellanger chassis. This car is built by the Gregoire Company, Poissy (S-O) et Asnières (Seine), and carries a Daimler-Knight motor. Marquis de Soriano, a leading Spanish sportsman, is at the wheel

New York Got $1,000,000—That the automobile yielded more than a million dollars in revenue to N. Y. State during 1912 is disclosed in the report of the Secretary of State's office for the past year. The registrations were divided as follows: pleasure vehicles, 95,484; commercial cars, 9,767; dealers, 1,716, and exempt vehicles, 295. The revenue collected for the year was $1,047,678, an increase of $132,155 over 1911.

Electrical Society Will Meet—The Society for Electrical Development, New York City, will hold a meeting on March 4 and 5 in the large meeting room in the Engineering Societies Building, 29 W. 39th street, that city. The society has been organized to assist in the development of the electrical industry throughout the country. A number of papers dealing on modern electrical problems will be read at the meeting by prominent men in the industry.

Connecticut Foreign Trucks Registered—As was expected the intention of putting through the Connecticut legislature a bill compelling foreign motor trucks to be registered in that state has caused much comment. Among other factions the Connecticut Automobile Association made up of state clubs affiliated with the A. A. A. are loud in denunciation of the proposed measure. The contention is that the bill is a direct contradiction of the state association avowed policy to make Connecticut a wide open state.

New Western Automobile Rates—Application of the new automobile insurance rates in the West has been postponed until March 15, before which time the two Eastern members of the executive committee of the Western Automobile Underwriters' Association will have been selected and a conference, can be held for an adjustment of the entire situation. The important changes from the present agreement are that the limitation of agents is made two instead of three, all features of automobile insurance are covered instead of only fire and theft.

Foreign Credits—A book of very practical value to every firm engaged in the export trade or planning to enter the foreign field has recently been issued by the Bureau of Foreign and Domestic Commerce. It deals with the credit problem. An important series of consular reports from all parts of the world is included. In these reports American consular officers describe fully the local credit conditions. Copies of the book, special agents series No. 62, may be obtained upon application to the superintendent of documents, government printing office.

White with Cole—J. L. White has joined the Cole Motor Car Company, Indianapolis, Ind., as purchasing agent.

Copper on Moon Staff—George Copper has joined the testing staff of the Moon Motor Car Company's factory in St. Louis, Mo.

East with Timken—G. L. East has become assistant advertising manager of the Timken-Detroit Axle Company, Detroit, Mich.

Skinner Opens Store—Richard C. Skinner, Connecticut representative of the Hood Rubber Company, has opened a store in Hartford, Conn.

Hathaway Kelly Manager—D. C. Hathaway has been appointed manager of the Kelly-Springfield Motor Truck Company's branch at Cleveland, O.

Potts Cole Motor Inspector—The Cole Motor Car Company, Indianapolis, Ind., has appointed E. R. Potts as chief motor inspector at the Cole plant.

Meade Superintendent Moon—J. J. Meade is the new superintendent of the motor building department of the Moon Motor Car Company, St. Louis, Mo.

Joyce Philadelphia Manager—James Joyce has been appointed manager of the Philadelphia, Pa., branch of the Kelly-Springfield Motor Truck Company, Springfield, O.

Detroit Supply House Purchased—The stock of the Detroit Motor Supply Company, Detroit, Mich., which has gone out of business, has been purchased by Heyn's Bazaar, that city.

Open Sheet Metal Works—W. A. Lang & Sons have opened a sheet metal works at 513 North Hamilton street, Saginaw, Mich., where they will do automobile radiator and muffler repairing.

Rohde Sails—O. J. Rohde, with a corps of magneto experts, sailed recently to Europe to establish headquarters in London, England, where they will attend the wants of those who are using the products of the Splitdorf Electrical Company, New York City.

Jones Buys Moyer Agency—G. W. Jones has purchased the controlling interest in the Moyer Automobile Company, Des Moines, Ia. Mr. Jones was manager of the United Motors Des Moines Company up to the time it was taken over by the Flanders interests.

Johns-Manville Salesmen's Conventions—Following a long-established custom, the 600 or more salesmen of the H. W. Johns-Manville Company, New York City, assembled in annual conventions on various dates from January 2 to February 8 in their respective districts to learn more about the products they sell.

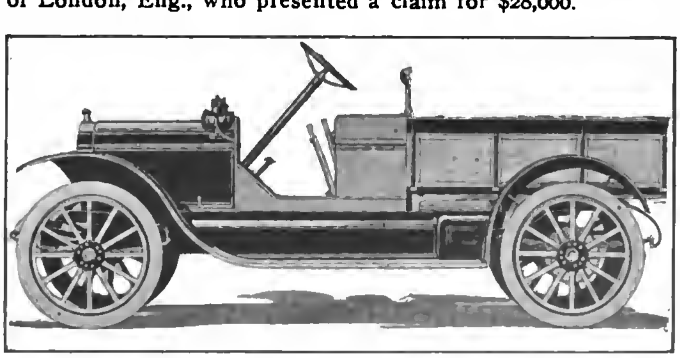
Automobiles on the Lakes—Automobile travel on the lake steamers last year was very large. During the season 1912 there were carried on Lake Champlain 1364 cars, as against 100 the previous year. On Lake George the increase is even more marked, there being transported in 1912 1335, as against 520 the year before.

Big Garage Fire—The garage and warehouse of the Manhattan Garage & Express Company, doing a public garage, car storage and trucking business, Milwaukee, Wis., was totally destroyed by fire February 12. Twenty-three cars of private owners were destroyed. The loss is $65,000, partly covered by insurance.

Fire in Washington—More than $9,000 damage was sustained by David S. Hendrick, G. R. Cowie Company and the Motor Truck Corporation, Washington, D. C., when a fire broke out Friday afternoon in the Hendrick garage. Of this amount $5,000 was sustained in damage to cars and the remainder to the buildings.

Made-in-Racine Show in June—A mammoth Made-in-Racine exposition, in which the automobile, truck and parts trades will have particular representation, will be held in the largest auditorium of Racine, Wis., in June under direction of the Commercial Club. Incidentally the club will wage a campaign to advertise Racine industries by means of pamphlets.

Commercial Rubber in Receiver's Hands—The New York Commercial Company, New York City, a large importer of crude rubber, whose assets, according to a financial statement issued recently, were $6,495,000, was put in the hands of the receiver recently. The application for receivership was made by J. N. Taylor, counsel for A. H. Alden & Company, Ltd., of London, Eng., who presented a claim for $28,000.



New light delivery truck recently announced by the Thomas B. Jeffery Company, Kenosha, Wis., manufacturer of the Rambler car. This car is distinguished by its unusually low price

Abolition of grade crossinga in France. Entrance to the old grade crossing at Lieuaant, on the Paris-to-Fontainebleau main road. Thia crosaing has been abolished by the building of a road over the railway by the P. L. M. Railroad Company

New road over railway to avoid the grade crossing at Villeneuve St. Georges, on Paris-Fontainebleau road. The P. L. M. Company has to abolish all grade crossings on its lines, thia being one already completed

Automobile Service in Medellin—A concession has been granted by the Columbian government for the establishment of public automobile service in Medellin.

Fees Larger in 1913—Fees collected by the secretary of state in the automobile registration department exceed the returns of 1912 by $6,000 for the months.

Fire Engine for Abeline—A motor-driven fire engine is to be purchased by Abeline, Tex. The city council authorized a maximum expenditure of $7,500 for the new engine.

Case Continues Racing—The J. I. Case Threshing Machine Company, Racine, Wis., manufacturing Case cars, will continue its track and road racing campaign during 1913.

Bus Line in Bedford—The Bedford Motor Bus Company is being organized at Bedford, Ind., to install a motor bus service. Four Buick cars each with a capacity of twenty passengers will be installed.

Lima's Speed Limit 15 Miles—A speed limit of 15 miles per hour has been made by a recent ordinance in Lima, Peru. The number of automobiles in the Peruvian capital is increasing rapidly.

Bus Line at Unionville—An automobile bus line has been established at Unionville, Conn., and will conduct a regular schedule between that town and Collinsville, carrying passengers and freight.

Newark Orders Fire Engine—The fire company at Newark, Del., has decided to order a $7,500 triple combination automobile fire engine from the United States Fire Apparatus Company, Wilmington.

Lander Manager Hagstrom—Upon the retirement of P. E. Zimmerman as manager of the Hagstrom Brothers Manufacturing Company, Lindsborg, Kans., this company will now be under the management of Mr. Charles Lander.

Panama Rubber Elects Officers—The following officers were elected by the newly organized Panama Rubber Company at San Francisco, Cal.; W. D. Newerf, president; W. E. McCune, first vice-president; J. S. Benner, secretary, and J. F. Roe, treasurer.

California Registrations Increased—The registration of automobiles for January, 1913, at Sacramento, Cal., presents some interesting figures. During the first month of the year 2,790 automobiles were registered, as against 2,594 for the same month of last year, a gain of almost 200.

Uruguay's Bus Lines Successful—The successful operation of motor buses in Montevideo, Uruguay, has caused a most favorable impression. An appropriation of $350,000 has been made by the government for the purchase of more vehicles of this type, which will run on regular schedules from the capital to points in the interior.

Havana Wants Two Ambulances—Two automobile ambulances have been authorized by the municipal council of Havana, Cuba. The sum of $10,000 was set aside for their purchase. No purchase will be made for several weeks in order that an opportunity may be given for the receipt of bids from companies in the United States and in France.

Washington's Road Fund—The first step toward raising by direct taxation a public road fund, which will reach $10,000,000 in the next 2 years was taken in the house of representatives at Olympia, Wash., recently. The measure passed fixes the road levy at 1½ mills. This will net approximately $3,000,000. There is already $1,000,000 unexpended in the state highway fund.

Ohio Road Bill Passed—The Ohio senate enacted a law styled the Weiser bill, which validates road improvement

Automobile Incorporations

AUTOMOBILES AND PARTS

Columbus, O.—New Columbus Automobile Company; capital, $30,000; to manufacture automobiles. Incorporators: Jesse J. Brown, L. M. Browu, W. E. McConnonn, C. E. Dennis, E. B. Dennis.

El Paso, Tex.—Longwell Automobile Truck and Sales Company; capital, $10,000; to deal in motor trucks. Incorporators: J. J. Longwell, H. M. Andreas, J. A. Tays.

Huntington, W. Va.—Jarvis-Huntington Automobile Company; capital, $100,000; to manufacture and sell automobile and motor trucks and operate a garage. Incorporators: Mrs. R. J. Poster, G. G. Poster, R. D. Seaman, T. L. Millard, F. C. Pifer.

Indianapolis, Ind.—Northern Auto Company; capital, $10,000; to deal in automobiles. Incorporators: J. J. Clements, R. M. Fleming, L. H. Van Briggle.

Jacksonville, Fla.—Gallatin Motor Company; capital, $10,000; to deal in automobiles. Incorporators: H. T. Phillips, Harry Botts.

Lima, O—Gladwill Crossley Motor Company; capital, $10,000; to deal in automobiles. Incorporators: A. J. Gladwill, C. E. Crossley, F. N. Holland, H. J. Blsnd and J. W. Roby.

Lockport, N. Y.—Amper Electric Company; capital, $25,000; to manufacture automobiles and automobile locks. Incorporators: T. D. Robinson, E. W. Jones, C. L. Nichols.

Milwaukee, Wis.—Oakland-Wisconsin Motor Company; capital, $50,000; to deal in automobiles. Incorporators: R. A. Creek, A. H. Small, N. M. Creek.

Mobile, Ala.—Mobile Overland Automobile Company; capital, $5,000; to conduct a general sales agency. Incorporator: Norman Richards.

New York City.—K-E-W Manufacturing Company; capital, $5,000; to deal in automobiles. Incorporators: John Jacobs, W. W. Ward, J. A. Bednarik.

New York City.—Willets Service Company; capital, $50,000; to deal in automobiles and motor trucks. Incorporators: W. C. Willets, Marius Jurgensen, Estelle M. Naylor.

New York City.—E. C. Pardee; capital, $65,000; to deal in engines and motors. Incorporators: K. T. Frederick, C. R. Dewey, L. F. Sniffin.

Oshkosh, Wis.—Oshkosh Automobile Dealers' Association; capital, $1,000; to conduct s wholesale and retail business in automobiles, to promote and conduct exhibitions of automobiles. Incorporators: J. A. Crum, F. S. Hoaglin, A. Thom, W. F. Scoular.

Petersburg, Va.—Virginia Motor and Machine Company; capital, $10,000; to manufacture automobiles and parts. Incorporators: W. E. Wells, C. F. Denton, J. B. Andrews.

Richmond, Va.—Waynesboro Automobile Company; capital, $15,000; to deal in automobiles. Incorporators: B. E. Watson, J. B. Young, H. M. Hanger.

Saratoga Springs, N. Y.—Ross-Ketchum Company; capital, $18,400; to deal in automobiles. Incorporators: J. A. P. Ketchum, N. B. Ross, J. W. Northrup.

Uniontown, Pa.—Automobile Service Company; capital, $5,000; to paint, repair, buy snd sell automobiles and motor vehicles. Incorporators: C. W. Johnson, Fred A. Close, B. F. Hall.

West Allis, Wis.—Auto Transfer Company; capital, $5,000; to operate an automobile express and transfer line throughout West Allis, the manufacturing suburb of Milwaukee, and between West Allis and other suburbs.

Wilmington, Del.—Lewis Motor & Engineering Company; capital, $200,000; to manufacture automobiles and parts. Incorporators: G. D. Hopkins, G. W. Dillman, S. M. Crawl.

GARAGES AND ACCESSORIES

Bangor, Me.—Penobscot Garage Company; capital, $10,000; to carry on a garage business. Incorporators: A. J. Shorey, C. H. Shorey.

New road over the railway at Villeneuve St. Georges, on the Paris-Fontainebleau road, avoiding the use of the grade crossing. This is part of a scheme of the Paris, Lyon, Mediterranean Railway Company to abolish all grade crossings on main lines

Spot on the main road from Paris to Fontainebleau at which a dangerous grade crossing existed. This has now been abolished by the P. L. M. Railroad Company building a bridge over the line

contracts which cover 25 counties and comprise hundreds of miles of improvement. The supreme court annulled the Garrett law which by implication invalidated the road contracts.

Davis Locomobile Truck Advertiser—W. H. Davis, Jr., has been placed in charge of the truck department advertising of the Locomobile Company of America, Bridgeport, Conn.

Fort Dodge Show Opened—The second annual Northern Iowa Automobile Show opened at Fort Dodge, Ia., recently. The Fort Dodge Dealers' Association is running the show.

Childs Promoted—H. P. Childs, branch manager of the International Motor Company, Philadelphia, Pa., was recently promoted to be assistant Eastern sales agent of the company.

Jacox Loses Manager—M. M. Wilcox, General Manager of the Jackson-Church-Wilcox Company, Saginaw, Mich., has resigned to become interested in the manufacture of automobile accessories.

Holland With Anderson Electric—The Anderson Electric Car Company, Detroit, Mich., announces the appointment of W. E. Holland as manager of its mechanical and electrical research department.

Studebaker In New Home—The Studebaker Corporation, Detroit, Mich., has taken possession of its new wholesale branch at 61 Pierce street, Washington, D. C., giving it a capacity of 41,000 square feet on one floor.

Receives Russian Gold Medal—The Pullman Motor Car Company, of York, Pa., has received the third annual gold medal from the Russian Government for Pullman cars entered in the recent government exhibition.

Dunlop Manufacturing Fabricord Tires—The Dunlop Tire & Rubber Company, New York City, recently reached an agreement with the Century Rubber Company for the exclusive use and manufacture of Fabricord tires in Canada.

By Way of Correction—In the January 16 issue of The Automobile the Packard truck should have been described as having roller bearings on the rear axle instead of ball bearings, and also the outside drive coupe model should have read cabette model.

New Omaha Association—An association by the name of the Automobile Supply Jobbers' Credit Association, was recently formed in Omaha, Neb., for the purpose of protecting its members in matters of credit and for the betterment of trade conditions in that territory. C. G. Powell was elected president.

Bus Monopoly Under Attack—A blow at the New York City stage-coach monopoly is aimed in a bill introduced in the Legislature, the intent of which is to allow prospective competitors of the Fifth Avenue Stage Coach Company to operate lines throughout Manhattan and to open up routes in the other boroughs.

Missouri Clubs After Garagement—The St. Louis Automobile Manufacturers' and Dealers' Association, jointly with the dealers of Kansas City and St. Joseph, has introduced in the Missouri legislature a bill to give a lien on automobiles for storage and repair charges. The bill guards the owners from overcharging by unscrupulous repair men.

New Canadian License Bill—A new bill is being prepared in Canada which calls for the repeal of all present legislation in regard to licensing automobiles and suggests a scale of weights and rates as follows: 30 cents per 100 pounds on cars up to 2,000 pounds in weight, 40 cents per 100 pounds on cars up to 4,000 pounds, and 50 cents per 100 pounds on cars over 4,000 pounds.

Automobile Incorporations

Brooklyn, N. Y.—Cumberland Garage Company; capital, $25,000; to engage in garage business. Incorporators: W. L. Gray, A. W. Wilmarth, Marie F. Wilmarth.

Brooklyn, N. Y.—Caton Garage; capital, $10,000; to carry on a garage business. Incorporators: Frank Lemmer, John Carlson.

Buffalo, N. Y.—Conover Limousine Top Company; capital, $125,000; to manufacture automobile tops and bodies. Incorporators: R. J. Conover, C. B. Anglin, J. T. Gilbert.

Chicago, Ill.—Lacy Motor Delivery Company; capital, $10,000; to carry on an automobile delivery. Incorporators: Herbert Decker, Franklin H. Lacy, Samuel J. Richman.

Cleveland, O.—National Garage Company; capital, $20,000; garage automobile livery and general automobile trucking. Incorporators: J. A. Nally, G. A. Gardner, G. L. Williams, E. G. Nally.

Columbus, O.—Automobile Protective Association Company; capital, $5,000; to guard owners against the theft of their automobiles or parts thereof, etc. Incorporators: William Loster, M. A. Capute, H. H. Switser, E. L. Richards, A. O'Hara.

Detroit, Mich.—Universal Wheel Company; capital, $250,000; to make a demountable type of wheel. Incorporators: J. P. Lavigne, W. F. Woodhouse, John Wynne, Jr., J. J. Knight.

Lynchburg, Va.—Sterling Electric Company; capital, $5,000; to deal in electric accessories. Incorporators: A. N. Carroll, J. C. Oakes, E. B. Templeton.

New York City—No Shock Wheel Company; capital, $400,000; to deal in automobiles, tires, automobile parts, etc. Incorporators: J. W. Ebbs, R. H. Waddell, A. A. Kelley.

Nashville, Tenn.—Capitol Body Company; capital, $10,000; to manufacture automobile bodies. Incorporators: Elmer Hinsbaw, R. Cogbill, Fred W. Henscben, W. A. Lyons, Elmer W. Hugbey.

Peru, Ind.—Peru Tire & Rubber Company; capital, $25,000; to buy and sell automobile and other tires. Incorporators: C. E. Miller, Oliver J. Tilettl, Ira H. Stanter and Lee Miller.

Rochester, N. Y.—Central Motor Supply Company; capital, $20,000; to deal in automobile supplies. Incorporators: P. B. Barager, R. F. Close, William Wood.

Richmond, Va.—Craig Transfer and Motor Car Company; capital, $5,000; to carry on an automobile transfer business. Incorporators: M. C. Boyden, W. W. Johnson, J. P. Jones.

Sherbrooke, Ind.—Connecticut Mills Company; capital, $1,000,000; to manufacture auto tire fabric.

Washington, D. C.—Dispatch Taxicab Service; to carry on a taxicab service. Incorporators: C. E. Miller, Claude E. Miller, G. W. Pierre.

Youngstown, O.—Youngstown Automobile Show Company; capital, $1,000; to hold automobile shows.

CHANGES OF CAPITAL AND NAME

Bowling Green, O.—Century Auto & Garage Company; capital increased from $6,000 to $15,000.

Bowling Green, O.—Bowling Green Motor Car Company; capital increased to $100,000.

Detroit, Mich.—Commerce Motor Car Company; capital increased from $50,000 to $100,000.

Buffalo, N. Y.—Willet Engine & Carbureter Company; change of name to the Willet Engine & Truck Company, Inc.

Toledo, O.—Toledo Tire & Repair Company; change of name to the Toledo Tire and Supply Company.

Toledo, O.—Mather Spring Company; capital increased from $100,000 to $300,000.

Xenia, O.—Baldner Automobile Manufacturing Company; capital increased from $5,000 to $150,000.

CARBURETER—in which a venturi tube is used, the diameter of which is varied by a ball contained in the second section of the venturi passage and supported by a cross pin.

The subject matter of this patent is a carbureter Fig. 1, the casing of which contains a main air inlet A from which the air passes through an angular venturi passage over a gasoline nozzle N, and thence through the throttle way to the intake pipe of the motor. A throttle of the butterfly type serves for regulating the quantity of mixture fed to the motor and a ball B, contained in the second section of the venturi passage and supported by a cross pin Q serves to accentuate the suction effect.

No. 1,052,897—to James M. Dayton, Torrington, Conn., assigned to Excelsior Needle Company, Torrington, Conn. Granted February 11, 1913; filed April 9, 1910.

Automobile Tire Tread—The band carries a channeled member supporting links which engage the road bed.

This patent refers to a tread band design as that shown in Fig. 2, where the tire is fitted with a tread based plate B, which is formed with projections B 1. The holes C 1 of a channeled member C engage the projections C 1 and a series of links L are in place in the channel and their surfaces in contact with the road surface. Between each two adjacent runs of links leather strips are in place and transverse rods R hold the links in the channeled member C.

No. 1,052,560—to John Carter Barry, Harrow, England. Granted February 11, 1913; filed October 14, 1910.

Automobile Engine Cleaner—Consisting of a rotary hammer which is carried in a flexible casing and driven by a suitable motor.

Fig. 3 shows the engine cleaner described in this patent, which consists of a flexible shaft F equipped with a handle H and a hammer K, which is directly and rigidly secured to the free end of F. The hammer K has an unbalanced portion on one side of the shaft center and by means of a suitable motive power the shaft may be rotated, thereby producing a series of successive blows on the surface being cleaned.

No. 1,053,007—to George Calvert, Stoke Newington, London, England, assigner to Mechanical Decarbonizer Syndicate, Ltd., London, England. Granted February 11, 1913; filed March 7, 1911.

Valve Compressing Tool—Consisting of a tongue with suitably designed terminals.

The tool shown in Fig. 4 consists principally of two members which are connected in the fashion of a tongue. One of these members has an elongated slot with an orifice extending into the same, there being a lateral recess in the member extending from the slot; a forked terminal formed on the member is disposed at an angle to the body of the same. The second member has a terminal which is adapted to be introduced into the slot, at the lateral recess, mentioned above. A terminal of the second member is greater in width than the slot, but less in width than the slot and the recess; the other terminal of the second member is forked and positioned at an angle to the body of the member, in which the latter are formed a number of orifices. A pin is in place in the orifices in the first and second members.

No. 1,052,941—to Charles Nyberg, Huntington, N. Y. Granted February 11, 1913; filed October 25, 1911.

Automatic Carbureter—in which a gate valve designed for throttling the motor is connected to the fuel needle to maintain a constant fuel-air ratio.

This carbureter, Fig. 5, consists of a casing C, which is formed with a float chamber F and a carbureting chamber D, the bottom of the latter being designed with an extension formed with the passageway P. This passage communicates with the float chamber and a guide way is formed in the carbureter chamber D; in this guide a gate J is mounted and provided with a needle valve extending through the upper end of the passage P, so as to be capable of closing the same when the gate closes the guide of the carbureting chamber. By this means the intake of air and gasoline are simultaneously operated and a constant ratio of gasoline and air is maintained at all speeds.

No. 1,053,136—to Carl R. Daellenbach, Ellwood City, Pa. Granted February 11, 1913; filed January 27, 1911.

Treating Battery Separators—Consisting in the impregnating of the wooden separators sulphurous salt solution.

This process consists in the treating of wood separators for storage batteries. The separators are immersed in aqueous solution of neutral sodium bisulfate while the solution is maintained at a temperature between 100 and 175 degrees C. The products of decomposition are washed from the treated wood after which the wood is dried under pressure.

No. 1,052,851—to James M. Skinner, Philadelphia, Pa., assignor to Philadelphia Storage Battery Company, Philadelphia, Pa. Granted February 11, 1913; filed March 13, 1912.

Vehicle Wheel—The spokes of which are formed of flat springs secured at their ends to the felloe and to the hub, respectively.

In this wheel the spring spokes are formed from flat strips of springs metal, one end of which is secured to the felloe. The main portion of each spring is curved and is doubled upon itself so as to form an eye; an auxiliary spring portion is curved on a flatter curve than the main spring and its free end only bears against the concave side of the main spring portion, being slidable on the same.

No. 1,053,889—to Joseph Frank Starbuck, Philadelphia, Pa. Granted February 18, 1913; filed April 24, 1912.

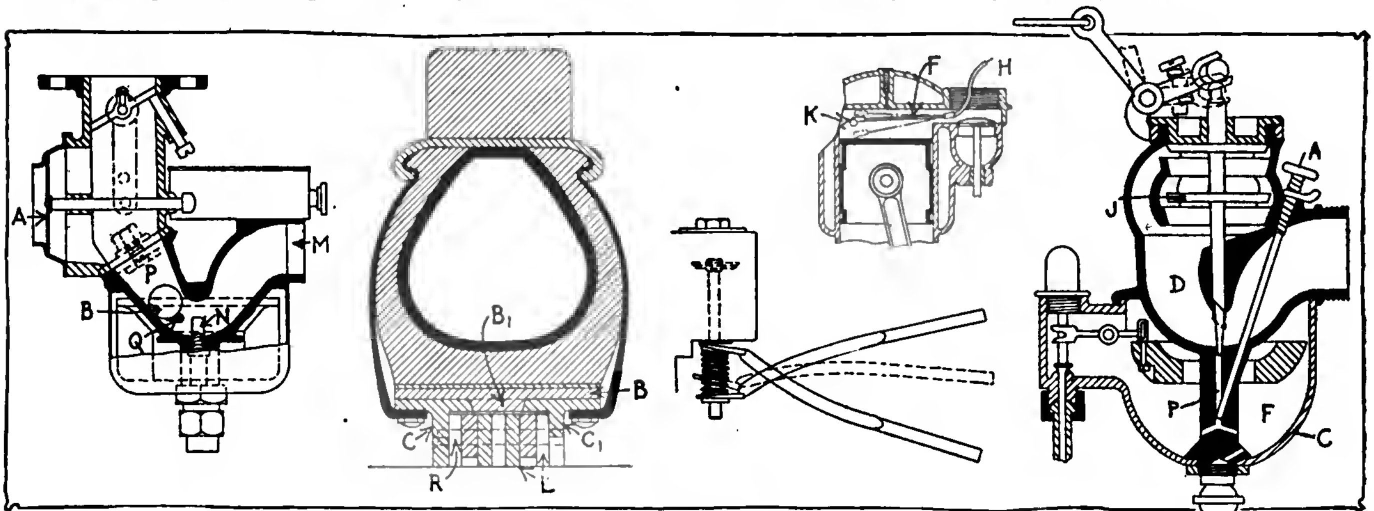


Fig. 1—Dayton carbureter. Fig. 2—Barry tread. Fig. 3—Calvert engine cleaner. Fig. 4—Nyberg tool. Fig. 5—Daellenbach carbureter

From the Manufacturer

Claim Internal Gears Are Superior to Outside Meshing Gears—Are Less Exposed to Breaking Strain

Magnetic Type of Controller Is Used on the Ohio Electric as Well as a Dynamic Brake

NEW YORK CITY—Editor THE AUTOMOBILE:—Recent announcements and demonstrations of the new Magic crescent sliding and poppet valve motor, designed by Martin Fischer, of Zurich, Switzerland, and the discussion of same at the recent meetings of the Society of Automobile Engineers, has caused much comment among automobile manufacturers and considerable interest is also being evidenced in the new Magic gear which will be used in conjunction with the motor. This is an internal gear and is a radical departure from the stereotyped change-speed gear.

Since its first try-out over 3 years ago it has proved an unqualified success, according to the makers.

The principal gear forming one piece with the driving shaft is on one end connected by a cardan joint with the clutch, and reposes at the other end in a square shifting block having large ball bearings. The high gear is obtained by the main driving pinion acting as a jaw clutch, no reduction gear wheels being in mesh, thus giving an ideal direct drive. The other speeds, first, second and third, are obtained by progressively bringing the main pinion directly into mesh with one of several internal gear rings with teeth cut conically, always having their center of generation in the cardan joint, thus doing away with the customary secondary shafts, the numerous gears usually employed, locking arrangements, springs, etc. In this way, this brings about the saving of at least 5 to 6 per cent. in general efficiency.

For the reverse drive, a small pinion is inserted between the main wheel and the internal gearing used for the first speed. The meshing of the main pinion with the internal gears is effected by shifting the end block on which there is a guide stud whch moves in the grooves of a horizontal plate. This stud also takes up any side pressure from the teeth, preventing any lateral displacement of the main pinion. The shaft of the internal gear rings reposes on two large ball bearings, one of which is mounted over the direct drive, and the other exactly under the foot-brake thus securing always a gentle and noiseless braking effect, and insuring accuracy of mesh.

Superior efficiency of the internal gears over outside meshing gears is what is claimed for the gear. With the internal gearing, there are always more teeth in mesh, consequently each tooth has to transmit a smaller amount of power and is correspondingly less exposed to breaking strain; or, if desired, an equal strength can be obtained as compared with outside meshing gears by having smaller gears. For every speed below direct, only two gears are in mesh.—MOTOR AND GEAR IMPROVEMENT COMPANY.

Control lever of the Ohio electric

Control for Electric Pleasure Vehicles

TOLEDO, O.—Editor THE AUTOMOBILE:—Most motors on electric vehicles are series wound. There should be at least four speeds: two starting speeds, with resistance in the circuit; one running speed, with the fields in series; and one runnng speed with the fields in series parallel. If additional speeds are desired, each of the above running speeds may be modified by shunting. It is agreed among engineers that a constant voltage should be maintained instead of using low voltage for low speeds and high voltage for high speeds. The net efficiency is greater because the loss due to heat in the resistance on the starting speeds is not as great as the loss in the efficiency of the motor, due to low voltage. Batteries will get out of balance if run in parallel and various other complications ensue.

The most common type of controllers are of the drum type. The Ohio electric controller is of the magnetic type, by means of which small currents controlled by a little disk conveniently located on the steering lever, operate magnets, which in turn operate the large currents which drive the motor. General Electric contactors are used. This type of control is growing in popularity for certain types of street cars and large power plants, as it is very rugged and will last a life time without burning out.

Dynamic brakes are used on some cars. On the magnetic control of the Ohio electric, a dynamic brake is operated by a small button located in the controller, and the degree of braking is governed by a small mechanical governor. This will hold the car on the steepest hill, down to 3 miles an hour if desired, without using the pedals.—OHIO ELECTRIC CAR COMPANY.

Harking Back a Decade

FROM THE AUTOMOBILE of February 21, 1903:

The yelping, howling and barking of dogs, the cracking of rifles and ringing of bullets against metallic targets, the puffing and rattling of gasoline motors in operation and the pounding of carpenters' and decorators' hammers characterized in an aural way the opening of the second annual sporting goods, automobile and dog show of the Tri-State Sportsmen's Association now in full swing at the Detroit Light Guard Armory.

The good roads movement has a delightful breadth of scope, but great things move slowly. It is particularly puzzling how it can be arranged rationally to a national rather than a local issue, so long as the long haul is distinctly monopolized by the owners of the excellent long-distance roads, the railways.—Editorial.

There is a politician in Wisconsin who, for unknown reasons, has a grudge against the owners of automobiles, and has decided that the state needs a law pertaining to that class of vehicles. Assemblyman Moldenhauer, who is from the northern part of the state, on February 3 introduced in the assembly a bill providing that all owners of automobiles must obtain a state license, for which they must pay $1.

The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

Hail to Motor Spirit

THE automobile industry should give careful consideration to the new fuel, motor spirit, announced in THE AUTOMOBILE a week ago, not because this fuel is specially intended for passenger car use but rather because its use in traction engines, stationary engines, motor trucks and for scores of other purposes will take the drain of these departments off the gasoline field and so leave this field to the passenger car.

Motor spirit is not primarily intended for passenger cars, but rather for the above uses. Statistics from North Dakota and other large agricultural states show that in the agricultural seasons the traction engines consume six times more gasoline than automobiles, this being specially true during the threshing period. It is also true that stationary engines are large consumers. A motor truck operating nearly 8 hours per day uses vastly more fuel than a passenger car running but a few hours per day. Motor spirit is better for all of these fields than gasoline. Motor spirit is better because it costs approximately 3 cents per gallon less and in addition it gives 25 per cent. greater efficiency.

At present the pungent odor is the one suggested argument against the use of motor spirit for passenger automobiles. This is not serious, not nearly so serious as imagined, and it is a certainty that there will be thousands of users of passenger vehicles running on this fuel because of the reduced price and the greater efficiency. There is not the slightest reason why the odor of this fuel should be objectionable, excepting when spilled on cushions or floors, and only then because it is much slower to evaporate than standard gasoline.

The manufacture of the present fuel must be considered a great boon to the motor industry and if it never were used in a passenger car it will still do its work of preventing any great increase in the price of fuel. The recent increases in the fuel price, amounting to in all 50 per cent. within the last year, have led some buyers to give special consideration to whether they would purchase a six-cylinder car or not, owing to the added cost of operation.

The National Shows

TWO or three automobile makers have been denouncing the national automobile shows held annually at New York and Chicago on the ground that they have outlived their usefulness and that to-day they are unnecessary expenses, in that the makers pay for approximately 60 per cent. of the attendance and that they are forced to expend enormous sums in daily advertising which could be expended to much greater advantage at other periods of the year.

On the face of it these two reasons for discontinuing shows appear inadequate as they are conditions that can be corrected by the makers themselves with scarcely any difficulty. The manufacturers make their advertising appropriations and it rests entirely with them how they should expend such appropriations and when; the purchasing of admission tickets to the shows for distribution among prospective buyers also rests with them.

The two national shows have played a wonderful part in the building up of the industry to-date and their discontinuance would be an injury at the present time. There is not any reason why shows cannot be continued for at least 5 years yet. The French industry imagined it could do without its annual show. It was discontinued for a year and the makers lost out so deplorably that there was a general call-together for the show. What is true in France is true in America, in spite of the fact that conditions are different in the two countries.

The fault with many manufacturers lies in themselves. They do not prepare for the show. They go into it in an expensive unprepared fashion and come home with barren regrets. The value of the show to the maker depends on the energies and preparedness with which the maker goes into it. A company generally gets from a show what it goes after. Those concerns not drafting out definite policies and perfecting plans will naturally reap regrets and they deserve to. The other concern that plans its show campaigns as carefully as its new season model, makes every preparation in advance; goes after its business systematically; drafts a complete show program and lives up to it; and, in a word, makes the show a value rather than going passively, looking for disappointments and receiving them in wholesale quantities.

The AUTOMOBILE

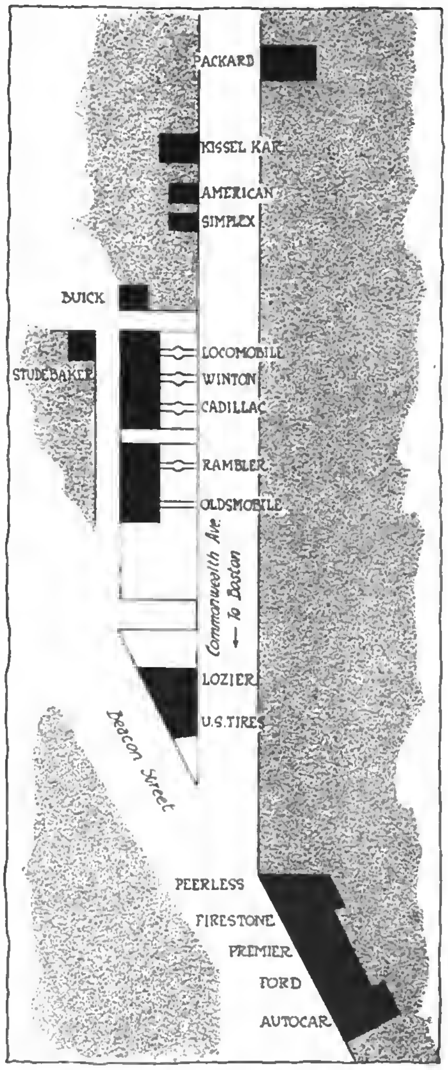
Service Plants for Boston Owners

The Hub Develops a Service District—New Buildings Represent Outlay of $1,750,000

BOSTON, MASS., March 1—No city in the country is doing more real service for the users of motor cars than Boston. The dealers and branches in the Hub long ago realized that to keep the good will of the men who bought motor cars there should be something more than merely a place where an owner could go in with his car, have a few jugs of oil, gasoline, and water poured in; a bit of grease daubed here and there; and a rag run over the body, work that any man with no knowledge of motors or mechanics could do.

So they started building places that would make adequate service stations. As a matter of fact it is believed that the title "service station" or "depot," was coined in Boston by Alvan T. Fuller. In this connection also it may be said that the Packard agent brought out also the phrase "renewed cars." At any rate when he built his big building in the Back Bay—a structure that many believed was to be a mausoleum of his hopes because of its size, cost and distance from the city proper and which was called "Fuller's Folly"—he had put over the door "service depot" and insisted that this name be used in his publicity notices.

Since he migrated many others have followed suit. As a result you can look along Commonwealth avenue and Beacon street today and within half a dozen blocks see at one glance service stations whose total value is more than $1,750,000. And if one were to look about and find the places in Cambridge where the Pope-Hartford, Stevens-Duryea, Chalmers, Hudson, Alco and others have buildings; the 6 acres of land just bought by the



Showing concentration of service stations in the Fenway district of Boston

Ford; the 150,000 square feet purchased for the Pierce-Arrow, the big shoe machinery building that was a colossal failure until turned over to motor service depots; the Bickerstaff street building; all these and a number of others scattered about the city it would total up several more millions. For the purpose of illustrating this article, however, it was decided to take the structures on a parallel line in the Fenway district all within a few blocks, as indicative of the vast growth, as the space of the article would not permit going into all details throughout the city. It shows, too, that the old order changes, for a few years ago no one ever dreamed of going out in the Fenway, more particularly for salesrooms. Yet thousands of feet of vacant land was available there needing only a pioneer, and once the threshold was crossed there followed the others.

Beginning at the extreme end with Mr. Fuller's Packard agency, that place represents an investment of about $300,000 for property alone. If one includes the stock carried it will jump to half a million easily. This big four-story building running back a couple of hundred feet is a real monument to progress in the motor industry. Yet even now it is too small for the Packard business, so plans have been drawn for additional wings to take care of the increase.

Across the way on the right a short distance down is the new home of the Kissel-Kar for the makers decided that Commonwealth avenue was none too good for this purpose. It is a two-story structure at the corner of two streets with a great deal of light and space about it, and rep-

LOCOMOBILE, WINTON AND CADILLAC

PACKARD

STUDEBAKER

PEERLESS, PREMIER, FORD, AUTOCAR AND FIRESTONE TIRES

resents a value of land and buildings of about $150,000. Some idea of its location may be gleaned when it is known that the White company, of Cleveland, after looking all over Boston and Cambridge for an available site has just purchased the lot beside the KisselKar for a new home, securing about an acre of land on which to erect a structure. Adjoining this is the home of the Marion and American, a one-story building running back some distance, also the new Simplex salesrooms and service depot. These two places represent more than $100,000, and a similar amount or more is tied up in the building of the Columbia Tire & Tool Company and the Hume carriage building. While these are not service depots they are devoted to the motor industry.

Going down the avenue there looms up in the sky the name "Buick" before anything else is seen, the service depot of that make being located around the corner on Lawton street. Across the street stands the long structure housing the Locomobile, Winton and Cadillac, while in the rear is the Studebaker structure. The Buick building is a four-story structure that has been in use the last few years and this represents a valuation of $65,000. That of the Studebaker is rated at $48,000.

The home of the Locomobile, Winton and Cadillac is one of the striking buildings in the city setting back as it does so many feet. The Locomobile occupies the Western end, the Winton the center and the Cadillac has just taken the easterly section. This structure having two stories and basement is well lighted and admirable in every way. It is taxed for $300,000. Excellent, too, are the Studebaker and Buick structures, although on a different plan because of the more restricted area.

Truck Industry Kept in Mind

Directly to the east of the Cadillac is the new home of the Thomas B. Jeffery company where are housed the Rambler cars. When it was built the Jeffery people had in mind the truck industry coming with its pleasure cars and so there is plenty room to take care of the latest Jeffery product. The Rambler has moved into its now home within a few months and it is not taxed yet, but it represents an outlay for land and buildings of perhaps $200,000 or more. Joined on to the Rambler is the Oldsmobile branch. This, too, is a new home and one finds it quite complete although only half the length of the Rambler. This is a building that when taken in hand by the assessors next May will be rated with its land at more than $100,000.

Standing in front of the Oldsmobile one can see the new building opened a week ago by the Lozier Motor Car Company. the Eastern end of which is occupied by the United States Tire Company. Here again the property values are high for it is at the junction of Beacon street and Commonwealth avenue and this will be another fine plum for the assessors to tax, the Lozier building alone being worth with its land well above $100,000. The Paige-Detroit will be marketed there, too.

Directly across the street where Commonwealth avenue crosses Beacon street stands another of the big monuments to the industry in the handsome Peerless plant. This was erected a couple of years ago, and for some time like a sentinel it guarded the eastern end of the Fenway while the Packard stood guard at the western end. This structure is assessed for $260,000. It seemed such a good investment for Governor Eugene N. Foss, of Massachusetts, who owns it, that he erected the Autocar building close by which is rated at $170,000. And the demand came along for others and so the genial governor said to his architects and builders to keep up the good work and in between was added the Ford, Premier and Firestone tire building rated at $115,000 and the handsome Peerless structure was no longer left alone.

To get some idea of what it means to have motor structures in this vicinity it may be said that Beacon street, beginning at the State House, whose gilded dome looms up in the distance from any of these structures is the home of the real blue blood aristocracy of Boston along the stretches to the Peerless building. So, too, is Commonwealth avenue, said to be one of the widest boulevards in America, and so laid out that it is included in the Boston Park system. As the city grew and homes were not to be had, apartments began to go up out in the Fenway where the motor structures are now rearing their heads. And looking back a decade one finds that the thought of business buildings in the Fenway was an abhorrent idea; one that would be scoffed at as unworthy of attention, while the owners of the land were not expecting to do any great developing for half a century. It was property that was eating its head off in taxes without a return even from letting billboards as a desecration.

Having erected service depots the men in charge have simplified matters in the way of giving real service these days. The Packard agency has such large facilities that it is possible to do more in the way of arranging for detail work in checking the car in and out than some of the other depots. For instance with four floors to work with more is needed than two, and so the matter of detail may be more comprehensive, but that does not necessarily mean that any better work is done than in some other places. For example, in the Packard building a car may go to the second, third and fourth floors for various requirements, while at the Locomobile it goes up one floor only. Therefore, it is not necessary to have such detail cards in the Locomobile branch as in the other. Manager Blake, of the Locomobile simplifies matters by passing out a blank on which is marked the work to be done, and this is sent to the owner for ratification before work is started. He reads it, and if agreeable he signs it so that there need be no dispute afterward on the charge. A time ticket stamps the car going in and out.

System at the Packard Station

In the Packard agency, when a car comes in a printed card is filled out giving the details of what is needed in the way of repairs. Then a long strip of tags are stamped, and the information card is put in a leather case and hung on the side. The tags are distributed to the workmen and whenever one man needs something or other he presents his duplicate tag and it is stamped and verified. A metal tag, not unlike a number plate, is hung on the car and a floor man coming along sees this and takes it to where it belongs, for a letter tells whether it is front or rear. The idea, like others, is to save time instead of having some one tell verbally or the floor man guess, where a car is going, and perhaps have a mixup of orders necessitating a car's being sent to the wrong floor. When the car is to be thoroughly overhauled it is stripped and every little thing on it is tabulated in duplicate and then put in a locker. The owner gets one of these check-up slips. If in but for a few days and the chauffeur is to work on the car on the lower floor—the only place a chauffeur or an owner is allowed—the robes, extra tires, etc., are checked just like baggage at a railroad station, and this eliminates any dispute about them, for they are locked in a separate closet. Everything is thoroughly systematized so that the car is sent along from one department to another, and when the work at one place is ended the man in charge of the department checks it off on the card while the tag of the workman is hung in a socket until the entire repairs are completed and all the tags are in place except one. This is the tester's tag, the last of all. He takes the car out and if he pronounces it O. K. it is stamped by the man at the office where the car first came in and the tag hung up on a board. Finally, a card is hung on the car that indicates it is ready for its owner, and he is notified to call for it. If he calls before the work is finished a telephone call to the department where the car is located will tell by a glance at the information card about how much longer the car will be in the shop. It is an extremely interesting system where no words are wasted; where men do things by reference to instructions before them; and where there can be no argument afterward because of the tabulations and checking up as the car proceeds from one department to another. Other service stations, too, have splendid systems, such as the Peerless, which was described in detail some time ago with a story on its new Boston branch.

LOZIER, PAIGE-DETROIT AND U.S. TIRES

N. Y. Bills Menace Motorists

Empire State Automobilists Dread Effects of Pernicious Legislation Threatened at Albany—Acts Would Mean Discrimination Against Private Owners and Members of Trade Without Opportunity of Offering Defense or Obtaining Hearing

¶ Bill No. 548—Every chauffeur must furnish to the Secretary of State a $500 surety company bond......*This means that all owners will be required to furnish such bonds for all of their chauffeurs.*

¶ Bill No. 649—All chauffeurs applying for registration must be photographed and have finger prints taken so that these may be compared with police records before the license is granted......*This assumes that all chauffeurs are criminals before they get their license to drive.*

¶ Bill No. 649—All tail lights shall be so connected that the switch for operating them cannot be controlled from the inside of the car......*With electric lights it would be necessary to stop the car, get out and operate a switch to light the tail lamps.*

¶ Bill No. 649—The Secretary of State shall have the power to revoke or suspend licenses with or without a hearing......*This would take away from every owner any possibility of defense.*

¶ Bill No. 842—The owner of a motor vehicle is held liable for damages to persons or property and no defense to any action brought shall be that the vehicle was being operated by an unauthorized person......*According to this, if your car is stolen and the thief in trying to escape kills a pedestrian or damages property, the car owner is liable and cannot use as a defense the argument that the thief was operating the vehicle.*

¶ Bill No. 567—The violation of a speed regulation by a motorist becomes a felony instead of a misdemeanor as at present...... *According to this any owner or driver who inadvertently exceeded the exact legal speed would be obliged to go to jail instead of paying a fine.*

¶ Bill No. 429—Every operator of a motor car must furnish a bond of $2,000 with the Secretary of State before his car can be registered or himself licensed......*Why?*

¶ Bill No. 896—Every motor vehicle in a first-class city with 1,000,000 inhabitants must come to a full stop in front of all fire houses; all street surface and steam railroad crossings; and all school houses, between 8 and 9 in the morning, 12 and 1 in the afternoon, and 3 and 4 in the afternoon......*With such an ordinance street congestion would be such as to imperil human life and stagnate traffic.*

¶ Bill No. 1067—The registration fees for passenger cars shall be doubled and the fees for commercial vehicles shall be $5 per ton load or fraction thereof......*At present the registration fee for a commercial vehicle is $5 per vehicle. At present there is not any registration fee for horse vehicles.*

¶ Bill No. 637—For an entire new automobile act to take the place of the present Callan law, which would include licensing motor cycles with automobiles and changing the penalties for violations of the law, etc.

¶ Bill No. 225—To increase the age limit for licensing chauffeurs from 18 to 21 years and reducing the registration fee from $2.00 to $1.00, at the same time making the owner liable for some of the fines which would be imposed on the chauffeurs under the act.

THESE excerpts from bills introduced into the New York State legislature show how motor-mad not a few of the legislators at Albany have become during the present session, and also give an indication of the acute seriousness of the situation, should any of these bills be enacted into laws.

It is impossible to understand just why such useless proposed legislation should be introduced: Sometimes it is due to ignorance, sometimes to a wrong viewpoint of the legislator, and other times for mere publicity. Irrespective of what has prompted the present legislators, one fact remains, namely, that motorists in New York State and owners of commercial vehicles must co-operate to combat many of the bills from which the above excerpts are taken, otherwise the Empire State will be placed under a serious handicap in automobiling.

It is difficult to conceive why the rate of registration on commercial vehicles should be increased from $5 per vehicle, as it is at present, up to $5 per ton, or fraction thereof, load, which the vehicle would carry. At present a 5-ton truck pays $5 per year license, but under the new law it would pay $25 per year. This legislation is apparently based on the assumption that the amount of damage done to a road is in proportion to the weight of the load. In this the legislators have entirely overlooked the one fact that road destruction is largely due to improper adhesion, such as skidding, which largely occurs at higher speeds than the 5-ton truck operates at.

Not infrequently the 1-ton truck damages the road as much as the 5-ton machine, because of the higher speeds at which it travels. The present proposed legislation assumes that road destruction is in direct proportion to load carried irrespective of width of tires, distribution of weight, etc.

If our legislators were to follow out the same policy in taxation in other avenues of life, it would mean that our school taxes would be graduated per family, according to the number of children attending school. That is, the property owner with a family of six would pay six times as much as the other owner having one child in attendance at school. Still further, it would mean that taxes for fire department service would be pro rated with those having fires, so that a concern having ten fires in the year would pay five times as much as another concern having two fires; and still further, concerns not having any fires would not be compelled to carry any of the burden. Amplifications of the peculiar operation of such a law could be carried much further.

In a word, the legislators are approaching the registration problem from an incorrect angle. Heavy horse wagons with narrow steel tires destroy the road. The calks in the horses' shoes destroy the road surface, forming little depressions in which the water collects. On the other hand, it has been proven in France and America that where special roadways intended for motor traffic have been created and horse traffic prohibited therefrom, that these roadways endured; whereas it is almost impossible to furnish a suitable road surface which will withstand mixed traffic. Legislators should recognize the motor car as an established means of communication, and one superseding the horse in many departments of commerce, and as such it is imperative on them to build roads and legislate in all fairness to it. It is wrong to let the horse truck go license-free and increase the fees on motor trucks.

The motor vehicle is a new factor in individual and freight transportation; it is one of the dominant forces that sprang into prominence with the growth of this century; it is a factor that is going to increase from year to year until the end of the century and beyond; and it is because of the position it has taken in human existence and in the world of commerce that legislators must not try to surround it with horse vehicle environments and compel it to carry the burden that rightfully should be shared by horse vehicles.

Some of the legislators introducing these bills claimed to have been prompted by the number of accidents caused by commercial motor vehicles and also motor passenger vehicles. In view of this argument it can be cited that there are in New York but twenty-five motorcycle policemen and these are all in citizen's clothes. The best method of preventing accidents would be to install a motorcycle force of 100 uniformed policemen, and with such a force it is a conservative estimate that accidents would be reduced more than one-half in a month's time.

To-day there are plenty of regulations surrounding the operation of motor vehicles. What is wanted is a better enforcement of existing laws rather than a multiplication of them. Compelling a motor vehicle to stop in front of every fire house or every school will not eliminate accidents. Horse vehicles have meen maiming as great a number in metropolitan centers as motor vehicles and yet legislators have not seen fit to even call for the registration of horse vehicles, much less horse drivers. Carelessness of pedestrians is to an enormous extent one of the leading causes of accidents. If, instead of trying to pass legislation compelling every motor vehicle to come to a full stop in front of a school, the legislations were aimed at placing a uniformed traffic policeman, or two if necessary, in front of each school house a better result would be obtained.

The passage of legislation as outlined in the excerpts already referred to would be a disgrace not only to the motoring interests of the State of New York but the entire electorate.

A hearing on this varied program of motor legislation is scheduled for Albany on March 13. Before that date every motorist should obtain the ear of his legislator and senator and see to it that he sees the motor vehicle in the position it at present plays in the development of transportation both passenger and freight. Each motor truck owner should register his influence against such legislation because of the dangerous situation it would create. Every dealer should co-operate in the movement to prohibit the passing of such bills. Makers of passenger cars and trucks should write their dealers in New York State; clubs should take up the opposition to these bills; and every business organization should do its part to see that unjust legislation such as this, unjust as it is to both maker and owner, is decisively defeated.

Dealers Organize To Meet Proposed Legal Measures

C. T. Terry Explains the Several Bills to Members of New York Association

AT a meeting of the Automobile Dealers' Association, Inc., at the Hotel Woodward, New York City, on February 26, the various automobile bills which have been introduced at the New York State Legislature at Albany at the opening of the present session were explained by Charles Thaddeus Terry. After going into the necessary detail, Mr. Terry explained why most of these bills if put into practice would be absolutely detrimental to the automobile industry and trade in the entire state. As has been reported repeatedly in THE AUTOMOBILE, the essence of the principal bills is that automobile registration fees be increased to two and a half times their present amounts and that the most rigid regulations be put in force against automobilists who were unfortunate enough to meet with mishaps on the road.

Among the interesting information brought out by Mr. Terry was the citation of a part of a bill which provides that whenever a chauffeur applies for a license the local police authorities may take his thumb prints with a view of comparing them to the records of the rogues' gallery, thus considering the automobile driver as a probable criminal from the beginning.

Another bill proposes that whenever an automobile owner is granted a license for driving his car he should file in the office of the secretary of state a bond amounting to $2,000, to serve as a guarantee of his law-abiding demeanor. Out of this bond any injuries or damages shall be paid and if the owner should become guilty of a criminal offense this bond would serve as a means of calling him to the bar.

Still another and equally ingenuous scheme has been introduced by a state senator. It provides that every chauffeur before being licensed shall file a bond of $500, guaranteed by a surety company; in other words, he must pay in advance for the possibility of an offense, an unprecedented course. Which, however, would no doubt prove of great advantage to surety companies.

What appears to be impudence Simon-pure constitutes the essence of a bill of considerable volume enumerating some twenty-five or thirty instances in which the secretary of state, at his discretion and without a hearing, may suspend or revoke a license granted to an automobile owner or driver. Such concentration of power in the hands of one man without any responsibility on his part to a body elected by the people is also an unheard-of innovation.

The following proposed measure should appeal to every thinking citizen:

Automobilists, when traveling through towns having 1,000,000 population or more, should bring their automobiles to full stop when passing a fire engine house, or a schoolhouse between 8 and 9 in the morning and 2 and 3 in the afternoon, excepting Sundays. The Solon who conceived this bill obviously forgot to make provision to except, in addition to Sundays, the seven National holidays which fall during the school season, as well as the 70 days of the summer during which the schools are closed in all cities. A first offense against this wise regulation, if the same be enacted, would cost an automobilist $25, a second offense $50 and a third $100 or 30 days in prison or both.

Another good idea: Any person registering as the owner of an automobile shall be primarily liable for any injury to persons or damage to property caused by his automobile, no matter whether driven by himself, his agent, a member of his family or an individual not authorized by him. That is to say, if a man's car is stolen while the owner is inside a house and if the thief driving the car kills a person on the highway and the number of the automobile is noted by a passer-by, the owner may be indicted for murder, manslaughter or whatever name the bill proposes for such an offense.

One feeble light in this otherwise impenetrable night of thoughtlessness—to use no stronger word—is the proposition that every vehicle using the public highways should display, from 1 hour after sunset until 1 hour before sunrise, a light which is plainly visible in front of the vehicle and in the rear of the same. This proposed measure includes, of course, horse-driven vehicles of every description.

Mr. Terry made it clear that concerted action on the part of automobile manufacturers, dealers, accessory makers and jobbers, owners and chauffeurs is necessary to prevent such legislation from being enacted and to prevent also the registration fees from being raised 150 per cent. over what they were in 1912. The Automobile Dealers' Association is preparing a protest against all unreasonable legislation now pending and will conduct an efficient campaign, including posters, to be conspicuously displayed in business places of automobile and accessory dealers, etc.

Desperados Fail To Win Tire Strike

Imported Agitators Merely Prolong Trouble for a Period of 7 Days—Loss Estimated at $50,000,000

AKRON, O., March 4—(*Special Telegram*)—Imported agitators into Akron, many being among the most desperate characters in the country, have been the means of prolonging the strike among the rubber workers here for another week.

A week ago the strike was broken and there was a great rush on the part of the thousands of men and women to get back to work. Then came the imported strike leaders and sensational demands by one of the local newspapers for a state senatorial investigation of the rubber factories here and the conditions leading up to the strike.

The senatorial committee has been in session here 3 days. All sessions are being held at the Portage Hotel and are open to the public. Many of the strikers, members of the I. W. W., have related their alleged grievances. The testimony from the men has demonstrated the fact that higher wages are paid in Akron rubber factories than in any other similar factories in the country. Many of the common laborers have testified that they received from $3.50 to $5 a day. None of the testimony from the strikers was substantiated, the charges made by the strikers being that they were poorly paid and mistreated. In the meantime one of the Socialist editors, a leader in the strike, has been arrested for inciting a riot and has been sent to the workhouse.

Two desperate characters have been fined and imprisoned for carrying red flags through the streets and many other imported strike leaders have been arrested. Announcement was made tonight that "Big Bill" Haywood will arrive in the city to try and pull together the remnants of the I. W. W. that has fallen to pieces. The chairman of the I. W. W. executive committee resigned tonight and threatens to make sensational exposures of the I. W. W. later. All of the sessions of the state probe committee are being daily attended by head officials of the local rubber companies. Frank A. Seiberling, president of Goodyear Tire & Rubber Company, was the first of the manufacturers to appear before the state probe committee this afternoon. Seiberling has furnished committee with every possible information. He testified today that out of 21,500 people employed in Akron Rubber factories there are now 11,700 at work and hundreds returning daily. Every plant in city is fast resuming normal conditions. Local rubber manufacturers say that they will never recognize the I. W. W. Estimates were made today that over $50,000,000 have been lost to stockholders and the city as result of strike. Saloons, which have been closed over a week in the city, were opened again today. The parades which were features of the strike a week ago have been called off. Interest is centred on the coming of Haywood. Police are prepared to arrest Haywood when he comes. The senate probe committee is disgusted with the probe and has said that Akron rubber factories are the best in the country.

Hartford Maxwell to Build Six

HARTFORD, CONN., March 4—The Maxwell Motor Company, Inc., successor to the Columbia Motor Car Company, continues to increase its manufacturing force and is hiring men every day, a great majority being the old workmen who have been with the company for years. The company is also installing considerable new machinery, and has in transit a carload of such with more to follow in a few weeks. The policy is to continue adding to the equipment as fast as required and to replace much of the old machinery with the latest types.

The company is going to confine its efforts to the Knight sleeve-valve motor and in addition to its four-cylinder model expects to market a six-cylinder one sometime in June. This six, using cylinders cast in threes, will have a bore of 4.5 inches, a stroke of 4.5 inches, and a 139-inch wheelbase. It is the purpose to completely equip this model with all accessories necessary for transcontinental travel, including an electric lighting and starting system. The car will list touring car bodies at $5,000.

The company expects to also market Knight-motored cars of smaller motor sizes and to be sold at correspondingly lower prices than those listed at present. The entire product of this company will be handled by a separate list of dealers from those handling the other products of the Maxwell Motor Company, Inc., and it is planned to have a separate selling organization with headquarters at the Hartford plant.

Hartford Tire Men Convene

HARTFORD, CONN., March 1—Forty-six service department heads of the United States Tire Company met at the Hartford Rubber Works plant this week for a 3-day session. The attending service managers are from the various branches throughout the eastern district. The object of the meeting was to discuss service in relation to the tire user. Talks were given by officials of the company. The local plant was inspected. The service department of the United States Tire Company has assumed large proportions within the past year.

Chalmers to Issue $1,500,000 in Stock

DETROIT, MICH., March 1—The Chalmers Motor Company plans to issue $1,500,000 in 7 per cent. preferred stock at a meeting of the stockholders to be held the middle of the month. The proceeds from the issue are to be used merely as a reserve fund for protection against contingencies, and not to pay off any existing obligations as was stated in some quarters.

Sixty-five representatives of banking institutions in various parts of the country inspected the factory today to ascertain whether they could handle the issue. As their opinion was favorable, there is no doubt that the issue will be formally authorized at the coming stockholders' meeting. Although a meeting of the stockholders was held today, the matter of the issue was merely brought before it, no definite action being taken at this time.

Court Upholds Consolidated Rubber Co.

On March 3, Judge Coxe, of the U. S. District Court, Southern District of New York, rendered a decision in favor of the Consolidated Rubber Tire Company, and the Rubber Tire Wheel Company, against the Diamond Tire Company, of New York, the Diamond Tire Company of Ohio, the Diamond Tire Company of West Virginia, the B. F. Goodrich Company, of New York, A. H. Marks, W. B. Miller and G. Work, to restrain the defendants from disposing of a quantity of tires, held by them which constitutes an infringement under the Grant patent, which expired Feberuary 18. The complainant also has a decision authorizing him to have destroyed the stock which is held by these companies, and also the Kokomo Tire Company, of Indiana. There is a suit now against the Diamond Rubber Company, in the U. S. District Court, Northern District of Ohio.

Detroit Is Short of Cars

Branch Office of N. A. A. M. Doing Good Work in Securing Cars for Use of Automobile Manufacturers

Members of the Trade Rendering Excellent Co-operation in Securing Data Covering Needs of Transportation

DETROIT, MICH., March 3—Since its establishment by the National Association of Automobile Manufacturers at the convention held in this city last fall, the Detroit office of the Association's traffic department has played an important part in the shipments of motor cars from this city and the return of the empty freight cars. During January the office was concerned in the shipment of between 5,000 and 6,000 carloads of automobiles. Figuring that each of these cars averaged four machines, the total shipment of automobiles from this city during January was somewhere between 20,000 and 24,000. These figures are conservative as some of the freight cars contained as high as eight machines. On the other hand, some of them carried only three.

According to J. A. Gardner, manager of the Detroit office, the greatest work of his department lies in the securing of the return of the special automobile box cars to this city for reloading after they have reached their destinations. The automobile industry is handicapped so far as its freight cars is concerned, since shippers of many other lines of merchandise can make use of the automobile cars equally as well, if not better, than they can the regulation box cars with side doors. On the other hand the motor car maker can use only the specially constructed cars. As a consequence, it keeps the traffic bureau busy tracing the special cars and preventing them from being purloined before they can be returned for further service to the automobile makers.

The Detroit traffic office is working to great advantage to the automobile makers. Mr. Gardner states that there has really been little or no car famine here this winter, although off and on there has been somewhat of a shortage. With the increasing shipments of spring goods in all lines there is beginning to be a slight curtailment of the freight car supply, although the bureau does not look for any great shortage.

Lyons-Knight To Build Cars

INDIANAPOLIS, IND., March 5—The Lyons Atlas Company, one of the four American Knight licenses, and which heretofore has confined itself to building the Lyons-Knight motors, has decided to embark into the car manufacturing field as well. This comes out in the announcement made today that the Lyons-Atlas people have purchased the sample cars, parts, drawings and patterns of the Knight engined cars which were designed and developed during the last 18 months by Harry A. Knox, of Springfield, Mass. Mr. Knox and his draughtsmen have been brought on from the East and already have been given quarters in the local plant and the new car will be brought out under the direction of Mr. Knox. Both sixes and fours will be built and the car will be featured by a worm-drive axle, left steer, center control, electric starter, electric lighting equipment and gasoline tank on the dash. The transmission is embodied in the rear-axle housing. Deliveries will begin in 6 weeks.

Knox Liability Schedule Filed

SPRINGFIELD, MASS., March 1—The schedule of liabilities filed this week in the United States District Court at Boston by Albert E. Smith, treasurer of the Knox Automobile Co., which assigned on September 27 last for the benefit of its creditors, shows but two secured creditors. The total liabilities are put at $1,286,409 and the assets at $1,380,386. There are more than 500 unsecured creditors. Here are the larger ones, some of them being well-known firms in the motor industry, makers of tires and parts:

Estate of Alfred N. Mayo, Edward O. Sutton, Harry G. Fiske and W. T. Schell, administrators. Promissory notes for money loaned, with interest	$926,500
First National Bank, Boston	40,000
Chicopee National Bank, Chicopee	30,000
National Exchange Bank, Hartford	6,000
Keely-Springfield Tire Co., New York	3,756
W. E. Wright, Springfield, salary	1,775
Cape Ann Tool Co., Pigeon Cove	3,007
Fisk Rubber Co., Chicopee Falls	80,473
W. F. Galle & Co., Cincinnati	5,025
Goodyear Tire & Rubber Co., Akron, O.	5,813
W. J. Kells Mfg. Co., New York	$3,792
E. R. Merrill Spring Co., New York	4,316
Merrimac Paper Co., Lawrence	1,195
Millbury Steel Foundry, Millbury	3,359
New Haven Carriage Co., New Haven	2,828
Ross Gear & Tool Co., Lafayette, Ind.	2,434
A. O. Smith Co., Milwaukee, Wis.	7,003
Spring Perch Co., Bridgeport, Conn.	5,482
Standard Oil Co., New York	2,300
Timken Detroit Axle Co., Detroit	4,959
Wyman & Gordon Co., Worcester	2,594
English & Mersick Co., New Haven, Conn.	6,196

The assets of $1,380,386 consist of incumbered real estate valued at $268,300, the estimated value of the patents and stock in trade put down at $750,000 and the estimated value of the machinery, fixtures, tools, etc., used in the manufacture of automobiles.

INDIANAPOLIS, IND., March 3—Judge Albert B. Anderson, of the United States District Court, has denied a petition filed some time ago by Indiana creditors asking that the Maxwell-Briscoe Motor Company, which had a plant at Newcastle, now owned by

Automobile Securities Quotations

As was to be expected, the much reduced tension obtaining at Akron caused a fairly general restitution of old prices of tire stocks during this week, Firestone common advancing 25, Goodyear common 25, Miller 35, Swinehart 7 and U. S. Rubber 4. Fisk preferred was the only tire issue which sold down, and the loss of 2 points appeared to be insignificant in every respect. Automobile manufacturing securities, including Chalmers, General Motors, Studebaker and Willys-Overland also scored advances.

the Maxwell Motor Co., be adjudged bankrupt. He has also dissolved an order restraining the removal of any property from the Newcastle plant or from the jurisdiction of the court. It was shown in court that the petitioners had assigned their claims, which have since been satisfied, to Henry V. Poor and that the court had no jurisdiction in the matter.

There was an absence of new developments of importance in the crude rubber situation yesterday. Trading in the leading markets of the world continued sluggish so far as the consuming demand was concerned. Manufacturers in some cases are believed to be carrying small supplies, but they seem to be sufficient for their needs, and few in the trade expect to witness any increase in the demand in the near future. Here in New York the market was devoid of new features of interest. The attitude of both the buyer and the seller seems to be a waiting one. Up-river fine was calling at $.95.

BUFFALO, N. Y., March 5—The entire plant of the Thomas company will be sold at an unrestricted sale covering the dates of March 17 to 22 inclusive. The sale will be handled by J. E. Conant & Company on the premises.

NEW YORK CITY, March 5—As reported exclusively in THE AUTOMOBILE of last week, the Merchants' Association, of New York has been studying the automobile situation with a view of bringing the industry to this city. The results of this study have been so promising that the industrial committee has now definitely decided to take vigorous steps to interest both new and old manufacturers.

Market Changes of the Week

Tin proved to be the most important change in the markets this week, gaining $.15 per hundred pounds. Starting on Wednesday at $47.75, it fluctuated sometimes $.25 below Wednesday's price, but pulled itself up to $47.90 on Tuesday. An easier tone was developed in refined copper yesterday, with less buying of electrolytic in Europe and fewer orders from domestic consumers, but prices were without essential changes, electrolytic and Lake rising $.00 1-4 and $.00 1-8 per pound, respectively. Linseed remained quiet but steady, although going a drop of $.03 on Saturday. Lead remained constant at $4.30 per hundred pounds. Cottonseed oil trading on the local market yesterday was of rather insignificant volume. Price changes were also unimportant. Offering of crude were not large, but there was no demand from refiners. The consuming demand continues light. It experienced a gain of $.05 per barrel. Forcing scrap rubber remains in a firm position.

International Co. Report

Earnings for the Year Amount to $590,149 After Deducting All Operating and $222,850 for Buying Machinery

Investigations Made by Committee Which Reports Conditions Highly Favorable for Sale of Trucks Next Year

NEW YORK, March 4—The annual report of the International Motor Company for the year ending December 31, 1912, shows a net earning of $590,149, and in a letter President C. P. Coleman of the company addressed to stockholders, he states that orders for the past year have increased 95 per cent. in quantity and 96.6 per cent. in value; and the shipments during the year show an increase of 78 1-3 per cent. in quantity and 72.6 per cent. in value.

At the end of the fiscal year the balance available for dividends was $499,048 equal to 7 per cent. on the preferred stock and an additional 4.39 per cent. on the common. The income account for the year including subsidiaries:

Net earnings after deducting all expenses and depreciation	$590,149
Interest	91,101
Surplus	$499,048
Preferred dividends (three)	185,260
Balance	$313,788
Special and extraordinary charges	117,151
Surplus	$196,637

In his report on the business of the year, President Coleman says: "At the end of the year there were remaining on hand unfilled orders amounting to $712,243 in sales value. During January, 1913, the company's sales approximated $250,000, or twice the amount of the same month in 1912.

"It has been necessary during the past year to assimilate and rearrange the several organizations taken over so as to produce one working as a whole. This has been, in a large measure, accomplished, and we close the year with an organization very much strengthened. The effect of this will be felt even more strongly during the coming year.

"In Greater New York there are now in service approximately 1,200 of our trucks.

"Owing to the increase of 95 per cent. in our orders during the past year, and the rapid growth of the motor truck industry, additions were made to our Mack plant at Allentown, Pa., and to our Saurer plant at Plainfield, N. J., for buildings, machinery and shop equipment representing an outlay of $222,850.

"You will note that, although this is our first year, when it was necessary to incur the expenses incidental to an organization period, the net earnings for the year, after writing off liberal amounts in connection with the organization and acquisition of the component companies, are largely in excess of the requirements of 7 per cent. on the outstanding preferred shares.

"The growth of the business and the necessity of carrying out certain contracts for materials made by our predecessors materially increased our investment in inventories and necessitated additional cash. This was accomplished in accordance with the plan of which you are advised by our letter of December 12, 1912.

"Your board of directors felt that because of these requirements, and for the development of the company's business, it was advisable to waive payment of preferred dividends, this action being taken after consultation with the holders of a large majority of the stock, who gave their approval.

"We have recently made a very careful canvass of the general market situation for motor trucks, through our own organization and otherwise, with the result that we feel warranted in concluding that the demand for motor trucks will be largely in excess this coming year over that of the previous one."

S. A. E. Talks Kerosene

Bennett's Experiments on Coal Oil Produced Results —Legislation Is Mentioned

Committee on Rims Named

NEW YORK CITY, Feb. 28—Kerosene and the kerosene carbureter were the subjects of discussion at a meeting of the Metropolitan Section of the Society of Automobile Engineers last night, where A. C. Bennett, of the Wilcox-Bennett Carbureter Company, Minneapolis, was the principal speaker.

In his address to the members Mr. Bennett gave many interesting particulars of practical experiments he has recently conducted with a view to evolving a satisfactory carbureter for the heavier fuel. The commercial possibilities of such a carbureter are generally recognized. With the increasing price of gasoline its introduction at an early date is becoming almost a necessity.

The greatest difficulty encountered in an attempt to use kerosene as a fuel in explosion motors, Mr. Bennett pointed out, was that of breaking up the fluid into sufficiently fine particles before entering the cylinder. There is a considerable difference in this respect between the operation of gasoline and kerosene. In the first vaporization takes place immediately after leaving the carbureter, whereas in the case of kerosene the fuel is in a state of spray throughout the inlet passages and until its entry into the cylinder. The real problem, therefore, is to devise a means of reducing the fluid to the finest possible particles, and in order to do this, Mr. Bennett found that a high velocity of inlet flow was desirable. This was accomplished by using a much smaller manifold than is general practice with gasoline engines, and also by opening the inlet valve late so that the partial vacuum created would induce a faster flow through the carbureter jets and manifold passages. Easy curves in the manifold are of no benefit. In fact, in the experiments in question fins were introduced for the express purpose of making the passages more difficult so that the breaking up of the fuel was more thorough. A multiple-jet carbureter was used and the kerosene before entering was heated. The air, on the other hand, was allowed to be drawn in cold. Water was then added in small quantities from a hand-controlled jet. It was found that the necessity of adding water varied according to the design of engine. Without it preignition is liable to occur in most engines. The compression was not altered for the kerosene experiments. But it was found necessary to provide more clearance for the piston owing to the greater heat encountered by its upper surface.

Little Trouble with Carbon

The question of carbon deposit was dealt with by Mr. Bennett. Results showed that with a careful choice of good lubricating oil and the correct positioning of the spark-plugs very little of the trouble usually associated with the word kerosene was experienced. An important point, however, is that the spark-plugs be not pocketed, but located in such a position that the points are swept by the gases. The points themselves should be of fine wire, arranged so as to minimize the accumulation of carbon as clean plug-points are absolutely essential.

In conclusion, Mr. Bennett expressed his belief in kerosene as a solution of the impending shortage of gasoline for pleasure car purposes by utilizing it as a fuel for all stationary and truck motors. A short discussion followed in which various members of the society took part.

Another matter decided at the meeting, on the suggestion of C. F. Clarkson, was the formation of a committee of three to inquire into the existing and proposed legislation affecting motorists. The three members appointed were: W. P. Kennedy, H. G. McComb and A. J. Slade.

The appointment of officers for the ensuing year was also part of the business transacted. J. A. Anglada was re-elected chairman of the governing committee; Herbert Chase, treasurer, and M. B. Pope, secretary.

At the annual meeting of the Society of Automobile Engineers held recently a committee was appointed to consider an improvement in the rim situation for pneumatic tires, the members of the committee being as follows: Henry Souther, chairman; H. L. Barton, G. G. Behn, T. W. Guthrie, F. H. Moyer, C. E. Reddig, W. C. State, J. G. Vincent, C. B. Whittelsey and C. B. Williams. This committee, which as a sub-committee or division of the Standards Committee of the society, will hold a meeting in Cleveland, O., on March 12 for the purpose of organization and hearing the views of representatives of some fifty pneumatic tire, wheel rim, steel bands and motor cycle manufacturing companies.

Napier Great on Benzol

LONDON, ENG., Feb. 26—The S. F. Edge, Ltd., London, has made a horsepower test with a motor designed for the 15-horsepower model Napier, the result being that the power developed by gasoline was 28.3 and by benzol 28.6 horsepower. Of gasoline, .75 pint was used for every horsepower developed, while only .70 pint benzol was needed for the same power output. This test would indicate benzol to be a satisfactory fuel, provided the price be brought below that of gasoline.

Working on Kerosene Carbureter

MILWAUKEE, WIS., March 1—That the Wisconsin Engine Company, Corliss, Wis., a large machinery and engine manufacturing concern which recently filed a voluntary petition in bankruptcy, was working on a kerosene carbureter, is divulged by the schedules of assets and liabilities just filed. Patterns, patents and drawings of the carbureter are listed as worth $5,000. As the assets are $909,000 and liabilities only $315,000, it is believed the concern will be speedily rehabilitated and the kerosene carbureter it is working on will eventually be marketed. Edward T. Adams, formerly president of the company, is the designer.

A Manufacturer's View

INDIANAPOLIS, IND.—We believe that the consumption of fuel is to a great extent a personal equation to be solved by each individual motorist. Our records show that the best economy for brake horsepower hour, was obtained with a fourteen to one on ratio and with this setting no carbon monoxide could be detected in the exhaust. We believe that this ratio will not please the driver who is always in a hurry to get away and delights in dashing around slower vehicles, *but for each percentage of carbon monoxide emitted in the exhaust from an overly rich or snappy mixture, a net loss of 4 per cent. in fuel will be suffered.*

The majority of cars will emit as high as 10 per cent. of carbon monoxide, which represents a waste of nearly 40 per cent. of the fuel fed to the motor. Also speed means horsepower, and if speed is desired, economy cannot be obtained, at least the maximum.

It has been determined by repeated tests that it takes more gasoline to get speed and power than the amount necessary to get the highest efficiency.

Therefore, in all models of carbureters, it is best to use as weak a spring as possible, and to have the gasoline adjustment just strong enough to keep the motor from firing back into the carbureter. If it is desired to get the most miles per gallon, it is the best practice to have the carbureter so that when the throttle is opened suddenly the motor will spit back once or twice, but if the throttle is opened slowly there will be no such backfire.—GEORGE T. BRIGGS, Wheeler & Schebler.

Hup Wins Swedish Run

Is the First Out of Sixty-Six to Cover 738-Mile Course in Reliability

English Daimler Second

PARIS, France, March 4—*Special Cable.*—Of the sixty-six entries in the Swedish reliability trials, which started in Sweden on February 23 and covered 1181 kilometers or 738 miles, number one Hupmobile, which was first to start in the contest, was first to reach the finishing line. The second car was an English Daimler; the third, a Swedish car, the Scania Vabis. In the contest were nineteen American machines, thirty Germans, five English, two Swedish, four Belgians, four French, and two Italians.

Prince William of Germany, who was a contestant in the run, finished with a small penalization against him.

Little snow was encountered during the trials but the greatest difficulty was experienced with the ice coating on the hills, due to which it was thought at one time it would be advisable to postpone the trials.

Average Accident Statistics for 1912

NEW YORK, March 5—Statistics covering the number of persons killed in Greater New York by motor vehicles, horse vehicles, and trolley cars as compiled at the coroner's office for 1910, 1911, and 1912, show that there has been a heavy increase in the numbers killed by motor cars and trolley in 1912 as compared with 1911, whereas the number killed by horse vehicles decreased materially in 1912. The average of figures obtained from different sources is:

Vehicles	1910	1911	1912
Motor	144	141	216
Horse	219	245	184
Trolley cars	153	128	163

These figures are an average of those compiled from three different sources in New York City, the figures compiled differing so that the above represent a fairly accurate condition.

Chicago Firms Test Motor Spirit

CHICAGO, ILL., March 3—With a view to determining the value of its new fuel, Motor Spirit, in actual service, the Standard Oil Company, of Indiana has distributed quantities of the latest substitute for gasoline among some of the large truck users in Chicago and elsewhere. Some of the trucks have been operating on Motor Spirit for a period of 2 weeks and that it is meeting with favor is attested by the fact that of the twenty-one concerns in Chicago, originally supplied with one or two barrels of the fuel for test, twelve have been well enough satisfied to re-order supplies of the new fuel.

Chicago, in particular, has been favored with weather which provides a rigorous test; cold, snowy and blustery days and sharp winds have been the rule during the past month. This, combined with the fact that motors must be kept slightly warmer with the Motor Spirit than with gasoline perhaps has prevented the new distillate from making the showing it otherwise would have made. However, many of those who have tried it find that there is little difference between it and gasoline. The chief complaint of the truck operators themselves seems to be the smell. Those who carry their supply of fuel under the seat seem to be the only sufferers in this respect. In the matter of mileage opinion seems to be divided.

Two concerns have actually tested the new fuel in service. These are Marshall Field & Co. and The Chicago Union Lime Works. The first concern had bad results, finding that they were unable to throttle down and had to use gasoline to pull their truck out of a snow drift. The second concern, which adjusted the carbureter to meet the requirements of Motor Spirit, had excellent results. It is evident that in using the new fuel about double the quantity of air must be used.

NEW YORK CITY, March 5—The high cost of gasoline has not affected the automobile industry alone. This is evidenced by the fact that the Dryers and Cleaners Association has resolved to combine their efforts with the New York Garage Association in their campaign for cheaper gasoline. A meeting of these two associations will be held tomorrow evening to map out a plan of action.

Omaha Show Breaks All Records

OMAHA, NEB., Feb. 27—With three times the number of paid admissions and several thousands more in attendance for the first day, as compared with previous years, the eighth annual automobile show, held under the auspices of the Omaha Automobile Show Association, in the auditorium, began with a rush Monday that forecasts the biggest success of any show ever held in Omaha or in the Middle West.

Not alone in attendance is this Omaha show a record breaker. Manager Powell is authority for the statement that one make of car brought 1,000 sales during the first 3 days.

BROOKLYN, N. Y., March 3—The third annual show which closed here Saturday, was a success. The official attendance figures have not yet been published, but it is said that close to 100,000 people visited the armory. A number of sales were closed by all exhibitors, the show proving much more of a buyers' affair than the New York show, although there seemed to be less ready money on hand than at the 1912 show.

HARTFORD, CONN., March 1—A dividend of about 50 per cent. will be returned to the dealers who exhibited at the recent Hartford automobile show held at the first regiment armory by Hartford Automobile Dealers' Association. This fact became known at a meeting of the dealers held at the Heublein this week.

Many Sales at Syracuse

SYRACUSE, N. Y., March 1—The fifth annual automobile show closed today with a total attendance for the 5 days of nearly 21,000, a record-breaking figure. Over seventy-five pleasure cars were sold during the show and about twenty-five trucks, this being the best record ever made at a Syracuse show. A large number of prospects were reported by the dealers and the outlook for the spring business is said by the dealers to be the best it has ever been. The farmers did considerable buying of both pleasure cars and of trucks. Generally considered, the industry in central New York is bigger and better than it has ever been.

MADISON, WIS., March 1—The Madison Automobile Dealers' Association has decided to give a third annual motor show in 1914, following the successful second annual event held February 19, 20 and 21 in the city market. The attendance was more than 4,000 and retail sales were made in large numbers. It is hoped that a larger building will be available by next year.

TORONTO, ONT., March 4—The 10-day annual automobile show, which closed Saturday night, proved by far the most successful exhibition ever held in Toronto. At least 70,000 people viewed the cars on exhibition. It is estimated that about $1,000,000 worth of cars were disposed of during the exhibition.

Manufacturers in Germany Cautiously Preparing for the Technical Perfecting of American and British Motor Starters—French Small Cars Built for Economy of Upkeep—Water Injection Baffles Control—Philosophy of Skidding—Tantalum

AMONG Motor Starters—While the German automobile industry as a whole is inclined to take distance from the idea of installing a motor-starter apparatus in every car and fears the cost, the complication and the weight, it begins to recognize that the subject must be studied in order to keep pace with the development in America and England where a completely practical solution may be found any day by reason of the great amount of work devoted to the subject. It is also realized that the connection of an electric starter with an electric lighting system for a car and with the ignition system of the motor presents possibilities which have not been exhausted and which may justify the carrying of a storage battery, even if the latter must weigh at least 200 pounds in order to stand up to the work required of it. The similar connection existing between lighting and starting by means of acetylene gas is also becoming recognized, though with some misgivings as to whether the acetylene lighting system, with its tubular connections to the individual lamps, will be able to compete with the electric system in the long run. With this uncertainty in view, a preference is discernible for starting-systems by which the gas introduced in one or more of the cylinders for starting purposes may be either acetylene or a normal gas mixture produced from gasoline or benzol, but the necessity of firing any gas charge so introduced again points to the need of an electric battery, though not a large one, unless the magneto-exciters already in the market are developed so as to operate with unfailing certainty. On the whole the arguments for the different systems are looked upon as so intricately involved with technical progress not yet fully accomplished that the simplest possible apparatus supplemented with a starting crank for emergencies looks like the best chance for the immediate present to a conservative German manufacturer dealing with a conservative public.

The Ashford starter which meets this view fairly well is described by the London correspondent of *Allgemeine Automobil-Zeitung*. It consists in a hand-operated pump, for drawing gas mixture from the carbureter and pressing it into one of the cylinders, combined with a sparking apparatus for igniting the charge. It can be used with acetylene if preferred. The pump is placed with its handle protruding horizontally from the dashboard toward the driver while the barrel of the pump and the piping are under the motor hood. Pulling the handle out fills the barrel with the charge and pushing it back drives the charge into one of the cylinders. The position of the handle determines which cylinder the charge shall reach and where the spark shall be fired. As shown in the drawing, Fig. 1, four pipe connections, A, B, C and D, each with a check valve, serve for attaching tubes leading to the combustion chambers of the four cylinders. The mixture arrives from the carbureter through F, and the lateral branch E thereon leads to a special small gasoline reservoir, so that, if necessary, a specially rich mixture may be provided. At the other end of the pump there are seen four wire posts, *a*, *b*, *c* and *d*, which are wired to the sparkplugs of the cylinders, and there is secured to the pump piston rod, below the handle, a conductive projection (as indicated in the auxiliary sketch with Fig. 1) between which and any of the four terminals a spark gap may be formed when the handle is turned so as to bring the projection opposite to the terminal. By this simple means the cylinder which is in position for an explosion is located.

At starting, the handle is first turned till a spark jumps across the gap at one of the terminals. Then the handle is turned still a little further, to a mark indicating that the pump now is in line for connection with the cylinder thus picked out as the right one to connect with. This done, the pump handle is pulled out sharply and at once pushed back again, and, as the piston works in unison with an internal distributer device which bars three of the four pipes, A, B, C and D, the gas mixture reaches the right cylinder, where it is ignited. The ignition may be taken care of either by means of a magneto-starter device or, more conveniently, by a battery with induction coil and vibrator. The high-tension wire is in this case laid from the coil over the distributer of the magneto.

If the motor is not started at the first attempt, the pump action may be repeated, and it is also possible, the German correspondent asserts, to load each of the four cylinders separately from the pump, to the extent determined by the positions of the motor pistons, before turning the pump handle into the position producing ignition.—From *Auto-Technik*, February 14.

THE Water Injection Theory—At recent trade exhibitions in Saint Petersburg and Jekaterinoslav in Russia extensive practical trials were conducted of a large number of stationary and marine motors, and in many of these motors certain devices for injecting water or steam into the cylinders, together with the fuel, were incorporated. The objects of water injection are (1) to contribute to the cooling of the cylinder walls and the combustion chamber, so as to obviate premature ignition, (2) to increase the compression of the explosive charge and thereby the economy of operation and (3) to obviate incrustations of carbon. The results of the trials showed very conclusively, however, that no means have yet been devised for regulating the water or steam injection so as to have it correspond, as it should do, to the variations in the work demanded of the motors. Only in the case of very skilful operation was the economy of the motor enhanced, and then only for limited periods. None of the automatic regulations proved available. A very considerable formation of coke in the combustion chambers was the uniform experience in motors of widely varying construction. When steam was employed instead, coal tar was formed. A whole kilogram of coke was taken from the ignition bulb of one motor. Ignition by incandescent bulb was a feature in a considerable number among the motors, and where this bulb communicated with the combustion chamber by a narrow neck the eventual result was invariably that the motor became stalled, because the carbon deposit coated the interior of the bulb and the temperature of the latter fell so low that the charges were no longer ignited. The reliability of the motors was in all cases enhanced when the water injection feature was eliminated.—From a detailed account of the trials, in *Gasmotorentechnik*, February.

—

FOUR-CYLINDER Six-Horsepower Construction—Among the very small cars built in France this year to meet the "American invasion" or those popular requirements of whose commercial importance this invasion is the sign, one called Le Zèbre (the zebra) is the smallest, at least if only those with four-cylinder motors are considered, and its general plan as well as some of its construction details are of interest to show the mechanical and other means which appeal to French builders when the object is to secure the trade of those who must cultivate economy in their luxuries. While the makers of the Zèbre offer a single-cylinder car of five horsepowers for 3,000 francs and a four-cylinder car of ten horsepowers for about 6,000 francs, it is the four-cylinder car of six horsepowers which is considered the most characteristic and which was the pet of visitors at the recent Paris show. It is offered for 4,000 francs and is intended strictly for a maximum load of 225 kilograms, representing the weight of two passengers with light baggage, and it is guaranteed to make an average speed of 48 kilometers per hour, while using only 6 liters of gasoline and one-third liter of lubricating oil for a run of 100 kilometers. The dimensions of all parts of the chassis are pared down to sustain the economy of maintenance through a minimum of total weight while at the same time making room for a certain technical completeness which is considered of value to the user and therefore indispensable.

It is especially in the motor that this purpose has resulted in some notable departures from the construction customary for larger vehicles. The bore of the cylinders is 2 inches and the stroke 4 inches. To place valves of the size required by modern technique in the usual manner in a motor of these diminutive proportions was found impracticable, and they are therefore placed in two rows, as shown in Figs. 2 and 3. In order to reduce the volume of the combustion chambers somewhat, the valves are placed at a small angle with the axes of the cylinders. The spark plugs are located directly opposite to the induction valves. The camshaft is placed between the two rows and controls the tappet rods by means of little levers so arranged that the same cam successively operates the exhaust and the admission of the same cylinder. The exhaust manifold is bolted to the side of the block casting, while the intake pipes to the individual cylinders combinedly form the intake manifold at the rear end of which the carbureter is attached.

The thinness of the pistons made it inadvisable to secure the piston pins in them, and these are therefore integral with the connecting-rods and turn in the pistons.

The crankshaft is built up of three parts, comprising two cranks with counterweights and a central plate to which the crankpins are secured by cone joints and cotters. The first result of this construction is to modify the order of firing, since the first piston must move with the second instead of with the fourth. The lightness of the pistons offsets the poorer balancing which would be expected with this arrangement. As a matter of fact, it is stated, no vibration is noticed in the vehicle in whatever manner the motor is operated, the explanation being that the reactions due to the inertia of the cylinders are very small compared to those which might result from an unsymmetrical crankshaft, and also that the reactions from the exhaust upon the block-cast cylinders counteract the vibrations which the pistons might tend to produce. The firing is in the order, 1, 3, 2, 4, instead of the usual 1, 3, 4, 2.

The connecting-rods have no knuckles in two parts but a simple eye, with a bushing, as in single cylinder motors, and are mounted upon the crankpins before the crankshaft is assembled.

The oil reservoir is mounted upon the dashboard and the oil is placed under pressure by means of an air pump, the flow being regulated by a needle valve.

As the crankshaft is mounted in ball-bearings between the cylinder casting and the crankcase-trough, it is easily removed together with the connecting-rods and pistons. The three-speed gear-box and the wheel axles are also provided with ball-bearings throughout.—From *Omnia*, February 15.

TANTALUM, a New Material—For the tools of the draughting-room and for many purposes in the laboratory the use of tantalum as a standard material is now open for consideration. Tantalum was first employed industrially in 1905, and was not popularly known before that time. It was used for the filament of the tantalum incandescent lamps which have now won a broad market. The metal is produced from an oxide of tantalum ore which is not rare. Recently other uses for this material have been developed. Its fusion point is very high, and its resistance to chemicals coupled with its ductility, which renders it practicable to roll it into thin sheets and draw it into fine wire, suggested its use for dental instruments, and it is reported that a whole line of fine tools in this class is now manufactured. These tools are not affected by iodine and do not ir-

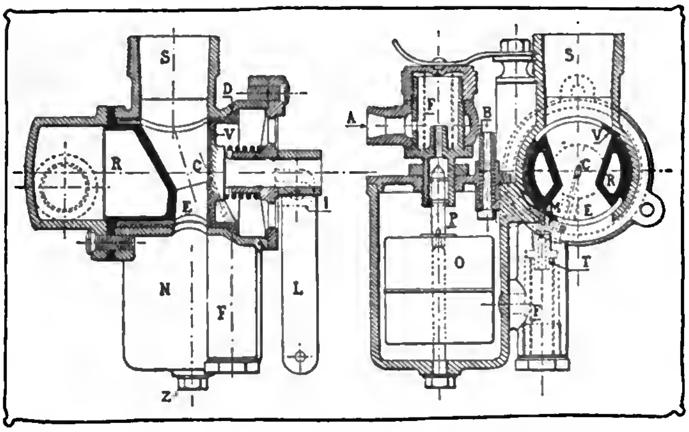

Fig. 4—Edelweiss carbureter with direct fuel control

ritate the gums. Writing-pens are also made of tantalum and are as elastic as steel pens while not subject to rust. Though exposed to corrosion from ink for several weeks, even if the ink contains acid, the new pens remain perfectly unchanged. Probably the material will soon be used for fountain pens to the exclusion of the much more expensive gold, over which it also has the advantage that it can be split, bent and shaped as freely as steel, while, also like the latter, it can be hardened by simple heat-treatment and in this manner can be made very resistant to wear.—From *Elektrochemische Zeitschrift,* January.

SKIDDING and Skewing—A lengthy study of the phenomena of skidding and skewing of automobiles by Henry Petit is summarized by the author in a number of conclusions among which the following may be of interest:

The fact that lateral adherence of a wheel to a road surface is much reduced when the wheel is kept from rotating may be utilized for making very rapid turns at high speed by applying the brakes to the rear wheels for a moment and allowing the centrifugal force to turn the vehicle around its front wheels. In case the front wheels skew to one side, the driver can utilize the same force which causes the front wheels to skew to correct the position and direction of the vehicle, by applying the rear wheel brakes, as the rear portion of the vehicle will then probably skew in the same direction as the front portion.

A vehicle whose wheel gauge is twice as large as the height of the center of gravity is practically secure against upsetting from centrifugal action, unless one of the wheels is positively prevented from skewing by a rut or other obstacle to transverse motion.

Among anti-skid tire treads those armored with metal studs have the advantage for certain road conditions and those made of rubber with larger projections and larger intervals between projections for other road conditions, the object being always to have the projections penetrate through a muddy layer to firm ground.

The differential, which is often accused of causing skidding, has on the contrary an action which is very efficacious to prevent it. Owing to its presence, the two wheels on the same axle are scarcely ever slipping at the same time. One of them continues to turn and its higher resistance to transverse motion holds the vehicle in line. If the two wheels were turned as a unit, the braking of one or both of them would remove the greater part of the lateral road adherence. It is this fact which renders it dangerous to apply the brakes on the wheel hubs harshly.

When the object is to avoid skewing as much as possible on all kinds of road surfaces, one of the driving wheels should be shod with a smooth tire and the other with an anti-skid tire, in which case one of the wheels will practically always continue to turn where the surface is slippery. But this provision, on the other hand, is poorly adapted to prevent slippage and loss of traction.

Slippage of rear driving wheels occurs most readily as the result of a braking effort, while a strong acceleration of the motor has a smaller effect in this direction. This is reversed if the front wheels are drivers; slippage will then occur mostly at the starting of the vehicle.

An excellent braking system is that adopted for the Argyll cars and consisting in coupling a brake on one of the rear wheels with another applied to the front wheel on the opposite side of the vehicle. In this manner, one front wheel and one rear wheel are always left free to turn, and the direction of the vehicle is not affected.—From *La Technique Automobile et Aérienne,* February 15.

CARBURETER with Direct Fuel Control—At two 15-minute tests conducted at the laboratory of the Automobile Club of France the carbureter shown in Fig. 4 and known as the Edelweiss developed 8.72 and 8.97 horsepowers in a four-cylinder Renault motor of 75 millimeter bore and 120 millimeter stroke running at 1091 and 1098 revolutions per minute. The consumption was 3.468 and 3.512 kilograms per hour of "motoline" fuel which has a specific gravity of 0.725. On the lowest adjustment the motor ran at 180 revolutions per minute. Accelerations were instantaneous.

The characteristic of this carbureter is the direct regulation of the fuel feed obtained by means of the rotary valve V in which there are openings E for the air intake and S for the gas mixture. It is tightly fitted on the seat D and upon its circumference there is formed a groove M which broadens out progressively, so as to present a small or a larger cavity—according to the adjustment of the valve—opposite the aperture in the seat through which the fuel is received, being first drawn from the nozzle T. The latter is made in several interchangeable sizes adapted for different motors. From the small end of the groove M a bore takes the fuel to the hole C opening into the carburation chamber of the carbureter at the point where the suction from the cylinder is strongest. When the valve is wide open, the communication from nozzle T to hole C is direct, and when the valve is turned the openings E and S are both gradually closed while the discharge of fuel is at the same time moderated by the modified position of the groove M. The shape of valve V may be realized when it is observed that the part of the illustration represents a section along the broken line SZ of the other part. RR indicates the provision for preheating the gas charge from the cooling-water or the exhaust gas. Several filters F are provided at the entrances of the gasoline to the float and from the float to the jet. It is stated by the testing engineer that condensation of the fuel vapor is avoided, even at lowest throttling, by reason of the high speed of the air current at the hole C.—From *Bulletin Officiel,* January.

The Song of Wire Wheels.—The soughing sound which is sometimes emitted by wire wheels, and which resembles that which comes from a ship's mast that bends in a strong breeze, is due to the elasticity of the rim which causes the spokes to rub where they touch one another. By greasing the spokes at the intersections the sound is reduced or obviated.—From *La Pratique Automobile,* January 10.

ABSORPTION of Driving Stresses—In about 75 per cent. of the automobiles shown at the last Paris salon the provisions for absorbing torsion and driving-thrust from the rear wheels were of one or the other of two types. Either the casing of the axle and the drive shaft transmits the thrust and absorbs torsion, and in this case the drive shaft has only one universal, while the springs have shackles in front and are secured to the axle by a joint admitting of some motion; or the springs serve all the three purposes—absorbing thrust, torsion and road shocks—have no shackles in front and are rigidly secured to the axle, while the drive shaft has two universals. Constructors are about evenly divided between these two systems.—G. Leroux in *Bulletin Officiel,* January.

Tire Carriers for 1913

More Attention Being Given to Neat Appearance and Rigidity—Single and Double Types

A MOST noticeable tendency in the automobile practice of the past few years has been the constant effort [illegible] towards improving the appearance of the car as a whole. The automobile of today presents a much more pleasing effect than its predecessors of only a year or two ago, Perhaps the chief contributory cause for this improvement has been the attention paid to continuous lines in the design of the body, and in addition the elimination or concealment as far as possible of external parts, such as gear change levers. But a serious stumbling block to the intentions of the artistic designer was met in the shape of the spare tire.

The spare tire is an absolutely necessary equipment for a touring car. Unfortunately it is not in itself a thing of beauty, and the designer's first thought was therefore to get it stowed away out of sight. It is here that the difficulty is encountered; the modern automobile is a compact mechanism, lacking in internal spaces large enough to provide the necessary accomodation.

A makeshift solution to this problem of the satisfactory disposal of the spare tire which became widely adopted was that of carrying it in a vertical position on the running board. This position can claim very few merits and several disadvantages. Among the latter the chief is that the major portion of the running board is monopolized by the presence of the tire and the adjacent side door rendered useless. But there is the further disadvantage of detracting considerably from the graceful appearance of car. For these reasons it is not surprising that a more suitable and less conspicuous position was sought. On the majority of cars at the present time provision is made for carrying the spare tire or tires at the rear, and an inspection of the various methods of support show that much careful attention is being given toward the perfecting of this detail.

A characteristic of the rear tire carriers to be seen on this year's cars is the more rugged construction and the better means of firmly securing the tire or demountable rim. The amount of vibration and overhung weight of a rim fitted with a tire suspended on brackets projecting from the rear of the body is liable of underestimation. This was evident in many of the earlier designs.

The most common form of carrier is that in which three points of support are given to the tire. But there are besides those in which a scoop-like cradle embraces a sufficient portion of the circumference to form a strong seating, and also another type where the rim only is gripped, the tire not being touched. Both single carriers and double ones are in evidence, and there are

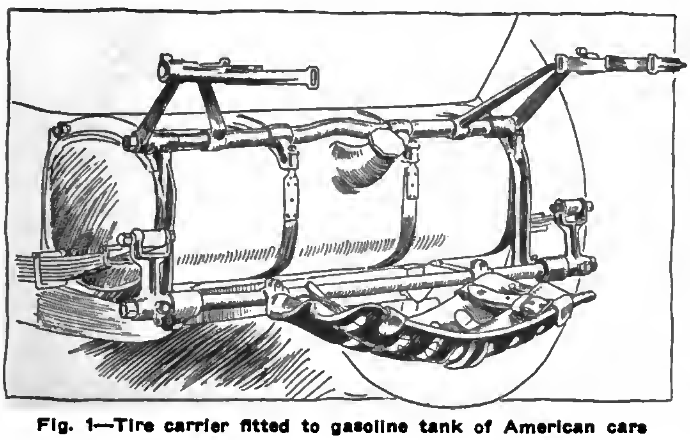

Fig. 1—Tire carrier fitted to gasoline tank of American cars

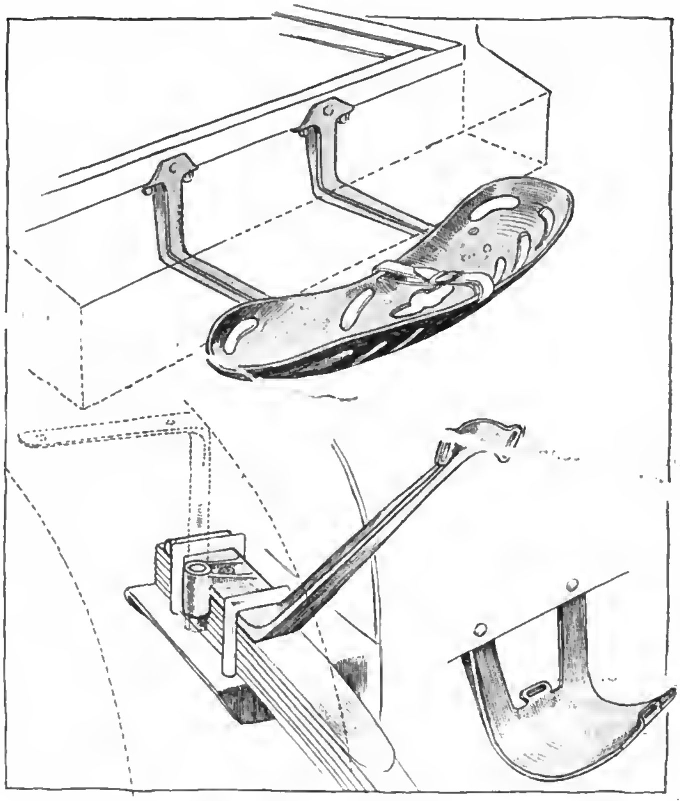

Fig. 2—Upper illustration shows Velie carrier in which the brackets form a support for tool-box. Below: Side and center tire brackets on Henderson cars, showing use of bracket base as clamping plate for spring and also as receptacle for fender carrier

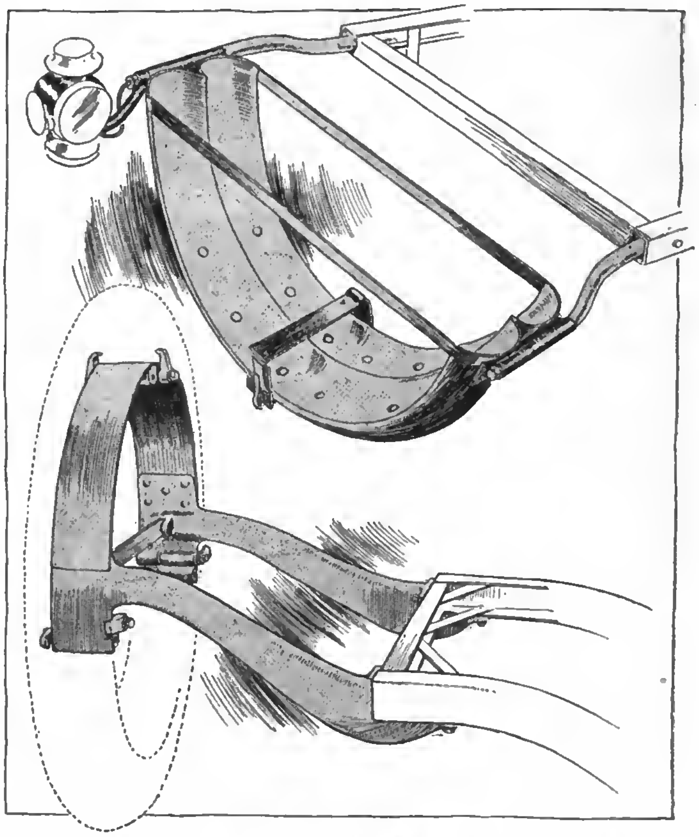

Fig. 3—Above: Double-tire carrier at rear of Oldsmobile, supported on tubular brackets and provided with a means of locking in the spares. Below: Rear carrier on Havers Six, which supports spare by clamping on rim. The brackets are made to form a continuation of the chassis lines

also many designs adaptable for carrying either one or two tires as required.

Other points of interest in considering these brackets are the means of clamping the tire into the carrier. In some designs a hinged clasp surrounds the tire; in others the ordinary leather strap is relied on. The former method permits the introduction of some form of lock to prevent theft, while the leather strap method, which is in the majority, ensures absolutely tight fastening irrespective of differences in the size of the tire.

Another interesting feature of the latest designs of tire carriers is that of saving weight by utilizing the brackets for some other purpose. Thus in one make the brackets form a support for a tool box, in another a support for the tail lamp is incorporated, while in a third the same frame extension to which the carrier is bolted forms an anchorage for the suspension of the gasoline tank.

The accompanying illustrations do not exhaust the many interesting types to be seen on the 1913 cars, but they are sufficiently comprehensive to indicate the extreme variety of methods of carrying spare tires.

American

A method of utilizing steel tubes to strengthen the gasoline tank and at the same time form a structure on which to mount the brackets of a tire carrier is shown in Fig. 1, being that adopted on the American cars. The side brackets are malleable castings to which the tires are fastened by leather straps. As shown in the illustration the accessibility of the filler cap of the tank is not interfered with in any way by the presence of the spare tires.

Velie

Fig. 2 shows two types, the upper being that fitted to the Velie cars. This consists of a malleable casting in the form of a cradle conforming with the curvature of the tire, riveted to a pair of steel angle brackets which are bolted direct to the frame. It will be noticed that the brackets are utilized as a support for a tool box, which conceals them and so conduces to the neat appearance of the back of the car. This desirable feature is further enhanced by the fact that the carrier itself, having no projecting parts, is also scarcely visible when a tire is in place. Ample provision is made for drainage and dissipation of moisture by a number of ventilating holes.

Henderson

The lower illustration in Fig. 2 shows an ingenious method of adapting side carrier brackets to the Henderson cars. The base of the bracket is made to answer the purpose of a clamping plate for the rear springs. In addition, a boss cast on the base provides a socket for the angle support of the fender. The lower central tire bracket, also a malleable casting, is shown. Both are intended for use with leather straps.

Oldsmobile

Two tire carriers marked by much originality of design are shown in Fig. 3. The upper one, fitted to the Oldsmobile, is unusual in that the carrier is made large enough to embrace half of the tire, or tires, for it is a double design, thereby obviating the necessity of any additional support . . . The double cradle is made from a single piece of sheet steel, and is carried on bent tubular brackets extending from the side members of the chassis, to which they are bolted. The tires are held in place by a hinged clamp which bears on the inner surface of the demountable rim and is provided with a lock and key.

One of the tubular brackets acts as a support for the tail lamp, the cable for which is passed along inside the tube to the channel side member.

Howard

Fig. 3 also shows the rigid form of rear carrier fitted to the Howard Six for this year. This is designed to carry the spare by means of the rim only, the tire itself being free. Although there is considerable overhang the design of the brackets suggests that the possibility of vibration taking place is very remote. The outer ends of the brackets are connected by a straight distance bar and also a semi-circular band of steel furnished with a pair of rim clamps at its upper center. Two similar pairs of clamps are fitted to the brackets. It will be observed that each clamp jaw has its own tightening bolt and that it is only necessary to slacken three of these and turn them in to permit

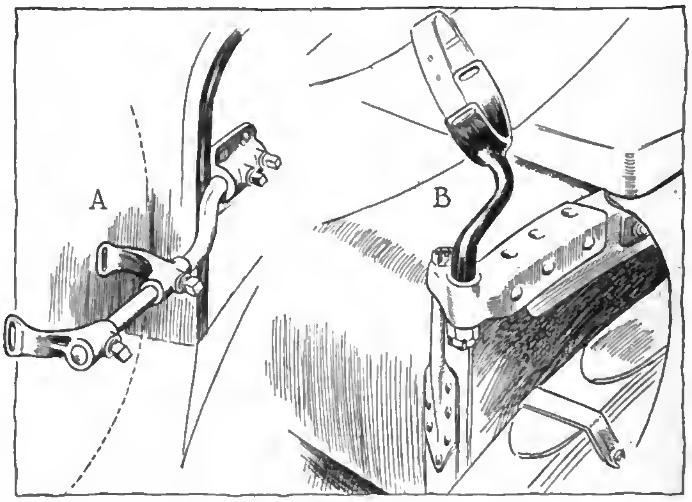

Fig. 5—A, adjustable carrier bracket on Moline coupé; B, tire carrier on Marmon two-seater

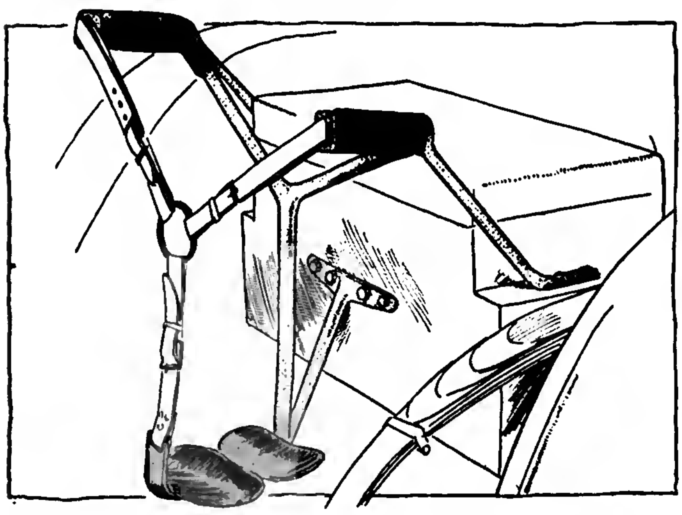

Fig. 4—Spider type of rear carrier on Pullman roadster

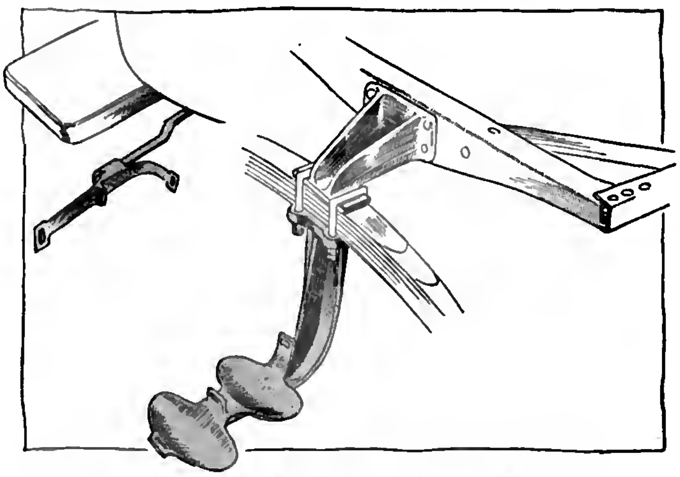

Fig. 6—Havers design of double tire brackets

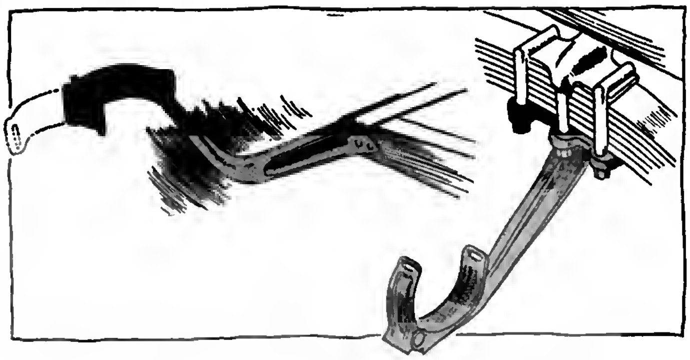

Fig. 7—Rear brackets for spare tires on Cadillac

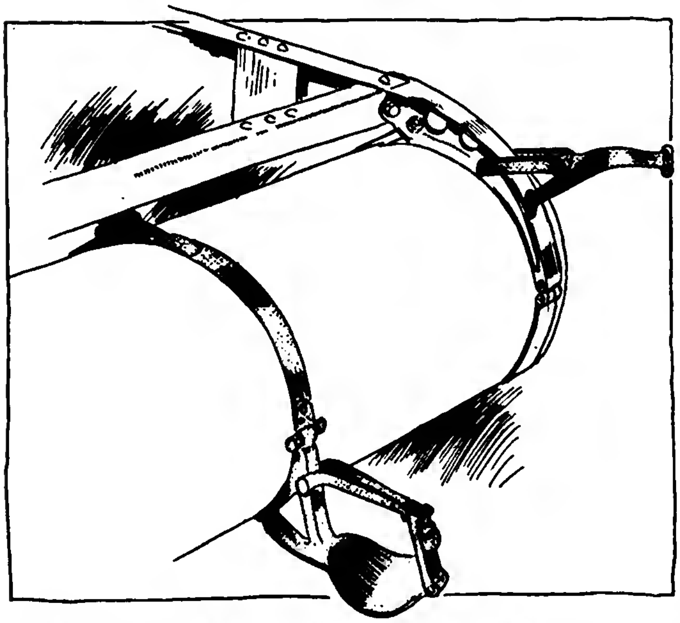

Fig. 8—Method of attaching tire carrier to tank on Edwards-Knight

removal of the rim. From the point of view of appearance, the rather massive form of the brackets is a point in its favor.

Havers

In the Havers design, Fig. 6, advantage is taken of the existing center bracket of the transverse spring, the lower tire carrier support virtually forming a continuation, being bolted thereto by the spring clips. Two side brackets supporting the tire at its horizontal diameter are bolted to the body.

Pullman

An unusual form of double carrier is that on the Pullman roadster, Fig. 4. A forged steel spider is mounted to the rear of the tool box to which it is attached by three arms. Two spoon-shaped receptacles at the base form a bearing for the tire, while the upper arms of the spider are covered with leather to protect the surface of the rubber. The straps are not arranged to surround the rim, but are tightened up against the face, as shown in the illustration.

Marmon

In the Marmon two-seater, B, Fig. 5, short extensions are riveted to the chassis members to form a seating for the carrier brackets which are arranged to hold the tire in the sloped position generally adopted in the case of two-seaters. The same frame extension is also utilized as an anchorage for the suspension of the gasoline tank.

Moline

The carrier fitted to the Moline coupé, A, Fig. 5, is chiefly interesting because of its large range of adjustment and the fact

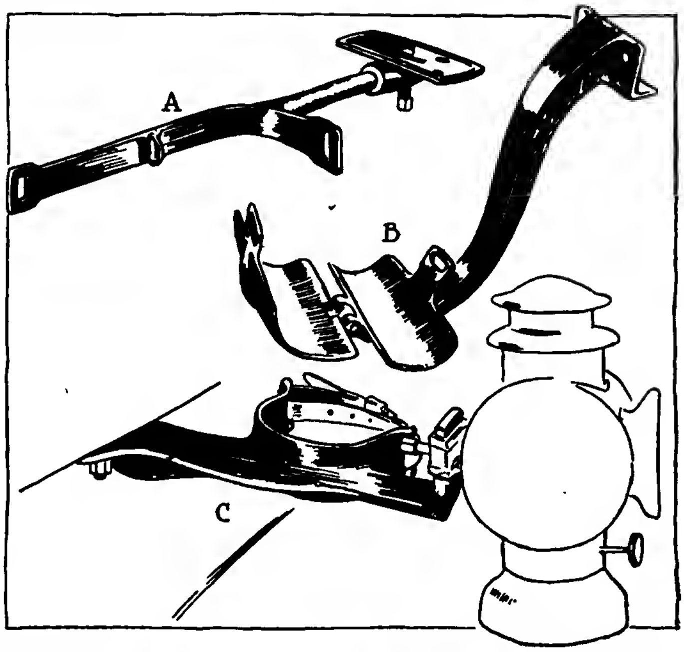

Fig. 9—A and B, tire carriers supplied by the Emil Grossman Co.; C, combined tire and tail lamp bracket on Marathon cars

that it is easily removable. A socket for the reception of the bracket, attached to the side of the body, makes it possible, by turning the cranked rod, to adjust the distance apart of the two brackets. The jaws, also adjustable, permit of their being arranged to accommodate one or two tires.

Cadillac

On the Cadillac touring phaeton a three-bracket type of carrier is fitted, Fig. 7. The center bracket, a malleable casting, is attached to the point of support of the transverse spring, the side brackets being bolted direct to the chassis members. By hinging one-half of the jaws which take the tire this carrier is adaptable for either one or two tires, it being merely necessary to adjust the leather straps.

Edwards

A unique method of attaching the tire carrier is that adopted on the new Edwards-Knight, Fig. 8. Here the center tire support is fitted to the cylindrical gasoline tank by means of a band fastening, the side supports being linked to the phosphor bronze brackets which carry the tank. A means of locking is incorporated in the lower tire fastening, while the side brackets are adapted for leather straps.

Marathon

The Marathon is provided with three tire brackets, attached to the rear of the body, C, Fig. 9. These are all malleable castings. One of the upper side brackets has an extension to take the tail lamp, as shown in the illustration.

Emil Grossman

It is to be wondered at that the accessory dealers are not more active in the preparation of tire carrier designs. The reason is doubtless that the particular conditions to be met in the case of each automobile differ so widely that it becomes difficult to furnish a carrier applicable to all. However, there are a few such devices on the market. One of these, produced by the Emil Grossman Company, possessing a great degree of adaptability, is shown at A and B, Fig. 9. This consists of two strong malleable cast brackets, the center one being intended for direct attachment to the frame, while the side brackets, furnished with a stem for adjustment, fit into sockets screwed to the body. The bracket B has a hinged tire support so as to be adaptable as a single or double carrier.

Use of Leather for Universal Coupling

Leather Rings Showed No Break or Tear Under a Load of 1,040 Pounds On Olsen Torsion Test Machine

Manganese-Bronze Cylinder Cracked and Broke When Subjected to This Strain on the Same Apparatus

Frank H. Kaiser Tells of Interesting Test
J. Demmler Thinks Horsepower Best Tax Basis
Ferdinand Jehle's Views on Exhaust Gas Analysis

Note—The discussion of the subject of exhaust gas analysis by prominent automobile engineers in The Automobile *is continued from week to week in the Engineers' Forum. Any of our readers interested in this topic are cordially invited to submit their views.*

WEST TORONTO, ONT.—Editor The Automobile:—Knowing that leather will give freely, it was experimented with in connection with a universal coupling to determine if it would give the self-aligning property to the assembled coupling. It was essential that the coupling be self-aligning.

The leather as tested was old two-ply belting, 9.75 inches wide, which was in good condition and more pliable than new leather. Four pieces or strips, each 3 inches by 9 inches, were cut from this belting. Pieces marked No. 1 and No. 2 in the accompanying table were cut crossways and those marked No. 3 and No. 4 lengthways of the belting. Steel plates, 3 inches by 2.25 inches by No. 11 gauge, were riveted to the leather as shown in Fig. 2. This was done to insure perfect gripping in the testing machine.

The table shows the length and width of leather strip test pieces at different loads during the test. It will be noticed that strips No. 3 and No. 4, which were cut lengthways of the belting, were stronger, and after the break the length and width were practically the same as at the start. Each piece broke at the end in the top of testing machine, the leather breaking between the steel plates on a line horizontal to the center rivet.

In the same table is also given the tensile strength in pounds of each leather strip, and the calculated tensile strength in pounds per square inch of cross-section and the tensile strength in pounds per inch width of leather.

The universal coupling consisted of a manganese bronze casting the shape of a hollow cylinder diverging at each end in the form of a flange. The leather was cut ring-shape, and this manganese bronze casting was riveted, at each end, through one of these leather rings at the inner or smaller diameter into a narrow steel ring. This steel ring prevented the rivets from tearing the leather. At the larger diameter or outer edge of the leather ring was riveted in the same way at each end a flange which was a manganese bronze casting. To each flange was keyed a shaft.

It wil be perceived that the hollow cylinder was suspended by leather. The power was transmitted from the shaft at one end to the flange, thence through the leather ring to the cylinder; from the cylinder to the other leather ring, to the flange and then to the other shaft. If at any moment these shafts were out of line, the strains thus set up would be neutralized, so to speak, by means of the leather rings.

A universal coupling thus assembled was tested by gripping the outer end of each shaft in an Olsen torsion test machine. When the load, applied gradually, amounted to a force of 1,040 foot-pounds, the manganese bronze cylinder cracked and broke. The leather rings did not show any break or tear. This force of 1,040 foot-pounds was greatly in excess of the actual torque delivered by the engine to the coupling as assembled in the automobile. The coupling is a success and fulfills its requirements.

The writer wishes to express his thanks for suggestions received from Mr. L. R. Evans, chief engineer, and Mr. A. Fish, mechanical engineer, of the Russell Motor Car Company, West Toronto, Ont.—Frank H. Kaiser, Russell Motor Car Company.

Wants Horsepower as Tax Basis

Grove City, Pa.—Editor The Automobile:—Taxes on automobiles are an injustice against every automobile owner.

Does every wealthy man own an automobile? Certainly not.

Men who buy automobiles and also spend a part of their money for upkeep every year, those are the men which are doing pioneer work in uplifting an industry, these are men who contribute their share for the welfare of the people.

It would be worth while to consider the idea that men who do not spend a cent for automobiling should be taxed for upkeep of roads on which the auto owners are driving along; this would be justice to both parties and boom the automobile industry considerably.

The S. A. E. formula doesn't give any value as to the amount of work required to propel a car along the road.

With a medium-powered car, a driver averages about 20 miles an hour, on level country, and taking into consideration the carrrying capacity of the car, its own weight and the coefficient of friction between the rear wheel and road, it is surprising to note the difference between the horsepower of the motor figured according to the S. A. E. formula and the actual work done at the rear wheel for propulsion of the vehicle. This has reference to any size of car. The result is somewhat different in hilly countries.

But it doesn't matter whether the number of horsepower for a given size of motor figured by the S. A. E. formula is too high or too low for a basis of taxation if a certain amount has to be raised through taxation of automobiles.

Taking another formula into consideration, which also includes the value of the car and reads:

Taxation value = X. S. A. E.

The factor X should have a sliding scale; a car selling for $1,000 the factor should be equal to 1. For all cars selling higher than $1,000 a scale could be worked out so that the factor X would range between 1 and 2, and brought in accordance with the scale, giving the sales price of cars.

For cars selling for less than $1,000 the factor X should be smaller than 1, and could vary between 1 and 0.4.

This formula also would take into consideration second-hand cars, whose value always is in reversed proportion to the age of the model.

Even if the formula of horsepower taxation would put the motor of a second-hand car higher up in the table of taxation, the factor taking into consideration the value of the car, would lower the result expressed in formula:

$$A = S. A. E. X.$$

Where A would indicate a certain value and serve as a basis to figure the amount of taxes which should be paid by the car owner.

In my opinion it is useless to prove that it is unjust to use the S. A. E. formula as a basis for taxation as long as the government wants to raise a certain amount on taxation of automobiles.

As long as only the size of the motor is taken into consideration any other formula would not change the final results, and a formula giving a lower horsepower than the S. A. E. would certainly not reduce the amount of taxes, as the government has only to raise the level of taxation to get the amount which taxation on automobiles should bring.—J. DEMMLER, Chief Engineer Bessemer Motor Truck Company.

—

Making Exhaust Gas Analysis

DETROIT, MICH.—Editor THE AUTOMOBILE:—The analysis of the exhaust gases in a motor test is an important part of the test. If the work is done carefully and accurately, it gives us more real information of the fitness of the carbureter to the motor, and of the correctness of carbureter adjustments than any other form of investigation. If the work is not done carefully, the results will be very misleading and sometimes ridiculous. The collecting of the sample demands the greatest of care.

First, the connections must be so made that there can be no leak of air into the sample tube.

Second, the sample tube should be connected as closely as possible to the last cylinder. If it is connected at some distance, and the exhaust pipe becomes red hot, the after-burning will effect the sample. We are only interested in the combustion that occurred in the cylinder.

Third, the sample must be taken over sufficient time so that it really is a true sample.

Fourth, the analysis of the sample must be made with extreme care, and by a person who has had experience along such lines.

To prevent air leaking into the sample, it is best not to suck the gas in with too great a head. It would be best to always keep the height of mercury or water in the sample and displacement tubes the same, then the slight pressure of the exhaust gas will fill the tube—any leak will then be toward the outside.

In every scientific test, of course, gas analyses are always taken. They have, however, a great commercial value as well. It is by far the quickest method of determining the best adjustment of the carbureter. Of course, the carbureter may be adjusted by the aid of a dynamometer, changing the adjustment until the highest load is reached at any one speed. This will then be the best adjustment for power, but it may not be for fuel consumption. After the best power has been reached, the fuel may be cut down still further without reducing the power. If a curve be plotted, using for abscissæ the opening of the fuel valve and for ordinates the power developed at a constant speed, we find that the curve is parallel to the horizontal axis for quite awhile. The best carbureter adjustment for both fuel economy and power can therefore be read from such a curve. Figure 1 shows a sample curve. The same result may be much more rapidly arrived at by changing the adjustment of the carbureter until the analysis of the exhaust gas shows practically no CO and a small percentage of O. The CO_2 will then be between 13 and 14 per cent.—FERDINAND JEHLE, Commercial Engineering Laboratories.

Fig. 1—International Motor Co.'s report which is made out in five copies sent to various officials and departments of the company

Fig. 2—Road report blank used by the inspectors of the same company in the work of inspecting trucks which are out doing work

SYSTEMATIC inspection of freight automobiles by representatives of the maker constitutes a service which goes with the products of most prominent truck makers which are sold in large cities. This inspection service is free to the truck user, that is, it is not paid for from case to case, although it is, of course, included in the selling price of the truck.

The purpose, use and value of systematic truck inspection may be summed up as follows:

1. VALUE TO THE MANUFACTURER.—The maker being kept informed of the weaknesses of his product is put in a position to improve on the parts inferior in design and construction. He may devise means for effectively protecting parts which originally are apt to be damaged or abused. He may, thereby, lessen the cost of upkeep and guarantee work, and render the entire maintenance of the truck less, which makes the product easier to sell.

2. VALUE TO THE OWNER.—The owner's attention is called, by inspectors' reports, to the abuses of his truck by the driver, so that he may hereafter watch out to prevent such practice from being continued. He is thereby made to reduce the upkeep cost of his truck. The consequent diminishing of expenses results in greater business profits.

3. VALUE TO THE TRUCK.—The better care which the truck will get, due to the points brought out in the foregoing paragraphs, results in longer life, lower total cost and better efficiency of the truck and its several elements.

4. MORAL EFFECT ON THE DRIVER.—The man who drives the truck, if he knows that he is being watched, will try to do better so as to hold his job and, if possible, to improve it. The truck will be all the better for the driver's moral rise.

5. MORAL EFFECT ON THE OWNER.—The man who owns the truck, seeing that the maker keeps his interest in view and tries to reduce upkeep for him, will appreciate this work on the part of the manufacturer and, other things being equal, prefer the truck of a company giving good inspection service to one of a maker who does not.

International Uses Two Trucks

In the following a number of truck inspection systems, used by large New York City branches, are described in short and the forms illustrated. The inspection is extended to the trucks, in most cases, periodically, either at fixed intervals or at such periods as the branch sees fit. In inspecting the automobiles, the men doing the work try to catch the truck on the road, thereby taking the driver unawares. The truck is then looked over, the important parts inspected, noises followed up, adjustments made, parts lubricated and so forth. Incidentally the driver is taught how to make minor adjustments and how to take care of the truck as a whole. After this inspection has been completed, the inspector, having returned to the service department, makes out a report of his work and a letter telling the truck owner of the condition, the needs and the troubles of the freight automobile.

The International Motor Co. sends its inspectors to look over every truck in use in the Metropolitan territory, having these inspections once every fortnight, approximately. The inspectors communicate with the truck owners, find out where the truck runs on a certain day, and then each inspector sets out in an automobile to catch the machine on the road. This being done, the inspector looks over the mechanism for loose parts, see whether magneto and carbureter are in good order and what parts are in need of oiling. Minor adjustments, such as that of a brake, the differential and steering gears, are also made by the inspector. He then lets the driver operate the truck and if the man does anything wrong, the inspector instructs him how to do things right. At all this work, the inspector makes notes on the road report blank, Fig. 2. This form is printed black on thin tan cardboard, 8.62 by 8 inches and having space for reporting the name of the owner, the number of truck and motor, date of the inspection and the work done. Each part is separately checked, and depending on its condition, is marked

O. K., in need of shop repair or as having required repair work on the road, which had been done by the inspector. When the cardboard record has been filled out, the driver signs it, after which the inspector returns to the service department. There he dictates the report, Fig. 1, five copies of which are prepared at the same time by the use of carbon sheets. The items appearing on this record are simply duplicating those of Fig. 2, but the report, Fig. 1, is much more adapted for office use. Each of the five copies is printed with black ink, but on thin, almost transparent paper, for various departments, to which the copies are forwarded as follows: White paper, No. 1, to general sales agent of the company at New York; light blue, No. 2, to auditor; light tan paper, No. 3, to agent or branch manager—the report blanks are in use in other cities as well; pink paper, No. 4, to the local service department manager; orange paper, No. 5, to the shop of the service department. A letter is then sent to the owner of the truck informing him of the results of the inspection.

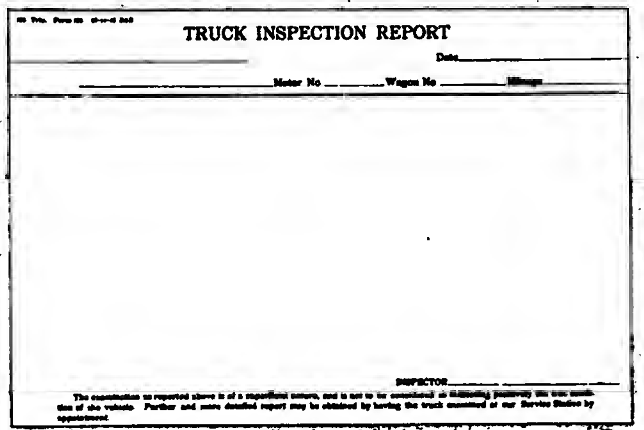
The Packard Motor Car Co.'s inspection service is entirely different from that just described. Packard trucks are inspected once a month during the first year after sale. For this inspection the machines are driven to the Long Island service department of the company and half a day is spent there by an inspector and the driver. After the end of the first year appointments must be made for these inspections. The driver is made to make adjustments and minor repairs under the observation and instruction of the inspector, thereby being familiarized with the mechanism and its requirements. After the half day is over the driver is again put in charge of the truck, the machine having been tested on the road, if necessary. Hereafter the service department makes out a triplicate inspection report, a copy of which goes to the owner, the duplicate to the New York office and the triplicate remains in the Long Island plant. In this way the New York establishment, from which the truck was sold, is kept posted on the history of the truck and enabled to treat the owner in the proper manner if he is again approached.

White Company Inspects Monthly

A different scheme is in use with the White Co. It employs two inspectors who are constantly on the job, traveling over the roads and looking for White trucks, after having been informed by the truck owners where their machines are apt to be at a certain hour of a certain day. Thus, once a month, every White truck in the New York territory is looked over by inspectors according to similar rules as those used by the International and Packard companies. The inspector makes his road notes on a pad of plain paper and transfers them after having returned to the service department to two sheets, Fig. 4. This blank is made in duplicate, being 8.5 and 13.5 inches; the original is printed on blue paper and the copy on yellow; one copy is kept by the inspector and the other in the file of the service department, after Fig. 5 has been filled out. This latter blank is a letter form, 8.5 by 11 inches, and printed with dark red type, the original on white paper and the office copy on orange. The letter form provides space for stating the results of the inspection, the work done by the inspector and suggested repair work. The superintendent of the service department signs the report of the inspector.

The New York representative of the Pierce-Arrow Motor Car Co. sends its inspectors after the trucks as often as it considers it necessary to do so. Repairs are made, the driver is instructed as in other systems, and after the inspection is over the results are compiled on a card of the same size as Fig. 2 and practically the same design. This card enumerates most of the parts of the car, and in spaces provided for the purpose the items are marked: S, A, O or Z; S means that the inspector, having looked over the part, found it in satisfactory condition; A denotes that the part required the attention of the inspector and received it, being in good order when he left the truck; O shows that the part is in need of attention and that the driver promised to take care of the situation, so that the matter is

¶ By the work of inspectors who, at regular intervals, examine the trucks sold by a company, the truck owner is aided and the business of the company is increased. It is necessary that this work be carried out conscientiously and records be exact and complete, to make the idea of free truck inspection a success from every point of view. Poor work is worse than none.



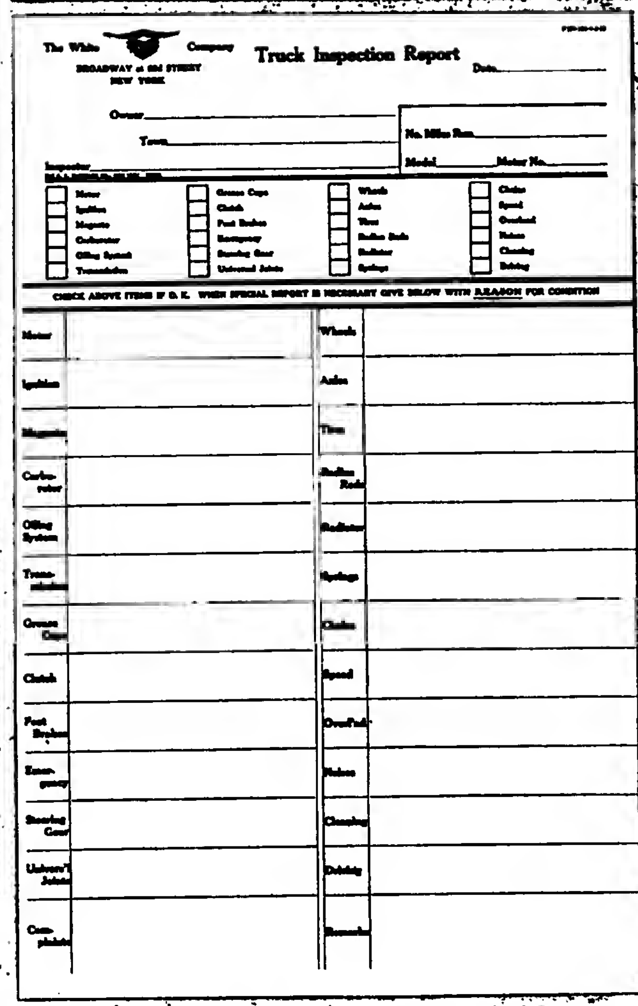


Fig. 3—Truck inspection blank used by the Packard company's inspectors, one copy being kept at the branch, one at the New York office and one being mailed to the truck owner

Fig. 4—White company's report is made out in duplicate by inspectors

in the hands of the owner, while Z is a note to the effect that shop work is necessary to put the part in good condition. Special attention is paid to the tires and their condition, and make, mileage, date of installation and condition are noted in the instance of each of the six tires, there being dual wheels on all Pierce-Arrow trucks. The following abbreviations stand for the various tires: F. R., front right; F. L., front left; R. R. I., rear right inner; R. R. O., rear right outer; R. L. I., rear left inner; R. L. O., rear left outer. After this report has been made out and turned over to the office, the superintendent of the truck service dictates a letter to the owner informing him of the points covered under A, O and Z, and stating just what repair work is needed to put the truck in perfect shape. Of course, the inspector having made notes, if the driver of a truck does not take good care generally or in any special respect this information is also placed at the disposal of the owner. In this way the owner is enabled to eliminate unfit elements among his driving force and to keep the good workers and advance them according to their merits.

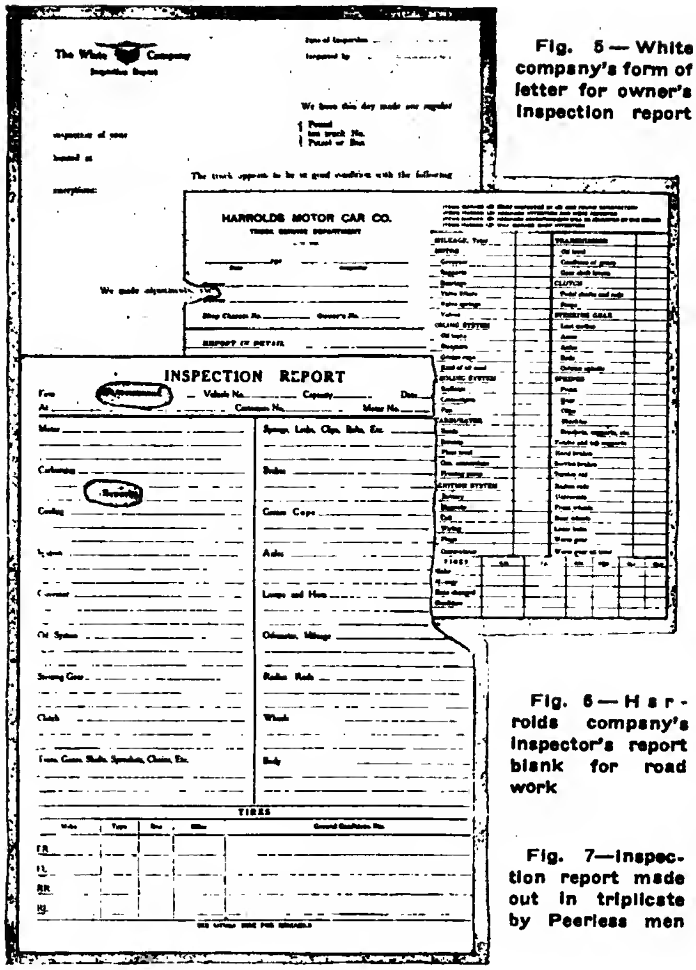

Fig. 5—White company's form of letter for owner's inspection report

Fig. 6—Harrolds company's inspector's report blank for road work

Fig. 7—Inspection report made out in triplicate by Peerless men

The Peerless Motor Car Co. inspects its trucks no less than once a month, and then the work is done on the road. The inspectors overtake the drivers on the road, having learned their route from the truck owners. The inspection work includes an examination of all essential parts, with minor repairs and adjustments being made right on the road by the drivers under the inspector's supervision. After this has been done, the inspector looking over a truck takes the latter and drives it for the next 5 miles so as to become acquainted with the trouble not developing during a stationary examination. The troubles and noises are then eliminated as far as possible, and the inspector makes his notes. After returning to the company's service department he makes out a triplicate report on the blank, Fig. 7. This form is printed black on yellow paper, 8.5 by 11 inches, and the duplicate and triplicate are made by means of carbons. The first copy goes to the owner of the truck, the second to the office of the service department and the third to Cleveland, so as to keep the factory posted on the history of each truck. As in the case of the Harrolds company, special attention is paid to each individual tire, and whatever remarks cannot find space on the front page of the form, under the various headings, are noted on the reverse thus affording ample space for details.

An inspector can make from 100 to 120 inspections per month, so that the cost of each individual examination is relatively small and really trifling when compared with the saving effected by calling attention of the truck owners to detrimental conditions.

Harking Back a Decade

FROM THE AUTOMOBILE of March 7, 1903:

The attendance at the Crystal Palace in comparison to the Grand Palais was probably one-half but, withal, this was a large attendance, considering that the Grand Palais had a paid admission of over 300,000.

Each maker of course is anxious to start first because the leader always has an immense advantage over those who follow him. He has a clear road and a clear atmosphere and can travel all the way at the highest possible speed. The man behind gets the dust, and unless by a very lucky chance—through a short stoppage of the leader for example—he has very little opportunity of passing. The dust is usually so thick that he has to keep prudently in the rear. If he makes a dash, he sees nothing around him. He is in a cloud of dust and only knows that he is near the car by the small stones which tingle his face. He knows, too, that the leader is in the middle of the road. It is of no use to sound the horn, for the man in front can't hear, and he risks his life when he tries to blindly squeeze through between the car and the roadside. No wonder the stoutest heart falters when it comes to fighting an invisible rival in this cloud of dust and stones.

It is generally accepted among contractors that a good horse on fairly good roads has a working capacity for 300 days in the year of 36 ton miles a day, and that in such work he has 5 years of effective service.

Improvements in the carbureters, mufflers and engines have brought about the present flexibility in the operation of gasoline cars, and have almost eliminated the noise which was so dear to the pioneer and so objectionable to the motophobes.

Among the transmission gears on cars exhibited at the New York show, especially those which ran in an oil bath though not belonging to the sliding-gear class, that on the Pope-Robinson cars attracted some attention, but could not be fully investigated on account of pending foreign patents.

The new Fredonia car represents the latest development of the light road car, every detail being of standard make. The wheelbase is 72 inches, the weight is 1,300 pounds, the speed ranges from 4 to 30 miles, the body is finished in black, with gold-leaf stripe and the gear is painted carmine, with black and gold stripe on it.

H. B. Larzere, a San Francisco automobile dealer, takes his prospective purchasers for a 103-mile trip, over the rough roads around San Francisco bay. One of these trips was made with but one stop, the actual running time for the trip being 4 hours 20 minutes, and so successful was the performance of the American car with which the trip was made that an immediate sale was secured.

Communications from The Manufacturer

Tests Conducted by Two Professors Show That Magnetic Speedometers Are Not Affected by Exterior Fields

CHICAGO, ILL.—Herewith are reports of two tests made on Warner and Stewart magnetic speedometers.

One of these tests recently made by Professor Carhart of the University of Michigan is very interesting and I am under the impression that it is of enough human interest to the automobile engineers about the country to merit their attention.

Report I—Pursuant to your request I have procured from stock in Los Angeles one Stewart and one Warner speedometer and have made thorough tests of both instruments relative to their susceptibility to change of readings through the agency of outside magnetic fields, such as that of an electric starting motor in a gasoline machine or the motor of an electric automobile.

The speedometers were driven through their long flexible shaft by attaching to the axle of a two-current generator; the revolutions per minute were measured by means of a sensitive frequency-meter connected to the alternating side of the generator. It was then necessary only to read simultaneously the scale of the speedometer and that of the frequency-meter. The readings of the two were nearly the same and any variation due to magnetism could be readily detected.

Excited Edison Machine Had No Effect

An old Edison bi-polar of .5-kilowatt capacity was employed to furnish an outside stray field. This was chosen because its stray field is greater than that of a machine of more recent make. Readings were taken with the distance between the center of the armature of the Edison at different distances from that of the speedometer up to within 10.5 inches. In no case could I detect any change in the ratio between the readings of the speedometer and the frequency-meter on account of the presence of the excited Edison machine. This statement applies to both Stewart and the Warner instruments.

I am not acquainted with any case in which the speedometer is mounted within 10.5 inches of the pole of a starting motor of an automobile, either gasoline or electric. I also tested the speedometers with a permanent magnet of the horseshoe type. This magnet was capable of holding by means of its armature a weight of a pound or more. The poles were applied directly to the case in various places. Not the slightest effect could be detected in the indications of the speedometers.

The conclusion is inevitable that the magnetic speedometer as made at the present time is not affected by the magnetic field of a starting motor nor by that of a magnet to any extent that can be detected by reading the scale.

The claim that the readings of magnetic speedometers are influenced by the currents or static effects of the ignition system of an automobile is a contingency too remote to deserve serious consideration or experimental disproof.—Henry S. Carhart, Professor Emeritus of Physics, University of Michigan.

Report II—The effect of external magnetic fields upon magnetic speedometers.

1—Horseshoe magnet near the speedometer.

A Stewart instrument with split ring magnet and field ring mounted upon the testing apparatus and operated at known speeds, was exposed to the influence of a permanent horseshoe magnet capable of lifting 4 pounds. This magnet brought as close as the casing of the instrument would permit, produced no appreciable effect upon the readings.

2—An electromagnet capable of lifting 15 pounds on one of its poles brought into like close proximity to the split ring magnetic speedometer on the testing apparatus produced no appreciable effect upon the readings.

A Stewart speedometer with closed ring magnet without field ring similarly exposed to the horseshoe magnet and to the electromagnet showed no appreciable change in its readings.

3—The effect of strong electric current around the speedometer.

A coil of thick wire was placed around the steel case of a speedometer and a heavy current from a storage battery was passed through it. The steel case of the instrument became sufficiently magnetized to lift 1 1-2 pounds. Switching this current off and on, while the speedometer was operated at known speeds on the testing apparatus, produced no appreciable effect upon the readings.

The strength of the magnetic fields passing through the speedometer due to the external magnets and the current employed in these tests greatly exceeded the strength of the fields which would be caused to pass through the speedometer by a generator or a motor mounted on an automobile at the distance from the speedometer at which such generators or motors are found in actual construction.

4—Effect of high-tension current passing through the speedometer.

A Stewart speedometer, Type B, and a Warner instrument were each in turn introduced into the secondary or high-tension circuit of an induction coil giving an intense spark 1 inch long so that the high tension current passed through the instrument while running at known speeds on the testing apparatus. Switching the spark on and off produced no change whatever in the reading of the instrument.

The foregoing test was repeated with the case of an instrument removed, so that the spark passed directly through the magnet and the aluminum cup of the speedometer, but no effect was produced upon the reading.

In these tests the disturbing influences employed greatly exceeded any disturbing influences which could be produced by stray currents or magnetic fields from a motor or a generator mounted on an automobile, even if the circuit of such motor or generator should become directly connected to the chassis or other metal parts of the vehicle.

These experiments indicate therefore, that it is impossible for a magnetic speedometer of these types to be disturbed so as to affect its readings by any influence proceeding from a motor or generator carried on the vehicle for starting or continuously operating it, or for charging a storage battery.—G. M. Wilcox, Armour Institute of Technology.

It will be obvious to you that these tests will probably upset a few stray notions, which were going around to the effect that magnetic spedometers could be affected by currents or stray waves furnished by other forces, such as close proximity to electric starters, magnetos and the like.—Berne Nadall, Stewart-Warner Speedometer Corp.

Danger in Truck Overloading

A car driving at more than a certain speed proves beyond the control of the driver when sudden and positive stopping becomes necessary. The same holds true of the overloaded truck. It should therefore be made the business of State and municipal authorities to forbid overloading of freight automobiles as they forbid travel at more than fixed speeds. This course is the more desirable, as a large percentage of truck owners overload.

Paris now arises at 14 o'clock, France having adopted the 24-hour day after the example of Italy. If America follows the lead, the A. M. and the P. M. are not hereafter to be confounded with a university degree and the postmaster, railway timetables and score cards for 24 hour races will be simplified and the "nick of time" will be promoted from the 11th to the 23d hour.

Special Process Steel Manufacture—An Incorrect Lighting Wire Diagram—Changing the Vacuum Oil Feed—Storage Battery for Ignition—Complains of Carbureter—Value of English Imports—Use of Kerosene in Motor

Difference in Special Process Steel

EDITOR THE AUTOMOBILE:—Will you kindly let me know the difference in Bessemer and Open-Hearth steel, whether they are one and same thing, only different process of manufacture, or whether different formulas?

Akron, O. W. C. MILLER.

—BESSEMER STEEL is made by blowing air through a bath of melted pig iron. The oxygen of the air first burns away the silicon, then the carbon, and before the carbon is entirely burned away, begins to burn the iron. Spiegeleisen or ferro-manganese is then added to deoxidize the metal, and to give it the amount of carbon desired in the finished steel. In the ordinary or "acid" Bessemer process the lining of the converter is a silicious material, which has no effect on phosphorus, and all the phosphorus in the pig iron remains in the steel. In the "basic" or Thomas and Gilchrist process the lining is of magnesian limestone, and limestone additions are made to the bath, so as to keep the slag basic, and the phosphorus enters the slag. By this process ores that were formerly unsuited to the manufacture of steel have been made available.

OPEN-HEARTH STEEL—Any mixture that may be used for making steel in a crucible may also be melted on the open hearth of a Siemens regenerative furnace, and may be desiliconized, and decarbonized by the action of the flame and by additions of iron ore, deoxidized by the addition of spiegeleisen or ferro-manganese, and recarbonized by the same additions, or by pig iron. In the most common form of the process pig iron and scrap steel are melted together on the hearth, and after the manganese has been added to the bath it is tapped into the ladle. In the Talbot process a large bath of melted material is kept in the furnace, melted pig iron, taken from a blast furnace, is added to it, and iron ore is added which contributes its iron to the melted metal while its oxygen decarbonizes the pig iron. When the decarbonization has proceeded far enough, ferro-manganese is added to destroy iron oxide, and a portion of the metal is tapped out, leaving the remainder to receive another charge of pig iron, and thus the process is continued indefinitely. In the Duplex Process melted cast iron is desiliconized in a Bessemer converter, and then run into an open hearth, where the steel making operation is finished.

The open-hearth process, like the Bessemer, may be either acid or basic, according to the character of the lining. The basic process is a dephosphorizing one, and is the one most available, as it can use pig irons either low or high in phosphorus.

Save Gas with One Headlight

Editor THE AUTOMOBILE:—I have recently had some long stretches of touring to do and in order to get to sleeping quarters through a sparsely populated country it has been necessary to do considerable night riding. I have found that I have been able to get along with one headlight and in this way have had my tank last twice as long as with the two lamps lit. At the same time I get a better light than if I had both lights lit dimly.

Westport, N. Y. JOE HUNTINGTON.

Wiring of Lighting System

Editor THE AUTOMOBILE:—Will you please tell me if the diagram for wiring an automobile for side lamps and tail lamps and horn is correct as I wish to wire our car over, the present wiring being inconvenient owing to a change in the location of the battery from rear to front?

Prairie du Chien, Wis. ARTHUR KNOERZER.

—This diagram is incorrect because you would be unable to blow your horn unless the side or tail light was lit. The horn circuit should not run through any of the lamp filaments. It is also improper to place the tail light in series with the horn.

Advantages of Worm Drive

Editor THE AUTOMOBILE:—We have had some discussions as to the drag produced in a worm-drive rear axle over the old gear and pinion and as yet have failed to notice any discussion concerning the subject in the columns of your paper. Kindly advise us as to the advantage of worm-drive over the former gear drive and why it seems to be gaining so much favor, especially with truck manufacturers.

Ashland, O. ASHLAND AUTO GARAGE.

—The advantages of the worm-drive are silence and long life, according to the claim of those who are putting it on the market. The drive is efficient and does not become noisy with wear. Wherever there is considerable reduction between the driving and the driven member a worm is very advantageous because it is not necessary to introduce members of widely different sizes as is the case in the reduction through bevel gears. Material must be carefully selected in a worm drive so that there will be no undue amount of wear. In worm drives the wearing parts are steel against bronze. For the more expensive pleasure cars there is a possibility of its extended intro-

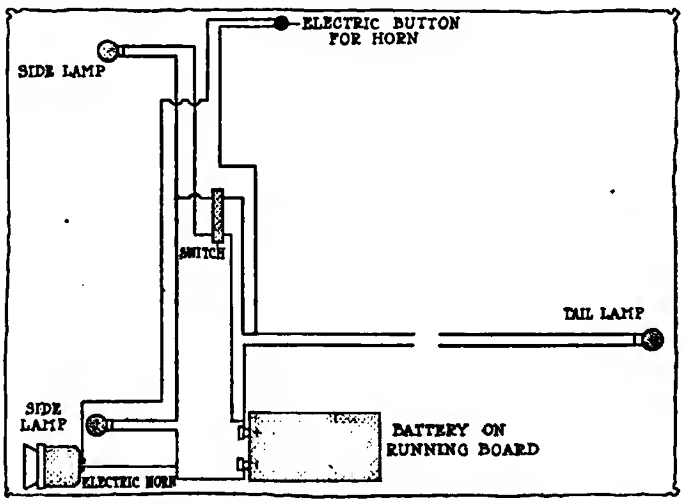

Fig. 1—Incorrect wiring diagram submitted by reader. Horn cannot be blown when lights are not lit

duction into this country because of the silence of its action. It is altogether free from the hum which is often perceptible in bevel gear drive. The makers of bevel gears, however, state that where back lash is eliminated and there is no lost motion throughout the axle the silence of the bevel gear axle is as great as that of the worm-driven device.

Use of Gum Camphor Bad

Editor THE AUTOMOBILE:—Will you kindly advise us if crystalized or gum camphor used in large quantities would have any bad effects on the internal parts of a motor, the above being mixed with gasoline?

The idea is to put more life in the present low grade of fuel, also from what proportion are the best results obtained and what would be the effects of an over dose?

Is there any other solution that you know of that would give better results than the camphor, figuring on same not being too expensive?

Philadelphia, Pa. WILLIAM ELLERSHAW.

—It is generally a bad idea to attempt to doctor a fuel by the addition of some extraneous material. In former years racing cars and motorboats were very prone to use doped gasoline while in contests in the hope of securing better results than from the ordinary fuel. Picric acid was very often used for this purpose, but, owing to the fact that it damaged the cylinder walls, was gradually abandoned until now its use is very rare. Gum camphor has never been used to any extent for this purpose and nothing like definite information can be obtained regarding its successful use in gasoline. Camphor is not readily dissolved and the use of large quantities looks from that standpoint to be bad. As stated, it is safer to use an unmixed fuel.

Hard to Start Cold Motor

Editor THE AUTOMOBILE:—I have a Studebaker Flanders 20 1912 model equipped with their own carbureter, but it starts very poorly in cold weather and I don't think it is as economical as some others. Should I be troubled in this way?

New Haven, Conn. FRED W. STEVENS.

—The carbureter is fitted with a tickler which if pressed should flood the mixing chamber and allow you to start without trouble. If you close the air adjustment slightly you may be able to get an easier start. According to the foreman of the repair department of the Studebaker Corporation in New York City, there are practically no complaints on this carbureter and even in the winter season 15 miles to the gallon is secured regularly. In the summer season on a warm day you will be able to better this and secure in the neighborhood of 18 or 20 miles to the gallon of gasoline.

Changing Vacuum Oil Feed

Editor THE AUTOMOBILE:—I have an E. M. F. with the vacuum system of oiling, which has never worked properly, and I wish to put in an oiling system with a sight feed, and ask suggestions from you.

My idea is to put a double glass adjustable sight feed upon the dash, and use the present 1-gallon oil reservoir on the side of the crankcase.

1—To use a hand pump by the seat to force the oil up to the sight feed, or would you advise taking the pressure from the exhaust pipe, and use a one-way valve on the pipe leading to the reservoir?

2—Would you advise using the present holes at the bottom of the crankcase for the intake of the oil to the crankcase, or would it be better to run the .125-inch pipes to the oil cups on the front and rear main bearings and the overflow running to the bottom of the crankcase for splash?

3—In using the hand pump it would be necessary to have a shut-off cock on the pipe line between the reservoir and feed so as to stop drip when not in use. By using the exhaust for pressure I see several faults. The pressure might get too great, and the carbon from exhaust gases would get into the oil and might clog the feeds as well as fouling the oil. Although it might be convenient, would you deem it necessary to have a pressure gauge from the reservoir in connection with the hand pump system?

4—If the oil leads or pipes to the main bearings be used would not the right side be the better side for the leads to enter the crankcase and would there be danger of the pipes not remaining in place inside at the front and rear bearing cups?

5—Although I have put new bolts in my springs, there is still considerable play. Is there any other way to take this up other than having the spring-eyes bored larger and fitting brass bushings?

6—In grinding valves is a polished or dull face considered the better? Should the valve face be put back absolutely clean and dry or with a little kerosene or oil on it?

7—One year ago I put Firestone demountable rims on my car and 34 by 4-inch tires in place of 32 by 3.5 and found that I now have very little clearance under the fenders. Using 32 by 3.5-inch tires four tires, by shifting around, never lasted more than 2,500 to 3,000 miles, but by using the 4-inch four new non-skid tires ran me over 7,000 miles. I give this to show the value of oversize tires.

New York City, N. Y. HERBERT V. W. CARD.

—The E. M. F. vacuum feed should be successful provided that the valve in the filling hole is tight and the leads to the crankcase are clean. The system which you intend to place upon your car will be very apt to be more troublesome than the vacuum feed unless the work of installing it is very carefully done. It will not be an automatic system, but hence will require attention from time to time. Referring to Fig. 2, which shows the system as it stands now, and as you suggest, the following advice may be readily followed:

1—If you intend to use this system it would be preferable to use the hand pump rather than the pressure from the exhaust pipe. Exhaust pipe pressure is unreliable as you are always exposed to the risk of leaky check valves.

2—It would be better to run the new leads to the oil cups on the front and rear main bearings and allow the overflow to run down into the splash troughs so that you can always be sure that the main bearings will have a sufficient supply of lubricant.

3—The sight feed would have to act in the nature of a gravity feed tank. The hand pump could be used to bring the oil up into this glass tank from which it would feed to the crankcase by gravity through adjustable holes which would permit the flow of oil to be more or less rapid as desired by the driver. If the device for controlling the speed of the oil flow from the glass tank could be inter-connected with the throttle, so that the wider the throttle was opened the more rapidly the oil flowed into the crankcase, the desired result would be obtained, that is, that more oil would be supplied when the engine was laboring than when running under a light load. In this way the system could be made automatic except in so far as it would be neces-

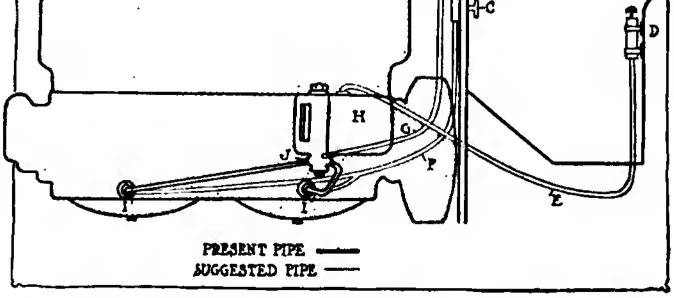

Fig. 2—Suggested oiling system to replace vacuum feed on E.M.F. car. Hand-pump located in reach of driver

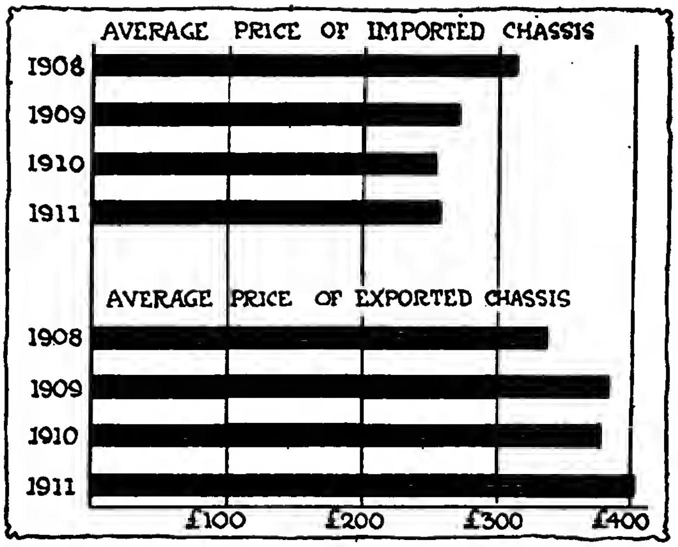

Fig. 3—Chart showing average value of English imports and exports from 1908 to 1911

sary to use the hand pump in bringing the oil from the reservoir to the glass tank on the dash.

4—It would not make any difference what side was used for the entrance of the oil leads to the crankcase. The methods of fastening the leads in place should be so thorough that there will be no danger of not remaining at the bearing cups.

5—The best method is to have the spring eyes bored larger and the brass bushings fitted. The bushings should be secured in place by a set screw so that all wear will be upon the bushing and that they may be removed readily when worn.

6—The face of the ground valve should have a polished appearance and should be absolutely clean except for a quick wipe with an oily cloth to prevent rusting of the newly ground surface.

7—Why not raise your fenders slightly by changing their curvature?

Prefers Four to Six Cylinders

Editor The Automobile:—In regards to the four-cylinder motor, much can be accomplished. The four is lighter than the six if not made too large and weight should be cut down. Some cars are very heavy and use a large per cent. of the motor's power to propel its own weight. The hood on some big sixes is 60 per cent. as long as the body and takes up too much room, leaving a limited space for the latter. A car of high class should be capable of carrying its load from 2 to 70 miles per hour on high gear without noise. A four-cylinder Knight motor 4.5 inch bore, 7 inch stroke as I described in my last letter would develop with steel pistons 120 horsepower and run perfectly smooth and noiselessly. When perfected the body should be made of aluminum with adjustable seats. These would be greatly appreciated on long tours. Light-weight cars would not get mired so often on soft country roads and would be much easier to operate.

Alton, N. H. H. P. Tibbetts.

Valve-In-Head Efficiency

Editor The Automobile:—Will you kindly tell us why a valve in the head motor produces more power than an L-head or T motor of the same bore and stroke?

St. Charles, Mo. St. Charles Garage.

—The reason that the valve-in-the-head motor has advantages over other types is because the combustion space can be more advantageously shaped. If it were possible to make the combustion space a perfect hemisphere the best possible results would be obtained. As it is, however, we are compelled to depart from this form of combustion chamber for practical reasons, among which is the location of the valve. In an L-head motor the designer is compelled to use a port to one side of the combustion space which departs quite radically from the hemispheric form desired, but which, however, renders possible the use of a very simple valve action and avoids the use of long push-rods and parts which tend to become noisy after use. Valve-in-the-head manufacturers who succeed in getting a good valve action which will remain permanently sound and who are able in this manner to take advantage of the nearer approach to the ideal combustion space have secured a very desirable feature from the internal-combustion motor. The T-head motor, of course, has the same problems to face as the L-head. That the power loss is not very serious may be illustrated by the fact that the stock car which won the championship of America during the 1911 racing season was of the T-head type. The use of the valve-in-the-head or other type of motor has been argued pro and con for a number of years and the advantages and disadvantages of both types have been given as outlined above. There are, however, at present many successful manufacturers of both types. This alone will signify that both types have their advantages and disadvantages and that the latter are not serious enough to militate against the successful manufacture and operation of either type.

Using Storage Battery Ignition

Editor The Automobile:—I have a Cadillac 30, 1911, on which I am about to install an electric lighting outfit, consisting of dynamo and storage battery of the 6-volt type. Can I connect the Delco wires to storage battery and discard dry cells?

Will this system work O. K. without harm to the controlling relay?

Perry, N. Y. Delco.

—The storage battery may be used for the ignition system without harm, provided it is of sufficient capacity. You will need an 80 ampere-hour 6-volt battery. What you are doing is simply adding the remaining units of the lighting system. On your car you have merely the Delco ignition. There will be no difficulty with the control, relay or any other parts if you install the remaining units in the same manner that any of the generator battery sets are fitted. It must be remembered that you need a controlling device which will prevent the voltage of the generator from mounting too high at great engine speed and which will prevent the battery from discharging back through the generator when the voltage of the latter becomes less than that of the battery. These systems may be bought complete and installed in many different ways. The most satisfactory manner, however, where the generator is not already fitted to the car is to drive this unit from the pump or magneto shaft of the motor. It can be done by silent chain without a large expense and the resulting installation will be noiseless and permanent.

Sparks Appear in Safety Gap

Editor The Automobile:—Would a poor mixture cause sparks to appear in the safety gap of a magneto, or is there only one cause for it—the secondary current having no outlet?

2—Is it your opinion that the use of a spark-plug air pump is harmful to the motor in any way?

New York City. A Reader.

—1—No, not this alone, although a poor mixture might bring a condition about that would constitute a secondary cause of a spark in the safety gap. The theory of the spark gap is that as long as a circuit is provided through the cables and spark-plugs, the current will not jump the wide gap on the magneto, but if the spark plug circuit be broken, and the engine continues to turn the magneto, generating a high-tension current, it is allowed to escape across the safety spark gap, and thus prevent the burning of the windings. A rich mixture might so carbonize an engine that pre-ignition would result. If this pre-ignition occurred at the time that the spark was about to jump the spark-plug, the increased pressure might constitute such a resistance to the electrical passage that it would jump the safety gap instead. Again, an abnormally rich mixture might cause the motor to overheat to such an extent that the sparking points would become warped, and the gap increased so that the current would find a more ready passage across the magneto spark gap than that of the spark-plug. These conditions would be more likely to obtain in a single-cylinder motor than a multiple-cylinder type, as it is highly improbable that a given mixture would produce the same results in say, four different cylinders with four separate plugs.

2—The types that have come to the attention of THE AUTOMOBILE have not been of such nature as to be conducive of harm to an engine, except the slight wear due to running with one cylinder missing, which, however, is almost negligible.

Wants Starter for Ford

Editor THE AUTOMOBILE:—I own a Ford car, which I stop and start over fifty times daily. I think a self-starter would save its price in time saved over cranking by hand. I wish you would suggest to me the starter I need. The car starts easily, so I had in mind a spring starter as the easiest and cheapest to operate. Do they give satisfaction? Do they easily get out of order? Do they automatically wind themselves after starting the engine?

Needham Heights, Mass. HARLEY E. CRISP.

—A spring starter would give you satisfaction. With a light car such as the Ford they should not get out of order readily. The general operation of these starters is as follows:

A button or lever is operated from the driver's seat. This automatically releases a coil spring which actuates through some mechanical means the crankshaft of the motor. When the cylinder explodes, the operating device is disengaged from the crankshaft. The next few revolutions of the motor rewind the spring and it is then ready for another start. The objectionable feature of the spring starter is not up to the starter itself but the operator. Many people are in the habit of absent-mindedly attempting to crank the motor without first switching on the spark. When this is done with a spring cranking machine it means that in a few moments the spring is unwound and the operator has the irksome task of rewinding it. On your Ford car a spring starter should be a success.

Cars Imported Into England

Editor THE AUTOMOBILE:—Kindly tell me what is the cost of cars imported into England. Are they of the high-priced or low-priced class? I should also like to know if possible the average value of the chassis exported from England. I should particularly like to know how the exported values compare with the imported values for each chassis.

New York City. K. SMITH.

—The chassis of the chart, shown in Fig. 3, will give the average values for the last 4 years in a better way than would figures. It will be noted that the average price of the imported chassis dropped quickly between 1908 and 1910, but that in 1911 it was about the same as 1910. The average value of the exported chassis has been climbing steadily.

Use of Kerosene in Motor

Editor THE AUTOMOBILE:—For the last 3 years I have been giving the subject of kerosene carburetion considerable thought and time studying the conditions under which kerosene operates best. I have developed seven distinct kerosene systems and subjected each to dynamometer tests under various loads and at various compressions, thereby obtaining graphical curves from each system under all conditions. As a result of these tests I have developed the Aultman & Taylor kerosene tractor, which can operate on kerosene quite as well as on gasoline, when once the surfaces of the cylinder walls are given an initial warming, which is done by priming with gasoline, having received quite satisfactory efficiency from the engine in the tests.

I am able to install on engines of good design a system for the use of either kerosene or gasoline simply by throwing a three-way valve one way or the other. I find that an engine must have a scientifically correct manifold in order to distribute the lighter and heavier oils (vaporized and unvaporized kerosene) equally to all cylinders and as a considerable percentage of automobile motor designers today pay little regard to this most necessary virtue it is necessary to take each particular type of motor and so change the design as to take into account these necessary features.

I find that any four-cycle gas engine when properly equipped will operate quite as well on kerosene as when on gasoline. The only trouble whatever is getting the engine warmed up, which difficulty has been surmounted by arranging to start on gasoline and after 1 minute turning on the kerosene. The great trouble heretofore has been due to the fact that kerosene leaves an excess of carbon deposit both in the combustion chamber and under the rings, which causes the rings to stick and forces them harshly against the cylinder walls. This trouble has been entirely avoided by water injection. A test which was conducted in the laboratory of the Aultman & Taylor Machinery Company by the writer, extending a solid week, at various loads, averaging 55 horsepower throughout the week, showed how complete was the combustion and how thorough the scavenging. At no time was it necessary to even clean the spark-plugs, and upon the completion of the test the heads were removed, the pistons taken out, the valves inspected, and there were no signs whatever of any bad effects from the use of kerosene. In fact, the combustion chambers were bright and the spark-plug porcelains were of a brownish white color, showing only the effects of the intense heat.

I predict that within 2 years all stationary engines, heavy-duty tractors and motor trucks will use this cheap 44-degree Beaumé coal oil exclusively, while the pleasure vehicles will use lighter kerosene of about 50-degree Beaumé. Gasoline costs 17 cents wholesale in Mansfield, while 44-degree coal oil costs 8 cents and 50-degree kerosene costs 9 cents. Each contains approximately the same British thermal units per pound, and as a gallon of 44-degree kerosene contains 6.5 pounds, against 5.8 pounds for gasoline, it can be seen that gallon for gallon kerosene contains 6.5 to 5.8 more heat energy. But, owing to the peculiarities of kerosene, an engine is not quite as efficient thermally on kerosene as on gasoline, owing, no doubt, to the fact that small globules of kerosene get into the cylinders without being vaporized and supplied with the necessary oxygen for combustion.

Mansfield, O. E. FIELD WHITE.

—In response to a request from the Editor of this department Mr. White has furnished the curve shown in Fig. 4 which gives the comparative efficiency of kerosene of 44 Beaumé test and of gasoline of 64 test. These were taken to determine the least possible fuel consumption at each load. It will be seen that a very low consumption was obtained by running at about .80 load and throwing the throttle wide open, then reducing the speed with the needle valve to give a very lean mixture. The horsepower was boosted by giving a rich mixture, thus causing the curve to ascend to the maximum horsepower.

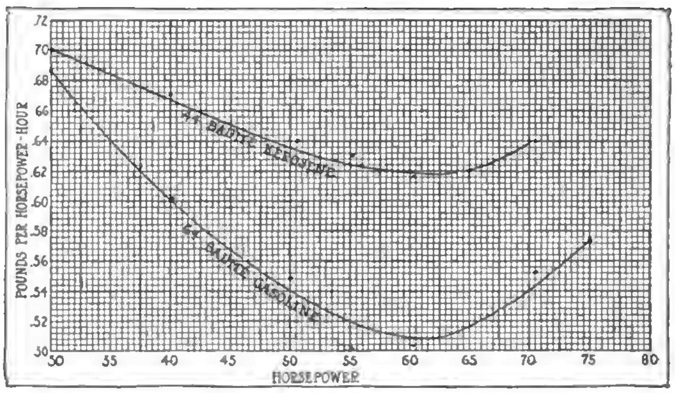

Fig. 4—Comparative consumption per horsepower of kerosene and gasoline in Aultman & Taylor tractor

Showing the way the top folds into the body on the Turcat-Mery torpedo and baggage and spare wheel compartments

Turcat-Mery Torpedo Has Unusual Baggage Facilities

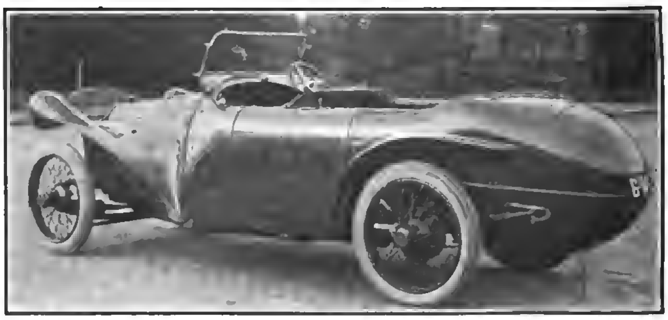
LONDON, ENG.—Many of the problems of luggage carrying have been solved in a torpedo body built by the Turcat-Mery Company on one of its 30-horsepower chassis. As can be seen from the illustrations, the car has really a double width, the side panels being swept out so as to incase the running boards, leaving a locker space all round between the seats and the outer paneling. On the right-hand side of the car there is a particularly big space for personal baggage, for as no entrance has to be provided to the driver's seat from the right, the running board is used for carrying three or four large size grips, which are put in position after removing a side panel. On the opposite side the same amount of space is not available, owing to a door having to be provided here. There is, however, on the running boards a series of cabinets placed between the two doors and having sufficient capacity for all the mechanical spares likely to be required for a long journey.

When the two rear doors are shut, the running boards within them become available for baggage, which is fully protected from the weather. In the egg-shaped tail there is room for a couple of spare wheels carried upright, and, of course, fully protected. To the rear of the wheels, in the extreme end of the tail, there is space for a large number of light articles.

The top lets down into the rear compartment. There is nothing very distinctive in the top itself, but it is hinged in such a way that when lowered it is between the two shells forming the body. The front hoops have a polished beading which completely covers up the space provided for entering the top between the two shells. Although completely out of sight when lowered, the time required to lower this top is no greater than with the ordinary type of external top. In accordance with modern practice, there are no straps for the top, the attachment being made direct to the windscreen. In addition to having great luggage capacity this car has an unusually clean underpan. At the midships section the pan is carried full out to the extremities of the running boards, and not to the frame members, as is usual. At the front end it is run up to join the lower ends of the fenders. Despite its greater width, the car offers considerably less resistance than an ordinary type of touring car with external fittings.

An idea of the external appearance of the car may be gained from the accompanying illustration showing the machine with compartments all closed in readiness for a trip.

The illustration at the top of the page shows the manner in which this novel body construction is adapted for carrying a great many things concealed from view which are generally fitted to the outside of a car in such a way that the effect of the body design is practically destroyed. The upper pictures show the way the top folds into the body while the lower illustrations show the method of carrying baggage and spare wire wheels.



Turcat-Mery torpedo, showing clean-cut lines combined with unusual baggage-carrying capacity

The Clement-Talbot on its world's record attempt, traveling at a speed of over 103 miles per hour on the Brooklands track

How the Clement-Talbot Racer Made Over 103 Miles in an Hour

LONDON, ENG., Feb. 22—The Clement-Talbot car which a week ago established a new world's record on the Brooklands track by traveling 103 miles 1470 yards in 1 hour has since that date been the center of motoring interest because of the phenomenal speed and the small power of the car.

The Clement-Talbot is a four-cylinder car, 101.5 by 140 millimeters bore and stroke. In inches these measurements are 4 by 5.51. This motor has a most enviable power curve, which is practically a straight line from 25 horsepower to 120. It generates 20 horsepower at 500 revolutions per minute, and 120 horsepower at 3,000 revolutions per minute. This is an ideal motor performance in that when the crankshaft speed is made six times as great, the horspower is increased sixfold. It also means that for all intermediate crankshaft speeds the production of horsepower is in direct proportion.

In the current issue of *The Autocar* the valve timing of the motor is given. It shows the intake valve opening 14.5 degrees after dead center and closing 30.5 degrees after bottom dead center, its period of opening being approximately 195 degrees, 360 degrees constituting an entire circle. The exhaust valve opens 46 degrees before bottom dead center and closes 9.5 degrees after top dead center. There is a period of approximately 5 degrees between the closing of the exhaust and the opening of the intake valve. The magneto was so set during the performance as to give a maximum advance of 40 degrees before the top dead center.

Percy Lambert at the wheel of the 25.6-horsepower, record-breaking Clement-Talbot waiting the signal to start

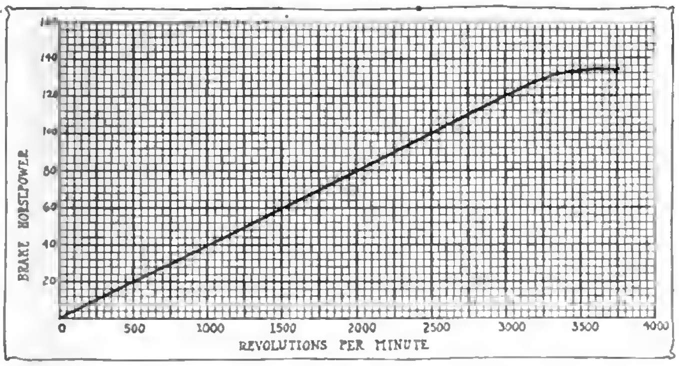
The Clement-Talbot motor was designed by George W. A. Brown, a comparatively unknown internal-combustion engineer. While not identified publicly or conspicuously, he nevertheless has been a close student of motoring and one who has gained much of his information from practical experience with cars on the road. He is looked upon as one of the best authorities on tuning up an automobile in the English industry.

Looking to the future, the next great performance of this character will be 120 miles in the hour. But it is not probable that this will live as long in the memory of the public as the present record. A remarkable feature of the achievement is the small size of the engine. A year ago the best speed for a 4-inch engine was 87.99 for the flying half mile. Interest centered in the way the Talbot car came off the banking each time in its attempt to cover the century in the hour and in the elaborate and successful signaling devices.

Large panels of three-ply wood, about 3 by 3.5 feet, were provided having on one side a red number and a white one on the other. If the car had covered 97 miles an hour in any lap the driver would see a red 7 when next he passed the stand, and if he made 103 he saw a black 3. The red numbers were not needed at all.

There was also a large dial marked out for the run. Every time a lap was covered a hand on the dial was advanced a section so that when the race was over the hand had completed its circuit. Such provisions as these are of great help to the driver in endeavoring to better a world's record.

The Clement-Talbot car, of 25.6 horsepower, has an engine capacity of only 4,531 cubic centimeters, is owned by the Earl



Brake horsepower curve of the record-breaking Talbot motor

of Shrewsbury and was driven by Percy Lambert. The car really covered over the distance of 103 miles 1,470 yards, the distance recorded, for the car kept to the outside of the timing line, which at least would mean another 70 yards per lap, so that actually the car attained the wonderful speed of 105 miles an hour, which speaks well of the advance in the design and construction of motor vehicles.

At the start there was an absence of wind, but in its stead there was a dense fog overhanging the track, rendering it impossible for the driver to see more than a quarter of a mile or so in front of him, while he stated that for five laps he could hardly see at all. This fog kept the tires cool, and at the conclusion of the run the tires were measured and it was found that the total reduction of the center rib on the off front tire amounted to 1 millimeter; the near front, 2 millimeters; the off back, 1.1 millimeters, and the near back, 1.4 millimeters. No preliminary run was made, and the first lap was covered at the rate of 87.38 miles per hour from the standing start, which is much slower than the first lap of last week's attempt. However, as the motor warmed to its work and the carbureter began to settle to its labors the speed increased to 103.76 miles per hour for the second lap. The car thus succeeded in establishing class records, and at 50 miles began to put up fresh figures for world's records. The 50 miles were covered in 29:2.5, equal to 103.3 miles per hour, and the 100 miles were covered in 57:49.38. Continuing to travel at this pace for 60 minutes it was found that the actual distance covered in the hour was 103 miles 1,470 yards. Last week, it will be remembered, that it was stated in these columns that the car would cover the 100 miles in about 58 minutes, and it will be seen from the above that that statement is correct within 11 seconds. The car increased in speed as the distance lengthened and at the conclusion seemed to be fit for a further gruelling. The previous figures for the world's record of 100 miles was 1:1:27, compared to 57:49.38.

Benz Wins at San Diego

Carlson Covers 5.9-Mile San Diego-Point Loma Course in 200:9:2—Buick Wins Small Car Race—Two Wrecks

SAN DIEGO, CAL., March 1—(*Special Telegram*)—In the race over the San Diego-Point Loma course today, a Benz, driven by Carlson, finished in 200:9.20 as the winner in the large car class, while the honors in the small car division went to Campbell in a Buick. The course of the road race is 5.9 miles in length and 34 laps were run in both the large and small car division, making the total distance 200.6 miles. In the small car division, Campbell's car was the only one which finished, while in the other division a Stntz, driven by Cooper, finished second.

The thrill of the day came when Jeannette's Benz, in the big car race, was wrecked during the fourth lap as the car threw two tires; the driver and mechanician being injured, but not fatally. A Mercedes driven by Compton was also wrecked due to tire mishap.

In the small car race, Buick (Roberts), Regal (Brown) and Studebaker (Shannon) dropped out in the fourteenth, tenth and second lap, respectively. A Buick for which Nikrent had been scheduled as the driver, did not start. In the large car race, a Buick, driven by Alexander, was flagged third when completing the sixteenth lap. A Stutz (Westburn) dropped out during the twenty-first lap.

Indiana-Pacific Starts July 1

INDIANAPOLIS, IND., March 3—It is expected that the Indiana tour to the Pacific Coast, which will start from this city on July 1 and which will take 17 days until the tourists reach Los Angeles, will be the great touring event of the coming season.

By leaving Indianapolis on July 1 it makes the Sunday stops fall consecutively in Kansas City, Denver, Salt Lake City and San Francisco. This also gives the tour great prominence on the day of leaving, and on July 4 in running from St. Louis to Jefferson City it will be the greatest event of the day.

The route has not as yet been definitely decided. It will take the tourists from Indianapolis to Kansas City via Springfield, Ill., St. Louis and Jefferson City. From Kansas City to Denver there is a choice of two routes, one by way of Omaha, the other straight across. From Denver there is also choice of two routes to Salt Lake City—the Midland trail by way of Colorado Springs and Grand Junction, and the Overland trail, via Cheyenne and Laramie. From Salt Lake City the tour will go to Frisco, thence down the coast to Los Angeles.

On seventeen nights the tourists will camp and arrangements for sleeping, lighting, eating, guarding and sanitation are being made. The sites will be selected by the pilot, who will go ahead of the tour each day and who is well able to select suitable locations. The average mileage will be from 125 to 150 miles per day.

Three passenger cars or less, forming a team, may be entered by any company for $100. The same applies to trucks. A company entering both the pleasure car and truck division will be charged $150. Indiana accessory makers may enter three cars or less for $100, and, if any car of the make entered is already on the list, only $50 will be the fee.

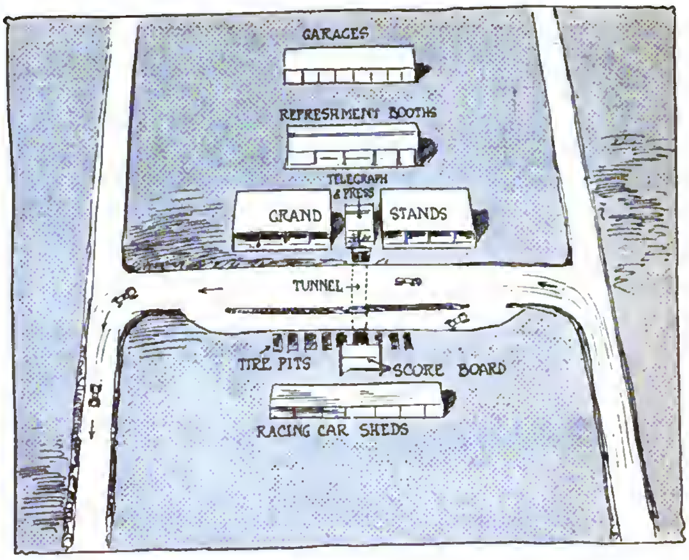
RACINE, WIS., March 5—The automobile department of the J. I. Case Co. is constructing two new racing cars of 450 cubic inches piston displacement, especially for the 500-mile race to be held at Indianapolis, May 30. Two small cars are also in the course of construction as well as a big free-for-all machine of unlimited piston displacement.

Preparing for Grand Prix

Cars Will Race Over a Distance of 57 Miles—Repair Track for Cars Making for the Pits

PARIS, Feb. 22—An unusually attractive scheme has been adopted for the arrangement of the grandstands and the tire pits at the next French Grand Prix race. The two main legs of the course, being almost parallel for nearly a mile at the Amiens end, and only 130 yards apart, will be united by a special cross road with a cement surface and a slight amount of banking. The main roads have a width of 16 feet; the cross road measures 26 feet at each end and 36 feet along the center portion. All the land between the two main roads has been purchased by the Racing Board of the French club; thus it is intended to build a permanent cross road and erect grandstands and offices of an elaborate nature. On the outside of the cross road will be the two main grandstands with the Press stand and telegraph office in a central position between the two. Behind these buildings will be the dining hall and refreshment booth, and further to the rear the private and public garages. On the opposite side of the cross road, and immediately in front of the grandstands, will be the line of tire pits, with the scoreboard behind them and further in the rear a set of boxes in which the cars will be kept under guard after being filled up with the necessary amount of gasoline for the race. In front of the line of pits there will be a special track onto which the cars can pull for repairs, thus leaving the full 36 feet road available for cars going by at speed. The earth dug out of the pits will be carried across the road and dumped on the outside of the cross road, thus forming a safety zone into which any car can run without danger to the public if it should get out of control. It has not been possible to make a very high banking safe for the highest speeds, but it is calculated that cars can take the bends at 50 miles an hour without any danger. The view from the grandstands will be directly onto the pits and the whole of the cross road, and also a clear view 700 yards in length on the two main roads approaching and leaving the grandstands. The grandstands being on the outside of the course can be reached at any time while the race is in progress, and being only 3 miles from Amiens and half a mile from a trolley car terminus, immense crowds can be handled with ease. There will be a tunnel under the cross road opposite the grandstands and a series of foot bridges at various other points will give access to the inside of the circuit while the race is on.

Careful measurement shows that the distance round the course is exactly 19 miles. It is probable that the cars will have to cover thirty rounds, giving a total distance of 570 miles. On the day following the big car race there will be a motorcycle race in the morning and a cycle car and side car race in the afternoon. These machines will use a shortened course with the same cross road, grandstands and tire pits, the distance round being 10.8 miles. The motorcycles will cover twenty rounds, or 217 miles, and the three and four-wheel machines fifteen rounds or 158 miles. The number of entries is limited to seventy for each race; it is expected that the limit will be reached.



Cross-road and grandstand scheme for French Grand Prix

Peugeot and Sunbeam Preparing

PARIS, Feb. 22—Peugeot and Sunbeam having decided to run in the 500-mile race at Indianapolis on Decoration Day, the preparation of the machines is being hurried forward so as to leave nothing to chance. The six-cylinder Sunbeam has been stripped of its Brooklands racing garb and fitted with two seats side by side and a big gasoline tank in the rear. Louis Coatalen, the designer of the car, took the racer to Brooklands this week and had it tried out by Crossmann. Despite unfavorable conditions, the Sunbeam showed a speed of 94 miles an hour. After slight changes it will again be taken to Brooklands track and tried out by Albert Guyot, who is scheduled to drive the car in the American classic. It is the intention of Guyot to leave France with the racing car early in May so as to have sufficient practice on the Indianapolis Speedway before starting in the race.

At the Peugeot racing department the big four-cylinder racers are being modified under the direction of Georges Boillot, the head of the team. At present these cars have a bore and stroke of 110 by 200 millimeters, or 4.3 by 7.8 inches, which gives a cylinder area of slightly more than the 450 cubic inches allowed under the racing rules. It has therefore been decided to cast another set of cylinders with a slightly smaller bore to fit the limit exactly. No other features of the car will be changed. It has been definitely decided that Zuccarelli and Jules Goux shall be in charge of the two Peugeot racers. All three Frenchmen are making their first visit to America.

The driver of a taxicab within the Metropolitan District of London cannot be compelled to drive for more than 6 miles, and if hired by time cannot be made to drive for more than one hour.

The Emery in Road Races

DOES a well-balanced properly driven high-powered racing automobile destroy road surfaces when driven at speeds of 60 miles an hour or over as is the rule in modern contests?

This question was partly answered by G. Lumet of the Automobile Club of France during the 1912 Grand Prize races over the Dieppe circuit in France, on which occasion an accurate record of the amount of travel done on the circuit during the 2 days of racing was compiled, the speed at which the cars traveled tabulated, and, at the end of the race, a careful examination made of the road conditions on the entire circuit. This examination showed that with a total of 28,267.5 miles traveled by the racing cars, of which mileage over one-half was in excess of 60 miles per hour that the road suffered very little because of the races. Mr. Lemut's report proves conclusively that **on a perfectly smooth road the speed, weight of the car and horsepower have not any destructive effect upon the road surface.**

The report establishes the fact that if a racing car is not well balanced, for example, not sufficient weight over the rear wheels, there will be a destruction of the road surface. Where the surface was broken at points on the Dieppe course where the road is straight and the speed in excess of 75 miles per hour, the breaking up was due to the skidding of the driving wheels caused from insufficient weight for adhesion to the road surface in proportion to the horsepower of the motor. This same fact has been demonstrated time and again in America and those racing drivers that have been most successful in victories have attributed not a little of their success to the careful balancing of their cars so that the car hugs the road irrespective of the speed at which it travels. For racing cars to obtain the best results the weight on the rear wheels must be such that the driving wheels cannot skid at high speed on straight-away stretches. This is necessary not only for the preservation of the roads but also for the preservation of the tires.

Mr. Lumet's report further shows that there are parts of a road-race course in which the road surface is more or less destroyed by the racing cars. One of these places is at the bottom of inclines just where the speed was changed for the up-grade. Variations in speed are shown by these examples to have a destructive effect on the surface, and for road economy not only in racing but in the touring car field there is a necessity for a gradual change of speed when shifting gears.

This report is ample proof of the necessity of car manufacturers giving more attention than ever before to the question of proper balance of the car for road use. There is not an engineer or owner but is familiar with the difference in riding in cars of different makes, some of whch adhere to the road surface better than others. Often it is the faster car that rides the smoother, holds the road surface better, and consequently is more economical on tires and less destructive to the road.

These are days when the question of road-destruction must be given serious consideration. To-day France is agitating an additional tax on motor cars, due to road destruction and at the same time she is cutting down her taxes on unimproved lands. This would appear to be a most unbusiness-like action, but the government feels such is imperative. Much of the road destruction by the automobile is directly due to the methods of French driving, namely, high speeds with poorly balanced cars, and not infrequently cars in which the weight over the rear wheels is not sufficient to prevent skidding, and consequent road and tire destruction.

Agitations are becoming more general in America for increasing the annual tax on the automobile in order to pay for roads. The manufacturer can to a considerable extent avoid this if he will give due consideration to the question of not only proportioning the weight properly over the front and rear wheels, but also if he will do his part to discourage the unnecessary speedy acceleration which has been pushed to the front so much in selling arguments during the last 2 or 3 years.

This report is one more argument for the construction of roads intended for motor traffic, instead of roads built specifically for neither horse or motor use. Roads built for motor cars will endure with rational driving so far as acceleration, speeding and braking are concerned. It is only when extreme carelessness in these matters, coupled with poorly-balanced cars, are combined that disaster follows to the modern road. It is going to be well-nigh impossible to maintain any type of road in good condition with mixed horse and motor traffic. It is the combination of the two that produces the injury.

The Principles of Scientific Management

There Must Be a Complete Mental Revolution on Part of Workman and Employer —All Labor Troubles Due to Division of Surplus

From an address delivered by Frederick W. Taylor, before the Canadian Club, Toronto, Ont.

WHAT is scientific management? It is not any efficiency device for increasing output; it is not a bonus system; it is not a cost system; is not motion study or time study; it is not unloading a lot of blanks at the goods entrance and saying, "There is your system, go ahead and use it." Most people think of it as one of these things. Scientific management cannot and does not exist until there has been a complete mental revolution on the part of the workmen and the employer, and until this great and complete mental revolution has taken place, scientific management does not exist.

Part of the cost of manufacturing is the cost of material. Another part is the cost of production of the article, and a third is the overhead expense. The difference between the sum of these three and the selling price is the surplus. All labor troubles are due to the division of this surplus. The workmen desire as much as they can get in the form of wages, etc., and the owners as much as they can get in the form of dividends. Under scientific management they have ceased combat over the division of this surplus. The result has been a surplus so large that both contenders get more than they ever received before. The workmen get at least 33 per cent. more wages, and the company gets larger profits. This is one result of the mental revolution.

The Four Principles

The delusion is almost universal among workmen that the division of the surplus in the past has been entirely wrong; that the working men are not getting their proper share of the general profits of capital and labor. Although in some cases it is true, their feelings have been rashly augmented by the labor leaders, newspapers and the public. In an article on Division of Capital, in the *Atlantic Monthly* of June last, Norman Faig showed their conviction to be wrong. All that the working man can ask for is that the profits that accrue to capitalists should come to the people of the United States. They themselves could not demand all this profit. If it should be divided in the manner suggested there would be 13 cents per day per man as dividend. It shows conclusively that the hope of the workman does not lie in the division of capital. It lies rather in an increase of output.

The speaker outlines the older type of management where, for example, 500 to 1,000 men in perhaps twenty different trades have acquired their knowledge, not by books, but by observation and by traditional word of mouth. This is just the condition that obtained in the Middle Ages, and still largely obtains. Yet, in spite of lack of progress his trade is the workman's greatest asset. To achieve the best results one realizes that he must get the initiative of his workmen, but one's realization of soldiering forces him to the conclusion that to render this initiative the workman must receive a larger remuneration than his competitors. The employer who has the pluck to do this, and to continue doing it, will find that his men will respond to such good treatment. This is the highest type of management under the old system, yet it cannot compete with scientific management, for under the latter there is no spontaneity on the part of the workman, but continuous effort. This, because of the new and unheard-of burdens which the management assumes.

The first of these principles is the gathering-in of the great mass of traditional knowledge held by the workmen; recording it and reducing it to laws, rules and mathematical formulas. These deductions become of immense assistance in increasing the output. Rule-of-thumb knowledge is replaced by science.

Secondly, it becomes the management's duty to study carefully every man in the plant, his capacities, possibilities and limitations; and to train each to the highest class of work for which he is shown to be fitted—progressive selection and progressive study.

Thirdly, the science and the scientifically trained man are brought together. This is difficult. It can be accomplished only by binding the workman to work by science. This, however, does not cause appreciable trouble. Nine-tenths of the trouble experienced comes from forcing the management and owners to assume *their* burdens.

And, fourthly, a great mass of work formerly done by the workmen is now partly taken over by the management, until the whole is more equally divided. On the management's side there is generally one man for every three workmen.

These principles are deduced from years of study and work under scientific management. The system is no longer something which might be found beneficial if tried—it has been well tried —and pays.

A careful study and series of observations in a plant where 400 to 600 shovellers were employed resulted in a reduction in the cost of handling iron ore from 8 cents per ton to less than 4 cents, after paying the workmen employed 60 per cent. higher wages, establishing a labor office, employing teachers to instruct the men how to scientifically handle a shovel, and timekeepers, etc., to record performances.

Investigation showed that the loads upon shovels under old methods varied from 3.5 to 38 pounds. Placed on a scientific basis, a load of about 21 pounds to the shovel, proper motions, simple and untiring, the work was now being done by 140 men. Furthermore, investigation into their private affairs showed the workmen to be living better lives, in every way, than before.

The Power of Scientific Management

Illustrations were also given in the operation of machinery. The speaker claimed that not one in fifty of the machines in the factories of America are speeded accurately. The majority of them are 200 to 400 per cent. out, and from two and one-half to nine times as much work could be done by them if they were properly adjusted. In the work of the high-class mechanic science is so great a factor that he cannot gain the proper knowledge of himself.

I know of one case in machine manipulation where mathematicians were confronted with a problem involving twelve unknowns, and struggled with it for 18 years. Now the problem is solved in 20 seconds on a slide rule taking care of the twelve variables.

"If you are willing to pay the price in time and hard work, things that have through the ages been termed impossibilities can eventually be solved and put to use for the good of man."

Waltham-Keene Decision

Judge Ray Draws Line Between Contract and Dealer's Sale License

By George Cooper Dean

THE decision of Judge Ray, sitting in the United States District Court for the Southern District of New York, in the case of the Waltham Watch Co. vs. Charles A. Keene has created something of a sensation among prominent members of the patent bar, apparently more by reason of what the judge says than by reason of what was decided in the case.

Most of the facts were stipulated by the parties and are set forth in the opinion. The Waltham Watch Co. sold watch movements conditionally with a right to recover the goods in case of a breach of conditions, the principal condition involving the fixing of the retail sale price to users. Keene bought movements from outside jobbers or dealers and resold at cut prices. The Waltham Watch Co. instead of seeking to recover the goods, as provided for by the contract, sued Keene for infringement of some patents covering only the frame and spring barrel of their watch movements.

The conditional sale contract of the Waltham Watch Co. was in the form of a notice inserted in the package in which each movement was packed. The form is as follows:

WALTHAM CONTRACT NOTICE.

16 size Waltham movement No. ——, bearing the trademark RIVERSIDE. 19 jewels, essential parts of which are protected by United States Letters Patent, is sold subject to the following conditions, which every buyer thereof by accepting this movement agrees with the undersigned company to keep and perform, viz.: (1) Jobbers may sell this movement to established retail watch dealers, except those designated by this company, and to no other persons, and only at the price and discount authorized by this company. (The term "retail watch dealers" shall include all watch dealers other than those recognized as jobbers by this company); (2) Jobbers must in every instance deliver this contract notice with the movement; (3) Retail dealers may dispose of this movement by sale only, and only to buyers for use and not for resale and must not advertise nor sell this movement for less than $25.00. A breach of any of these conditions shall revest in the company the title to this movement and upon tendering the price paid therefor to the holder thereof the company may retake possession of the same.

These conditions will be enforced by the company.

WALTHAM WATCH COMPANY,
Waltham, Mass.

The invoice had annexed or printed to it the following:

CONDITIONS OF SALE.

(Bill to Jobbers)

Each Waltham movement and Waltham watch in this bill is sold subject to the following conditions and to those in the Waltham contract notice issued with the movement or watch, which conditions every buyer thereof by accepting said movement or watch agrees with the undersigned company to keep and perform, viz.: (1) Jobbers may sell said movements or watches to established retail watch dealers, except those designated by said company, and to no other persons, and only at prices and discounts authorized by said company; (2) Must bill said movements or watches only on billheads approved by said company and bearing the condition of sale; (3) Must not bill said movements or watches with any other goods; (4) Must not exchange said movements or watches for any other goods whatsoever; (5) The Waltham contract notice must be delivered with the movement or watch in every instance.

These conditions govern the sale of the following movements: VANGUARD, 18 size and 16 size; CRESCENT ST., 18 size and 16 size; No. 845; APPLETON, TRACY & CO. PREMIER; RIVERSIDE MAXIMUS, 16 size, 12 size and 0 size; RIVERSIDE, 16 size, 12 size and 0 size; No. 645; ROYAL, 16 size and 12 size; all Colonial Series watches.

(6) A breach of any of said conditions shall revest in the company the title to all movements of the grades named and all Colonial Series watches in the possession of the violator and of any one who shall have induced or knowingly participated in such breach; and upon tendering the price paid by the holder of such movements or watches the company may retake possession of the same.

(7) Jobbers must immediately send to the company's selling agents a duplicate of every bill of the above named movements and watches which they issue.

The undersigned will enforce these conditions.

WALTHAM WATCH COMPANY,
Waltham, Mass.

This conditional sale contract with right to retake goods is noticeably different from the conditional patent licenses commonly used for controlling conditions of resale by the Victor talking machine, Edison phonograph and Klaxon companies.

Judge Ray held that the case was analogous to the "Bath Tub" case recently decided by the Supreme Court rather than like the Dick vs. Henry (Mimeograph case) recently decided by the same court. These cases, decided in October and November 1912, were urged before Judges Lacombe, Cox and Ward on an appeal in this circuit decided as recently as January 13, 1913. As I pointed out when acting as attorney for the complainants, this latter case was a straight infringement suit under the Lovell-McConnell Manufacturing Co.'s Klaxon patent licenses, which provide that breach of a condition is infringement of the patents. The defendant, International Automobile League of Buffalo, had bought Klaxons under conditional licenses and sold them to members of the league at cut price, and being enjoined by the court from infringement of the patents by cutting prices, they advertised that being compelled to sell at full price they would hereafter give their profits to a charity to be named by the purchaser. Judge Lacombe, for the Court of Appeals, held that even this evasion of the Klaxon patent license was an evasion of the injunction against infringement, and ordered that the injunction be enlarged so as to specifically prohibit the league's charity scheme. Now, barely a month afterwards, Judge Ray seems to say that all attempts to fix resale prices under whatever guise are illegal under the Sherman act. This apparent conflict between Judge Ray's opinion and the Court of Appeals' decision in this circuit presents considerable difficulties to lawyers attempting to reconcile the two.

Another feature of the decision is that while Judge Ray devotes some twenty-two pages to discussion of this branch of the law, he gives only a paragraph, without mentioning even by name, various important cases, such as Circuit Court of Appeals decisions in Victor Talking Machine Co. vs. Fair, 123 Fed. 424; National Phonograph Co. vs. Schlegel, 128 Fed. 733; The Fair vs. Dover Manufacturing Co., 166 Fed. 117; also District Court decisions in Edison Phonograph Co. vs. Kaufman, 105 Fed. 960; Edison Phonograph Co. vs. Pike, 116 Fed. 863, and others.

When asked my opinion, I responded that relying on the decision of the Court of Appeals and his memory of the discussion of the hearing before Judges Lacombe, Cox and Noyes on his appeal in the International Automobile League suit, he would feel no diffidence whatever about bringing a patent infringement suit and a motion for preliminary injunction against any dealer violating Klaxon patent licenses in this jurisdiction.

The decision in this Waltham watch case, of course, does not apply outside of the Southern District of New York, and does not control other jurisdictions in which the Circuit Courts of Appeal have most emphatically sustained price fixing by patent license conditions.

Klaxon Suits Progress Slowly

In the suit against Manhattan Electrical Supply Co. there is a preliminary injunction now in force which, it is understood, is satisfactory to both parties, so that up to the present time this suit has not been pushed.

The three suits against the American Ever Ready Co. have not been pushed because the Ever Ready horn has already been enjoined by preliminary injunction of the District Court affirmed by the Court of Appeals.

The seven suits against New York dealers, New York Auto Supply Co., Zeisler, Crane & Wagner Auto Supply Co., Thirty-Five Per Cent. Auto Supply Co., National Auto Supply Co., American Auto Supply Co. and Charles E. Miller, are against sellers of the Newtone horn, and the Lovell-McConnell Manufacturing Co. having no desire to unnecessarily burden dealers are permitting these suits to await decision of the Brooklyn suit against the Automobile Supply Manufacturing Co., in which final hearing is expected in the latter part of March.

The three suits against automobile companies, Garland, Jackson and Haynes, who have offered the Sparton horn of the Sparks-Withington Co., have not yet reached the taking of testimony even under the new rules, the defendants' answers not being due until some time in March.

New Law for Texas

Favorable Report Made on Bill Providing for the Registration of Cars

Fees Based on Horsepower

AUSTIN, TEX., March 1—The judiciary committee of the Senate has reported favorably on a bill for the registration of motor vehicles and regulating their use. According to the bill, license numbers will be issued by the secretary of state without cost, the registration fee being graduated as follows: 20 horsepower and under, $8; over 20 horsepower at the rate of 40 cents per horsepower. If a motor vehicle shall have been licensed for 5 separate years the annual registration fee thereafter shall be one-half of this amount. Motor bicycles will be registered at $3 each. The bill provides for number plates of a different color in successive years. Persons, firms, associations or companies manufacturing or dealing in motor vehicles may instead of registering each vehicle manufactured or handled by them make a verified application for a distinctive number for use on all the vehicles owned or controlled by them. The new bill contains the usual provision for brakes and lights. The front lights shall be visible 500 feet in advance and the rear lamps must illumine the number plate making it visible 50 feet. The law as framed calls for careful and prudent driving at a rate of speed not to endanger the property of another or the life of any person, and fixes the legal limit in the country at 25 miles an hour. It permits the exclusion of commercial vehicles from parks, and also invests local authorities with the right to regulate the speed within their domains, which speeds shall not be less than 10 miles an hour in any case. Chauffeurs must take out licenses.

Illinois Towns May Have More Power

SPRINGFIELD, ILL., March 5—If House Bill No. 77, which is now before a committee of the Legislature, becomes a law, every city, village or incorporate town in the state will be given the power to regulate the size of tires used on commercial vehicles and also the annual license fee. In a word, the bill gives permission "To direct, license and control all wagons and other vehicles conveying loads within the city or village, or any particular class of such wagons and other vehicles, and prescribe the width of the tire of same, the license fee, which when collected is to be kept as a separate fund and used only for the cost and expense of street or alley improvement or repair. Provision is made for a fine not in excess of $200 and imprisonment not in excess of 6 months for one offense."

Idaho Legislature Busy

BOISE, IDAHO, March 3—The solons of Idaho are just now wrestling with two bills providing for the regulation of the use of motor vehicles. The first bill, known as the Booth bill, was introduced early in the month of February. It was held up in committee when a second, known as the Koelsch bill, was announced.

The bill introduced by Booth provides for a registration fee of $1. This looks simple and easy, but there is a proviso, to wit: That when any bonds are issued and sold by the county commissioners for the purpose of building roads in the county, then the license fee shall be $1 for each horsepower of any motor vehicle. The money collected in this way is to go into a "bond interest fund" to be used to pay the interest on the road bonds. The other details of the bill are patterned after the uniform law.

The Koelsch bill is more comprehensive and covers three distinct features. It provides for a state highway commission of three members; use of convict labor on the highways, and the registration of motor vehicles. In this bill the user of a motor vehicle is taxed a graduated scale. Under 30 horsepower, $15; 31 to 40 horsepower, inclusive, $20; 41 to 50 horsepower, inclusive, $25; over 50 horsepower, $40. Dealers are taxed $35 and $1 for each additional plate issued. The money is to go into the road fund and the car owner is exempt from any personal property tax on his car. The state highway commissioners are given power to expend this money on the roads anywhere in the state. It is estimated that at the present time this bill would afford a fund of about $75,000. There are about 4,000 motor vehicles in Idaho at this time.

Pennsylvania to Tax Trucks Heavily

HARRISBURG, PA., March 3—A bill to take the place of the present automobile laws of Pennsylvania was introduced into the Senate at the session of the legislature last week. The bill has the support of the Motor Federation of Pennsylvania. It changes or affects the present law as follows:

Dealer's registration fee is raised from $5 to $10. Fee for solid tire vehicles (motor trucks) regulated by combined weight of vehicle and load as follows: Less than 4,000 pounds, $10; from 4,000 to 5,00 pounds, $15; from 5,000 to 10,000 pounds, $20; from 10,000 to 15,000 pounds, $25; from 15,000 to 20,000 pounds, $30.

No vehicles, including load, shall exceed 86 inches in width nor shall weight with load be more than 10 tons.

Ohio Drivers Always Liable

COLUMBUS, O., March 3—Automobile owners and drivers in Ohio are up in arms over a bill pending in the Ohio General Assembly which seeks to do away with the contributory negligence feature of the personal liability law of the state. The bill provides that any one injured in any way can collect damage for such injury, even if he is negligent. While the law does not apply to the driving of automobiles any more than any other line of endeavor, still, it is looked upon with some considerable askance by automobile drivers, An effort will be made to defeat the proposed law.

Minnesota to Get New Law

MINNEAPOLIS, MINN., March 3—Modifications of the present Minnesota automobile and road law, passed 2 years ago, have been approved by the Minnesota State Automobile Association, and a bill has been introduced in the legislature to make the changes. The bill was discussed at the annual meeting of the directors of the association during show week. In effect the changes are as follows:

Creation of a state automobile commission of three members appointed by the governor to take charge of the licensing of motor vehicles and the examination of chauffeurs, now vested in the secretary of state and the state board of examination; diversion of all receipts from licenses and fines for violation of the law into state road and bridge fund; registration fee of $3 for 3 years for automobiles, instead of $1.50; $10 registration for manufacturers and dealers and $1 for each additional car, except where in private use or for hire; misdemeanor for owner selling car to fail to report sale to the commission; charge of $1 for remainder of year when person selling a car applies to retain the number for another car; trial judge may recommend revocation or suspension of license of driver on conviction for violation of law; licensed physician arrested for speed in answering emergency call must be allowed to proceed on giving car number and showing driver's license; creating salary of $1,800 a year for secretary and allowing $5 a day and traveling expenses for examiners of chauffeurs, who may be appointed in localities to represent the commission, making it a misdemeanor for anyone to drive a car while intoxicated; making it unlawful to leave car standing with engine running and to cut out the muffler. The clause exempting non-residents and the paragraph prohibiting local speed ordinances are allowed to stand. The clause requiring all occupants of a car in an accident to return and give names and addresses changed to exempt other occupants than the driver and owner.

Steering Gear Design Is Conservative

Trend Favors the Worm-and-Gear Types, Although Screw-and-Nut Constructions Are Numerous

STEERING gears, like other stable automobile parts, this year continue practically the same in design and general construction as heretofore, although here and there refinements of details such as the placing of grease cups in more accessible locations and the further facilitating of adjustment features have received attention.

The worm and full gear types are in the lead in point of numbers, the easy adjustment which the full wheel makes possible being the principle advantage claimed for this type. In accord with the general aim to make all parts of the modern automobile as silent in operation as possible, steering gear makers have brought out types in which the spark and throttle levers are held in position on the quadrant by friction instead of ratchet devices. Though a small noise factor in itself, nevertheless the slight click which the ratchet makes is deemed objectionable, and the manufacturers are therefore prepared to eliminate it, in most cases supplying optionally either friction or ratchet controlled levers.

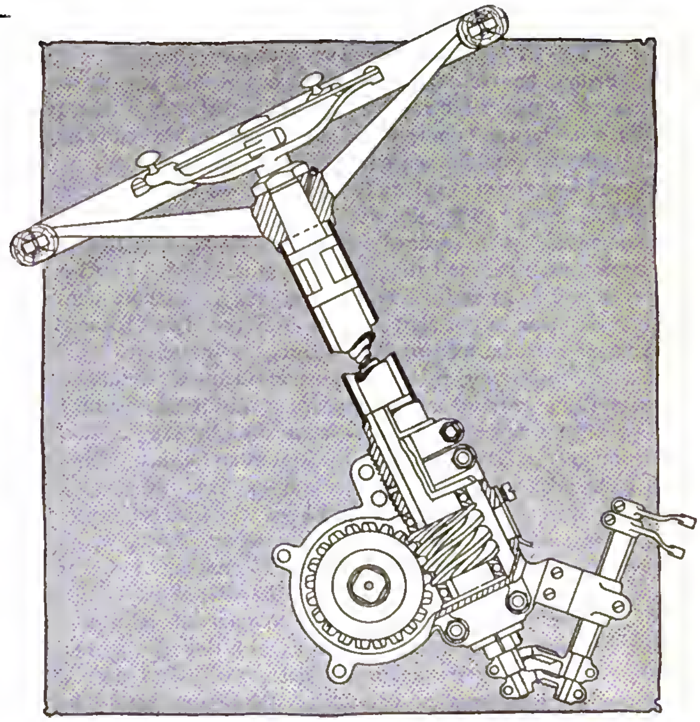

Fig. 1—Gemmer model K of the worm-and-gear type

Gemmer

The Gemmer Manufacturing Company, Detroit, produces at present four models of pleasure car steering gears and three types for commercials. The model K is seen in Fig. 1. This is a typical Gemmer type and illustrates the full worm and gear construction embodied in all of the steering mechanisms of this make. The worm is carried on annular ball thrust bearings, one above it and one below. The worm wheel is mounted on a squared shaft, permitting of the shifting of the wheel a quarter turn, thus bringing a new set of teeth into play when another set has become worn. To facilitate the lubrication of the wearing parts, grease cups and grease openings have been made very accessible. Above the worm, for instance, an opening has been provided in the housing and fitted with a spring cover, making it very easy to lubricate the gearing. To prevent rattle a spring bushing has been placed around the shaft just below the point where the spider joins the tube. This serves to steady the shaft within its housing. For light cars a new model in the Gemmer line is the type S which also has the worm and full wheel construction.

The housings of all the Gemmer types are of malleable iron with a minimum wall thickness of .1875 inch, while shafts are one-piece steel forgings. Ball arms are also forged and from high carbon steel. Jacket tubes are made of seamless brass tubing ranging from 1.5 to 2 inches in diameter and finished in brass, nickel or black enamel. The main column tubes are seamless steel of various dimensions to meet the requirements of the different sized gears. The control tubes are also of seamless steel, bronze bushed at the ends to prevent rattle and provided with a series of grooves, properly placed and reamed to avoid whipping due to vibration. The Gemmer concern furnishes four forms of controls, viz., spring lever, ratchet and two styles of friction controls, all of which are standard and interchangeable. A dozen types of spiders are also included in the line.

Warner-Toledo

Steering gears produced by the Warner Manufacturing Company, Toledo, are in six types for various sizes of cars, the heavier ones being adaptable to trucks up to 2 tons. The Warner design embodies the worm and full gear construction, the latter being mounted below the worm in the usual way. Type 5-A for cars of about 40 horsepower is shown in Fig. 3. It is for right-hand steer and the slope of the column is adjustable to any desired angle. Ball thrust bearings are fitted above and below the worm. Both worm wheel and worm are constructed of forged steel, hardened and ground and the mounting of the former makes it possible to change the meshing teeth for adjustment purposes. The Warner gear is, in fact, thoroughly adjustable in every way. The ball arm is conventional and is mounted on the end of the worm wheel shaft which is squared to receive it. A bolt tightens the split end of the arm around the shaft. The arm is furnished in 6, 7.5 or 9-inch length to meet the requirements. Spark and throttle rod gears are furnished either as bevels or spurs and arranged for accelerator. The column diameters range from 1.38 inch to 2 inches in diameter, while the steering wheels which are corrugated around the inner edge come either 16 or 18 inches in diameter. The spark and throttle levers may be had either with ratchet or friction control. The finish of the column and spider is also optional in that it may be either nickel, brass or black enamel. Grease cups are accessibly located.

In the Warner construction the worm gear is integral with its shaft which is eccentrically mounted in a sleeve so that wear may be easily taken up. The housing for the gearing is of malleable iron and at its top there is an adjusting nut which takes up any lost motion.

Muncie

Also of the worm and full gear type are the steering gears marketed by the Muncie Gear Works, Muncie, Ind., one style of which—model S-34 for right-hand steering—is depicted in Fig.

2. The concern makes six styles of its steering mechanisms, three for left and three for right drive and all constructed along the same lines, the features in general not differing materially from the dictates of present practice. The worm has a triple thread while the gear is provided with 20 teeth, .5-inch pitch. A ball thrust bearing is mounted above the worm and another below it. The worm wheel shaft is integral with the wheel and carries the ball arm at its squared end. The gear housing is of malleable iron and at its top there is an adjusting nut which provides for the taking up of end play.

Grease cups are accessibly located on the upper side of the housing and at the top. The spark and throttle rod gears located below the housing are beveled, while friction control of the levers on the quadrant is favored. The Muncie types include styles for use with cars having fixed spark, model S23A being provided with throttle lever only. The spark lever may be supplied with this type, however, at a slight extra cost. Steering wheels are of plain mahogany and range from 16 inches to 18 inches in diameter.

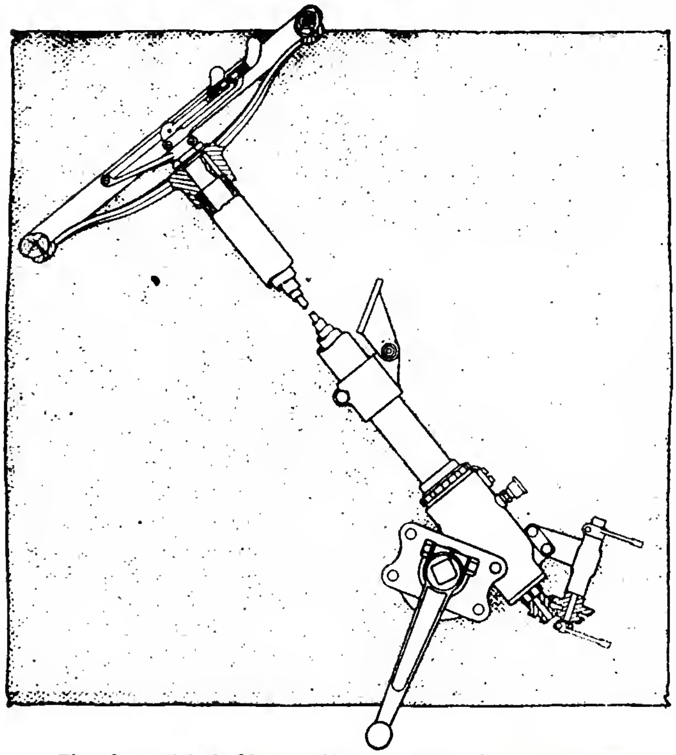

Fig. 2—Model S 34 Muncie gear for right-hand drive

Warner-Muncie

The Warner Gear Company, Muncie, Ind., makes a very complete line of steering gears for pleasure cars, taxicabs and commercial vehicles. These are all of the worm and full gear type with adjustable angle column. One type is shown in Fig. 4, which is typical of the styles made for pleasure cars. A sectional view showing the details of the worm and gear construction and mounting is also given. A ball thrust bearing is mounted above and below the worm, while take up for end play is provided in the usual way, by means of a nut at the top of the housing. Grease cups on housing take care of the lubrication of the contact parts. The type shown in the figure is model 12E and is designed for cars of from 35 to 45 horsepower. The shaft carrying the worm wheel is integral with the latter in this type, but the Warner concern also makes types in which wheel and shaft are separate. In this case the gear fits to a squared shaft end.

Several types of hand wheels are furnished with the Warner gears. The rim of the spider may be made continuous with the spokes and rabbitted into the wood, the top and bottom laminations being glued together thus concealing the metal. Or the ends of the spokes may be fitted into grooves in the wood rim or screwed to it. These gears may also be had with throttle lever only for fixed spark cars. All types are furnished in either black enamel, nickel or brass finish as desired. The commercial car styles retain the design characteristics of the pleasure car types, but they are, of course, made heavier for the heavier duty service.

Ross

The Ross Gear and Tool Company, Lafayette, Ind., manufactures steering gears for commercial cars only. These are made in five styles for vehicles ranging from 5 tons to 500 pounds capacity. The type shown in Fig. 5 is the heaviest of the line and is model BF for 3 to 5-ton propositions. All of the Ross steering gears have the same features of construction. The steering wheel hub is tapered and keyed to the steering

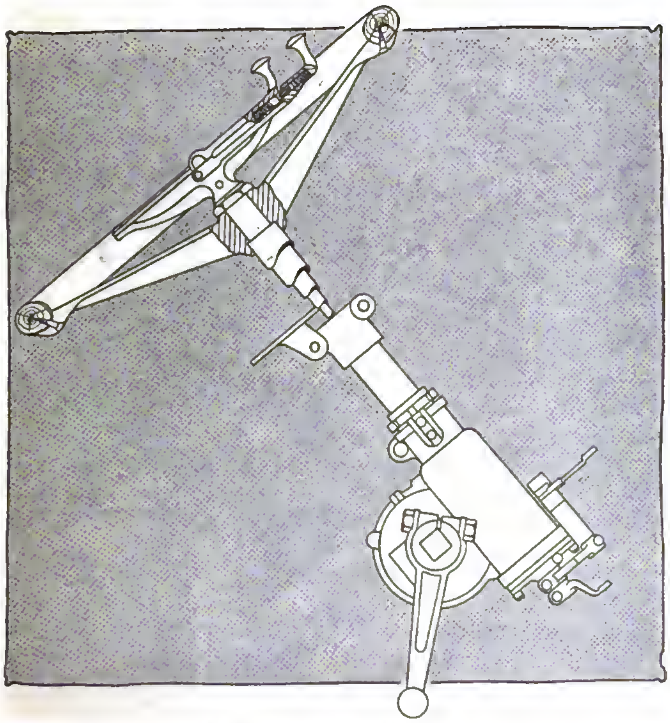

Fig. 3—Warner Mfg. Co.'s style 5-A for 40-hp cars

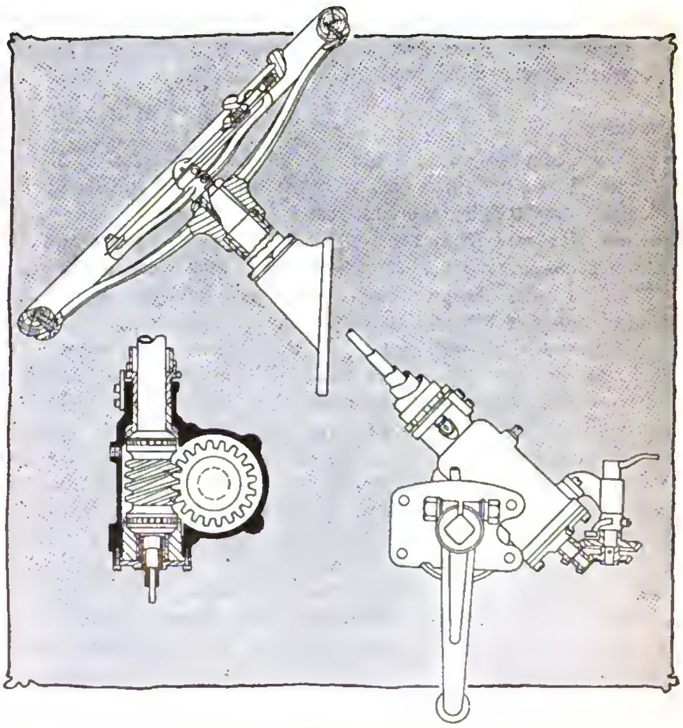

Fig. 4—General construction of a Warner Gear Co. type

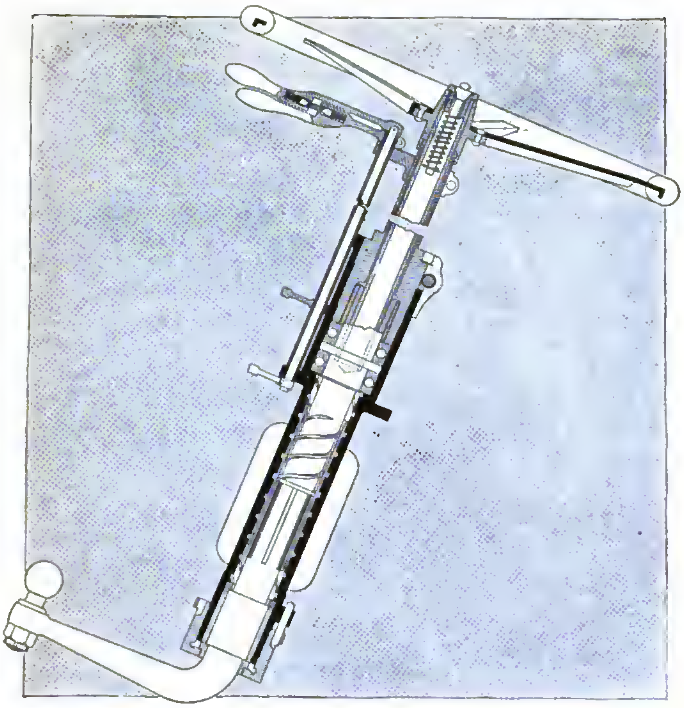

Fig. 5—Ross type BF steering gear for heavy trucks

tube, the lower end of which is integral with a steel screw. This screw operates a sleeve of phosphor bronze which surrounds it and which is threaded to receive the screw. The outer surface of this sleeve is provided with spirals, the pitch of which is very long as compared with that of the screw threads. A malleable housing surrounds the sleeve, in turn, and its inner surface is spirally grooved to receive the spiral projections of the sleeve. Thus when the steering wheel is turned, it turns the screw and gives up and down motion to the sleeve, and in order to so move, it must turn, due to the spirals on its exterior mating with the spiral grooves in the housing. This rotary motion is transferred to the ball arm which extends half way up into the housing. The upper end of this arm is splined, the splines fitting into slots in the inner surface of the sleeve, thus allowing the sleeve to move up and down and at the same time turn the extended end of the ball arm. A feature of the Ross gears is the oiling plug on the nut holding the wheel down on the taper.

Lavigne

These steering gears, made by the Lavigne Gear Company, Racine, Wis., are in styles to meet the requirements of the pleasure car and commercial vehicle. They are in four sizes, suitable for cars from 1,800 to 4,500 pounds in weight and for commercials of from 1,000 pounds to 6 tons capacity.

The Lavigne design comprises a push-and-pull mechanism having a double leverage arrangement for operating the steering connections. The ball arm is moved backward or forward by the operation of two slides which are guided by the housing. These slides are threaded right and left on their inner surface, the spiral thread grooves meshing with the threads of a worm which is integral with the steering rod to which the steering wheel is attached. The lower end of each sliding block is slotted to receive a trunnion block which carries a trunnion. These trunnions are parts of a rocker arm, one being on each end of the rocker arm. The latter attaches to the shaft which carries the ball arm connecting to the steering rods. When the sliding blocks are moved up or down by the screw action of the worm which, in turn, is being operated by the steering wheel, the rocker arm is turned due to its trunnion connections with the sliding blocks. This rocker turns the shaft and the ball arm. The construction eliminates the use of ball thrust bearings, since the thrust is taken by the trunnions. The wear of the sliding blocks or head against the housing is taken up automatically by two shoes which are pressed out against the sliding contact surface by springs.

Jacox

This is the trade name of the steering mechanisms made by the Jackson, Church, Wilcox Company, Saginaw, Mich., which products are designed for both pleasure cars and trucks. The principle involved is that of a double threaded screw and two half-nuts. The screw is attached to the steering rod which runs up through the column and is turned by the steering wheel. The half-nuts surround the screw and slide up and down within the gear housing when the screw is operated. The lower ends of these half-nuts bear on rollers at each end of a rocker or yoke which is mounted on the horizontal shaft. This shaft carries the ball arm. In operation the screw serves to back one half-nut off while the other is screwed in the opposite direction, due to the double thread. This motion of the nuts twists the yoke and its shaft and also the ball arm.

The Jacox screw is made of a solid bar of high carbon steel, casehardened to make the proper bearing surface between it and the two half-nuts which are bronze castings. To the lower end of each of these half-nuts is pinned a hardened steel thrust block across which the yoke rollers travel.

Boyer

The Boyer steering gear, designed and invented during 1910 by Joseph Boyer, president of the Burroughs Adding Machine Company is now being placed upon the market by the Boyer-Miller Company, Detroit, which has been organized for the purpose. In the Boyer gear, shown as a whole and in section in Fig. 6, an integral steel double screw is used which has full contact with two separate bronze nuts. The steering action is taken from the center of these nuts by a trunnion collar and is transferred to the steering reach rod by the ball arm suspended on roller bearings at its rocker shaft and ball bearings between steering arm yoke and trunnion fins. The end thrust is taken by two ball thrust bearings located at the end of the steering rod below the screw. The bronze nuts, which travel up and down in opposite directions in order to move the ball arm in either direction, are solid, yet they are entirely adjustable by loosening the trunnion collar bolt and turning one nut. This steering gear is being made in several sizes to meet all requirements of frame construction, weight, size and kind of steering wheel.

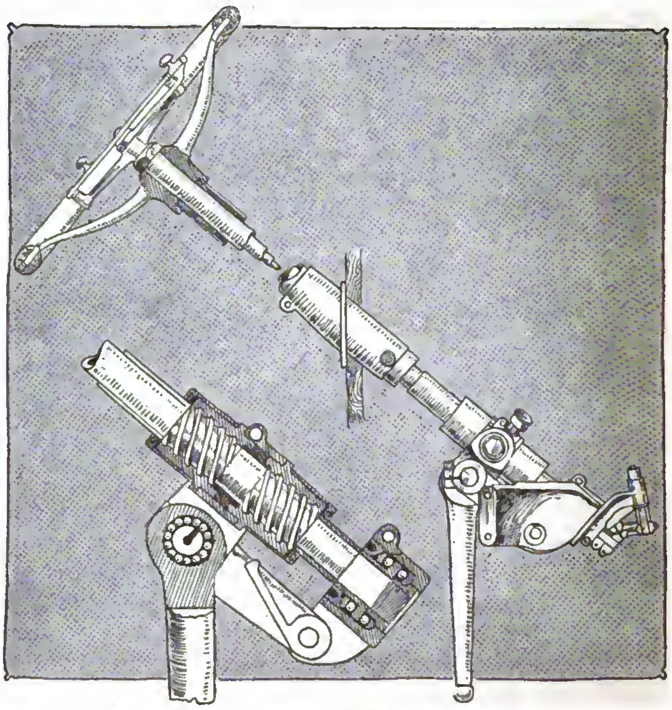

Fig. 6—New Boyer gear of the screw-and-nut design

Side view of the Maxim tricar equipped with light delivery body

A Three-Wheeled Vehicle

Maxim Tricar Adapted for Both Business and Pleasure—Two-Cylinder Motor

THERE has been more or less activity among automobile engineers during the past few years in the way of three-wheeled vehicles designed for both pleasure and commercial use. The tricar has always been an alluring proposition and the makers of these vehicles point out that the foremost of the world's designers and builders of motor cars have begun with a three-wheeled vehicle, and only cast aside three-wheel construction because of its limitations in the matter of speed.

An acquisition to the three-wheeled fold is the Maxim Tricar built by the Maxim Tricar Manufacturing Corporation, of New York City. This vehicle, which is designed for both business and pleasure is the joint construction of Maxim Karminski, an automobile engineer who has had much experience on the continent, in France, Germany, Italy as well as in England, and Charles Peters. The type of car is well known in Europe, but not as much so in America.

The Maxim machine is equipped with a unit power plant, so that the substitution of a new equipment is the work of but a moment.

The motor is of the double-cylinder vertical type, and develops about 8 horsepower. The unit type power plant is suspended above the front wheel and the drive is through a single roller chain to a larger sprocket secured on the front wheel. The construction is a simple affair, practically the entire machine being built over the front wheel. That is to say, the motor and transmission are thus placed.

It has been the practice of some followers of the three-wheeled design to place their single driving wheel in the rear, but the Maxim makers place theirs in front, a reversal of the common practice.

The motor cylinders are cast singly, side by side, and are secured to an aluiminum crankcase which is cast in two vertical sections having integral with its side-plates which form the bed or support. The motor is secured to a bedplate above, and cast as a solid piece with the mudguard. This acts as the support for the motor, steering device and the shock-absorber at the same time. The cylinders have integral ribs. Automatic inlet valves of large diameter are used, though the exhaust valves are mechanically operated. The bore of the cylinders is 3.25 inches and the stroke is 4.5 inches. The pistons, like the cylinders, are cast of gray iron and have three compression rings placed above the wristpin, while there is a fourth holding the pin. The crankshaft, which is 1.5 inches in diameter, is a built-up member. The transmission is a simple two-speed planetary affair, controlled from the operator's seat, and as but a slight movement of the wrist is necessary to engage either speed, to stop the car is a very easy matter. This transmission is carried on the left side of the motor case, being controlled from the steering rod or guide from which is a horizontal steel tube 1.5 inches in diameter. The operator holds a grip which describes a horizontal plane. The drive of this transmission to the front wheel is through a roller chain.

To eliminate road shocks, this chain is fitted with a small sprocket idler and this is provided with a spring attachment easily adjusted so that, as the car jounces over a rough piece of road, the tendency of the chain to jounce or wobble out of position is overcome.

The axle of the front wheel is fitted onto these springs, and the worst kind of road cobblestone, etc., does not affect the smooth running of the car.

One of the most commendable features of this machine is that it is interchangeable. The motor, transmission and driving clement being mounted over the front wheel, the entire propelling assembly is a unit. The withdrawal of the locking bolt connecting this unit with the chassis, is all that is required to take out the damaged unit, and replace same with another one. The frame of this Maxim is made of heavy gauge tubular steel 1.5 inches in diameter, and the construction is of the so-called bridge type. It is, however, the intention of the builders to turn out these cars with a channel steel frame same as used by other automobile manufacturers.

The springs used are semi-elliptic in form, being built of five leaves 1.5 inches wide, and 32 and 29 inches long respectively. These springs are provided with a shackle, which allows plenty of play without disalignment. The wheels are wood, artillery type clincher rims being used, the tires being 28 by 2.5 inches in size. Ball bearings are used in the front and rear members. The hubs are made of steel and the spokes are of hickory.

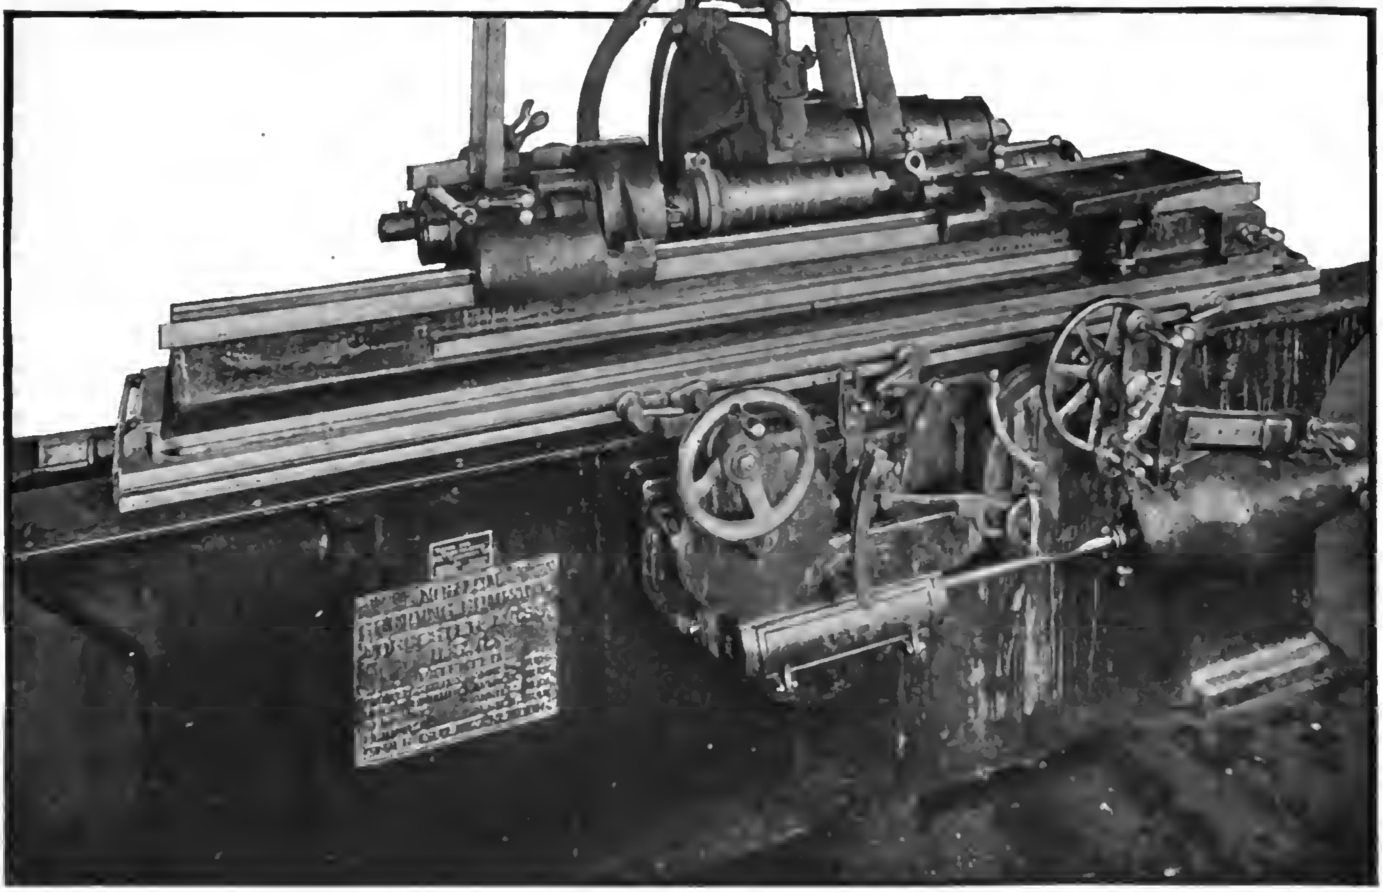
There are two brakes on the rear wheel drums, the drums being steel 10 inches in diameter, with a 2-inch face. These brakes are of the internal expanding type similar to those used on other cars, and are actuated through a single pedal on the right hand side of the floor board, besides a lever used for emergency cases.

Ignition is by the Bosch high-tension system, the magneto being secured to the motor base and driven from the crankshaft.

There are two types of bodies used for delivery purposes, one of the box type with space area of 23 cubic feet and the other is on the Ford commercial body type, covering the driver's seat. The capacity is about 600 pounds.

Power plant of the Maxim machine, showing motor mounting

Factory Miscellany



One of the twenty grinding machines used in the factory of the F. B. Stearns Co., Cleveland, O., on the outside surface of the Knight sleeves

IN the Knight sliding sleeve motor the sleeves must be accurately ground. In the manufacture of this motor there is a great area to be ground and for that reason the grinding machines used in the factories which make these motors are of special interest. The above illustration shows one of the machines used for this purpose in the Stearns company which specializes in Knight cars. Twenty machines of this type are used in the Knight factory and it takes three operations for each sleeve. It requires but one operator to take care of the machine. The operation is similar to other grinding jobs in most respects. The emery wheel turns toward the work while the latter turns in the opposite direction away from the wheel. Above the wheel a pipe keeps a constant supply of cool water flowing on the metal keeping the surface clean and cool.

POWER Plant Efficiency—One of the aims of automobile designers has been to increase the efficiency of the power plant, that is, to secure a maximum of power on a minimum fuel consumption and with a minimum of wear. The marked advance in the price of gasoline in the last year has made this efficiency a more important factor than ever. One of the steps is the use of the long-stroke motors.

Chatham Planning Factory—The Chatham Auto-Wheel Company, Chatham, Ont., is planning the erection of an auto-wheel plant, the estimated cost of which is $40,000.

Wilcox-McKim Builds—The Wilcox-McKim Company, Saginaw, Mich., has been organized to manufacture automobile accessories. Plans for a factory have been completed.

Hudson's Second Addition—The Hudson Motor Car Company, Detroit, Mich., will start work at once on a second addition to its plant, which will result in the doubling of its facilities.

Working Day and Night—The Warner Manufacturing Company, maker of automobile parts, is employing 750 men and the factory is working day and night in an endeavor to keep abreast of orders.

Rubber Company in Maissonneuve—The Plymouth Rubber Company hopes to locate a factory in Maissonneuve, Ont. It has written to the council asking for the best terms, and it looks as if the negotiations would end successfully.

Hendrie Tire's New Factory—The W. C. Hendrie Rubber Company, Denver, Col., has just purchased 6 acres of land in Torrence, Cal., and has closed contracts for a $100,000 automobile tire factory, to be erected on the site this year.

Establishes Rolling Mill—The Standard Aluminum Company, Two Rivers, Wis., is planning to establish a large rolling mill in connection with its present foundries and stamping works. A large combination stamping and drawing press has recently been installed.

National Gauge Builds Plant—To accommodate the rapid expansion of business of the National Gauge and Register Company, La Cross, Wis., a new factory is to be erected. Eighty-five men are employed. The new plant will have 20,000 square feet of floor space.

Alliance Purchases Land—The Alliance Motor Car Company, Alliance, O., has purchased land in that city upon which it will erect a two-story brick block factory, 52 feet by 160 feet. This plant will cost between $16,000 and $20,000 and will be begun prior to April 1 and completed within 60 days thereafter.

Mather Spring Increases Capacity—The Mather Spring Company, Toledo, O., will double its plant capacity.

Plant in Cuyahoga Falls—A concern is being organized at Cuyahoga Falls, O., to erect a factory for the manufacture of automobile lamp reflectors. W. A. Wyatt is one of the promotors of the concern.

Beloit Works Enlarged—The Stewart-Warner Speedometer Corporation, of Chicago, Ill., is planning to enlarge its works in Beloit, Wis., in the addition of a couple of wings, to be added in the early part of spring.

Plant Turned Over to Trustees—R. H. Cook, doing business as the Cook Body Company, Flint, Mich., has turned the affairs of the company over to C. O. Hetchler, as trustee. Mr. Hetchler will effect a settlement with the creditors.

Go By Name of Fuller—On account of the recent change in name of the Michigan Automobile Co., Ltd., to Fuller & Sons Mfg. Co., it has been decided by the company to hereafter call all the products of the new company by the name of Fuller.

Truck Plant for Salt Lake—If plans are carried out there is every promise that Salt Lake City, Utah, will have in the near future an automobile truck factory that will mean an investment of $1,000,000 or more. It is said that the plant would eventually employ 3,000 workmen.

Starter Company Formed—The Krank-Less Starter & Manufacturing Company, Cleveland, O., advises that it has been organized to manufacture the Krank-Less starter, speeder and gasoline saver. No factory will be built at present, but the company contemplates building later in the year.

Clark Manufacturing Brass Gauge—The Clark Motor Car Company, Louisville, Ky., has begun the manufacture of a patented brass gauge for use in handling liquids, especially oil and gasoline. The company plans the enlargement of its facilities to take care of the new business if it develops favorably.

Body Company Builds—Automobile bodies are to be manufactured by the Capitol Body Company, which has just been organized in Indianapolis, Ind., and incorporated with an authorized capitalization of $10,000. A factory is to be established immediately and about 2,500 bodies will be manufactured annually.

Atlas Forge Company's Plant—According to Manager S. H. Carpenter, of the Atlas Drop Forge Company, Lansing, Mich., the company will double its capacity this spring by the erection of a fireproof steel plant twice the size of the one being used. While the plans have not been completed, it is said the new building will be modern in every respect.

Quick Work In Rebuilding—On February 8 the Double Fabric Tire Company, Auburn, Ind., suffered the loss of its factory by fire. By February 15 the vulcanizing kettles and metal cores were dug out, cutting tables were made, large quantities of material and equipment were wired for, and by the 17th practically a full force was working in the new factory.

Painesville Starts Automobile Factory—The Vulcan Manufacturing Company, a new Painesville, O., concern, is to enter the automobile manufacturing business. A plant which had been idle has been purchased and is to be remodeled for best use of the company. One hundred and fifty men are expected to be employed there before July 1 and 1,000 automobiles are to be turned out during the present year.

State Electric Will Build—A company, to be known as the State Electric, Ltd., has been formed with Montreal, Que., and Toronto, Ont., capital to manufacture electric commercial vehicles at Walkerville, Ont., and plans are being prepared for a factory to cover more than 40,000 square feet. The directors of the new company are H. Timmins, N. A. Timmins, W. S. Hutchinson, C. E. Archibold and S. Carsley.

Plant at Xenia—An organization for the purpose of increasing the capital stock of the Baldner Automobile Manufacturing Company, Xenia, O., from $5,000 to $150,000 has just been effected. The selling stock of the company will be increased to $48,000. It is the purpose to establish an automobile manufacturing plant at Xenia to manufacture a car of the roadster type after a model made by Jacob Baldner. A commercial car will be built.

Swinehart Expanding—Contracts have been let by the Swinehart Tire & Rubber Company, Akron, O., for the construction of new buildings. One addition, 100 feet by 70 feet, and three stories high, will be added to its main plant. Other buildings, including a laboratory, 30 feet by 60 feet, have been erected. In the main building will be installed new rubber machinery capable of tripling the company's present output. A new 1,200-horsepower Corliss engine, with additional boilers, is now being installed.

Shows, Conventions, Etc.

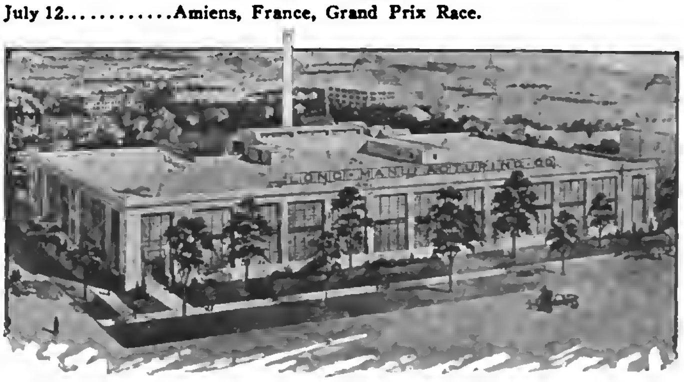
March............Indianapolis, Ind., Spring Automobile Show. State Fair Grounds, Indianapolis Automobile Trade Association.
March............Nashville, Tenn., Annual Show, Nashville Automobile Dealers' Association.
March 1-8........Pittsburgh, Pa., Annual Automobile Show.
March 3-8........Bridgeport, Conn., Show, Park City Rink, B. B. Steiber.
March 3-8........Denver, Col., Annual Show, Municipal Auditorium.
March 3-8........Springfield, Mass., Automobile Show, New Auditorium Building, United Amusement Company.
March 3-18.......Des Moines, Ia., Annual Show, Pleasure Car Section, Coliseum, Dealers' Association.
March 5-8........Tiffin, O., Annual Show, Tiffin *Daily Advertiser.*
March 5-8........Louisville, Ky., Annual Show, Dealers' Association.
March 5-8........London, Ont., Annual Show, Drill Hall, Louis Blumenstein.
March 8-15.......Boston, Mass., Annual Automobile Show.
March 8-15.......Columbus, O., Annual Show, Billy Sunday Tabernacle, Automobile Club and Traders' Association.
March 10-15......Columbus, O., Opening Week, Columbus Automobile Trades Association.
March 11-15......Buffalo, N. Y., Commercial Vehicle Show, Auditorium, Automobile Dealers' Association.
March 12-15......Ogdensburg, N. Y., Automobile Show, Louis Blumenstein, Manager.
March 17-22......Norfolk, Va., Annual Show, Armory Building, Norfolk Automobile Trade Association, Inc.
March 19-26......Boston, Mass., Annual Truck Show.
March 20-24......New Orleans, La., Annual Show, N. O. A. D. A.
March 24-29......Indianapolis, Ind., Annual Automobile Show.
April 1-6........San Francisco, Cal., Motor Truck Show, Coliseum Hall, *Motor Field.*
April 5-19.......Pittsburgh, Pa., Annual Show, East Liberty Market House, Dealers' Association.

Race Meets, Runs, Hill Climbs, Etc.

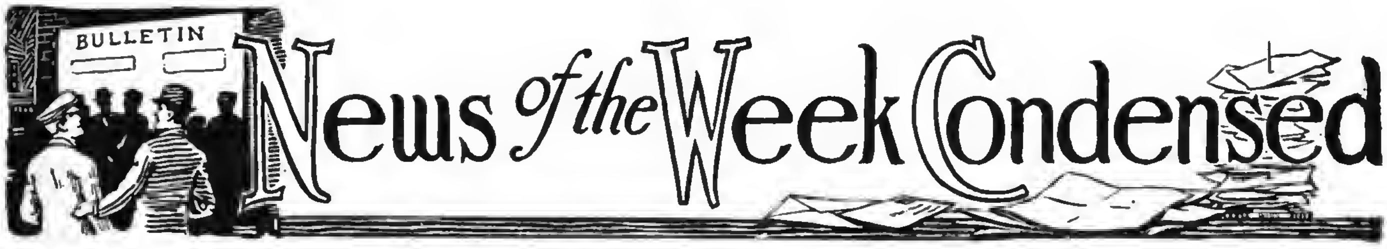
May 5-8..........Washington, D. C., Motor Truck Reliability Run, *Washington Post.*
May 30...........Indianapolis, Ind., 500-Mile Race, Speedway.
July 1...........Indianapolis, Ind., Tour of Indiana Automobile Manufacturers' Association to the Pacific Coast.
July 1-16........Winnipeg, Man., Motor Plow Competition, Dr. A. W. Bell, Manager.
July 8-16........Winnipeg, Man., Midsummer exhibition, A. C. Emmett, Manager.
July 27-28.......Tacoma, Wash., Tacoma Road Races.
Nov. 24..........Savannah, Ga., Vanderbilt Cup Race, Motor Cups Holding Company.
Nov. 26..........Savannah, Ga., Grand Prize Race, Automobile Club of America.

Foreign

March............France, Sealed Bonnet, 3000-Mile Run.
March 31.........Montevideo, Uruguay, International Competition of Agricultural Motor Vehicles.
April............Barcelona, Spain, International Exhibition.
May..............St. Petersburg, Russia, International Automobile Exposition, building of Michael Maneze, Imperial Automobile Club of Russia.
July 12..........Amiens, France, Grand Prix Race.



Factory of the Long Mfg. Co., Detroit, Mich., where motor hoods are made



General view of the Brooklyn automobile show held in the Twenty-Third Regiment Armory last week

PRESIDENT WILSON Invited—President Woodrow Wilson is to be extended a special and cordial invitation to attend the Grand Prize and Vanderbilt Cup automobile races on the Chatham County course in November. It is possible that a special committee from the Savannah Automobile Club, Savannah, Ga., promoters of the races, will deliver the invitation to him in person in Washington, D. C.

Utica's Show Busy—The annual automobile show is being held this week in Utica, N. Y. The exhibition is being held at the Amory building.

Manager of New Branch.—E. C. Cox has been appointed manager of the Findeisen & Kropf Mfg. Co.'s Eastern sales and service branch, New York City.

Elmira's Third Annual Show—The third annual automobile show held under the auspices of the Elmira Automobile Club proved successful. Twenty dealers displayed their cars.

Large Registration in Ohio—According to the announcement of state registrar of automobiles J. A. Shearer, 37,000 automobiles were registered in Ohio since January 1. This figure was reached February 23.

McCulla with Packard—W. R. McCulla has accepted a position with the Packard Motor Car Co., Detroit, Mich., as assistant research engineer. The Packard company has secured his services for experimental work.

Opens New Franklin Building—R. C. Hamlin, Franklin dealer in Los Angeles, Cal., has completed and opened up his new building. The structure is a story and a half in height with a frontage of 87 feet and is 105 feet in depth.

Age Limit Reduced—A bill has been introduced in the Connecticut legislature reducing the age limit necessary for the operator to obtain a license from 18 to 16 years. The bill is set for a hearing shortly along with other proposed measures.

Import and Export Figures—Automobiles show an interesting record in our trade, the value of the import of automobiles and parts thereof having fallen from $5,000,000 in 1906 to a little over $2,000,000 in 1912, while the exports increased from $1,000,000 in 192 to $28,000,000 in 1912.

Bennett Succeeds MacDonald—J. H. MacDonald, for 18 years executive head of the Connecticut highway department, states that he has decided to relinquish his post in favor of C. J. Bennett of Hartford, appointed recently highway commissioner, with dispute.

Civic Garage Proposed—A civic garage in which to house automobiles while owners are transacting business in the congested districts of Rochester, N. Y., is being advocated. A small fee would be charged each owner who desires to take advantage of the garage. The garage would be maintained by the city.

World's Visible Cotton Supply—Secretary Hester of Louisiana recently made a statement of the world's visible supply of cotton, showing the total visible to be 5,636,955 against 5,667,841 last week, 6,001,350 last year and 4,795,889 year before last. Of this the total of American cotton is 4,135,955 against 4,222,841 last week and 4,841,350 last year.

New Britain Wants Apparatus—New Britain, Conn., is anxious to improve fire and police service by the installation of motor equipment. In the budget for the new year the police department asks for a motor patrol and ambulance at a cost of $5,000. The fire department wants two motor fire trucks to cost $12,000 and a car for the chief to cost $1,500.

Wisconsin Association's Second Convention—The Wisconson County Highway Commissioners Association, Madison, Wis., recently held its second annual convention. It lasted 4 days and brought out a splendid discussion of ways and means, as well as achievements in permanent highway construction in that state during the time that the state-aid law has been in effect. A law was passed making the annual appropriation by the state, after 1913, $850,000.

New Agencies Established During the Week

PLEASURE CARS

Place	Car	Agent
Aberdeen, Wash.	KisselKar	M. M. Stewart.
Barre, Vt.	KisselKar	Barre KisselKar Co.

Wilson Midland Sales Manager—C. G. Wilson was recently appointed general sales manager of the Midland Motor Car Co., East Moline, Ill.

Murphy Resigns from Splitdorf—G. H. Murphy has severed his connections with the Splitdorf Electrical Co., New York City, as assistant treasurer.

Pittsburgh Show On—The Pittsburgh Auto Show Association is holding an automobile show this week at the Exposition Building, Pittsburgh, Pa.

Mackaye with Keeton—H. D. W. Mackaye has received the appointment of special factory representative of the Keeton Motor Co., of Detroit, Mich.

Ambler Wants Fire Apparatus—The Old York Road Fire Co., Ambler, Pa., has appointed a committee to purchase a new fire fighting automobile, at a cost of $10,000.

Livingston Goodrich-Diamond Manager—G. E. Livingston has been appointed manager of the Columbus, O., branch of the Goodrich-Diamond Co. to succeed C. W. Walker.

Republic's Indianapolis Factory Branch—The Republic Rubber Co., Youngstown, O., has established a factory sales branch in Indianapolis, Ind., with E. A. Stone as manager.

New Shock Absorber Manufactured—A new industry will shortly be started in Waynesboro, Pa., for the manufacture of the Landis shock absorber. F. F. Landis is the inventor of the new device.

Bus Line in Chile—A concession to operate motor buses has been granted by the Chilean government to Carlos Eastman, who will equip and conduct several lines between Santiago and its suburbs.

Smith on Western Trip—Paul Smith, recently appointed sales manager of the Lozier Motor Company, Detroit, Mich., recently left that city on a month's journey through the Central and far West.

Stearns Returns from Vacation—F. B. Stearns, president of the F. B. Stearns Co., Cleveland, O., manufacturer of Stearns-Knight cars, returned recently from his midwinter vacation in Florida and Cuba.

Taxicab Rates Cut—Competition in taxicab service in Wilmington, Del., has resulted in cutting of rates, the Brandford Automobile Co. announcing a minimum of $0.50 per mile, with $0.25 for each additional person.

Mayer Carburetor Appoints Distributor—The Mayer Carburetor Co., Buffalo, N. Y., has appointed the Maydwell Company, Los Angeles, San Francisco, Cal., and Seattle, Wash., distributor of its product on the Pacific coast.

Breaking heavy wiregrass sod at the Richmond, Va., state fair with a Parker motor plow

Johnson Ford Manager—Fred Johnson has been appointed manager of the sales branch of the Ford Motor Company at Omaha, Neb.

Goodhart Advertising Manager—H. H. Goodhart has been appointed advertising manager of the Lippard-Stewart Motor Car Company, Buffalo, N. Y.

New Kerosene Carbureter—The Air Friction Carbureter Co., of Dayton, O., has placed on the market a carbureter designed for use with kerosene oil as fuel.

Dowse Promoted—R. P. Dowse has been appointed general sales representative in the Central District for the Goodyear Tire & Rubber Co., Akron, O. His headquarters will be in Detroit, Mich.

New Manager for Velie—C. R. Gardner has been made manager of the automobile department of the John Deere Plow Co., Omaha, Neb., and will have charge of the Velie in the Omaha territory.

Miller's New Quarters—G. C. Miller, automobile dealer, is preparing to move into his new home at Main and Northampton streets. After removal, the concern, of which Mr. Miller now is manager, will be known as the Kane-Cadillac Motor Company.

Wolf with Henderson—The Henderson Motor Car Co., Indianapolis, Ind., announces the appointment of O. R. Wolf as factory representative and territory manager for the Central States District. His headquarters will be in Chicago, Ill.

Bay State Lamp Bill Killed—Despite a campaign in favor of it, the Massachusetts tail light bill introduced by Representative Greenwood, was defeated by the House of Representatives recently. The bill made it unlawful for an automobile to be so equipped that the rear light could be extinguished from the driver's seat.

Havana Good Second-Hand Market—Within the last few months there has been an enormous increase in the volume of the export business in the used car market in Havana, Cuba. The popularity of American made cars is not appreciated by those who are ignorant of the remarkable frequency of shipments of used cars in that part of the world. The Latin-American countries are not slow to take advantage of improved facilities, especially when these facilities can be secured at a discount.

Wireless Now From Automobile—A new portable type of complete wireless telegraph station has been recently exhibited to the Government officials in Washington, D. C. The outfit, which includes two telescopic towers, is carried on a large automobile truck. It has living quarters for twelve men. The two towers can be raised to an altitude of 200 feet by the same motor which propels the automobile truck. At night illumination is supplied by a small electric plant operated by the truck motor. The signal officers of the army are studying the wireless auto-truck, and in the event it stands the tests several may be purchased for the army.

Automobile Incorporations of the Week

AUTOMOBILES AND PARTS

Altoona, Pa.—Central Motor Car Co.; capital, $10,000. Incorporators: C. C. Baker, Albert C. Akers, G. M. Smith.

Boston, Mass.—W. C. Bates Co.; capital, $10,000; to do a general automobile business. Incorporators: William C. Bates, G. A. Kearsley, W. J. Munday.

Brooklyn, N. Y.—Ackerman & Baird, Inc.; capital, $10,000; to manufacture engines, motors, etc. Incorporators: Raymond P. Ackerman, Andrew D. Baird, Andrew D. Baird.

Camden, N. J.—Par-Keel Wheel Co.; capital, $100,000; to manufacture, buy and sell, and deal in automobiles. Incorporators: Frank S. Muzzey, F. Stanley Saurman, Frank A. Kuntz.

Chicago, Ill.—Rayfield Motor Sales Co. of Illinois; capital, $41,000; to deal in automobiles and accessories. Incorporators: R. C. Wheeler, C. L. Cobb, C. Barnes.

Lockport, N. Y.—Amper Electric Co. Incorporated; capital, $25,000; to deal in autos, auto locks, and switches. Incorporators: Theodore D. Robinson, Ernest W. Jones, Charles L. Nichols.

Milwaukee, Wis.—Creek Motor Sales Co.; capital, $25,000. Incorporators: R. A. Creek, Nora M. Creek, Willett M. Spooner.

Mt. Vernon, N. Y.—Motor Truck Mfg. Corp.; capital, $150,000. Incorporators: Arthur J. Albert, Henry Hilchenbach and Louis Bertsch.

Providence, R. I.—Lister, Smith & Walsh Co.; capital, $50,000; to do a general automobile business. Incorporators: James J. Lister, Herman R. Smith, Wilbur R. Walsh.

Providence, R. I.—Savoie Tire Co.; capital, $10,000; to deal in automobile and other tires. Incorporators: Joseph Savoie, Edward C. Clines, Harry D. Reed.

Ravenna, O.—Ravenna Motor-Truck Co.; capital, $200,000. Incorporators: W. F. Traves, A. H. Knuth, H. Schwartz.

Rochester, N. Y.—Carthage Auto Co., Inc.; capital, $5,000. Incorporators: Frederick A. Kuhnert, Arthur W. Alderman and Chas. L. Pierce.

Saratoga Springs, N. Y.—Ross Ketchum Co., Inc.; capital, $18,400; to deal in automobiles, motorcycles, bicycles, motor boats and motor vehicles. Incorporators: J. Arthur, P. Ketchum, Norman B. Ross, James W. Northrup.

Thomasville, N. C.—Thomasville Motor Co.; capital, $5,000. Incorporators: T. J. Finch, B. F. McCuister and Z. V. Crutchfield.

Trenton, N. J.—Taxi Service Co.; capital, $25,000; to do a general automobile business. Incorporators: H. W. Snook, F. J. Butter, C. H. Naylor.

Wilmerding, Pa.—Valley Rapid Motor Co.; capital, $5,000. Incorporators: John Genre, Dominick Genre, H. F. W. Rentzel.

Worcester, Mass.—Overland Winton Sales Co.; capital, $10,000; to do a general automobile business. Incorporators: H. T. Pierpont, Geo. F. Daller, J. Clarke, Jr.

GARAGES AND ACCESSORIES

Amesbury, Mass.—Walker, Wells Co., Inc.; capital, $25,000; to manufacture automobile bodies. Incorporators: H. P. Wells, James H. Walker, H. Miller.

Bangor, Me.—Penobscot Garage Co.; capital, $10,000. Incorporators: Charles H. Shorey, Amos J. Shorey, G. D. Shorey.

Boston, Mass.—Arco Rubber Co.; capital, $15,000; to deal in rubber goods, tires, etc. Incorporators: L. D. Apsley, H. G. Cressinger, F. E. Black.

Boston, Mass.—Peabody Square Garage Co.; capital, $5,000. Incorporators: John T. Duke, J. J. O'Keefe, M. A. Duke.

Brooklyn, N. Y.—Peerless Radiator & Auto Lamp Works, Inc.; capital, $5,000; to deal in auto lamps, parts, supplies, etc. Incorporators: Max Stadlen, Luis Schapiro, Bernard Wolfensohn.

Brooklyn, N. Y.—Cumberland Garage, Inc.; capital, $25,000; to deal in automobiles, etc. Incorporators: A. Wilmarth, W. L. Gray, M. F. Wilmarth.

Brooklyn, N. Y.—National Auto-Radiator & Lamp Works, Inc.; capital, $10,000. Incorporators: Jacob Samas, Julius Pasternack, Milton J. Gordon.

Camden, N. J.—American Silencer Co.; capital, $50,000; to manufacture devices for silencing automobiles. Incorporators: F. R. Mansell, Geo. H. B. Martin, S. C. Seymour.

Charlestown, W. Va.—Kanawha Garage Co.; capital, $5,000; to conduct a garage for the hire of automobiles and other vehicles to the public. Incorporators: H. M. Bertolett, George Morrow, W. E. Waybright, J. H. Ford and Leroy Allebach.

Chicago, Ill.—Chicago Original Auto Polo Co.; capital, $6,000; to operate places of amusement, and also deal in automobiles. Incorporators: Jos. R. Dcahl, Frederick W. Moore, Marie C. Subr.

Cleveland, O.—National Garage Co.; capital, $20,000. Incorporators: R. D. Morgan, E. G. Nally.

Columbus, O.—New Columbus Auto Co.; capital, $30,000; to do a general repair business. Incorporators: Jesse J. Brown, Lillian Brown, Wm. E. McGannon, Chas. E. Dennis, Edson B. Dennis.

Cleveland, O.—Eaco Auto-Lock Sales Co.; capital, $5,000. Incorporators: W. G. Wells, Ralph W. Fellows, Charles Pugh, M. P. Carrig, Stewart Hart.

East Orange, N. J.—Norwood Garage, Inc.; capital, $10,000. Incorporators: Walter C. Jacobs, Dwight R. Davies, Louis Boehme.

Far Rockaway, N. Y.—Far Rockaway Motor Vehicle & Cab Owners Association, Inc.; capital, $500. Incorporators: James Harris, Edward J. C. Kelly, Harry Traver.

Hartford, Conn.—Hartford Auto Pump & Supply Co.; capital, $50,000. Incorporators: Henry F. Schwarb, Edward E. Tryon, Thos. Lockwood.

Indianapolis, Ind.—Motor Starting Mfg. Co.; capital, $40,000; to manufacture a motor starting device. Incorporators: W. J. Sylvester, Samuel Brundage, H. J. Herff.

Indianapolis, Ind.—T. M. S. Mfg. Co.; capital, $25,000; to manufacture a combination front fork and shock absorber. Incorporators: F. M. Strong, W. J. Gemmill, L. W. Mellette.

Newark, N. J.—Puncture Cure Sales Co.; capital, $50,000; to deal in devices for repairing tires. Incorporators: Frances B. Stewart, Howard F. Kirk, Chas. H. Stewart.

New York, N. Y.—Star Taxi Cab Co., Inc.; capital, $2,500. Incorporators: H. T. Silverman, Nathan Waxman, James B. Vaughey.

New York, N. Y.—Forty-seventh Street Taxi Cab Co., Inc.; capital, $500. Incorporators: Thos. G. Corvan, James E. Corvan, Jerome P. Corvan.

New York, N. Y.—Auto Center Inc.; capital, $25,000; to do a general garage business. Incorporators: E. W. Forrest, C. H. Fuller, B. C. Thomas.

New York City, N. Y.—Tioma Oil & Grease Co.; capital, $50,000; to deal in greases, lubricating oils, etc. Incorporators: E. J. Forham, F. B. Knowlton, J. J. Harper.

New York, N. Y.—No-Shock Wheel Co.; capital, $400,000; to deal in automobile wheels. Incorporators: J. W. Ebbs, R. H. Waddell, A. A. Kelly.

Philadelphia, Pa.—Franco-American Safety Tire Co., of Philadelphia; capital, $100,000; to deal in automobile tires. Incorporators: Emile LeFevre, Eugene Wolf, Armand Gallard.

Richmond, Ind.—Sedgwick Mfg. Co.; capital, $10,000; to manufacture the Sedgwick lifting jack for motor cars. Incorporators: James H. Judson, Richard Sedgwick, J. R. Sedgwick.

Rochester, N. Y.—Zimbrich Taxicab Co., Inc.; capital, $3,000. Incorporators: Fred Simmons, Alexander G. Wall, Herman J. Zimbrich.

Rochester, N. Y.—Stein Auto Supply Co., Inc.; capital, $3,000. Incorporators: Andrew E. Stein, Harry E. Pramer, Louise M. Stein.

Rockaway Beach, N. Y.—Seaside Garage Inc.; capital, $5,000. Incorporators: Patrick H. Morrison, Anthony Hauser, Jennie Morrison and Louise Schilling.

Savona, N. Y.—Kirkham Aeroplane & Motor Co., Inc.; capital, $100,000. Incorporators: Edwin H. Skinner, Chas. B. Kirkhs, Stanley I. Vaughn.

Yonkers, N. Y.—Broadway Auto Supply Co., Inc.; capital, $5,000. Incorporators: Frederick J. Snyder, Pauline A. Snyder, Bernard E. Reardon.

CHANGES OF CAPITAL AND NAME

Dayton, O.—Air-Friction Carbureter Company; capital increased from $20,000 to $30,000.

Toledo, O.—Rapp Mfg. Co.; change of name to Toledo Spark Plug Mfg. Co.

Looking north in Grand Hall; in the foreground is seen the arrangement of the passenger car exhibits flanked by 25-foot Bermuda palms. The turret-shaped sign posts may also be seen. In the background is a huge painting of the entrance to the Palace of Nebuchadnezzar

The Boston Show

Most Elaborate Exhibition Ever Held in New England

By J. Edward Schipper

BOSTON, MASS, March 8—On Saturday, March 8, the doors of Mechanics' Hall were thrown open on the biggest and most elaborate automobile show that has ever been held in New England. Over the 105,000 square feet of floor surface were distributed more than 400 passenger cars and 1,116 useful automobile articles, the products of 232 accessory manufacturers. Last year's show, which exceeded every previous exhibition, had a total of 242 pleasure cars and chassis on exhibition. This year there are over 50 per cent. more cars than last year.

Chicago had a total of ninety-nine pleasure car exhibitors. New York had eighty-eight. Boston has 103 different makes on the floor. Chicago had 205 accessory exhibitors, twenty-seven less than Boston. New York had 340 accessory manufacturers who showed their products at the Palace or Garden. This is 118 more than Boston.

The Boston show, which used to be considered the big accessory exhibition of the year, no longer holds sway in this particular. New York, with its multitude of small accessory plants scattered about the metropolitan district, exceeds it in this respect. As for a pleasure car show, however, the status is different. Boston exceeds both New York and Chicago in the number of exhibits. In total exhibits New York ranks first with 467, Boston second with 345 and Chicago third with 304.

Boston is the big dealers' show of the year. They come from all New England and the southern border of Canada to close agencies, to make arrangements for the approaching season and to confer with the Boston office which, in most instances, is the central distributing point for this section. The dealers' territory covered by the Boston show runs as far south as Bridgeport, north to the Canadian border and west to Pittsfield. Practically every dealer in this territory is represented at the show by one or more members

Show Facts

¶*More than 400 passenger cars are distributed over floorspace of Grand Hall and Exhibition Hall*

¶*Every inch of the 105,000 square feet of floorspace available has been taken up by cars or accessories*

¶*Boston has 345 exhibitors and ranks second, New York having had 467 and Chicago 304 at this year's shows*

¶*The decorations were done by renowned scenic painters and decorators at a cost of $45,000*

South end of Grand Hall, showing the magnificent painting of the Hanging Gardens of Babylon. These gardens were constructed by the Babylonian king to please his Medean bride and to satisfy her yearnings for the tropical splendor of her native land

of his selling organization. Advantage is taken of the time to hold conferences and the hotels in back-bay Boston are thronged with visiting members of the automobile and allied trades.

Mechanics' Hall does not lend itself readily to decorative effects but this year the committee has outdone itself. At a cost of $45,000 the interior of the historic building has been transformed into a huge garden. Grand Hall, the main section of the building, forms the center of the decorative scheme. The motive of this section represents the hanging gardens of Babylon.

The Babylonian king in order to satisfy the yearnings of his bride, a Medean princess, for the luxuriant gardens of her youth transformed the barren wastes about the palace into a scene of tropic splendor. The main floor scene represents one of these gardens. An array of Bermuda palm trees 25 feet in height borders the center space while from the terraces of the hanging gardens illuminated waterfalls give a striking effect. At each end of the hall is a huge scenic painting. At the north end is the entrance to the palace. Nebuchadnezzar's tribute to his Medean bride, painted by Walter Burrage. In the center of this garden is an electric cascade which gives an intensely realistic effect to the work. The remainder of the building has been decorated on the scene of the gardens 100 years ago. Colonial pillars from which hang festoons of garlands and electric

The exhibits were labeled by a series of turret-shaped posts containing an illuminated semi-opaque glass sign. Swinging beneath the sign is a fern cluster which adds greatly to the decorative effect of the hall. The numerous sign posts of this nature diffusing a soft white glow gave a well-illuminated and rich appearance to the hall, forming a splendid setting for the cars

lights. The idea of separating the exhibitors throughout these spaces by the white picket fences, so common in colonial times, is in tasteful keeping with the general outdoor scheme.

More than 30,000 people saw the show on opening night. The total attendance at the show last year was 227,108. At the 1911 show it was 146,343. It is probable that last year's figures will be exceeded. Last year every car on the floor of the hall was sold at the exhibition. According to figures compiled by the management of the show 1,498 cars were sold as a direct result of the 1912 display.

Chester I. Campbell, manager of the show, has sent out over 3,000 letters to dealers inviting them to attend the show. It is stated that practically every dealer in the territory will respond. With very few exceptions these dealers bring prospects with them. Many have been invited to the show by the dealers themselves. The business predictions throughout the show are extremely optimistic.

The growth of the Boston shows, of which this is the eleventh, is of great interest and the following table shows the increase in attendance since the first was held in 1902:

Shows	Attendance
First, 1902	17,350
Second, 1903	30,000
Third, 1905	47,000
Fourth, 1906	51,000
Fifth, 1907	56,260
Sixth, 1908	69,371
Seventh, 1909	91,007
Eighth, 1910	107,000
Ninth, 1911	146,343
Tenth, 1912	227,108

General view of Grand Hall which illustrates the garden-like atmosphere created by the Bermuda palms. One of the most novel features is the waterfalls which rippled from the terraces to the pools on the main floor. Glass foundations make these fountains beautiful

The possibilities of New England as an automobile field are vast. With its large prosperous population, the pleasure car finds a ready sale throughout the entire territory. The roads in most of the states, where the natural difficulties due to mountainous country are not too great, are excellent.

There are at present 94,334 automobiles registered in the six states of New England. With its enormous population and with the number of large cities that are included in this section of the union, this does not represent half of what there will be eventually. Within the next 2 years the dealers will find that New England will purchase thousands of cars. The prosperity of the country and its accessibility will render it remarkably responsive to the vigorous campaign that the dealers of this section of the country are only beginning to wage. Massachusetts, including as it does Boston and other large centers, has the largest registration in New England. The others follow in the order named:

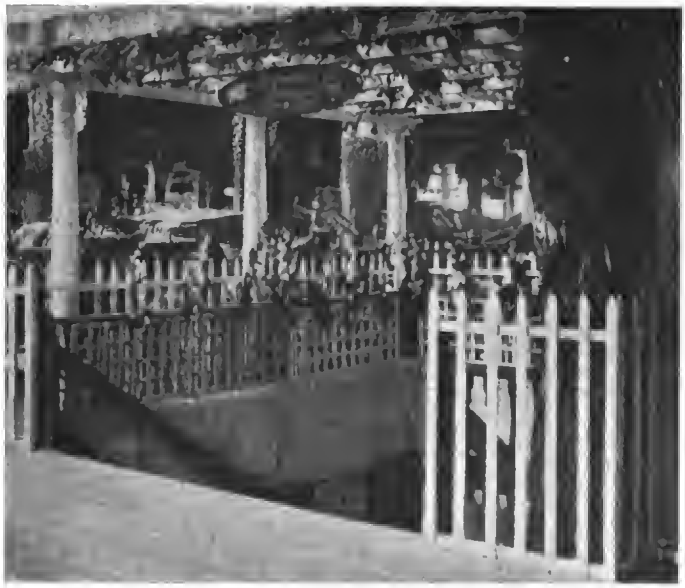
State	Registrations
Massachusetts	51,229
Connecticut	17,950
Maine	7,743
Rhode Island	7,565
New Hampshire	5,764
Vermont	4,183
Total	94,334

With its enormous population, New England can stand three times this number of cars. Connecticut, in spite of its magnificent touring country and fine roads, has less than seven cars to every 1,000 of its population. Massachusetts with its large number of people of the wage-earning class has over seventeen cars to every 1,000 people.

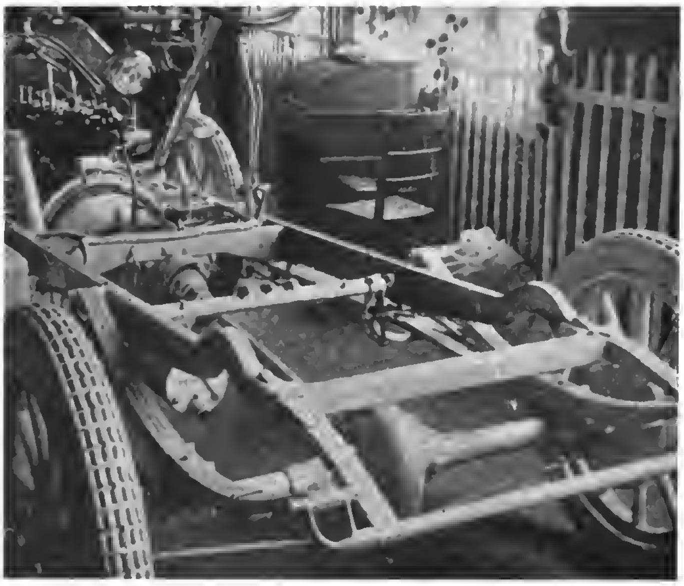
Exhibition Hall is arranged to represent the garden of a century ago. White picket fences serve to separate the different exhibits while old-fashioned hollyhocks, honey flowers and blue-bells cling to the fences. An out-door effect created by vine-clad arbors which practically cover the center aisle. The exhibits are grouped beneath the arbors and along the white picket fences which go to make up the effect of a garden

The field of the electric car in this vicinity is large. Boston, with its traffic difficulties, almost requires electric cars if women are to drive them through the streets. The impossibility of stalling in traffic, the ease of control and the accessibility and number of suitable charging stations renders them particularly desirable. The possibility of attending the theater in an electric, leaving the car parked in a suitable place and then, after the play is over, getting into the electric and going home, appeals to a large class of buyers who could afford to have electrics as well as gasoline cars.

The accessory show in Boston is most complete although the many devices seen displayed on the balconies and in the basement were in the main familiar to those who have studied the situation this year, there were many new and useful implements with which the automobilists have been heretofore unacquainted. The Boston Show in spite of the fact that the number of accessories exhibited may not be as great as that in New York, is still looked upon as the big accessory show of the year. Throughout New England many prosperous plants are devoted entirely to the manufacture of inexpensive tools and equipment for the use of automobilists. These they show in Boston knowing that it is the one exhibition



Stair leading to basement from main floor of exhibition hall



Moyer car with novel spring suspension which attracts attention

which reaches both the dealer and consumer at the same time.

The big accessory houses of New England always have space at the Boston Show and it is rare that some of these concerns have not some new device of interest to the automobile user or to the garageman.

A fact which is worthy of attention is that a large number of accessories designed for specific low-priced cars were exhibited. Tire removers, lighting outfits, gasoline gauges for Ford, Metz and other small cars could be seen at the tables of all the jobbers' exhibits and in many instances these special accessories are shown at the booth of manufacturers.

Exhibits of interest to a garageman are also numerous. In the basement there are a number of gasoline tanks and oil storage devices showing methods of handling the volatile fuel and other liquids in a cleanly and economical manner. There are large air compressors for garages to be seen and a carbon remover by means of which the carbon is burned from the cylinder by the use of a carbon-consuming gas.

Motorists' clothing is shown in the rooms just off the balcony around the main hall. It may be remarked that the exhibitors in this line did not follow the lead of the other exhibitors in making their exhibition seasonable. The fact that spring will be soon with us and that automobilists are now preparing for warmer weather was not noticed. This is evidenced by the fact that on every hand are to be seen fur coats and heavy gloves.

The bodies seen at the show are generally of the touring type, the closed cars being confined to the electrics and in a very few cases to the higher-priced gasoline car. The Locomobile company has a noteworthy exhibit in this line, a handsome town car finished in beautiful upholstery with silver mountings being shown.

Many roadsters of racy lines are to be seen evidencing the fact that this style of car is gaining in popularity. Fiat, Pathfinder, Stutz and others have distinct models shown which attracted much attention on opening night. These roadsters are of semi-racing design fitted in some cases with no windshield end in others with an elliptical shield clamped to the steering column. The tires are carried on the rear deck or on brackets in the rear of the car. The carrying of tires on the side has been practically eliminated in cars of the race-about type.

One car new to the shows on the big circuit this year is the Moyer. This car is unique owing to its peculiar spring suspension. The illustration on this page shows it clearly. The rear spring is what may be called a separated three-quarter elliptic. It is composed of a half-elliptic spring suspended between two oscillating cross bars which extend across the chassis, and a quarter-elliptic spring which forms the rear member and which is attached at one end to the chassis frame and at the other end to the rear cross bar.

Out of the 103 makes of passenger cars exhibited there are not more than seven makes of electric. There are twenty-five large makers of electrical vehicles in this country and it is strange that more have not taken advantage of the Boston Show to exhibit their wares to the New England market. As has been stated the electric is popular in this part of the country and a big market is found for this type of vehicle. Those shown are of coupé design in most instances and make ideal cars for theater or shopping use or wherever ladies are driving through traffic. The electric exhibits at the Boston Show attract considerable attention and the salesmen have been kept busy answering inquiries ever since the doors were opened.

As at New York and Chicago the principal inquiry made by visitors to the booth of those exhibiting passenger cars relates to the cranking and lighting equipment. The design and construction of the car itself is taken for granted and the attention of the attending purchaser is focused largely on general appearance and equipment. Cars selling above $1,000 are with few exceptions equipped as well as the much higher-priced makes, the only difference being in the luxuriousness of the upholstery and finish. As far as starters are concerned the electric predominates even in the lower-priced makes. Some of the higher-priced cars, however, are fitting an acetylene priming device in addition to the electric starter.

It is too early in the show to predict accurately its value from a business standpoint. It is the consensus of opinion, however, among dealers that the show is more seasonable from a selling standpoint than either that held at New York or Chicago. Touring cars bodies are far in the majority and it was stated by several that where purchases were made 95 per cent. would be of this type. With the approach of warmer weather the desire of owning an automobile becomes stronger and the enthusiasm created by the show is all that is needed to lead to many a purchase. Last year every car on the floor of Mechanics' Hall was sold before the doors closed, and with the ever-growing attendance it has been but natural that those exhibiting expect good results from a business standpoint.

While the show is going on at Mechanics' Hall an Importers' Automobile Salon is being held at Copley-Plaza Hotel, at Copley Square, Boston. The exhibitors are the Benz, Metallurgique, Lancia, Isotta-Fraschini, De Dion, Bouton, Minerva, Mercedes. These are all selling more than one chassis. Benz and Lancia each having two while Mercedes has nine different models, one of which is a Knight. Isotta-Fraschini has five. This ball-room exhibition is being attended by many prominent Bostonians.

Twenty Racing Cars Entered in French Grand Prix

PARIS, FRANCE, March 5—All entries are now closed for the French Grand Prix race at Amiens on July 12. The list comprises twenty cars, of which two were entered at the last moment on payment of double fees. These eleventh-hour entrants were a six-cylinder Excelsior, which will probably be driven by Arthur Duray, and a Th. Schneider to be handled by Rene Thomas, who was a member of the Peugeot team last year. It was expected until the last moment that the Fiat would enter a team of cars for this race. The German firms, Mercedes, Opel, and Benz also boycotted the contest and although the Belgian and English agents of the Mercedes company made every effort to put a team of cars in the race the factory persistently refused to give their consent. Although the number of entries is small, this fuel consumption race will not be lacking in interest, for a very fast short course has been selected in the suburbs of Amiens, and the Racing Board of the French Club has made such arrangements that the event will be more spectacular than any previous race held in France. The entry list, with the names of the drivers so far as they are known, is as follows:

1	Sunbeam, Victor Rigal	11	Itala, ——
2	Sunbeam, Gustave Caillois	12	Itala, ——
3	Sunbeam, W. Lee Guinness	13	Itala, ——
4	Sunbeam, Darius Resta	14	Opel, Joerns
5	Peugeot, Georges Boillot	15	Th. Schneider, Champoiseau
6	Peugeot, Jules Goux	16	Th. Schneider, Gabriel
7	Peugeot, Paul Zuccarelli	17	Th. Schneider, Rene Thomas
8	Delage, Bablot	18	Th. Schneider, ——
9	Delage, Albert Guyot	19	Excelsior, Christiaens
10	Mathias, Mathiss	20	Excelsior, Arthur Duray

The French light-car race will be held at Boulogne, Sunday, September 21, and is for cars of 183-inch piston displacement, the maximum weight being 1,984 pounds. The circuit is 32.3 miles and the distance is 452 miles, or fourteen laps.

Hudson Wins as Ice Racer

STOCKHOLM, SWEDEN, March 6—America scored its first motor car victory in Sweden during the annual winter ice racing classic. The first prize for the kilometer race was captured by a beautiful 1913 Hudson car. The distance of 1 kilometer from a standing start was covered by the fleet automobile in 40 seconds. The rate of speed was a mile in approximately 65 seconds.

An American car won second position at the finish, the Cadillac finishing the kilometer in 45.4 seconds.

Quakers Prepare 30-Day Run

PHILADELPHIA, PA., March 10—The touring information department of the Automobile Club of Philadelphia 2 days ago started a Multiplex car on a 30-day, sealed-bonnet run. The car will travel from Philadelphia to Harrisburg and back, making 210 miles every day and the seal on the bonnet will be broken once in every 1,000 miles so as to permit of tightening up the dynamo and fan belts.

Smada Car for May 30 Race

INDIANAPOLIS, IND., March 10—With twelve formal entries to date the entry list for the 500-mile race at the Indianapolis Motor Speedway, May 30, looks very promising. The latest entry is by F. L. Adams of this city who will drive a specially built car known as the Smada. The car will have a four-cylinder motor, with the cylinders 3.5 by 5 and a piston displacement of 384.8 cubic inches.

Raymond Heads Badger Contests

MILWAUKEE, WIS., March 10—William H. Raymond, president of the Wisconsin State Automobile Association during 1912, has been designated as Wisconsin representative on the contest board of the association, thereby supervising all sanctioned contests to be conducted in Wisconsin during 1913. Mr. Raymond is treasurer of the Milwaukee Automobile Club.

Akron Strike Conditions Becoming Normal

Leaders of the I. W. W. Still Struggling To Keep the Remnants of Their Organization Together

Tire Plant Officials State That Fully 75 Per Cent. of the Strikers Are Back at Work

AKRON, O., March 10—Local and imported I. W. W. leaders are still struggling to keep the remnants of their organization together in connection with the rubber strike in this city. However, hundreds of strikers who have been marching under the I. W. W. flag a week ago have broken away and are now back at work. The strike leaders claim 5000 followers, but their strength is about 1000, as shown by their parade last Saturday, and of these 1000 in line 300 were imported and another 300 had never seen the inside of a rubber factory.

At the Goodrich, Goodyear, Firestone and other local plants the head officials state that hundreds of men have returned to work and that conditions are fast becoming normal. Goodyear has announced that night shifts will start at once. In general the manufacturers claim that of the 25,000 factory help, fully 75 per cent. are back at work. There are hundreds of others who are apparently afraid of being attacked if they return to their jobs.

Strikers Are Still Violent

Three hundred reserves are here from all over the country and are known as the Strong Arm Squad. For nearly a month the I. W. W. leaders have been preaching violence. They have said that "other countries have been overthrown and that the United States must be overthrown." They have carried red flags through the streets and have defied the police. They have prepared a new scale and have sent it to the manufacturers. The demands made by the strikers have been characterized as absurd.

Since the strike commenced the first real violence occurred Friday night when the strikers, 500 in number, gathered at the Goodrich plant and defied the police to move them on.

Saturday noon it was announced that the leaders would "put on the San Diego work." A parade started for the Goodrich plant. Police and deputies under Sheriff Fergusson charged the strikers after they had refused to move on. A fierce fight followed. Clubs and rocks were used by the strikers and the police had to resort to their clubs. After the charge was over it was found that many had been injured. One man was taken to the hospital. The police made many arrests.

Sunday afternoon the I. W. W. strikers and the strong-arm squad held a meeting. They denounced the police and said they would continue to defy the law. Orders were issued to march down on the Goodrich again. The police and deputy sheriffs made preparations to meet any emergency that might arise.

In the meantime the Senatorial Probe committee is yet at work. A midnight session was held Saturday after an all day session. The senate committee expects to complete its investigation this week. Up to the present time F. A. Seiberling, president of the Goodyear Tire & Rubber Company, and H. S. Firestone, president of the Firestone Tire & Rubber Company, are among the manufacturers who have been before the senate probe committee. A dozen or more of the strikers and a few of the I. W. W. leaders have also testified before the state committee. Among the leaders was George H. Speed, chief organizer of the I. W. W. Mr. Speed closed his testimony before the state committee with these words: "There is but one bargain that the I. W. W. will make with the employing class—Complete surrender of all control of industry to the organized workers. In short, the I. W. W. advocates the use of militant direct action tactics to the full extent of our power to make good."

This defiant statement was like the dropping of a bomb in the senate probe room. Members of the committee openly commented on it. Mr. Speed told the state committee that the factories belong to the strikers and that they would take them.

So far but one witness has testified before the committee that has in any way had a tendency to show that the I. W. W. strikers have any grounds for grievance. That witness was a girl who was before the committee Saturday night. She testified that one day she received 32 cents for 10 hours on piece work. It was also shown that she was sickly and had often been in the hospital at the plant. Another girl testified that her average pay for 2 weeks was $23. One of the I. W. W. leaders who has been before the state committee and testified that conditions are bad in the factories has since denounced the I. W. W. and has withdrawn from the order.

H. S. Firestone, president of the Firestone Tire & Rubber Company, was before the committee all day Saturday. He testified that the average monthly earnings of his employees, outside of the superintendents, department foremen and assistants on salary, for the month of January was $66.65. He placed the average monthly earnings at $64.95.

Mr. Firestone said that while he was at all times ready to meet with his employees that he would never meet with any committee from the I. W. W. He told the senate committee that he had what he considered to be the best rubber plant in the country. He invited the state committee "to come and see for yourselves." Other manufacturers told the committee the same thing. The committee will make a tour of investigation some day this week.

Members of the Grand Army have become so incensed at seeing the red flag carried through the streets by the I. W. W. men that the former commander of Puckley Post, R. F. Palmer, has made this announcement: "I am authorized to announce that the services of 200 members of the local G. A. R. are at the service of the sheriff to assist in putting down this riot of Red Revolutionists in Akron. Let us have peace first. We can settle our differences afterward."

Following are the demands made by the strikers at Akron:

1st. That all employees now on strike shall be reinstated in their old positions and not be considered as new employees.
2nd. That the union workday shall be one of eight hours, six days in the week.
3rd. That all workers shall be paid double time for overtime.
4th. That all male and female employees shall be paid not less than 22½ cents an hour.
5th. That all male inspectors shall be paid not less than 55 cents an hour.
6th. That all female inspectors shall be paid not less than 30 cents an hour.
7th. That all inspectors shall be experienced men and women.
8th. That all tiremen, machine men and finishers shall be paid not less than 55 cents an hour.
9th. That all apprentices in the pit shall be paid not less than 30 cents an hour.
10th. That all men curing tires shall be paid not less than 60 cents an hour.
11th. That all truckers trucking tires or cores shall be paid not less than 60 cents an hour.
12th. That all tire buffers, cementers, treaders or wrappers shall be paid not less than 55 cents an hour.
13th. That all tube builders, ply cutters, or tread cutters shall be paid not less than 50 cents an hour.
14th. That all stock carriers shall be paid not less than 45 cents an hour.
15th. That all calender men shall be paid not less than 50 cents an hour.
16th. That all wind-up men shall be paid not less than 55 cents an hour.
17th. That all mill men shall be paid not less than 50 cents an hour.
18th. That all wind-up men shall be paid not less than 55 cents an hour.
19th. That all mill men shall be paid not less than 50 cents an hour.
20th. That all feed men shall be paid not less than 45 cents an hour.
21st. That all wind-up helpers shall be paid not less than 42½ cents an hour.
22nd. That all extra helpers on calenders shall be paid not less than 42½ cents an hour.
23rd. That all tire men shall be paid not less than 25 cents an hour to start.
24th. That experienced tire men shall be paid not less than 55 cents an hour.
25th. That electricians shall be paid not less than 40 cents an hour.
26th. That all first class electricians' helpers shall be paid not less than 30 cents an hour.
27th. That all second class electricians' helpers shall be paid not less than 25 cents an hour.
28th. That all electricians' apprentices shall be paid not less than 20 cents an hour.
29th. That all oilers and motor tenders shall be paid not less than 27½ cents an hour, and that electricians shall have double pay for Sunday and holiday work.
29th. Steam fitters, pipe fitters shall be paid 45 cents an hour.
30th. Steam fitters' helpers shall be paid 35 cents an hour.
31st. All straight wrappers, cross wrappers, pulling and blowing on tubes and cutting tubes shall be paid 50 cents per hour.
32nd. Bag rollers and pulling tubes shall be paid 40 cents an hour.
33rd. All first-class machinists shall receive 60 cents an hour.
34th. All erectors and bench hands shall receive 50 cents an hour.
35th. All handy men shall receive 40 cents an hour.
36th. Machinists and helpers shall receive double time for Sundays and holidays.
37th. All men employed making beads shall receive 50 cents an hour.
38th. All foremen shall receive not less than 50 cents an hour.
39th. All motorcycle tire builders, whether hand or machine men or finishers, shall receive the same as automobile tire men—55 cents an hour.

All girls working in rubber factories at flat rates and no piecework shall receive not less than $14 per week.

If working on a piecework basis they shall receive a 25 per cent. increase over the standard piece in their respective departments in January, 1912.

Any and all departments not represented in the foregoing scale, either male or female employees—shall receive an increase of 25 per cent. over standard price for piecework in January, 1912.

When the company is in any way at fault for employees not putting out required amount of work per hour, they shall receive the usual price per hour as when running full capacity.

All day work labor shall be rated at not less than 30 cents.

Wages Are Higher Each Year

In an open letter to the public Mr. Frank A. Seiberling, president of the Goodyear Tire & Rubber Company, has said: "Every year since we have been in business the average wage paid our people has been higher than that of the preceding year and 1913 will be no exception. Our record for fair treatment in the past is a guarantee for the future. Akron's industries have already been sufficiently crippled and its people have suffered enough distress to satisfy any one with a sober judgment that nothing of value can possibly be gained by a continuance of existing conditions. Let us all get to work again, and the time will show that most of our troubles have been imaginary and that those that are real will be fairly adjusted in the ordinary course. Perhaps one feature of value has come out of it all; namely, the pricking of the bubble of fictitious values on the stocks of the various corporations. Speculators have carried the value of Goodyear common stock to a basis of $465 per share. It is now around $350, while its intrinsic valne is approximately $125. Let this good work go on, and we will not have as much false reasoning when the fictitious basis of value has been properly exploded."

Mr. Seiberling was before the state committee an entire day. He reviewed the history of his plant and urged the committee not only to come and see for themselves but to have their expert accountant look over the books of the company. He denied the insinuations and charges by the strikers that his employees were poorly paid, that the sanitary conditions were bad, that his employees were unfairly treated and that a blacklist was in vogue at his plant.

In his testimony before the state probers Mr. Seiberling said: "I don't think there ever was a company started in Akron that has made such a record as that of the Goodyear company. We started with practically nothing and we have built up a great business. We have not one drop of water in our security out. We did a $25,000,000 business last year and it took $17,000,000 capital to handle the business."

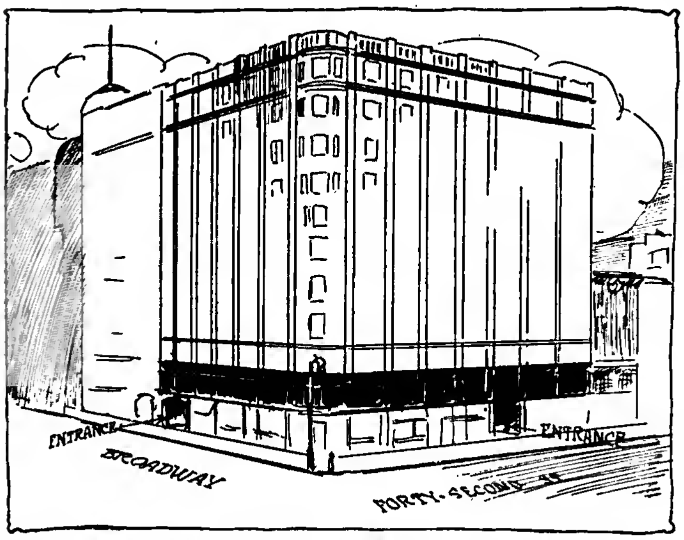
Mr. Seiberling, as did also Mr. Firestone, denied emphatically that there is a combine on among the rubber men of Akron to maintain prices. Mr. Seiberling told how his company has spent $20,000 in installing a water system at his plant and that a hospital was built on top of one of the buildings at an expense of $6,000. Dining rooms have also been installed. He also told of the establishment of a welfare department at his plant where 6000 people are employed at the high point.

"We have in the United States," said Mr. Seiberling, "approximately ninety concerns engaged in all kinds of rubber business, with a capitalization of approximately $300,000,000, doing a volume of business approximating $250,000,000. We have in Akron a capitalization approximating $110,000,000, doing a business of $90,000,000, divided among seven concerns."

Form New York Automobile Center

New York City, March 10—The Antomobile Center, Inc., has been formed in order to give New York a permanent accessory exhibition at a locality where it is bound to attract the attention of a large number of people interested in automobiles. The second floor of the Longacre Building, Broadway, Forty-second street and Times Square, has been selected for this purpose. The floor has a floorspace of more than 10,000 square feet, with 103 feet frontage on Broadway and 115 feet on Forty-second street. The floor is divided into a number of spaces by the nature of its construction, the ceiling being supported on columns.

Due to its location at a corner where about 750,000 people pass during a day, the Automobile Center affords a bright outlook. The spaces will be rented to various accessory makers from week to week, and even now, 2 weeks in advance of the opening of the place, 65 per cent. of the space has been disposed of. The place will be open daily from 8 a. m. to 12 p. m., being accessible and attractive to the majority of passengers arriving on the New York Central, Pennsylvania and Long Island railroads, to say nothing of people on Broadway. Another scheme is a service for assisting cars having accidents within 30 miles of the city.



The entire second floor of the Longacre building at Forty-second street and Broadway is to be occupied by the proposed automobile center

Washington Roads Convention a Success

Delegates from Various Good Roads, Civic, Motoring and Other Organizations Were In Attendance

National Construction of Roads Was the One Thought—Senators and Congressmen-Elect Give Addresses

WASHINGTON, D. C., March 7—The 2-day convention called for federal aid in good roads construction at Hotel Raleigh, in this city, came to a most successful conclusion this evening. Delegates from various good roads, civic, motoring and other organizations were in attendance from forty-two states in the union. Many senators and congressmen-elect were present, and a portion of 1 day entirely given over to their addresses on the subject of national road construction.

This convention will be recorded as one of the most successful in the history of the national road-construction movement in that it was attended by delegates who are working tooth-and-nail on some good roads movement in their own locality. Some of them are presidents of local highway organizations for cross-state or other inter-territorial highways; several are representatives of civic clubs and chambers of commerce that are actually building roads. This was a convention of business road men who came inspired with a single purpose, namely, securing national construction of roads. Because of this every session was well attended. Thursday's sessions began promptly at 10 o'clock and ended at midnight. Today's sessions were equally businesslike.

The legal aspect of national road construction received much attention and it was settled to the satisfaction of all that the building of national highways and the maintenance of them by the Federal Government does not in any way interfere with the constitution, but rather that power is given in the constitution for the construction and maintenance of such highways. Lawyers, senators and congressmen were equally agreed on this.

The first essential in securing national road construction is the proper presentation of the question before Congress. At present the only avenue of presentation is through the standing committee of the Department of Agriculture. That there should be a standing committee on national road construction and maintenance was accepted by all, and the first step in securing such a committee was taken by the committee on resolutions, which drafted the following, which was adopted:

"Whereas, Federal aid for good roads has become of such national interest and importance, and whereas the second national aid for good roads convention feels that this subject should be resolved by Congress with the greatest care, therefore, be it resolved, that Congress be respectfully requested to create a standing committee on national roads."

Further resolutions adopted were: "That we recommend our federal government to build and maintain an inter-state system of highways connecting the capitals of the various states and with the national capital." And be it further resolved: "That we advocate the creation wherever they do not now exist of effective state departments of highways in the various states, and that a copy of this resolution be forwarded to the governor of each state."

One of the most important aspects of the convention was the various reports from presidents of more than a dozen of the highway associations which have been organized during the last year for the improvement of state, territorial and inter-territorial highways. Among these organizations represented were: National Trails Ocean-to-Ocean Road, Quebec-Miami International Road, Lakes-to-Gulf Road, Meridian Road, Pacific Highway, Southern Transcontinental Highway, Santa Fé Trail, Memphis-to-Bristol Highway, Cross Arkansas Highway, Omaha-Denver Good Roads Association, Platte Valley Transcontinental Road, Iowa River-to-River Road, Crest of the Blue Ridge Highway and Park-to-Park Road.

Weed Infringement Suits

Whittaker Chain Tread Co. and E-Z-On Chain Tire Protector Co. Are Defendants

Complainant Recently Obtained Preliminary Injunctions Under Parsons Patent No. 723,299 on Chain Grips

BOSTON, MASS., March 10—The Weed Chain Tire Grip Company has recently obtained preliminary injunctions under Parsons patent No. 723,299 on chain grips against the Whittaker Chain Tread Company. in Boston and against the E-Z-On Chain Tire Protector Company in Chicago.

The papers in the Whittaker suit show that the Whittaker company has for some time been making and selling the Whittaker, Besdam, Empire and other chain grips. The Weed Chain Tire Grip Company brought suit some time ago against the E. J. Willis company in New York, a distributor of the Whittaker company's grips. The defense of this suit was assumed by the Whittaker company and its officers, Stillwell G. Whittaker and Clinton E. Hobbs. The Willis suit was brought to a final hearing in the summer of 1911 and a decree for permanent injunction and accounting issued by Judge Lacombe in September, 1911. In the early part of 1912 the decree was made final by the fixing of the amount of profits, damages and costs recoverable by the Weed Chain Tire Grip Company by reason of the infringement by the Willis company. An appeal was taken by the Willis company, but has not been actively pushed and is still pending in the Court of Appeals. Having made various endeavors to persuade the Whittaker company and its officers to appear openly in the Willis suit and to get the Willis appeal to an early hearing, the Weed Chain Tire Grip Company finally commenced a new suit against the Whittaker Chain Tread Company, Whittaker and Hobbs in Boston and moved for a preliminary injunction. The motion was argued before the Honorable Frederic E. Dodge on February 27, and early in March Judge Dodge handed down his opinion reviewing the numerous cases in which the Parsons patent had been sustained and held to be entitled to a broad scope, found the Whittaker company's grips to be within the Parsons patent, and directed the issuance of a preliminary injunction.

Mohawk Buys Stein Tire Plant

AKRON, O., March 10—The Mohawk Rubber Company has been organized at Akron, O., and has bought the Stein Double Cushion Tire Company plant and machinery. The new company is organized with a capitalization of $350,000; $250,000 common stock and $100,000 7 per cent. cumulative preferred stock, redeemable at 110 with accrued interest after January 1, 1916. The new company has been organized without any water in the stock. The plant is located in east Akron, near the factory of the Goodyear Tire & Rubber Company. It consists of a 3-acre tract of land, a brick factory in good condition, with switching facilities, and free water rights, having a capacity of between seventy-five and one hundred tires per day. The Stein company has discontinued and liquidated its business.

Grabowsky Creditors Get 20 Per Cent.

DETROIT, MICH., March 10—The Security Trust Co., trustee in bankruptcy for the Grabowsky Power Wagon Co., is now returning to creditors of the defunct Grabowsky concern a dividend of 20 per cent., providing they have filed valid claims. An additional dividend of about 15 per cent. will be distributed to wind up the remaining assets when such action is ordered by the Federal court.

The Grabowsky concern was adjudicated a bankrupt in November last by Judge Tuttle in the Federal Court, and at the time of the appointment of the Security Trust Co. as trustee, the liabilities totaled about $400,000. The plant was later sold to the Edward G. Budd Mfg. Co., maker of automobile bodies, for the sum of $110,000, while the Seitz Automobile and Transmission Co., Wyandotte, Mich., purchased the physical assets, including machinery, patents, cars and parts for $55,000. These sums, together with the small amount realized from outstanding accounts, are the basis of the present dividend distribution.

DETROIT, MICH., March 8—At a special meeting of the stockholders of the Lozier Motor Co., to be held on March 19, the capital stock of the company will be increased from $3,000,000 to $5,000,000, according to a statement issued by President H. M. Jewett, who gives as a reason for the increase the necessity for extending the manufacturing facilities, the large sales of the light six having over-taxed the present plant.

The Lozier concern's present capitalization consists of $2,500,000 in common stock and $500,000 in 7 per cent. preferred. The contemplated increase is $1,000,000 common and $1,000,000 preferred. It is stated that the greater portion of the issue will be taken by the directors of the company.

COLUMBUS, O., March 10—According to the report of appraisers Julius F. Stone, J. F. Hatcher and Paul T. Norton, named by the court to appraise the assets of the Columbus Buggy

Automobile Securities Quotations

A general decline all along the line of automobile and kindred stocks marked developments this week. There was hardly a security quoted in New York that did not drop from 1-2 to 5 points, with the exceptions of Firestone, the common stock of which rose 2 points and the preferred 3; and of Chalmers common, which dropped 20 points during the week. The Akron situation being well nigh normal once more lent strength to the various rubber and tire manufacturing securities, although these dropped generally and slightly, with the exception of the Firestone issues.

Company, of Columbus, O., now in the hands of Receiver McLaren, if the concern continues to operate under efficient management and is not thrown into forced sale, the corporation is solvent. The figures showed the assets to be valued at $892,935.53 which is only about half of the valuation given for the assets at the time of the receivership, January 18.

In arriving at the valuation the gasoline cars were appraised at but 50 cents on the dollar because of the inevitable difficulty in disposing of the completed product.

PONTIAC, MICH., March 10—At a recent meeting of the directors of the General Motors Truck Co., Pontiac, Mich., the capital stock was increased by $250,000 all of which is owned by the General Motors Co., of which the Pontiac concern is a subsidiary. Prior to this time the Truck company was simply a selling company but it now takes complete charge of its manufacturing. It is the successor to the Rapid Motor Vehicle Co., another General Motors subsidiary which has been discontinued.

The General Motors Truck Co. was formerly capitalized at $10,000, all of the stock being owned by the parent concern.

WASHINGTON, D. C., March 8—The Prest-O-Lite Company has filed a suit in the District Supreme Court for an injunction to prevent the alleged infringement of its trademark by the National Electrical Supply Company. It is alleged that the defendant has attempted to refill the interchangeable cylinders of the plaintiff when they have been offered for exchange. The claim is made by the Prest-O-Lite Company that the good will of its business and trademark are worth $7,000,000.

Market Changes of the Week

Few changes took place in last week's markets. Tin proved to be the most important, experiencing a drop of $1.85 per 100 pounds. But more interest was shown in tin in the domestic market yesterday both in nearby and future positions. Lead dropped to $4.20 per 100 pounds, a loss of $.10. Electrolytic copper dropped $.00 1-8 per pound. Antimony slumped to $.07 5-8 a loss of $.00 5-8. Both Bessemer and open-hearth steels remained constant at $29.00 per ton. Cottonseed oil fluctuated throughout the week, its highest mark being $6.38 per barrel, and its lowest $6.37, a loss of $.01. Domestic scrap rubber remained in a very steady position. Collections are still reported to be unusually light and stocks continue small. Dealers report a moderate movement into consuming channels at home and abroad. No new features developed in the export branch of the market for refined petroleum yesterday. The prices of Kansas and Pennsylvania petroleums, per barrel, were $.88 and $2.50 respectively.

N. A. A. M. in Conclave

Decides Not To Have Separate Building at Panama-Pacific Exhibition—Trade People Apathetic

Recommends Abandonment of Truck Shows Week Following Passenger Car Show in New York and Chicago

NEW YORK CITY, March 7—At a meeting of the National Association of Automobile Manufacturers, March 5, it was announced that the proposal of having a separate building at the Panama-Pacific Exhibition to house the automobile exhibits has been dropped, owing to the inadequate response of the trade. Instead it was decided to accept the offer, on the part of the exhibition authorities, of 60,000 square feet in the transportation building. The feeling was general that this space would be found insufficient, bnt having regard to the attitude of the trade no other course could be taken.

The proposed consolidation of the N. A. A. M. was also touched upon, and a committee meeting will be held March 19, presumably to make final arrangements for the union. The incorporation of the new organization will probably take place before the end of the month. It will be styled the Automobile Chamber of Commerce, and the present officers of both existing bodies retained.

The ocean-to-ocean stone highway, to which a great deal of attention is being devoted at present, was considered by the good roads committee, which reported its approval.

Charles Thaddeus Terry, counsel for the N. A. A. M., was authorized to take action to protect the interests of the industry where adversely affected by the pending legislation in this state and Massachusetts.

It was unanimously recommended by the members present that commercial vehicle shows at New York and Chicago, which have been held on the week following the passenger car shows, be not held in 1914, such action being due to poor attendance during the recent shows and not doing the anticipated volume of business. This action, however, is not final, but in the form of a recommendation to the executive committee. The matter will next go before the consideration of the commercial vehicle committee which will meet in the course of a few weeks and hand its recommendations to the executive committee which may act on the matter at its meeting April 2. It is imperative that the subject be settled in the course of a few weeks.

January Exports Were $2,668,013

WASHINGTON, D. C., March 11—(*Special Telegram*)—The exports of automobiles and parts from the United States for January, 1913, are as follows: Total, $2,668,013; increase over January, 1912, of $240,122. The total for the 7 months ending January, 1913 is $14,761,139, being an increase over same period 1 year before of $2,890,946. In January last, eighty-seven commercial cars having a value of $182,271 and 2,070 passenger cars totaling in value $2,051,806 were exported from this country. Engines and tires not included in "parts of."

Imports were as follows: During January, 1913, automobiles and parts of the total value of $212,377 were bought from foreign countries, making a decrease of $11,965. For the 7 months ending January last, the decrease was $174,884.

DETROIT, MICH., March 10—The Studebaker Corp. of America announces the appointment of E. R. Benson as vice-president, which position he will fill in addition to retaining the sales managership. This move enables Mr. Benson to sign any legal papers incident to his sales work.

Many Car Sales At Boston Exhibition

—

Denver Dealers Enthused Over Advertising Value of Show—40,000 Saw Des Moines Show

—

Attendance and Sales Gratifying at Louisville, Pittsburgh and St. Louis—S. A. E. Studies Rims

—

BOSTON, MASS, March 11—(*Special Telegram*)—The indications for 1913, judging by the business of the Boston show, will be much better than the preceding year according to the men who have been identified with the Boston show. They base this on the general increased interest in the show this year. To test the matter some of the leaders and leading dealers did not put in any chassis this year in order that the crowds that hang about them might not interfere with prospective customers. These dealers say that it was a good move, for their spaces were crowded as usual, but by a lot of people who were real buyers and to whom a chassis display was not a novelty.

Then there were a great many more dealers from New England at the show. Manager Chester I. Campbell said that last year a little more than 3,000 men identified with the industry were registered. With the show but 2 days old this number had been increased by nearly 300, and many outside dealers do not register until the middle of the week to stay to the finish, so many more are coming.

—

Denver Show Good Advertising

DENVER, COLO., March 7—Denver dealers in automobiles and accessories are unanimous in declaring the outlook highly favorable for a heavy trade in their line this coming season, and their prediction is strengthened by the business indications developing at the twelfth annual automobile show now in progress at the Auditorium. The event will last one more day, and it promises to prove profitable to all participating.

—

DES MOINES, IA., March 8—Forty thousand people saw the fourth annual show of the Des Moines Automobile Association, which closed at the Coliseum tonight. Sixty different makes of cars were shown with a total of 200 models. A consensus of opinion among the dealers was that not less than 20,000 cars would be sold in the state this season.

—

BRIDGEPORT, CONN., March 10—The largest automobile show in the history of Bridgeport came to a close Saturday night at the Park City Rink. During the entire week the building was filled with automobile owners, prospective buyers and sightseers and the paid admissions numbered 7,500.

—

ST. LOUIS, MO., March 11—The Eighth Annual St. Louis Spring Automobile Show which was held in this city the week of February 24, was one of the most successful from a business standpoint ever held indoors in this city.

—

PITTSBURGH, PA., March 10—The third annual automobile and truck show held by the Pittsburgh Automobile Association in Exposition Hall was entirely the most successful exhibit of its kind ever seen in Pittsburgh. The attendance the first day was about 15,000, which was a gain of nearly 80 per cent.

—

LOUISVILLE, KY., March 8—After having held attention since Wednesday evening, in the First Regiment Armory, which covers 54,000 square feet of floor space, what is believed to be the best business show ever held south of the Ohio River closed tonight. Many car sales were reported and attendance was good.

—

Rims Occupy S. A. E. at Cleveland

CLEVELAND, O., March 12—*Special Telegram*—Following the regular March meeting of the Council of Society of Automobile Engineers, which was held at the Chamber of Commerce here this morning, at which meeting, in addition to the regular routine business, it was decided to appoint a fuel committee to co-operate with the recently-formed similar committee of the National Association of Automobile Manufacturers, the hearing before the pneumatic rim standardization division of the society was opened.

About thirty-five engineers and representatives of the rim makers were in attendance, while, in addition to the members of the council, the Rim Committee, consisting of Henry Souther, chairman; G. G. Behn, Hudson Motor Car Co.; T. W. Guthrie, Standard Welding Co.; F. H. Moyer, Firestone Tire and Rubber Co.; W. C. State, Goodyear Tire & Rubber Co.; C. B. Whittlesey, Hartford Rubber Works; C. B. Williams, Mott Wheel Works, were present. J. G. Vincent, Packard, and H. L. Barton, General Motors, were unable to attend.

There have been a number of letters of protest received by the society as to its appointing interested men on its committee, but it was shown to be desirable to have these experts so that their testimony might be used to the committee's advantage. The number of rim makers on the committee, however, is in the minority.

To facilitate the work of uniformly recording the testimony of the various makers, the committee prepared previous to the meeting a list of the points considered vital to the investigation, and the witnesses were examined along these lines. The committee has recognized the work of the Clincher Rim Association as applied to the one-piece type. It was made clear that while standardization was sought progress would not be checked, in that anything fixed by the division would be done so, with the idea of later changing the standards providing such changes were made.

The investigation was opened by the taking of testimony of representatives showing quick detachable rims as distinguished from the demountable types. There were four samples of strictly detachable rims. Each representative was questioned as to the weight of his type, whether it could be sold in competition, how it withstood service, method of operation, number of loose parts, its adaptability to wire wheels, whether the standard dimensions of the Clincher Tire Association had been adhered to and whether it could be manufactured by any mill without special machinery. Other special questions were put in order to bring out as far as possible every feature of every type exhibited.

At the morning session three rim representatives were quizzed, these being W. L. Burgess, Firestone; O. W. Mott, Mott Wheel Works, and E. R. Hall, Goodyear. It is probable that the inquiry will extend over several days.

—

Proposes Regulation of Tire Width

NEW YORK CITY, March 10.—George McAneny, president of the Borough of Manhattan, had an ordinance introduced today in the City of New York, which is intended to regulate the width of vehicle tires and the loads carried thereon as well as the body width of vehicles. Objection has been raised to the excessive width of some automobile truck bodies because they practically limit the right of way to one direction along certain narrow streets. The ordinance proposes a standard maximum body width of 6 feet 6 inches and to tax all additional widths as follows: 6 feet 6 inches to 7 feet, $5.00 per inch additional; 7 feet to 7 feet 6 inches, $10.00 for each inch in excess of standard; 7 feet 6 inches to 8 feet, $15.00 per inch in excess of standard; 8 feet to 8 feet 6 inches, $20.00 per inch in excess of standard, and 8 feet 6 inches to 9 feet 6 inches, $25.00 per inch in excess of standard. The regulations covering permissible weight on a wheel arranges for annual licenses ranging between $1.00 and $1,000 per year, according to excess load per vehicle. Where loads are greater than 10,000 per wheel the additional tax is $500 for each 1,000 pounds increase per wheel or fraction thereon.

Parcels Post Needs 100 More Automobiles

Trucks of Various Makes with Complete Equipment Ordered To Be Bought by Postmaster-General

Hupp's Company to Be Tribune Motor Co.—Crop Report Favorable—Western Insurance Underwriters Organize

WASHINGTON, D. C., March 6—One of the last official acts of Postmaster-General Frank H. Hitchcock, before he was succeeded by Albert Burleson, was to sign the recommendations made by the committee of award for the awarding of contracts for furnishing 100 motor vehicles for the parcels post service, as they may be ordered during the fiscal year ending June 30, 1913. These vehicles will be distributed throughout the country. The contracts were awarded as follows:

The White Co., New York, five White cars, 1,500 pounds, $2,000 each; Stewart Motor Corp., Buffalo, ten Stewarts, model F, 1,500 pounds, $1,440 each; Kissel Motor Car Co., Washington, ten Kissel Kars, 1,500 pounds, $1,350 each; Durant-Dort Carriage Co., Flint, Mich., ten model C, 1,600 pounds, $1,225 each; Louis J. Bergdoll Motor Co., Philadelphia, ten Bergdoll 30 delivery cars, 1,500 pounds, $1,240 each; Atterbury Motor Car Co., Buffalo, ten model A, 1,500 pounds, $1,323 each; the Willys-Overland Co., Toledo, ten model 69 delivery special, 900 pounds. $1,000 each; Studebaker Corp. of America, Detroit, five model 20 delivery wagons, 750 to 1,000 pounds, $755; Prest-O-Lite tank, $25 extra; C. B. B. Motor Car Co., Washington, ten Modern model B, 1,000 pounds, $1,270 each; Waverley Co., Indianapolis, five machines, 1,000 pounds, $1,739 each; Kentucky Wagon Mfg. Co., Louisville, five model 10 Urban, 1,000 pounds, $1,793 each; Ward Motor Vehicle Co., New York, five commercial type EA, 1,000 pounds, $1,975 each; Baker Motor Vehicle Co., Cleveland, five model H, 1,000 pounds, $2,000 each.

Each car is to be equipped with the usual accessories, including windshields, lamps, horns, storm curtains, tools, etc.

To Sell Matheson Plant

WILKES-BARRE, PA., March 10—William C. Shepherd, receiver of the Matheson Automobile Co., has been directed to sell at public auction the right, title and interest, etc., of the company on April 21, at 10 a. m. The property will be offered for sale in separate parcels, most of which is subjected to mortgages. It includes real estate, buildings and equipments on which there is a first mortgage of $200,000 of which there are outstanding $183,200 bonds carrying interest amounting to $4,268.56. There is a second mortgage of $105,000 of which there are outstanding bonds $68,500 together with interest. The total of mortgage bonds with interest on April 21, 1913, will amount to $257,222.11. Bids must be accompanied by a certified check or 10 per cent. of the total amount.

Nearly 200 Inquiries on Thomas Sale

BUFFALO, N. Y., March 12—(*Special Telegram*)—The entire plant of the E. R. Thomas Motor Car Co. is to be sold at public auction beginning Monday morning, March 17 at the plant on Niagara street. There are 5,843 catalogue lots in this sale and it will require about 6 full days to complete the auction. J. E. Conant & Co., auctioneers, of Lowell, Mass., will conduct the sale. As a result of advertising about ten inquiries have been received from Europe while those from the United States and Canada total 180 in 30 days. Articles to be sold include modern high-speed automatic and other machine tools with machinery and mechanical equipment. The Thomas sale will be one of the biggest auctions ever conducted in North America.

Hupp's Firm Is Tribune Motor Co.

DETROIT, MICH., March 10—It has developed that L. G. Hupp, formerly of the R-C-H Corp., and his associates cannot make use of the name Monarch Motor Car Co. for the new automobile concern which they have launched recently. Two applications for this title were filed at Lansing at about the same time, that of Mr. Hupp being superseded by a few hours by an application fathered by A. J. Bloom, F. J. Priest and E. L. Wallace, who have incorporated with a capital of $30,000 to manufacture motor cars. Consequently, Mr. Hupp had to decide on another name for his company, and he selected that of Tribune Motor Co. A low-priced car is to be manufactured in a factory on Scotten avenue. Mr. Hupp will head the company, while H. C. Limbach is to be chief engineer.

WASHINGTON, D. C., March 11—(*Special Telegram*)—The governmental crop report of March 1 shows percentages of wheat, corn, oats and barley on farms on March 1, 1913, to be considerably in excess of amounts on farms on March 1, 1912, with present conditions in the West, Northwest and Southwest as to all these crops unusually favorable, the crops on farms being greatly in excess last year.

INDIANAPOLIS, IND., March 10—A company to hold the patents of Thomas J. Lindsay has been organized in this city under the name of the Lindsay Automobile Parts Company, which has been incorporated with an authorized capitalization of $250,000. Mr. Lindsay is the inventor of many devices and automobile parts, including the Lindsay roller bearing axle. The company will hold these patents and control the licenses granted other companies for manufacturing purposes.

The officers and directors are: Mahlon E. Bash, president; Joseph T. Head, vice-president and Matt W. Lowder, secretary-treasurer. Mr. Bash and Mr. Lowder are officers in the Lowder Manufacturing Company, manufacturers of automatic timing devices.

Stromberg, Accessory Pioneer, Dies

CHICAGO, March 10—Alfred Stromberg, former president of the Stromberg Motor Devices Co., died Saturday noon at his home in this city of apoplexy. He had been ill 3 weeks. He was born near Stockholm, Sweden, March 9, 1861, and lived to be 1 day less than 52 years old. He learned the telephone business in Sweden, coming to Chicago in 1883, where he identified himself with the Chicago Telephone Co.

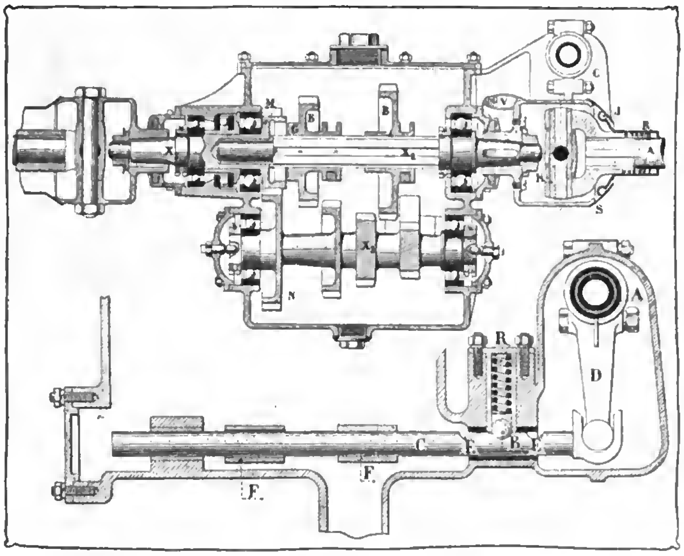
BATTLE CREEK, MICH., March 8—The annual meeting of the stockholders of the Castle Lamp Company, the factory of which is at Battle Creek, Mich., was held in Toledo on February 28, and practically all the stockholders were represented.

The directors elected by the stockholders were: E. A. Williams, Jr., Walter Stewart, Royal R. Scott, Rathbun Fuller and C. B. Mertz. These met afterwards and elected E. A. Williams, Jr., president; Walter Stewart, vice-president and treasurer and Royal R. Scott, chairman of the Board and secretary.

Western Underwriters Organize

CHICAGO, March 11—Lower rates of insurance on new models and higher rates on second-hand cars will result from the formation of the Western Automobile Underwiters' Association in this city recently and an alliance with the Automobile Underwriters Conference, the parent body, to be effected soon. With the new organization established as a subsidiary body to the conference, the Eastern schedule of rates will be adopted.

The schedule of rates now in force in Chicago and the Middle West do not differentiate between the new and the second-hand machine. For example, the owner of a 1913 model, listed at $3000, who wishes to insure against fire and theft for $2,500, must pay a rate of 2.5 per cent. or an annual premium of $62.50. The owner of a second-hand car, put on the market 2 years ago and selling then for $3,000, wishing to insure for $2,500, pays a rate of 3 per cent. on $1,500, 40 per cent. being deducted from the desired amount of insurance for depreciation, or a yearly premium of $45.



Figs. 6 and 7—Change-gear system in Sizaire-Naudin car

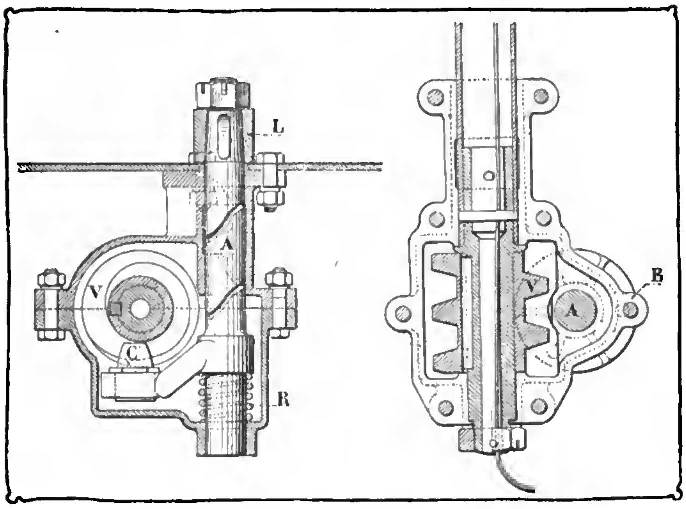


Fig. 8—Self-adjusting steering gear for small car

part G and push back the front part of the sheath. Then the adjustment nut can be reached with a spanner. If the cone is to be dismounted, the front end of the short shaft connecting the universals is allowed to drop, and then the spring-adjustment nut, the ball-bearing abutment B and the spring can be removed, whereafter the cone can be withdrawn.

Fig. 5 gives a view of the clutch mechanism and a part of the motor in a 25-horsepower Rochet-Schneider car.

The construction of the clutch proper, as shown, also applies to the 12-horsepower model of the same make, in which, however, the universal joint is omitted, as the motor, the clutch and change-gear box are supported on a single aluminum casing, differing from ordinary unit construction in this that the casing is open at the top between the motor and the gear box cover, so as to leave the clutch as accessible as if the parts were separatély mounted.

The clutch-operating parts in the 25-horsepower model are all inclosed, and the cone is of the inversed type with special provisions for preventing oil from straying onto the cone facing. To this end, the flywheel is made in two parts, the female cone being formed as a separate annular lip, and the annular space *h* between this lip and the flywheel rim receives all oil which may be thrown out centrifugally from the central parts. The latter are oiled from the bore H which constitutes an oil reserve in the end of the crankshaft. Every time the clutch is released, the clutch shaft which is aligned and supported in the bore H, acts as a piston, driving a small amount of oil back through its own hollow center. The oil supply is renewed at the filler *j*.

The rest of the unique construction relating to the conservation of the clutch control mechanism may be understood from the drawing, in which Q is the primary shaft supported in ball-bearing N, L the clutch pedal shaft mounted in the gearbox, M the clutch brake, O the universal joint surrounded by a bell-shaped casing secured to the primary shaft at the rear and by a felt-lined joint P to the hub of the sheet-steel cone. K is the end-thrust ball-bearing of the clutch spring, and *l* that of the clutch pedal movement which is received through a sleeve mounted upon the primary shaft and abutting against an intermediate piece sliding in a slot in the shaft and in turn bearing against the universal. There is, by this construction, no break in the continuity of mechanism from the clutch cone to the gearbox and no chance for dust to enter or oil to escape—all of which relates to the reduction of maintenance cost.

The motor comprises a four-cylinder (110 bore by 140 stroke) block casting with very long bearings in which the oiling is safeguarded by a very powerful pump D, which filter E, driven from a spur gear mounted directly upon the crankshaft at one side of its middle bearing.—From *Omnia*, February 22, and *La Vie Automobile*, February 22.

FEATURES of 10-12 Horsepower Car.—In addition to the clutch of the small Sizari-Naudin car mentioned in the preceding note, the change-gear and the steering-gear in the same model are also interesting. The gearbox is shown in Fig. 6 and the control and locking system in Fig. 7. The three front speeds and the reverse are controlled by two shifting forks which extend horizontally from the left side of the gearbox. The lever for operating them is of the type which is worked transversely. By placing the intermediate shaft X, below the primary shaft X_1 and the secondary shaft X_2 and keeping only the intermediate shaft submerged in oil, the level of the latter is kept far below the level of the sliding gears and the stuffing-boxes through which oil is likely to exude, with the result that the gathering of dust and oily grime is largely avoided.

All journals are ball-bearing, and the primary shaft has an abutment and an end-thrust ball-bearing between the two radial bearings, relieving the latter of those stresses which cause most wear. The control of the shifting-forks is completely inclosed in a small casing C attached at the front left of the gearbox. The locking device is inclosed in a separate portion, V, of this casing and can be inspected by removing two nuts from the cover of this portion.

Each of the two sliding gears is controlled by one of the forks FF, and each of these is mounted upon both of the selector-rods, which lie side by side, but is of course secured only to one of them, while the other in each case acts as a guide rod, passing through the boss of that fork which it does not control with an easy sliding-fit. Each of the rods can be engaged by the arm D, Fig. 7, which is fixed upon the shaft A of the operating-lever. Three notches E correspond to the three possible positions of each selector-rod, and a steel ball B is pressed into each notch by a strong spring R according to the position to be secured. A definite lever movement is required for dislodging the ball.

Steering of the Sizaire-Naudin car is especially hedged with precautions against wear and play, embodying devices for taking up all play automatically. A worm gear V with very coarse thread is secured upon the steering port, but does not engage a screw or sector. A conical finger C is secured to an arm mounted upon the shaft A of the steering-arm L and extends into the thread of the worm. Rotation of the latter naturally causes the finger C to move up or down and a corresponding movement of the steering-arm.

The shaft A is constantly pushed by the spring R, so that the tendency of the finger is always to seek the bottom of the thread. It is noticed that this spring action is at right angles to the steering effort and remains unaffected by shocks upon the front wheels.—From *La Vie Automobile*, February 22.

Packard Service System Simple and Sure

Boston Branch Uses, Besides Time and Labor Records, Scheme of Checking All Accessories

SERVICE department systems are used because of their manifold advantages. Firstly, they enable the manager of the department to ascertain the exact cost of every repair job and to charge the customer no more than necessary for first-class work, without taking a chance of conducting the department at a loss to the company. Secondly, they minimize waste or loss of labor and material, thus directly reducing the two principal cost items. Thirdly, they make it possible to keep exact records of accessories, parts and equipment of automobiles brought into the department to be repaired, and to avoid completely or almost so the loss of such articles, which, if it occurs, means a loss to the company of just as much money as the article cost.

In the long run, a record system has the additional advantages of permitting the establishment of standards of repair cost and of determining exactly the comparative efficiencies and consequent values of the various workers. All this information may be obtained in a very easy manner, that is, by the use of a small number of forms filled out to record every essential operation done in the department. In the course of time this system may be more and more simplified, until it takes almost no work yet helps to keep efficiency at the top notch all the time.

As an example of an excellent scheme the service system of the Boston, Mass., branch of the Packard Motor Car Company, described below, is simple and has a number of strong points. One is the small number of forms used; another, that shop workers are hardly troubled at all with the record system, but that this work is done entirely by the office forces of the several departments; furthermore, there is provision for recording every essential detail, so that records form a good basis for correct minimum charges to the customer. These points hold good for all Packard service systems, the method being the same in all cases and the only difference lying in variation of details as carried out in the various plants.

The forms illustrated and described below are only the main five blanks. Outside of these, the Packard system includes the well-known time-clock card and a requisition form as well as a card-file form for the stock room. These, however, having been shown repeatedly with explanations of their use, in THE AUTOMOBILE, are not taken up in the following description. The forms

Fig. 2—Body equipment part checking card

here shown and described, with an explanation of their purpose and use, are:

1. The job card or order card.
2. The name and number tag.
3. The equipment checking blank.
4. The claim tag.
5. The body equipment blank.

Taking these forms up in the order of their numbers, the first to consider is:

1. The Job Card or Order Card—This form is 7 by 12 inches, and is made out in the main office as soon as a car is brought in by its owner to be inspected or repaired. The form comes in pads of consecutive triplicate blanks, a yellow original, a white carbon duplicate and a third copy on thin tan cardboard. When the customer brings his car in, the order taken by the superintendent of the department is typewritten on the form, Fig. 1, noting, on the top of the page form, the model car and motor number of the machine, the date on which it is brought in, the name and address of the owner and the terms at which the work ordered is to be carried out. Then, the details of the work ordered are entered on the blank and when the latter is filled out completely in so far as the customer's wishes are concerned, the yellow copy remains in the superintendent's office, the white copy is sent to the coach department and the tan cardboard copy is attached to the car. It is carried in an envelope designed specially for this purpose, which is fastened to the steering wheel.

2. The Name and Number Tag—Whatever transactions are carried out in the service department and which refer to a certain car, are recorded on blanks on which the job number and the name of the car owner appear. To insure this, the tag, Fig. 3, is filled out. As a matter of fact, about fifty or seventy-five such tags are made out, by means of a tag-printing machine, as soon as the motor car is received in the service department. A number of these tags are used for labeling the accessories which are taken off the car—which phase of the work is described further below—while the rest are put in the aforementioned envelope and carried on the car.

3. The Equipment Checking Blank—Before the car is sent out of the shop, however, all accessories which are removable are taken off, recorded and numbered by means of tags, after which they are locked together in a special bin by themselves. This work is done most carefully and every part and accessory, whether part of the regular Packard equipment or not, is noted on the form, Fig. 4. This blank is 8.25 by 20 inches in size and printed black, being ruled red and blue. It is made out in duplicate with a carbon which is given to the owner as a receipt for the equipment. When the car comes out of the shop again, the clerks specially employed for this purpose go over it and check every single item on the record. If a part or accessory which was there when received is missing or damaged, the

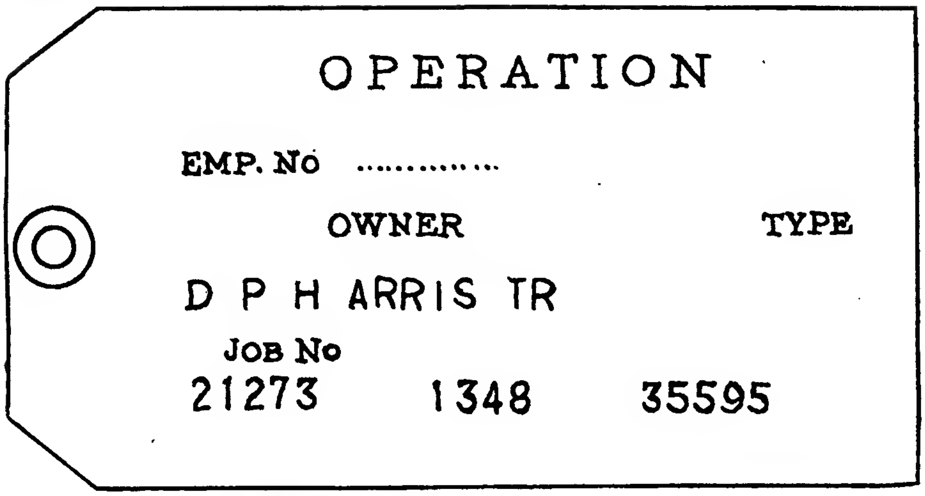

Fig. 3—Tag used for labeling accessories and noting parts needed

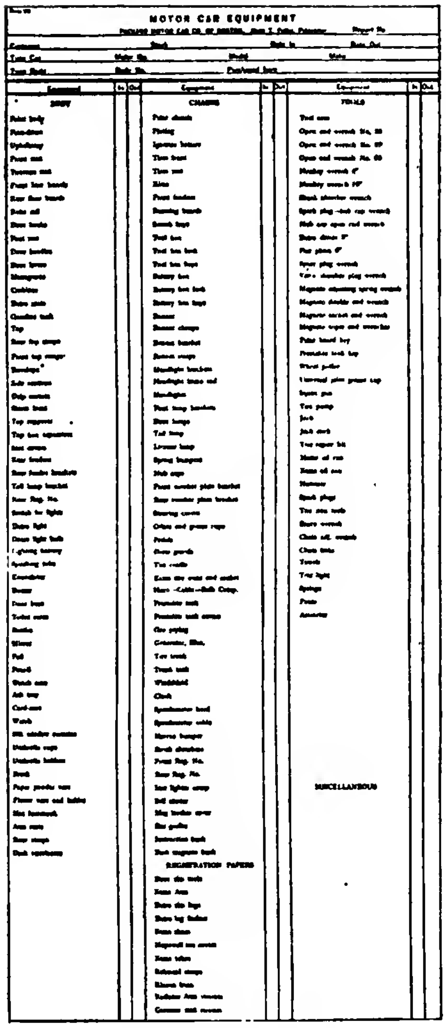

Fig. 4—Accessories record

Packard company makes good for the loss incurred. While here only the front side of this blank is shown, it should be stated that the reverse is also printed, so as to permit recording the accessories and parts of top, body, lamps, horn, batteries, tires and whatever miscellaneous, special accessories are carried on the car.

4. **The Claim Tag**—This form, Fig. 5, is an original blank, especially introduced by the Packard company for the recording of accessories which are brought in by the owner of a car later than the car itself, but which he wants put on the car in connection with the work done in the shop. This form is 3 by 7.5 inches in size and printed on tan cardboard of the shape seen in the illustration. The lower portion of the blank forms a coupon which is torn off after the form is filled out and is given to the owner as a receipt for the accessory brought in. The claim tags are consecutively numbered.

5. **The Body Equipment Blank**—This form, Fig. 2, is 8.5 by 11.5 inches in size and is used, when repair work is done on the body or if the latter is painted, so that it must be taken down and all its parts be disassembled and stored by themselves. If this is needful, exact recording becomes necessary, as in the case of accessories, and the form used in this case serves exactly the same purpose, in its special field, as form, Fig. 4, for checking accessory and equipment of the car. A record is made of the parts which remain on the body and of those which are taken off it and placed in a locker to be reinstated and checked after the body is ready to leave the department.

Following is the method adopted for handling the forms by the clerical force.

1a. **Use of Job Card**—The blanks of this form, like all other forms, are stored in the stationary department, except for a relatively small number of pads stocked in the office of the superintendent of the service department. The blanks are filled out by an office clerk, and attached to the cars while a copy goes to the coach department, as already stated. The copy affixed to the car stays there, and after the repair work has been completed and every item checked by the workers who carried out the operations the shop foreman or a clerk of his enters the cost of labor and material used on the back of the card. The coach department copy remains with the foreman of that department and after the work is completed there it is returned to the main office. If the coach department has no work to do on the car, the copy is sent for by the superintendent's office, when the car is ready to be turned over to its owner.

2a. **Use of Identification Tag**—The tags are prepared in the main office and after part of them have been used by the accessory checking clerks, the remainder are placed in the same envelope with the job card. The workman operating on the car is not troubled with any detail work, but when requiring a part makes a note on a tag, the detail work of making out a requisition being taken care of by a clerk used to do this work. The stock records are of course also worked by clerks.

3a. **Use of Equipment Blank**—This blank is filled out simultaneously with the dismounting and tagging of the accessories, and by the same people. When the repairs are complete, the same clerks mount them on the car again and check them.

4a. **Use of Claim Tag**—All blank claim tags are stocked, with other blank printed matter, in the stationery department. When accessories are brought in and registered on them, this is done by the clerks checking off the accessories and parts.

5a. **Use of Body Equipment Form**—The majority of these forms is kept in the stationery room, but a number of them are held in the body shop and when it becomes necessary to overhaul a body a workman and a clerk of this department go to work on it, the one taking down whatever parts may be disassembled and the other recording them and putting them in a suitable storage place. When the work on the body is finished, the parts are put back in place and the form after having been checked is turned over to the superintendent's office.

The Engineers' Forum

Carbureter Manufacturers on Carburetion

Makers of the Zenith, New-Miller, Newcomb, S. U. and Solex Give Their Views

Ideas on the Subject Differ Widely But All Agree That There Are Many Factors To Be Considered

¶*N. R. Heftly Finds That Results Depend on Practically Every Part of the Car—L. H. Colvin Lays Stress on Machining—Holtzer-Cabot Co. Features Control—G. W. Skiner Gives Test Results*

AT the present time interest in the problems of fuel economy and carburetion is so widespread that THE AUTOMOBILE decided that it is time for the automobile public to hear from the carbureter manufacturers as well as from the engineers who have been giving expression to their views on this subject in The Engineers' Forum. Accordingly letters were sent to most of the leading carbureter makers in this country as well as to some in England and France. Some of the replies have arrived and are printed herewith.

The ideas of the carbureter manufacturers should be of great value in studying this fuel problem, especially as practically all of the makers are conducting research work and making experiments with a view to bringing about improvements in design and a consequent increase in carbureter efficiency.

Results Depend on Many Factors

DETROIT, MICH.—The subject of increasing the mileage per gallon of gasoline is really very large and should include not only our experience on our own carbureter, but also some remarks of a general character, as, indeed, the mileage obtained, not out of a carbureter, but out of a car, depends on everything from the shape of your body to the type of your tires and the condition of the road, including all the intermediate parts, such as carbureter and motor, ignition, transmission, brakes, bearings, and the skill and individuality of the driver. We have also failed to mention the muffler, which is very important.

We have always refrained from stating the guaranteed mileage per gallon with our carbureter. Our only claim is that, other conditions being equal, we will give either increased mileage or an increased pick up, or a higher speed, or a combination of all these advantages.

There are, however, several points which have lately come to my attention, and which might be interesting. The design of the air passages from the carbureter to the intake valve is very often not made in accordance with the old principle that the less there is of an intake manifold, the better it will be. Emile Mors used to say of the intake manifold: "It is a necessary evil," but that was 5 years ago, and the foreign tendency is now to do away with as much of it as possible. There lies one of the great advantages of the pressure feed tank or of the tank in the dash. This shortening of the intake brings to a minimum the chances for condensation at the same time as it renders the carbureter more responsive to sudden opening of the throttle. The design of the valve pocket also has a great deal to do with the condensation, and there is more gasoline lost through the supplying of an over-rich mixture to overcome the condensation at low speed than one would imagine.

Then the driver should exercise proper judgment in driving and remember that every foot and pound of power wasted costs a few cents. When a bicycle rider approaches an obstruction he will slow down as soon as he sees the obstruction; the careless driver will keep on with his foot on the accelerator pedal until he comes near to it, and then applies the brake:—Cost, gasoline and rubber.

It must also be remembered that sudden acceleration as well as sudden braking is very wasteful.

These remarks do not apply to our carbureter any more than to any other carbureter. While we do not pretend that ours cannot be improved, we merely mean to say that the discrepancies in the results obtained from a standard carbureter show conclusively that the greatest work to be done towards economy is within the province of the motor designer and of the individual driver.—N. R. HEFTLY, The Zenith Carbureter Co.

Machining Is an Important Feature

INDIANAPOLIS, IND.—When the layman can realize that gasoline will find its way through almost microscopical crevices and that at no great distance in the future the price will be almost prohibitive, then, and not till then, will he appreciate some of the well-known facts that apply to the carbureter as well as any other part of his car.

There has never been a machine put on the market for producing and machining metal that will turn the work out automatically at a high rate of speed and hold all dimensions to a plus or minus of a half thousandth or less.

To make a carbureter that will be machined so that it is gasoline-tight, the dimensions must of necessity be held closer than the well-known term steam-tight.

Now, to illustrate: Notice the sectional cut-off of the New-Miller model A, shown in the illustration. The throttle, or butterfly valve, T, when closed is perfectly flat. You can realize the care necessary in machining this disk to bring it to correct dimensions and the care for making the under-cut in body. The exact dimension for the nozzle J over the needle is just three-tenths of a thousandth—no more, no less.

A clearance of one-thousandth on either side of the gas needle by actual test on a block will develop 2 to 6 horsepower.

Now, to secure economy in driving there are several things all must do and know.

FIRST—Gas mixture will burn at a certain speed. When the motor travels faster than the burning of the gas you have either reached your limit or you must lessen the quantity of gasoline, so that it will burn faster than the motor is traveling.

SECOND—The getaway, if quick, must be rich as the motor is not up to speed and can handle or burn the quantity.

THIRD—The intermediate speed or the average driving speed is the same as the "getaway" speed, as to throttle opening.

RESULT: If the driver insists upon a quick getaway with a rich mixture, immediately he is traveling at the average driving speed of 15 to 20 miles per hour he is wasting gas—not burned—of from three to four thousandths past his needle, or, in other words, from 2 to 6 horsepower of unconsumed gases.

The adjusting of our carbureter is most satisfactorily done by closing off the gas until the motor spits and then giving it one and one-half turns, or a lift of the needle equal to about three-thousandths. This is for proportions between speeds. Then in driving we always use the steering-post control. We cut the gas down until motor spits, reverse control and give one or two notches.

This control has command of all speeds and is on the gas only. The air is positive, is set, and mechanically operated. The driver has nothing to watch—he simple listens to the purr of the motor and can cut the quantity of gasoline fifty times a day as easily as opening and closing the throttle. There are no wearing parts —simply a clearance and as the parts controlling do not touch they remain perfect for years, accurately metering out a saving charge to the layman or the expert.

Where a person buys a carbureter that has been made by placing the joints to a surface grinder, by stamping a disk out of sheet metal for a throttle and leaning it against the wall of the body for a closed throttle, it is just as reasonable to expect a sieve to hold water as that carbureter to hold gas; and it is well to remember that the machining of the instrument, outside of design, makes for a very large percentage of the economy.—L. H. COLVIN, New-Miller Carbureter Co.

Controlling from the Steering Column

NEW YORK CITY.—To secure the greatest mileage per gallon of gasoline will frequently mean making sacrifices in other respects, such as running the motor very hot, thus increasing lubrication difficulties, and cutting down the maximum power, or heating the mixture, which will probably reduce the power and may interfere with the smooth running of the motor on account of the quicker burning of the charges.

The most practical way to economize fuel that we have tried is to place the lever controlling the load-carrying mixture in a convenient location, say, on the steering column, so that the proportion of fuel can readily be kept at the lowest possible limit for any given driving condition. This works out well with our system of fuel control which serves to uniformly increase or decrease the fuel proportion throughout the entire motor range. instead of the effect being concentrated at some particular throttle setting as is frequently the case.—THE HOLTZER-CABOT ELECTRIC CO.

Testing by Analysis of Exhaust Gas

NEW YORK CITY.—It is important in taking exhaust gas analysis that the samples of gas be taken under all circumstances. Owing to the peculiarities of the carbureter the combustion will be most complete in some particular set of circumstances. For instance, on a test of a certain small automobile it was found that it was possible to secure on the average about 22 miles to the gallon of gasoline on a level road running on high gear at an average speed of 18 miles per hour. Although it would seem that this mileage was very fair, it was found that the exhaust products were too rich in uncombined carLon in the form of CO. The same car was tested on Fort George Hill, New York City, and was able to attain 18 miles an hour on low gear up the steep gradient. The gasoline combustion was at the rate of 9 miles to the gallon, but the combustion was perfect. There was no free CO in the exhaust and the percentage of CO_2 was at a maximum. In order that a fair test for average performance be made it is necessary that both level and hilly country should be tried. Samples of gas should be taken with the motor running idly, with the car driving the motor as when descending a hill, with the car accelerating and when running up hill, besides taking ordinary flat roads at medium speeds.

It would also seem to be essential that in comparing the results obtained in testing, the conditions under which the tests were made should be taken into consideration.

When the motor is driven by the car in descending a hill there is a marked tendency on the part of the carbureter in many instances to flood and to furnish an exceedingly rich mixture. This will be noted in the exhaust by the presence of a large percentage of CO as compared to that found in the exhaust under ordinary circumstances.—LOUIS VAN RENSELLAER.

Results of Some Bench Tests

LONDON, ENG.—It may interest you to know of the bench tests made by our BX carbureter. It has a 1.75-inch bore and was fitted to an engine 3.54 by 3.94, rated at 40 brake horsepower at 3,600 revolutions per minute, this being a standard engine manufactured by a well-known automobile firm in this country.

We find that from cars fitted with 3.15-inch bore engines we have obtained as much as 32 miles per gallon of gasoline.

From a Chenard-Walcker car fitted with a 3.15 by 5.91 engine fully loaded with four passengers and being driven at an average of 25 miles per hour, 28 miles per gallon of gasoline has been obtained over give-and-take roads.

Standard 3.54-inch cars, which are used to a large degree in this country, weighing unladen from 30 hundredweight to 2 tons, will average 18 miles per gallon. Generally speaking, on passenger cars you can depend on getting 30 to 35 ton-miles per gallon. —G. W. SKINER, The S. U. Co., Ltd.

Trying Two Carbureters on Same Car

PARIS, FRANCE.—We find it difficult to give very precise data on the fuel consumption obtained with our apparatus. In fact, this varies within relatively wide limits according to the condition of the road, the nature of the carriage body, the manner of driving and the climatic conditions.

The only method which really means something consists in trying two different carbureters in the same vehicle under absolutely identical conditions, and it is only in this manner that the difference in consumption between two devices can be ascertained.—GOUDARD & MENNESSON.

Motor Testing Plants

Carbureter Manufacturers Alive to Necessity of Having Complete Apparatus for Accurate Testing Purposes

By J. Edward Schipper

A CORRECTLY designed carbureter can save its price in one season. It is a question of dollars and cents and as such strikes the automobilist in his tenderest spot—the pocketbook. It is the question that the carbureter manufacturers are trying to answer through data secured by the use of accurate testing plants.

Three main facts are determined by the use of carbureter testing apparatus. These are, the horsepower at any rotative speed of the motor, the fuel consumption per horsepower hour and the correct adjustment of the carbureter to attain the maximum efficiency at any given revolutions per minute. Besides these the weight and temperature of the cooling water before and after passing through the jackets is determined by sub-apparatus, the oil consumed is measured, the condition of the carbureter under conditions of speed variation can be found besides other important facts that go to make up a fund of data which is of the utmost importance in future design of the carbureter.

The presentation of them in curves is the most convenient manner of offering them and it also automatically guards against error because the nature of the curve is such that it must be fair and regular. It is therefore plotted so with due regard to the points secured from the readings given by the apparatus.

The layout shown in Fig. 1 is the installation designed by P. P. Dean, of the Diehl Manufacturing Company, at the Schoen-Jackson plant at Media, Pa. This laboratory in which the Feps carbureters are tested may be taken as an example to show the process of making these tests.

The apparatus consists of three principal parts; namely: the dynamometer, fuel weighing device and control mechanism. Besides these there are the necessary tachometers, pressure meters, thermometers and clocks to take the readings of speed, pressure, temperature and time which are necessary to secure complete data of the action of the motor and the carbureter. They are laid out about the room to suit the convenience of the operator, but should be in such positions that they are accessible with a minimum amount of effort on the part of whoever manipulates the plant. Taking the Schoen-Jackson layout as typical of a modern installation a brief description may be valuable: Imagine a rectangular room approximately 20 feet in length and 35 feet in width, partitioned off from the end of a long oblong-shaped frame structure devoted to the manufacture of carbureters. The partition forms the dividing wall between the remainder of the factory and the testing laboratory. It is one of the 35-foot walls of the room. The wall opposite the partition is pierced by a large window which furnishes an abundant supply of daylight through its eastern exposure. This light is supplemented by two windows in the north wall and numerous skylights.

Along the west wall, formed by the partition, is the dynamometer and motor supports. This is shown in Fig. 1. Behind the motor may be seen the door which connects the testing plant to the rest of the factory. The north wall supports the water measuring and fuel measuring apparatus and along the east wall is arranged the control mechanism which is portable, however. The motor to be tested is brought in through a large double door which pierces the east wall at its juncture to the south wall. The space along the south wall is left free to bring in an entire car if desired. Overhead there is a traveler which is used for lifting the motor from the chassis and placing it in the testing frame. At the Schoen-Jackson place the dynamometer frame and the motor frame are both supported by one massive cast-iron T-slotted base plate, weighing 8,000 pounds, stiffened on the under side by a number of parallel vertical ribs, cast in a concrete foundation anchored on bed rock, running longitudinally the length of the plate. The plate is stiff and free from diaphragmatic vibration. This plate is shown in Fig. 1, with the dynamometer and motor in place.

The dynamometer used on the Feps carbureters is of the direct-current Diehl electric absorption type. It consists of a steel frame fitted with commutating poles. The revolving armature is proportionately small in diameter to allow of high rotary speeds with comparatively small peripheral velocity. The steel frame is carried on two ball-bearing pedestals, one of which may be clearly seen at the near end of the dynamometer shown in Fig. 1. The pedestals are in turn carried on a heavy independent base plate. The ball bearings in this particular pedestal are of Hess-Bright manufacture and are practically frictionless, offering a negligible resistance to movement of the frame.

The armature shaft is extended and tapered to take a Spicer universal joint between it and the engine. A shield, carried by two stanchions, is placed around the Spicer universal shaft between the motor and the dynamometer to protect operators in case of fracture. The entire magnetic field frame rests in a ball-bearing cradle which offers no resistance to its free rotary movement.

Referring once more to Fig. 1, it will be seen that the motor drives the armature of the dynamometer by the universal shaft, or if desired, the engine may be driven by the dynamometer, when acting as a motor, through the same shaft. The motor can be started by means of an outside current which is allowed to flow through the windings converting the dynamometer into a motor. Owing to the magnetic drag between the fields and the armature, the entire field frame, swinging on the ball bearings, tends to rotate in the same direction as the armature, hence the torque. The torque varies with the magnetic drag. The magnetic drag is a direct result of varying currents in the field and armature, which currents may be controlled directly by the operator. The operator, therefore, has direct control of the torque and hence of the horsepower absorbed. Owing to the method of electrical connection the strength of the field current controls the load, therefore, the operator in controlling the torque need only manipulate the resistance in the field circuit. This is done at the master control table to be explained later.

Since the pull exerted by the armature is through a radius it will have to be reduced to horsepower by a formula in which cognizance is taken of this leverage. Matters can be simplified to a great degree if the radius is made 1.315 feet from the center of the shaft because the horsepower formula then becames:

$$\text{Horsepower} = \frac{\text{Pull in pounds} \times \text{revolutions per minute}}{4{,}000}$$

From this formula a chart is made up showing the horsepower delivered by the motor at any given number of revolutions per minute. This chart is shown in Fig. 4. It is placed upon a board on the master control table, shown in Fig. 2. The radial lines represent revolutions per minute, fifty apart, starting with 50 on the left line.

In order that the readings may be exact, it will be noted in Fig. 1 that there are two scales. First, a spring scale which gives the rough readings and then the double beam suspension scales which are set for finer readings down to tenths of a pound. The insertion of the spring scale in the line aids greatly in the rapid shifting of the weights on the beam scales to the correct points and therefore helps in taking quick successive readings from the beam scales. It is

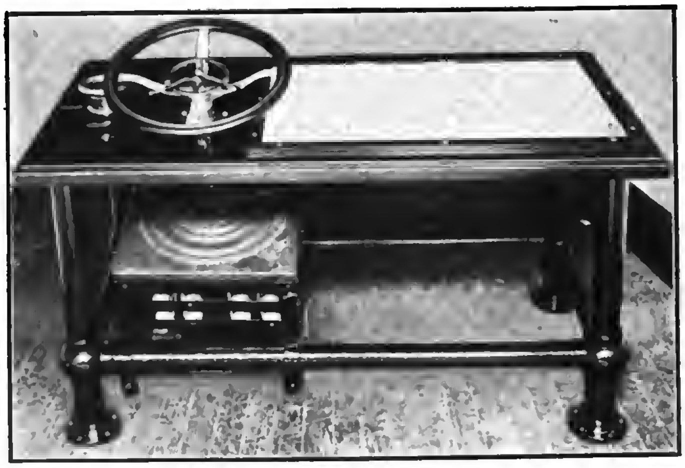

Fig. 2—Master control table, showing the steering wheel rheostat control which regulates the strength of the field circuit and the small wheel which controls the outside current

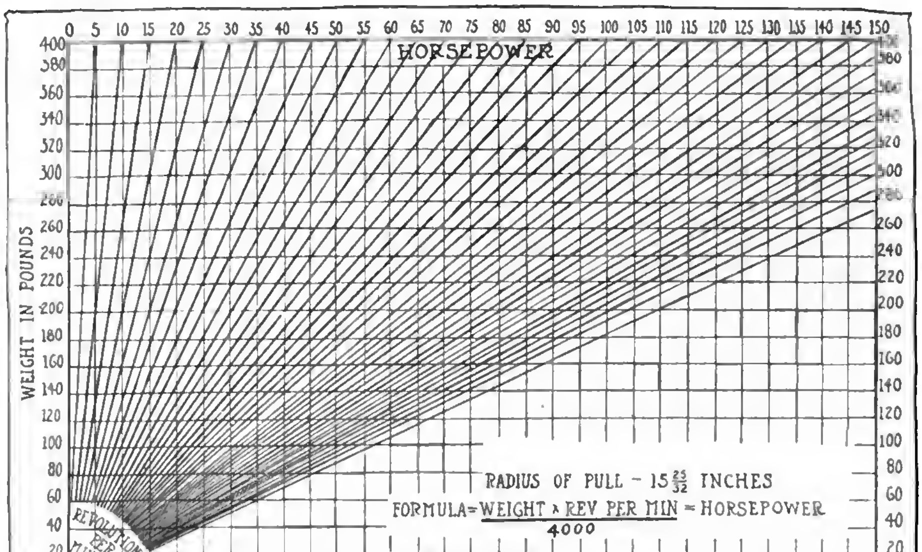

Fig. 4—Conversion chart for changing the pounds pull on the dynamometer to terms of horsepower. The radial lines represent revolutions per minute and start with 50 on the left and run at intervals of 50 up to 2,200 revolutions per minute

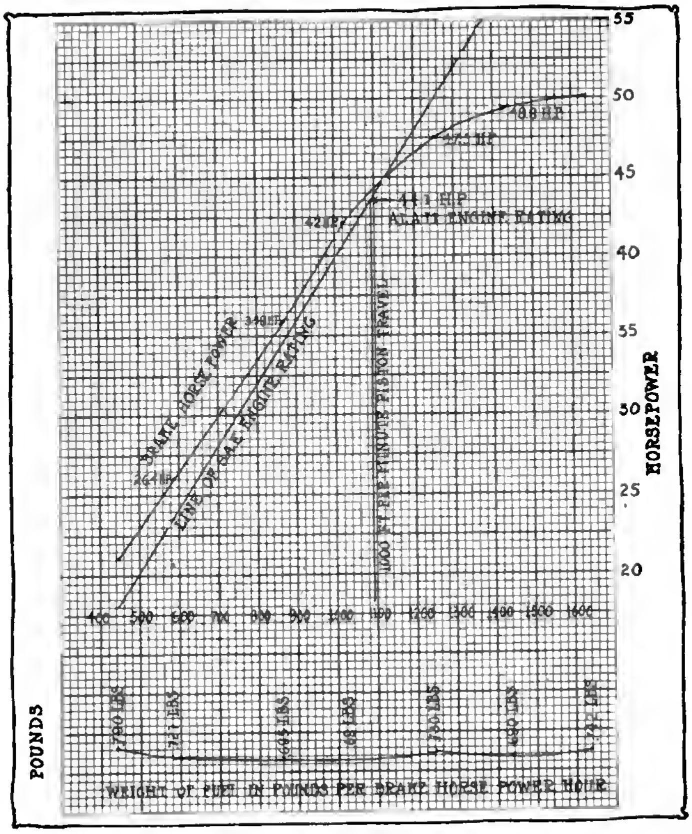

Fig. 5—Horsepower and fuel curve of 44 horsepower motor, Fepa carbureter

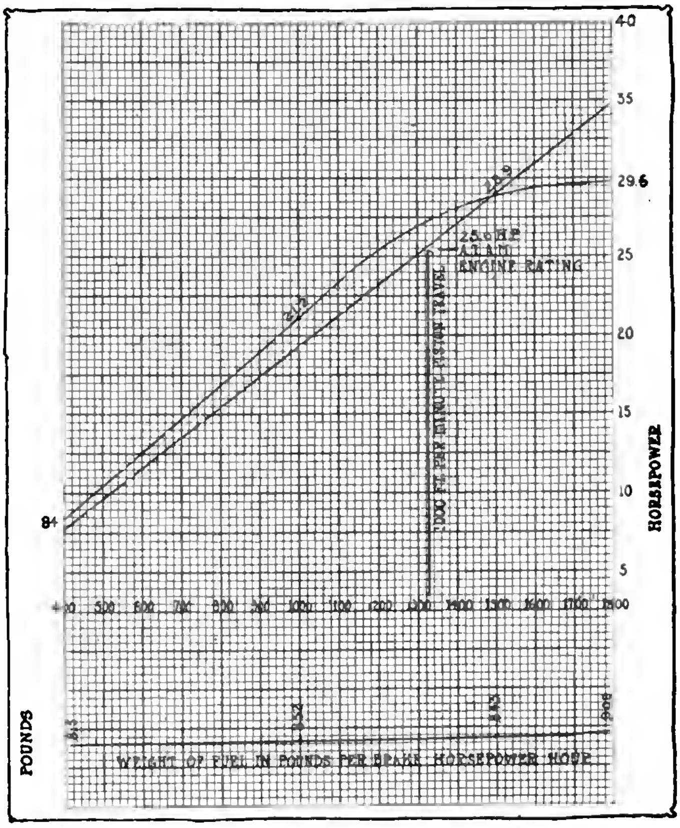

Fig. 6—Horsepower and fuel curve of 25 horsepower motor, Fepa carbureter

these readings which are depended on rather than on any readings taken from the spring scale.

One more reading must be taken from the dynamometer besides the pull in pounds exerted by the frame; this is the speed of rotation. In the Diehl installation at the Schoen-Jackson plant there are two tachometers for this purpose. One can be seen in Fig. 1 just behind the spring scale. It is of the mechanical type driven from the motor shaft. It is actuated by weights which spread apart in the manner of a centrifugal governor. The other, an electric tachometer, whose magneto is driven by the shaft at the extremity which projects from the pedestal to the left of Fig. 1. The flexible cable leading to the instrument may be seen dropping down from the shaft. This instrument may be brought to the master control table, Fig. 2, and be directly under the eye of the operator while his assistant stands at the machine and watches the dial of the other tachometer while manipulating the scales.

With the apparatus described thus far we are in a position to make the tests which result in the horsepower curve plotted on a basis of revolutions per minute.

Seated at the master control table, Fig. 2, we have before us a steering wheel similar in all respects to that upon the steering column of a car. The spark and throttle levers are in their customary positions and take care of the usual functions in the usual manner. The wheel, however, instead of governing direction manipulates the field rheostat shown beneath the table in Fig. 2. Just to the left of the steering wheel is a small wheel which corresponds exactly to the switch of an electric cranking motor except that in this case it controls current which comes over the wires from a central station instead of from a storage battery. Turning this wheel, the dynamometer for the moment becomes a huge starting motor. The ignition is switched on, the spark advanced, the throttle opened and the motor is off under its own power. The uses of the dynamometer as a starting motor are now at an end and the switch is turned to a point marked load, which throws the load resistance into circuit. This leaves the engine running under its own power and driving the dynamometer.

The chief operator remains at the control table, while at the dynamometer stands his assistant with his eye on the tachometer and the spring scale. The bar scale is for the time being hooked in place and cannot move. Suppose it is intended to take the first reading at 800 revolutions per minute. The throttle is opened until the desired speed is attained. From this point on, as the throttle is opened, the load is increased by turning the master control wheel, which increases the field resistance through the rheostat seen in Fig. 2. Finally the motor is running at the desired revolutions per minute with the throttle wide open. In other words, the motor is developing its utmost torque at the given number of revolutions per minute.

When the electric tachometer at the elbow of the operator at the master control table registers exactly 800 revolutions per minute with the throttle wide open he signals his assistant at the dynamometer, who immediately checks the speed on the mechanical tachometer and places the beam scales in position to take measurements. At the instant that the chief operator signals, the reading on the scale is taken and noted on a blank form opposite the cross heading 800 revolutions per minute. Two or three readings are taken at this speed to secure accurate results. From the conversion chart, Fig. 4, the horsepower is readily obtainable directly from the readings. After a set of these figures have been obtained they can be arranged in curvilinear form, as shown in the upper section of Figs. 5 and 6, which show sample curves taken on two motors at the Schoen-Jackson plant.

To measure the fuel a very ingenious device, designed at the Schoen-Jackson plant, is used. The 50-gallon gasoline tank is so arranged that the exact time through which 1 pound of fuel is consumed, together with the exact number of revolutions during that time, is measured with extreme exactness. The device is shown in Fig. 3.

The fuel-measuring mechanism consists of the tank, a beam scale, telegraph relay, transmitter, split-second watch and a Veeder revolution counter. The latter is magnetically thrown in and out of gear while the stop-watch is connected mechanically to the telegraph transmitter.

When the engine is operating under any given load the sliding poise on the scale beam, which is graduated to read in tenths of a pound, is set so that it almost floats, but remains in the upper position. As soon as the engine has consumed enough fuel to cause the beam to fall due to the reduced weight of fuel in the tank, the poise is set to 1 pound less and the beam again rises. As the beam dropped it hit the transmitter contact of the relay, which automatically started the stop-watch and threw the gears of the Veeder revolution counter into mesh with the dynamometer shaft. As soon as a pound of fuel has been consumed the beam again drops and through the relay instantly disengages the gears of the Veeder revolution counter and stops the watch, thus accurately registering the time required for the consumption of 1 pound of fuel and the number of revolutions during that time. This test can, of course, be carried on while the horsepower test is in progress and by combining the two the fuel consumption per horsepower-hour is determined. It is entirely possible for the assistant to be carrying out the fuel test while the operator carries on the horsepower test since the gauges for the horsepower test are in plain sight and the spring scale readings may be taken instead of the more delicate beam-scale readings. Since the results are to be plotted along a curve small errors are automatically compensated for by the required fairness of the curve.

The method of laying out the fuel consumption-horsepower curve is comparatively simple. The revolutions per minute can be taken on the tachometer during the time that the test is under way and the reading here checked back on the revolution counter. They should be the same if the motor has run steadily during that period. The pounds of fuel per hour can be figured from the reading on the stop-watch. This supplies sufficient data for the determination of the pounds of fuel per horse-power-hour.

By the use of thermometers and pressure gauges the temperature and pressure of the exhaust gas can be obtained. The pipe is so arranged that the action of a motor with and without a muffler can be duplicated. A by-pass is also placed in the line of the exhaust pipe so the products of combustion and the contents of the exhaust pipe may be noted at any time. Three vacuum gauges are used to determine the vacuum in the exhaust manifold and carbureter.

For use in determining the amount of water used in cooling there is an arrangement by means of which the temperature of the water entering the jacket can be measured as well as that of the water leaving the jacket. The velocity of the water flow is measured by pitot tubes, and knowing the time and velocity it is readily possible to calculate the flow in pounds per horse-power-hour or in any other units desired.

From the foregoing description it may be seen that there is practically nothing which may not be determined as regards the motor with the testing apparatus as outlined. Various road conditions may be simulated on account of the dynamometer's ability to act as a motor and drive the gasoline engine. For instance, the motor may be allowed to drive the dynamometer under a heavy load, as in climbing a hill, and then the dynamometer may be switched over suddenly to drive the motor as would be the case in going over the brow of the hill when the action of the force of gravity on the car would cause it to revolve the motor rapidly. Other parallels with road conditions may also be simulated by the operator.

With the successful testing of the motor and carbureter well in hand it is but natural that another step forward should be made. This has been done recently by the Diehl Manufacturing Co., which has brought out an entire chassis testing outfit of the type shown in Fig. 7. It is designed by P. P. Dean, their engineer. With this plant the operator may sit in the driver's seat, walk around the chassis or remain at the master control table and test every part of the chassis except the springs. The action of the gearset and rear axle and the different gear reductions may be ascertained. In using the chassis testing dynamometer set, the rear axle is rigidly fixed to a pair of cradles and provided with a pair of chain-sprockets in place of the ordinary wheels.

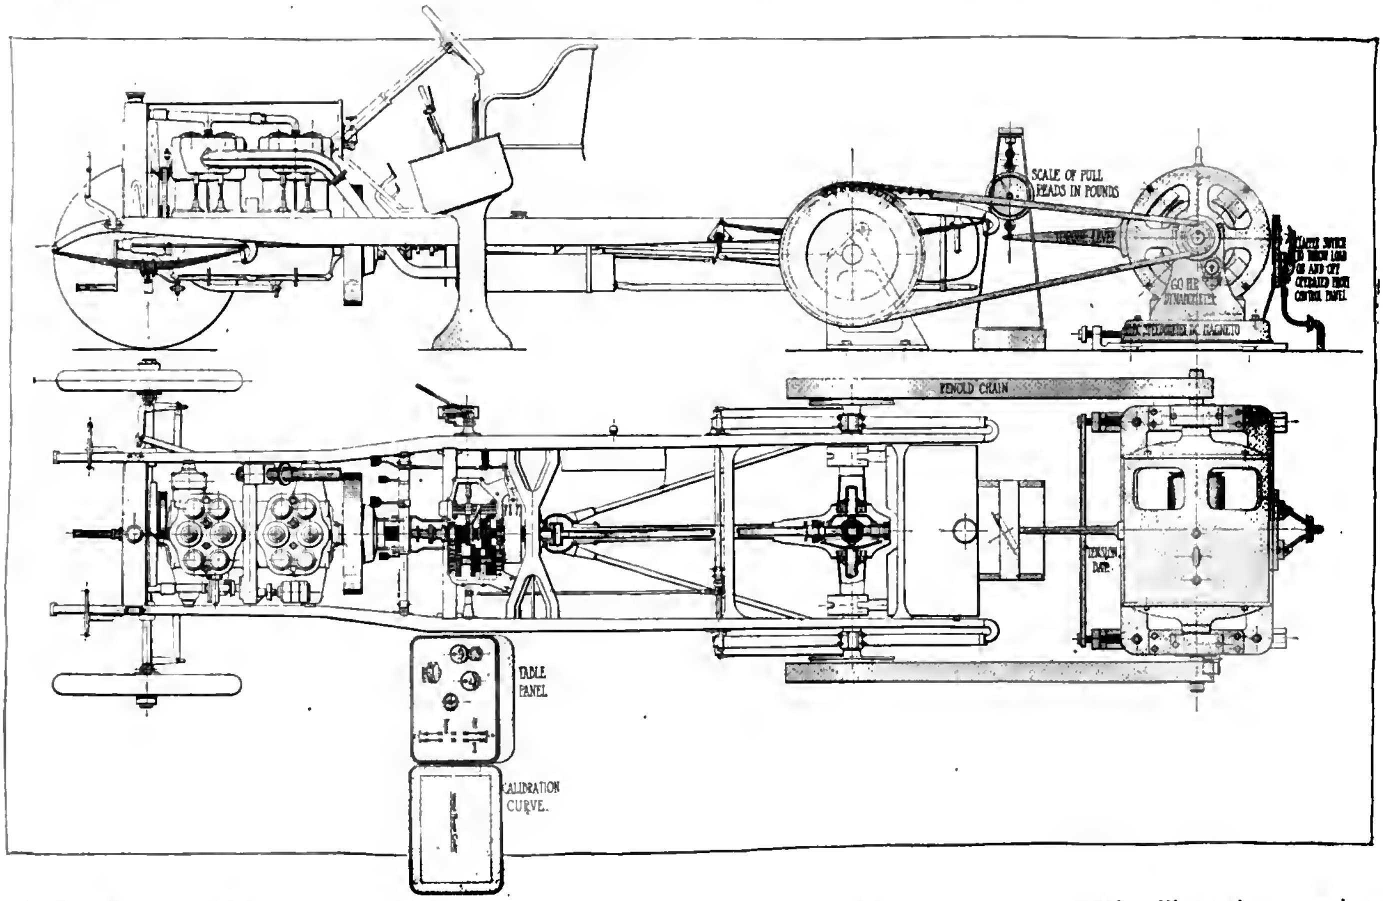

Fig. 7—Dean chassis testing dynamometer, by means of which many of the tests made on the road can be made with greater convenience in the laboratory

Frameless Glass Windows for Automobiles

By George J. Mercer

Body Designer

THE use of frameless glass windows on closed bodies is growing rapidly in favor. At the last Importers' Salon, held in New York, at the Astor Hotel, Jan. 2nd to 11th, there were twenty-two bodies having frameless glass while sixteen had windows with wooden frames.

There are, however, two very noticeable drawbacks connected with the newer method. One of these is the increased liability of breaking the glass, and the other is the letting in of water when it rains or when the car is washed. The letting in of water is not due to a mistake or fault, but is the accompaniment of one of the methods used in operating the glass.

Fig. 1, A, a cross section through the body of a limousine, shows the door pillar with the glass suspended by the lift strap. This window is of the frameless glass type and as illustrated the glass travels in a straight groove extending from top to bottom of the pillar, being supported at all times by the strap. The metal channel in which the lower edge of the glass rests and to which the strap is attached, is continuous across the whole width of the glass between the pillars. This channel always remains below the top of the bar and out of sight. The necessary clearance, however, to enable the glass to pass by the back face of the bar without touching, is sufficient to enable the water to enter. Where this method is employed, provision is made at the bottom of the door and body for drainage, and if the construction of the body is practically all metal no great inconvenience is experienced.

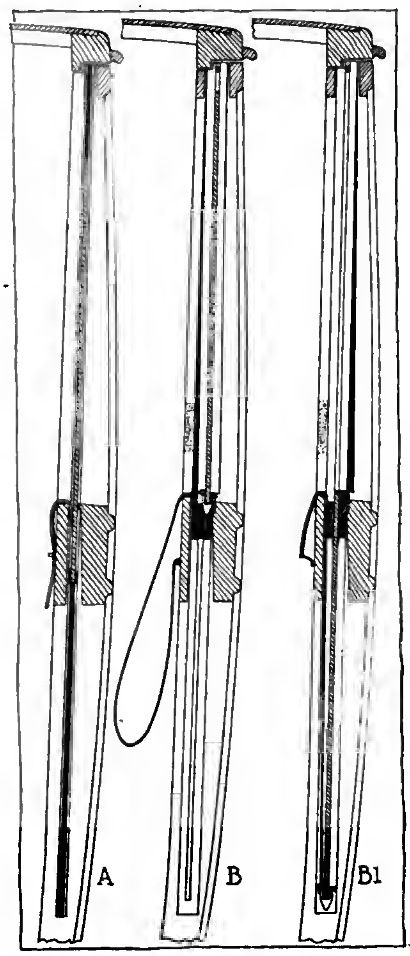

Fig. 1—Sections showing two methods of fitting

In some of the best bodies made this method is used with apparently satisfactory results. The two strong features in its favor are the safety with which the glass can be operated without breaking, and the opportunity that it presents of utilizing a mechanically operated lifting device. The disadvantage of this method is that it permits the entrance of water in the glass pockets with a consequent deteriorating effect on the wood framing of the body.

B and B1, Fig. 1, illustrate another method of operating the frameless glass window. Two positions are shown and the section of the body illustrated is the same as at A. These two illustrations show a method employed to overcome the tendency of the glass breaking when raised and lowered, and at the same time keep out the water. B shows the glass raised and the entrance of water effectively barred, while B1 shows the glass dropped to its lowest position in the pocket.

Fig. 2, an enlarged view of the door bar at B, Fig. 1, better illustrates the glass in raised position. The wood channel in which the glass moves up and down, is not one continuous piece, but is parted and is put in the pillar in two pieces. The lower half is stationary in the pillar and the top and terminates at A. The upper half of the channel is fastened with one wood screw at the top, in the center. With this screw as the pivot point the lower end of the channel moves in the arc of the circle from C to D and carries the glass with it. This channel terminates at the lower end at BB. A cross section showing the dimensions of the channel is given at E1. At the rear of the glass the channel has a downward extension so as to support the glass when the pull comes on the strap.

Across the lower edge of the glass is the metal channel K. The glass rests in this channel, being first protected by a rubber channel that fits over the glass and in turn fits into the metal groove. This metal channel K is very strong, so as not to bend when the strap is drawn tight. At the front the metal terminates in a lip or hook that slips over the fence iron on the door bar, thereby forming a watertight contact that prevents any leakage of water into the body. On the inner side the channel is flat and to the center are fastened lugs that provide attachment for the lifting strap.

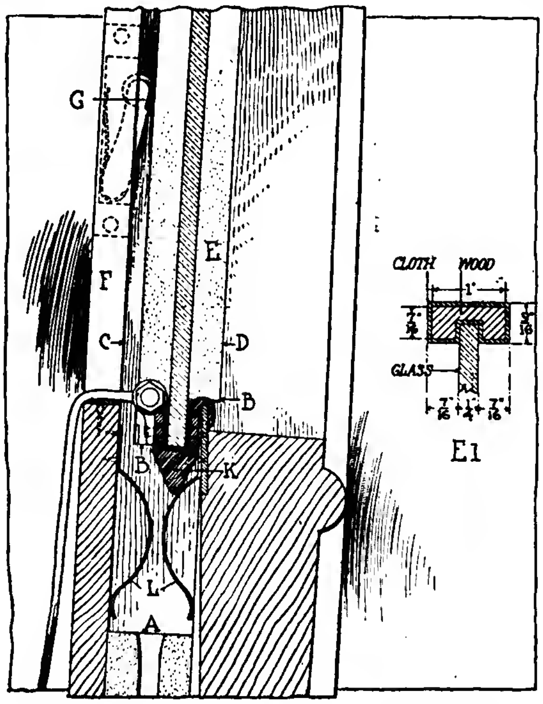

Fig. 2—Watertight method of supporting window

The position of the glass as illustrated is with the opening closed, when the glass is supported by the metal lip of the bottom channel hooking over the fence iron. In order to facilitate an easy movement forward of the channel containing the glass, a strong spring G, fitted with a roller at the end, is pocketed in the side of the groove and presses constantly against the channel.

When it is desired to lower the glass, it is first lifted slightly by the strap and then lowered, the two springs LL guiding it into the groove of the lower channel that commences at A. When in its lowered position the top of the glass is even with the top of the fence iron and the springs LL perform the duty of holding the glass rigid and prevent rattling.

Mirrors For Dangerous Street Corners

Insure Safety

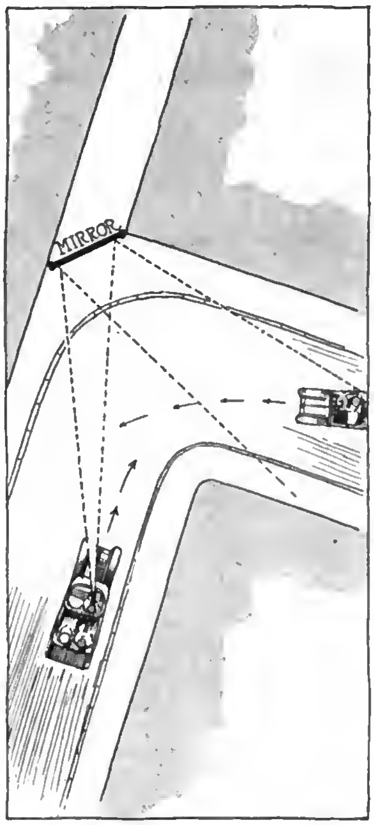
ALL motorists are familiar with that feeling of uneasiness which is experienced when driving toward a blind corner. There is always present the danger of some careless road user looming out of the hidden approach too late to avoid a collision. In this connection the extensive use of rear view mirrors on automobiles must often have suggested to drivers the possibility of using a larger fixed reflector at the dangerous street corners, to show the approaching vehicle. But, strangely enough very little has been done in the way of actual experiment with such a device. The success, however, attending the adoption of these mirrors in the few places where trials have been made renders the available information of great interest to road users.

Some years ago the Touring Club of France placed mirrors of this type at dangerous turns on the Corniche road at Menton and Ventimiglia with satisfactory results. And at a few towns in England similar success has followed the use of these devices.

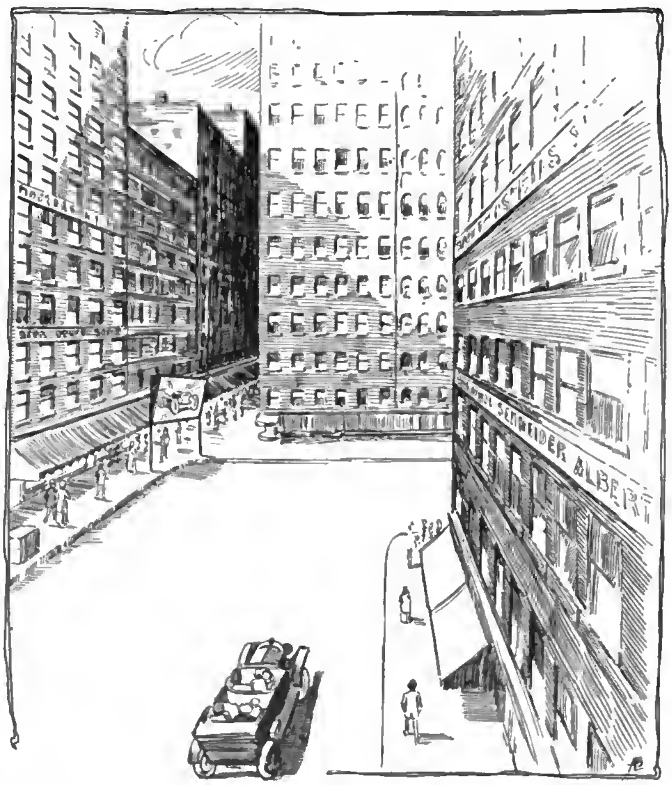
In Folkestone, England, at a street crossing where previously accidents were of frequent occurrence, the roads at that point carrying quick traffic, a mirror 2 feet square has been in use since June, 1910. With reference to it, A. E. Nichols, borough engineer and surveyor of that town says: "Since the mirror has been fixed I have not heard of anything approaching an accident, and as a motorist myself have personally experienced its value. I do not find that the damp, mist, rain or frost has any ill-effects on the mirror, which is occasionally cleaned by a passing lamplighter when cleaning his lamps. Nor do I think apparatus of this description unduly encourages high speed at turnings. I do suggest, however, that these street mirrors would be of much greater value if they were very slightly convex, in order that a very much greater area could be observed than is possible with a flat mirror."

The reflector in question is mounted at a suitable angle on an upright of 1.5 inch gas pipe, driven into the ground.

With regard to the important point of including a greater or lesser amount of reflected area it is of interest to note that at a similarly dangerous street corner in Malmesbury, another English town, a larger flat mirror, measuring 8 feet by 5 feet is at present in suc-



Plan of turning, showing radius of view included in mirror as car approaches the point of danger



Method of mounting safety mirror at city street corner, showing approaching car, hidden from view by the building

Practical Results

cessful use. This is mounted on two vertical pillars on the sidewalk, the long side being placed horizontally, leaving sufficient headway for pedestrians. The large size brings up the question of unsightliness and also the possibility of objection on the part of the occupants of adjacent houses, and suggests the desirability of experiment with smaller convex surfaces.

In fitting mirrors of this description, the deteriorating effects of the weather make it necessary to take into account several constructional considerations. The most important of these is that of the silvering. Ordinary mirror silvering, to meet interior conditions is not sufficiently heavy to prevent oxidization. The thin protective paint backing as generally applied is also inadequate for exterior requirements. This coating must be thicker and so mixed that extreme variations of heat do not tend to cause cracking of the surface and consequent peeling or exposure of the silvering.

The thickness of glass used is also a point of considerable importance although only partly connected with the weather conditions. All glass is porous to some extent and therefore the thicker it is in mirrors the less trouble will be experienced in causing oxidization of the reflecting surface. But while thick plate glass is an advantage in this respect it has the great drawback of causing a double image when used as a street corner reflector. This is due to the refraction of the glass. Refraction is always present, but its effect is negligible when the entering ray is not removed far from the normal, as for instance, when an observer looks at his own reflection. In this case the entering ray is at 90 degrees. In the particular mirrors in question, however, the angle of incidence, or relation of the sight line to the mirror surface is in the neighborhood of 45 degrees, and the refraction then becomes a serious objection, causing a confused image. If the glass is thin this drawback is lessened, but the liability of breakage through accident or wilful damage is increased and therefore some suitable mean thickness should be adopted.

This question of street corner reflectors is well worthy the serious consideration of city authorities.

Cleaning Out the Crankcase—Using Drip Gasoline—The Differential Gear—Overheating Causes Power Loss—Allowing for Clearance—Gas Turbines—Concave Piston Motor—On Adjustments—Ignition System on the 1910 Mitchell

Removing Oil from Crankcase

EDITOR THE AUTOMOBILE:—I have seen several directions, at different times, to remove the oil from the crankcase of the motor and to flush the latter out with kerosene. I have a car which, according to my instruction book, uses a splash system of oil. I am very much of an amateur when it comes to doing any work around the motor and I would therefore appreciate specific directions, with illustrations if possible, telling how to remove this oil and how to get the kerosene to the correct spot.

New Bedford, Mass. SUBSCRIBER.

—You will note on the bottom of your crankcase a series of petcocks and a drain plug, as shown in Fig. 1. Open the petcocks and remove the drain plug. This will not only permit the oil to flow from the splash troughs, but will also remove that which is contained in the oil reservoir. After all the oil is out, pour 2 quarts of kerosene in the breather pipe or oil filler hole, as shown in Fig. 2. Run the motor for about 30 seconds—no longer—then open the petcocks and the drain plug again and let the kerosene flow out. After this has drained thoroughly replace with new fresh oil.

Use of Drip Gasoline

Editor THE AUTOMOBILE:—Do you think it a safe and sane plan to use drip gasoline (caught direct from a well) in a 30-horsepower motor without any refining? I know a number of people who use it and claim it more powerful and quicker than refined gasoline, although it smokes and causes more carbon. I can get plenty of it for almost nothing, and have been thinking of buying some refined gasoline with good gravity, then using half refined and half drip. I think by mixing it it will be safer and better fuel than using the drip gasoline alone, but would like to have the opinion of someone with more experience than myself before trying it.

Metz, W. Va. L. C. S.

—Drip gasoline taken directly from the well cannot harm your motor. If your carbureter can handle it there is no reason why you should not take advantage of the low price at which you can secure it. Before using the drip gasoline, or any other gasoline, as a matter of fact, it is necessary to strain it through chamois skin or through two or three layers of exceedingly fine wire gauze mesh. It would not be wise to mix refined gasoline with the heavier fuel; the result of this would be that even if it did arrive in its mixed state at the nozzle of the carbureter the gasoline constituent would be evaporated while the less volatile part of the mixture would remain in globular form.

When using the heavier fuel you will find that a different carbureter adjustment is necessary. From 50 to 100 per cent. more air is required than with the higher grades of refined gasoline. The reason for this is that owing to the difficulties of evaporation it is necessary to pass more air over the surface of the unevaporated gasoline than would be the case where the more volatile products were used.

Action of Differential Gear

Editor THE AUTOMOBILE:—Would you kindly tell me if the engine power of an automobile is distributed equally to the two rear wheels in taking a turn or corner or if the most power is transmitted to the outside wheel? Also if running at 15 miles an hour on the straight and without changing your throttle lever you go around a corner, if the speedometer will go above 15 miles an hour with the same amount of gas?

Clermont, N. Y. R. R. SAULPAUGH.

—In turning a corner more power is exerted by the outside rear wheel. When the front wheels are turned by the steering gear in order to make the car turn a corner they force the car to swing about the inside rear wheel as a pivot. This wheel therefore exerts very little power. The narrower the circle in which the car is turned the more stationary the inside wheels and hence the less power exerted by this wheel. The action of the differential is such that the power is transmitted to the wheel which opposes the least resistance to its motion.

The action of the speedometer is altogether dependent on the peripheral speed of the wheel to which it is geared. When turning a corner if the wheel to which the speedometer is geared is the outside wheel it will show a greater mileage per hour than it would were it the inside wheel. In other words, the odometer shows the number of miles traveled by the wheel to which it is geared. If the car were traveling around a circular track the outside wheels would travel a greater distance than the inside wheels, and hence if the speedometer were geared to the outside wheels it would show a greater mileage than when geared to the inside wheel. As the number of left and right turns made in a day are very nearly equal, and since most of the running is done along straight roads, the report of the odometer at the end of the day is generally accurate.

Cooling Water Boiled Suddenly

Editor THE AUTOMOBILE:—Recently on a trip to Peoria, a distance of 12 miles, my engine ran well. On the return trip, however, when about half way home, the motor lost power rather suddenly and the water boiled violently. At first I thought the carbureter was flooding, but examination showed that it was not flooding. The carbureter adjustments are the same as they have been for nearly 3 years. There was no popping or back firing into the carbureter or exhaust manifolds. After arriving home I removed the valves and proceeded to grind them, even though they did not seem to need it. I looked for carbon deposits, but found not enough to cause much trouble. I very seldom use hard water in the radiator, and I have a habit of draining it often. The carbureter is a Schebler. The ignition, Remy type "S" and the motor a Regal.

Now, what, in your opinion, caused this boiling of the water and the loss of power, for the motor would not pull on high gear on a level road?

Spring Bay, Ill. WILLIAM L. ZELLER.

—There is only one thing that could cause the cooling water to boil suddenly in the radiator in this manner and that is the failure of the water to circulate. This could be due to but two causes. First, breakage of the water pump, and, second, to the clogging of the cooling system by some foreign matter.

The second is the probable cause and may be cured by pouring a pail of boiling water and soda through the radiator and then flushing this out with two or more pails of hot water. If the tendency to clog be very marked and the deposit stubborn, the motor may be run for a few moments with the soda water in the system if so desired. The proportion of soda to water should be about a double handful to each pail of water.

Should the pump drive, or the pump itself be damaged, it is a matter of replacing the damaged parts. It would also be wise to look at the spark and throttle linkage to see if either of these could possibly have become disarranged.

Design of Diesel Motor

Editor THE AUTOMOBILE:—Can you tell me where I can secure a book on the theory and design of the Diesel motor? Also where I can get the data published by the S. A. E. in loose-leaf?

Watertown, S. D. W. H. McCULLOUGH.

—The best place to secure data regarding the theory, design and construction of the Diesel motor would be from the Diesel Engine Co., Busch-Sulzer Bros., 30 Church street, New York City. The literature furnished by this company goes deeply into the principles of the Diesel motor and its manufacture.

2—The loose-leaf data given out by the S. A. E. can be secured by addressing Coker Clarkson, care of the Society of Automobile Engineers, 1786 Broadway, New York City.

Wants to Use Bell Signal

Editor THE AUTOMOBILE:—I disposed of my automobile last fall, and I thought I would quit, but as spring approaches I feel the fever coming on again and suppose nothing will do but get one. On my former automobiles I found the bulb horn very unreliable. Would you kindly inform me is there any regulation, rules, ordinances or laws, city or state, forbidding the use of bells on automobiles, such as used by the city fire department or ambulances?

Mt. Vernon, N. Y. A. D. EVERTSEN.

—The law of New York on warning signals states that each car shall be provided with an adequate horn, bell or other signal. There is nothing which would prevent you from using a bell if you so desire. It would be inadvisable, however, to equip yourself with a bell identical with that used by the ambulances or fire department of your city, as you would find yourself in trouble with the local authorities.

Correct Allowance for Clearance

Editor THE AUTOMOBILE:—The cylinders of my Stoddard-Dayton have worn so as to allow pistons to slap. Cylinders now measure 4.742 and I have ordered pistons measuring 4.752. Would it be better to have cylinders bored at a machine shop or could a satisfactory job be done by grinding down with emery using the old piston as a grinding tool. What is the proper clearance to allow for expansion between piston and cylinder walls?

Holyoke, Mass. CYLINDER.

—The correct clearance at the top of the piston is .004 inch and at the bottom or skirt of the piston .002 inch would be correct. The clearance between the top and bottom of the piston is decreased .0005 at each of the rings. This gives a sort of stepped taper which has been found to correctly take up all slaps and leave a good, quiet-running motor.

It would not be wise to attempt to use the old piston as a grinding tool in reboring the cylinder. This should be done at a machine shop which has the correct equipment for doing this work.

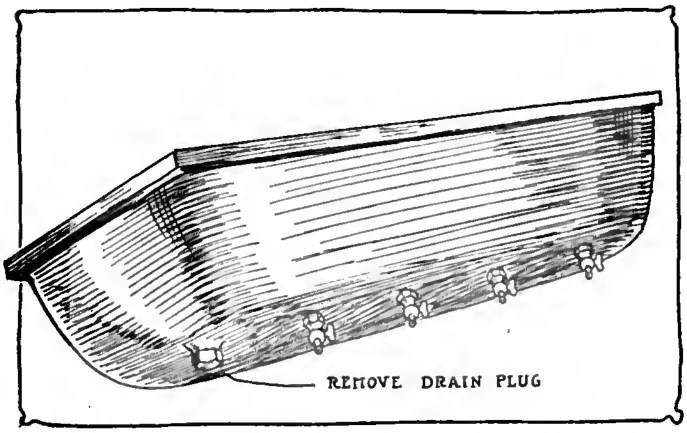


Fig. 1—Petcocks on the bottom of the crankcase should be opened and the drain plug removed to clean out the old oil

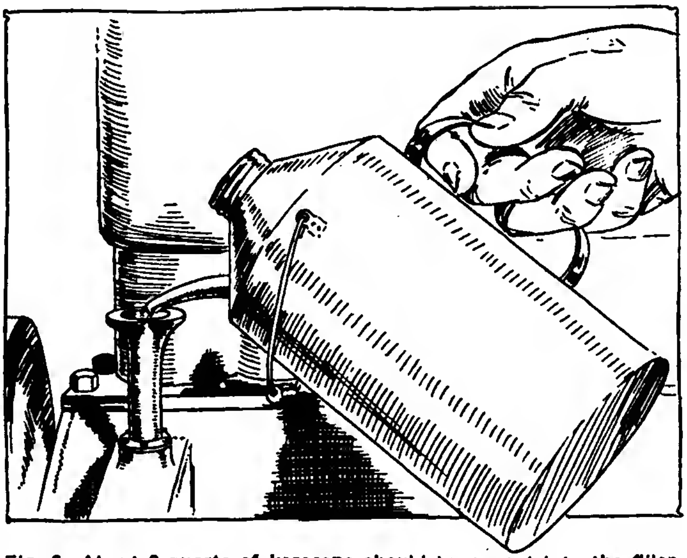

Fig. 2—About 2 quarts of kerosene should be poured into the filler hole after the old oil has been removed

Vulcanizer for Garage Purposes

Editor THE AUTOMOBILE:—I am about to purchase a vulcanizing plant and not having any experience in that line, I would like to have you tell me what make of plant would you advise me to buy.

Is there any special objection to the Haywood system? What kind of stock is best for use with the Haywood system? Is retreading practical with any style of vulcanizer?

Natick, Mass. L. E. DAVIS.

—The Haywood system is excellent for garage purposes. It is made by the Haywood Tire & Equipment Co., of Indianapolis, Ind. Besides this concern there are several others which make excellent systems for garage use. Among these may be mentioned the following:

Auto Tire Vulcanizing Co., Lowell, Mass.
Biggs Boiler Works Co., Akron, O.
Burge Machine Works, Chicago, Ill.
Diamond Mfg. Co., Des Moines, Ia.
Milwaukee Auto Specialty Co., Milwaukee, Wis.
Schafer Company, Waupun, Wis.
Westinghouse Electric and Mfg. Co., Pittsburgh, Pa.
Williams Foundry and Machine Co., Akron, O.

Gas Turbines In Existence

Editor THE AUTOMOBILE:—Do you know of anyone who has experimented on a turbine operated by gasoline, and, if so, what advance has been made?

Cumberland, Md. J. H. DANTZIC.

—Gas turbines have been experimented upon for a number of years; as far back as 1648 there have been traces of investigation of this type of motor. One of the earliest of which we have knowledge is the gas turbine designed by Barber, who patented his device in England in 1791. His patent number was

1833 that year. After that nothing more was done for 50 years, until 1850 W. F. Fernihaugh took out a patent No. 1,328 on a mixed steam and gas turbine. Following this came Burdin's hot air turbine, which was proposed by him in 1847 and actually built in 1853. The first of what may be called the more modern types of gas turbine was made by M. W. Boulton in 1864. He was the first to realize that the high velocity of the jet of gases issuing from the nozzle offered a practical difficulty and proposed to remedy this by use of successive induced jets of increasing volume and consequently lower velocity. There have been a number of works upon the gas turbine, one the latest being by Henry Harrison Suplee, J. B. Lippincott Co., 1910. There are many turbines which are suitable for either steam or gas. Among these may be mentioned Bucholz, of which an account appeared in *Electrical Review,* January 8, 1904, and the Patschke turbine, which has had extensive use in Germany. The French firm of Armengaud & Lemale have gas turbines up to 300 horsepower which are actually in use at the present time. Another turbine which has been brought forward within the last 3 years is that of M. Karavodine, of Paris. The reason that gas turbines have not become more popular and brought into general use is that the efficiency obtained with them has been very low.

Desires Motor Encyclopedia

Editor The Automobile:—Is there any encyclopedia or text published on modern automobile engineering and design? What is desired is something quite complete and useful to the automobile engineer, setting forth the best practice together with a good list of formulæ and plenty of diagrams and results of tests.

Bozeman, Mont. Arthur C. Ford.

—There is an encyclopedia of automobile engineering published by the American School of Correspondence, Chicago, Ill.

Theory of Concave Piston Motor

Editor The Automobile:—Kindly advise whether in your opinion one of the results obtained from an L-head engine of the general design shown in Fig. 3 as compared with the ordinary domed cylinder type will be a stratification of the burned gas above the piston with the fresh charge unmixed with it or partially mixed above it.

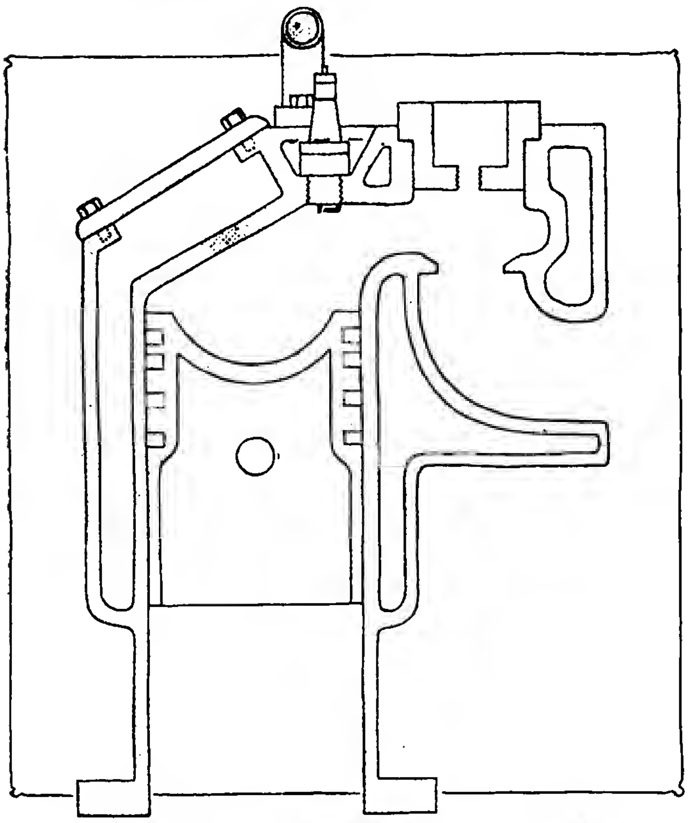

Fig. 3—Novel L-head motor design embodying a concave piston

2—Would such a stratification result in more rapid combustion, higher initial and mean effective pressure?

3—Would the central location of the spark-plug tend to produce the increased power resulting from the use of a two-spark system in T-head engines?

4—Would the burned gases on the piston tend to cushion the more violent explosion?

5—Is not the claimed increased power of Knight and V and H engines due to similar stratification rather than to cleaner scavenging, it being, of course, assumed that the engines compared have the same displacement and compression and are identical as to gas passages, size and lift of valves.

Port Henry, N. Y. F. E. Bachman.

—1—Such a stratification would probably result owing to the fact that there would be a pocket formed in the bottom of the piston bowl.

2—It is impossible to state that such a stratification would result in any better combustive efficiency. It is absolutely impossible to get any definite data of this nature through drawings or for the motor itself without the aid of indicator or manograph cards.

3—The central location of the spark-plug would doubtless be the most advantageous for the shape of combustion chamber which you have in your motor. It would not give the rapidity of combustion that would be secured by two sparks.

4—The burnt gases on the piston would not act as a cushion because the pressure in any part of the combustion chamber is the same at any instant. Besides this, no cushioning effect, which would virtually amount to slower combustion and expansion, is necessary.

5—The basis of advantages claimed for Knight and valve-in-head motors has never been laid to stratification. The reason for this is that nobody has ever proved definitely that stratifition existed within the cylinder.

Some Pertinent Adjustment Queries

Editor The Automobile:—1—Would it be advisable in order to stop compression leaks to use white lead on the threads of the petcocks, gaskets, etc? If not, what would you advise?

2—How can I stop a slight leak through the petcock, due to its not closing tightly?

3—I have read your answer on eliminating noise caused by tapping of loose valves in your magazine of October 17, 1912, but should like to know if after the engine is heated up there is still a space between the valve stem and tappet, would it be advisable to further tighten the valve?

4—Do you think it shall be necessary to retime the valves on a car which has been run only 3,500 miles? It is a Cadillac 1912.

5—In the directions for readjusting the carbureter there is one given to "adjust screw E until the motor attains a speed of 280 to 300 revolutions per minute." How can this speed be determined by an inexperienced person?

6—Do you think a tap would be caused by worn cam-followers, as you suggested, in an engine run as little as this?

Oakland, N. J. Waldemar Büsing.

—1—It is better to use shellac than white lead on the threads of the cylinder petcocks, gaskets, etc. Shellac will withstand the effects of heat better than white lead and does not offer as much resistance to removing the parts.

2—The leak in the petcock can be stopped by grinding in the valve or, since they are so cheap, by simply fitting a new one. If you desire to grind it in you can put a little valve grinding compound between the petcock valve and its seat and work the handle back and forth in the same manner as you would do in grinding a poppet valve. This will make a tight fit between the valve and its seat.

3—If there is still a space between the valve stem and the tappet after the motor is heated up it would be wise to close this gap by turning the adjustment nut. The clearance between the tappet and stem when the motor is cold should be .003 inch.

4—It should not be necessary to retime the valves on a car which has run 3,500 miles. You might check the timing by noting the marks on the flywheel and seeing if they agree with the action of the valve. For instance, where the flywheel is marked E.O. 1 it means the exhaust valve on cylinder one is just starting to open when the mark at E.O. 1 is just opposite the indicator.

5—It is impossible for an inexperienced person to accurately estimate the revolutions per minute of a motor. Three hundred revolutions per minute, however, would be just about the point at which the motor appears to be running rapidly but not racing. This may give you a vague idea of the speed. With the spark in medium position 300 revolutions per minute would probably be obtained when the throttle was opened a little less than one-quarter way, assuming the gears to be in neutral.

6—A tap may be caused by a worn cam follower in any motor, although it is not likely to be the case with a car run such a short time.

From Hattiesburg to Chicago

Editor THE AUTOMOBILE:—Can you furnish map showing route taken by Glidden Tour? I want to go from Hattiesburg to Chicago in my car and would like advice as to the best way to go.

Hattiesburg, Miss. H. S. LILIUS.

—It will be necessary for you to take whatever roads you can find from Hattiesburg to Newton, which is a few miles north of you. From Newton to Jackson leading through Brandon. Once at Jackson you are in a position to take the regular Blue Book routes north as compiled from the 1910 Glidden Tour, which passed through that city. Your course will lie through Canton, Lexington, Greenwood, Memphis, Middleton, Tuscumbia, Nashville, Bowling Green, Cave City, Louisville, Indianapolis, Lafayette, Chicago. These routes will be found in Volumes 3 and 4 of the Blue Book.

Ignition on 1910 Mitchell Car

Editor THE AUTOMOBILE:—Would you please explain the ignition system used on 1910 model T Mitchell? My car has a Splitdorf magneto. I gave my car an overhauling, ground the valves and had it all apart and since I put it together it does not seem to have the same compression it had before I sent the magneto to the repair shop and had it tested and fixed up, but I cannot get any ignition. Why?

Some time ago I started to take my car out and after running about 10 feet out of the garage my transmission subshaft broke. I had a new one made and then I went about 15 miles, and not running over 15 miles per hour, and my subshaft broke for the second time. The car was not handled rough, making all changes in gear as they should be; each break looked as though the shaft was twisted off. I have not had car out since my last break.

Pittsburgh, Pa. GEORGE E. KESTNER.

—The system on this car consists of a low-tension magneto with a tube transformer. The diagram of the wiring system is given in Fig. 4. The system will be readily understood from the diagram and but one precaution need be observed, that is, that both poles of the battery must be brought to the transformer. The battery should not be grounded under any circumstances. The current for ignition is generated by the low-tension magneto and is then led up through the transformer, where its voltage is increased to such an extent that it readily jumps the 1-32-inch gap between the spark-plug electrodes. It may be that the reason you did not get a spark is that you have grounded the battery current.

It is natural that immediately after the valves have been ground that the compression will be lower than usual. This condition will disappear after running a short time. The reason for this is the fact that the piston rings do not get a running fit for some time after they are removed.

It is impossible to state why the gearset shaft broke unless it was improperly lined up or unless it had a bend in it. It might be possible that the bearing surface for the layshaft is too small or that the bearings are too far apart to furnish adequate support.

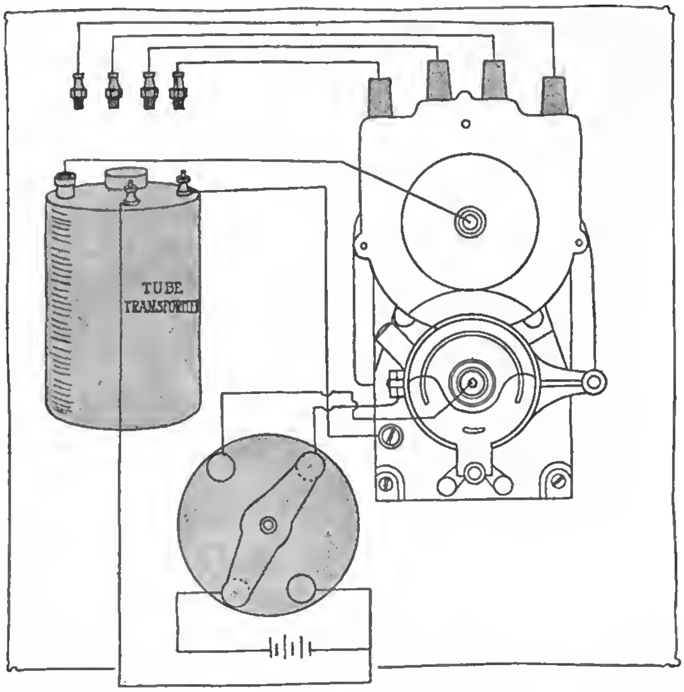

Fig. 4—Diagram of 1910 Mitchell ignition wiring system

Editor THE AUTOMOBILE:—Apropos of the recent controversy regarding whether automobile shows pay or not, it strikes me that there being such a question is in itself a circumstance which would indicate that something is fundamentally wrong with the big shows. A report of the 1912 Paris salon—which, if I am not mistaken, appeared in THE AUTOMOBILE—stated that after paying for the cost of the show, a surplus was left which was distributed among the exhibitors.

While the number of show visitors at New York and Chicago was a large one, it has been stated that some 40 per cent. of the people that went to see these exhibitions had complimentary tickets. The question then arises, was it necessary to give these people gratis tickets, or would they have paid admission to see the shows?

In my mind, the answer is: No, they would not have paid. For the majority of these people are not necessarily interested in automobiles for the immediate future, though they are possible buyers for some time hence. Yet, in a city like New York or Chicago, which every evening has scores of entertainments for the man who is seeking them, an exhibition to which people are expected to come and to pay for their tickets, must be made as attractive as any other entertainment. People want to enjoy themselves, not to be educated. Soloist singers of the cabaret style and adequate dinner and tea facilities should be there.

Furthermore, if fewer complimentary tickets had been distributed and that with utmost care, the paid tickets selling at $1 should have made the show a commercial success. If only well-to-do people would come to the shows, all of them would be there. And these are all that are looked for.

New York City. D. VON BERN.

Simplex Car Has Force Feed

Editor THE AUTOMOBILE:—Will you please tell me if the Simplex company of New York are going to put out a new car for 1914 with steel pistons and force feed lubrication? If they are can you give me the specifications?

Alton, N. H. H. P. TIBBETTS.

—The Simplex for 1914 will no doubt use the force feed lubricating system as is the case this year. The possibility of its using steel pistons is very remote. There is no intention of doing so at present.

Silk Stockings on Trucks

IT is not surprising that the members of the National Association of Automobile Manufacturers at their regular meeting last week should vote practically unanimously for a recommendation that the commercial vehicle shows at New York and Chicago be discontinued, ostensibly on account of the expense to the manufacturer in conducting them, failure to make the anticipated sales, because of poor attendance and sundry other reasons.

You do not dress a football hero up in court costume when he is going into one of the severest battles of the year on the gridiron, neither does the business man go to his office in evening dress to transact the business affairs of the day. The commercial vehicle shows up to the present have been carried on in the dress and setting of the passenger car shows. The walls of glass and mirrors to add attractiveness to the polished lines of the passenger car have been used when the coal-dumping truck, the lumber truck, the brewery truck and the emergency repair wagon, have filled the exhibit spaces on the following week.

These vehicles designed for business have been taken out of their proper setting. They have been transported from what should be an atmosphere permeated with everything that is most businesslike in the transportation field, and deposited in what would be the same environment as a person wishes to enter when buying a spring hat or Easter gloves.

Even in the conduct of shows for motor trucks recognition must be had of those universal feelings and influences in life. Shakespeare wrote: "How many things by season seasoned are!" What could be more true? Apply this to the present style of motor truck shows, and it must be admitted that it would be more rational to demonstrate these vehicles of labor on the boulevards of Central or Jackson parks than to hedge them in with mirrors and church windows in an exposition building.

The fact that the present type of show has proven a failure, as the manufacturers admit by their action, is no reason that they should come to the conclusion that commercial vehicle shows are all failures. Far from it. Such a course is precipitant. Such decisions will be changed by the passage of time. There is need to-day for commercial vehicle shows, but they must be held at the proper time, in the proper place, and in the proper manner.

The week following the passenger car shows is not the proper time for a commercial vehicle exposition. It does not meet with the conveniences of many business houses. It comes too close at the end of their fiscal year, it being a well understood business fact that few concerns make large investments, such as motor truck equipment calls for, nearing the end of a fiscal year or immediately upon the opening of another year's business.

A better season for the show is in the early spring or early fall. These are the periods of greatest purchasing by the largest industrial houses.

A combination exposition and demonstration is needed. It is not sufficiently convincing to display commercial vehicles with dumping bodies passively on a carpeted floor. They should be out actually operating in a zone of business activity where every warp and woof of interest would prove an additional force in the selling arguments.

Such a program is not impossible. During a show extending over one week certain hours of each afternoon could be devoted exclusively to such demonstration work. These demonstrations could be in actual progress in some outlying section of the city. In either New York or Chicago it is possible to secure such demonstration grounds within short distances of the exposition centers. Long Island City affords excellent room in the East; and in Chicago the Lake front would more than meet every requirement.

But the outside demonstration must go further. All trucks have not dumping bodies, and only a small percentage of the buyers are looking for such a design. Other afternoons can be given over to some forms of city demonstration, or inter-urban work. These outside demonstrations should also be outlined to bring forth the time-saving aspects of the truck. Time-saving loading apparatus and unloading apparatus should form a part of such demonstration. These assume the forms of endless conveyors, traveling buckets, cranes, chutes, etc., and there is no reason why the adaptation of these for loading and unloading means should not be dwelt upon. There is no end to the rational ramifications for good of a combined commercial vehicle exposition and demonstration in at least three, or perhaps five, of our biggest American cities.

Is Barometer of Value in Motor Tests?

Following Introductory Paper by Herbert Chase on Fischer Motor, Ferdinand Jehle Put This Hypothetical Question up to Detroit Section of S. A. E.

Abbreviated report of Section meeting held at Detroit last Friday.

DETROIT, MICH., March 7—A representative gathering of automobile experts was present at last night's meeting of the Detroit Section of the Society of Automobile Engineers, which was the first to be held since December, the national shows having occupied the attention of the members during January and February.

The session was particularly interesting because of the presentation of the report of the test by the Automobile Club of America of the Martin Fischer slide valve motor by Herbert Chase, the club's laboratory engineer. A paper in explanation of this non-poppet type, which is being introduced in this country by L. B. Brown and George Ratcliffe under the name of the Magic motor, was read at the last meeting of the section, its unique crescent valve slides being the principal distinguishing feature, and Mr. Chase's report answered many of the questions which were left open from lack of data at that time.

Mr. Chase's report did not seek to compare the motor with other existing types of engines in any way, nor to offer any comment as to the results obtained. It was merely a presentation of the facts as obtained in the club's laboratory and to which the club was willing to give its official signature. The report was supplemented by lantern slides showing some of the special apparatus used for the test and the arrangement of the various apparatus, as well as curves plotted from the data obtained and manograph cards of both working and pump strokes. There was no special discussion of the results set forth in the report.

The second paper of the evening was read by Ferdinand Jehle of the Commercial Engineering Laboratories, this city. Mr. Jehle's subject was: "Are Barometric, Temperature and Humidity Readings of Any Value in Comparative Motor Tests?" Mr. Jehle did not attempt to answer the question but merely wished to set the facts before the engineers so as to bring out a discussion of the subject, and possibly, to cause some careful and scientific investigation to be made along this line in the near future. He took the stand that the ordinary variations in the temperature, barometer and relative humidity readings do not appreciably affect the practical comparative tests of motors, although there may be very slight differences due to them.

When one motor does not show up as well as another in test, these atmospheric conditions are blamed for the poor showing, thus offering a loophole. Calculations were offered to show that even with the most extreme differences in atmospheric conditions, coupled with the maximum effects which they could cause, no such differences should be taken into consideration.

Mr. Jehle stated that the only way in which we can arrive at definite conclusions on this subject is to run special tests with this particular end in view. "Some of us have cold rooms in which motor tests can be run," he said. "In these we could control the temperature and possibly the humidity. The pressure of the entering air might be controlled by a small blower. Such tests would be of real value. They would show better what differences atmospheric changes bring about than any calculation."

The general trend of the discussion which followed was toward the views held by Mr. Jehle, barometric changes due to altitude and humidity variations being taken up, principally in their effects upon carburetion. Frank H. Trego, research engineer of the Packard company stated that he was about to start a 500-hour test and that he would be glad to get any suggestions from the members present as to what determinations or observations in addition to those ordinarily included in a test of this kind which would be of value. He sketched some curves made from data taken on a recent 351-hour test of a Packard motor running continuously at 1,200 revolutions per minute with wide open throttle. Through one range of about 40 hours during this particular run, the weight of air per cubic foot diminished while the torque remained constant. This was offered as a proof that even with a varying humidity, the engine running was constant.

The question of difference in atmospheric conditions during the daytime and at night was taken up as to its influence, if any, on motor running.

Museum of Safety League Grows

NEW YORK CITY, March 10—More than 175,000 school children of New York City are now wearing the green and red button of the Safety League and a thousand or two more become members of the League every school day. A children's safety crusade has been carried on in New York since last December by the American Museum of Safety with the hearty cooperation of the Board of Education. Its object is street safety for children and the basis of the campaign is daily class-room talks to school children by lecturers from the Museum of Safety, both public and parochial schools being included. These talks are followed by the distribution of pamphlets containing "safety fairy tales," which the children are encouraged to take home and discuss with their parents. Lectures are illustrated by models which enable the speaker to point out graphically the dangers to be encountered in public streets and how to avoid them. To be a full-fledged member of the Safety League all a girl or boy has to do is to put into practice the safety rules and wear the safety button. These badges have the design of a green railroad lantern on red ground, thus carrying out the color scheme of the safety movement—red for danger and green for safety. In many instances children have made the stories contained in the pamphlets the basis of school essays and compositions. Some of the fundamental rules for the children run as follows:

NEVER fail to look both ways for automobiles, trucks and trolley cars before crossing a street. Keep eyes to the left until the middle of the street is reached, then eyes to the right until the curb is reached.

NEVER play any kind of a game in street where automobiles and heavy trucks are constantly passing or in streets where trolley cars are operating.

NEVER hitch on behind a trolley car, automobile or motor truck as you may lose your footing and be thrown under the wheels.

NEVER run pushmobile races in the streets. Pushmobile is hard to stop and may run right in the way of an automobile, heavy truck or trolley car coming in the opposite direction.

NEVER step from behind a trolley car without hesitating and looking as another car may be coming from the other direction.

NEVER take chances.

ALWAYS safety.

Caution and self-control are at the root of the lesson taught; to teach children to take care of themselves and through the children to reach the adults. It is training the children of today to be the prepared workers of tomorrow.

1914 Packard's New "48"

Has Left Drive, Control Centralized on The Steering Column and Combination Electric Lighting and Starting

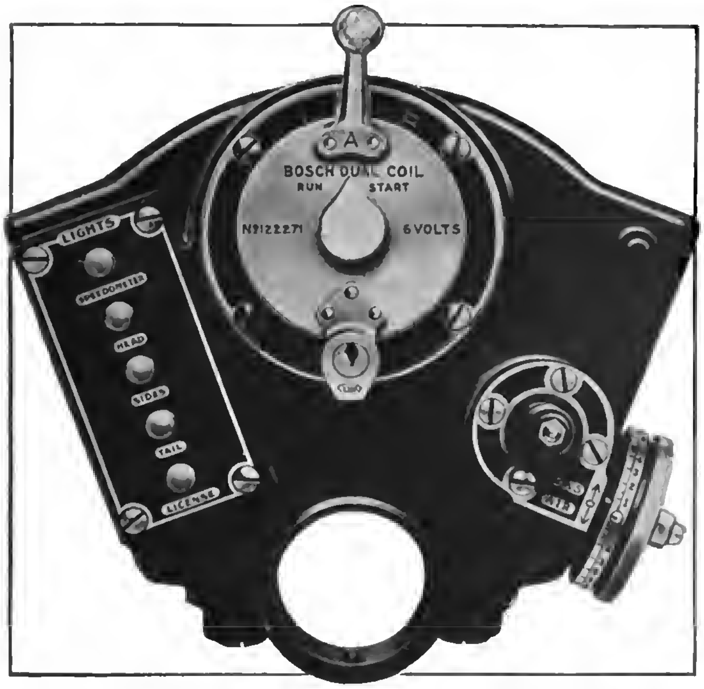

Fig. 1—A unique feature of Packard design which is incorporated in the new 48 is the centralizing control board which is placed on the steering column. The ignition switch is at the front and the light switches, each of which is labeled, are at the left, while the carbureter adjustment is at the right of the board

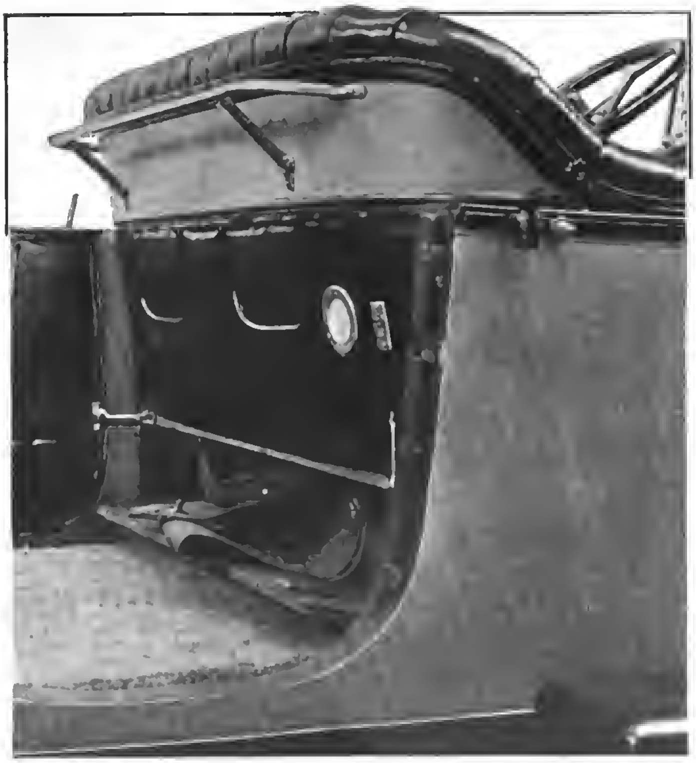

Fig. 2—Rear compartment of the new Packard 48 touring car, showing detailed view of the tonneau and the ample storage space which is provided for side curtains and other impediments. The tonneau is roomy and comfortable and all appointments are finely finished

DETROIT, MICH., March 8—In accordance with its present policy to develop and announce one model of chassis at a time, offering it to the market when ready, as stated in H. B. Joy's recent report of the directors, the Packard Motor Car Co. has just announced another model—the 1914 model 48, six-cylinder type. This new scheme of bringing only one chassis through the factory at a time arises from the fact that the former method of carrying two chassis through the engineering department of two sizes at the same time to be turned over to the manufacturing department together in order to have them ready for the market at the same time, both thus going along together through the shop, has proved unsatisfactory for many reasons, causing delayed deliveries and restricted output.

Summing up the features of the new larger six; it combines the salient features of the 1913 model 48, except that it has left drive, centralized control on the steering column and electric cranking and lighting in combination. These features make the new 48 consistent in design with the smaller six, model 38, which was put before the public last fall.

Control on Steering Column Continued

This control board, Fig. 1 which appeared for the first time last fall as a part of the then new 38, has the ignition switch located at the front and at the left are the various light switches, labeled so as to be readily seen. There are five of these buttons, making it possible to switch on any or all sets of lamps without shifting the driving position. At the right is the carbureter adjustment for varying the ratio of gasoline to air. The box is finished in black enamel, and since its inception has been favorably received by Packard owners.

The first of these new 48's appeared at the New York show. While the same as the model 48's which are now coming through the factory, the car seen at Madison Square Garden was a special job made up to show the public how the car would appear when placed upon the market.

The first demonstrators will be shipped from the factory this week.

In the motor, the only changes over the 1913 model 48 are those brought about by the shifting of the drive to the left side and the centralizing of the control below the steering wheel. The T-head construction with cylinders cast in pairs is retained. Carbureter, magneto and hydraulic governor are placed on the left side, making this now the business side of the power plant. The Delco motor-generator and water pump are placed on the right, the former at the rear, close to the rear support and the latter forward. The timing gears and pump and magneto shaft gears are helically cut and inclosed.

The front end of the motor is hung from an arched cross member of I-beam section, whereas the two rear supports are integral with the upper half of the crankcase, in fact, the careful observer is unable to discover any departures whatever from accepted Packard motor design.

The motor has a bore of 4.5 and a stroke of 5.5 inches, the horsepower by the S. A. E. rating being 48, which gives the model its name. The Packard engineers state that the actual brake horsepower at the same piston speed as that used as a basis for the S. A. E. formula (1,000 feet per minute) is 62 with the muffler on. The maximum is said to be 82 which is at a piston speed of 1,576 feet a minute, or 1,720 revolutions per minute.

The cylinders and pistons are ground and interchangeable, each of the pistons being fitted with two rings. These parts are all lapped together after assembling. The crankshaft has four main bearings supported conventionally by large caps bolting to the upper half of the crankcase. Its diameter is 2 1-4 inches. The valves are of nickel steel.

The electric cranking and lighting combination is too well known and has been commented upon too often in these columns to be taken up in detail here. It is manufactured for the Packard motor by the Dayton Engineering Laboratories Co., and when used for cranking drives through gearing which meshes with teeth cut in the periphery of the flywheel. The unit is normally a generator, being operated by the engine to generate power for the lights and for charging the storage battery which is a part of the equipment. When temporarily a motor for turning the crankshaft, the storage battery returns some of this electric energy to the unit. This battery also assists the generator in supplying the lights when the demand is greater than the amount being generated due to the low running speed of the engine.

To operate the cranking apparatus, it is only necessary to engage the driving gear with the flywheel teeth after the current has been switched on. To assist the cranking mechanism in extremely cold weather, an acetylene primer is included in the regular equipment. The small tank at the right forward side of the running board supplies the acetylene for this purpose.

The current for the ignition system is furnished by a Bosch dual system employing magneto and a storage battery, both of which are entirely distinct from the Delco cranking and lighting system.

Special Carbureter and Governor

The special Packard carbureter operating in connection with a hydraulic governor is retained, though now placed on the left side. The essential feature of this governor is a diaphragm against one side of which the pressure of the water system is directed. The other side connects with the carbureter throttle. The outward bulge of this diaphragm is in proportion to the pressure of the water on the other side, which pressure is, in turn, in proportion to the engine speed. Through its connecting to the throttle, the bulging acts to shut off the fuel somewhat, thus aiding in uniformly governing the engine speed. The advantages claimed for this governor, which is integral with the carbureter on the 48, are that it prevents stalling the motor in crowded traffic, avoids racing the motor when the clutch is disengaged and affords uniformity of road speeds without requiring skillful use of the accelerator pedal. The carbureter combines float feed with a large cylindrical mixing chamber directly above the aspirating nozzle and automatic mixture regulation for all speeds. The auxiliary air inlet is automatically regulated by a spring-controlled poppet valve, the adjustment of the spring tension of which is accomplished from the control board, Fig. 1. From the control board the primary air intake may also be shut off to facilitate the obtaining of rich mixtures for cold weather starting. The air entering the carbureter is heated by a scoop passing around the exhaust manifold, while the mixing chamber is hot-water jacketed.

Motor lubrication is of the same form as used on the 38. The main system feeds oil directly to the crankshaft, connecting-rods, wrist-pins and motor-gear bearings by pressure from an eccentrically-driven pump. The system also lubricates the intermediate camshaft bearings by spray from the lower connecting-rod bearings. The cylinder walls are lubricated by this spray for light running, but when the motor is under heavy load, an auxiliary system, governed directly and automatically by the throttle, feeds oil directly to the cylinder walls. The crankshaft is drilled to provide an oil passageway. All of the surplus oil eventually finds its way into a reservoir at the bottom of the crankcase, from which point it is re-circulated after being strained. The bottom of the crankcase slopes both ways to form the reservoir, and sediment pockets provided with drain plugs are placed in front and at the rear of the strainer. The normal

Fig. 3—Fore end of the touring model, showing left drive

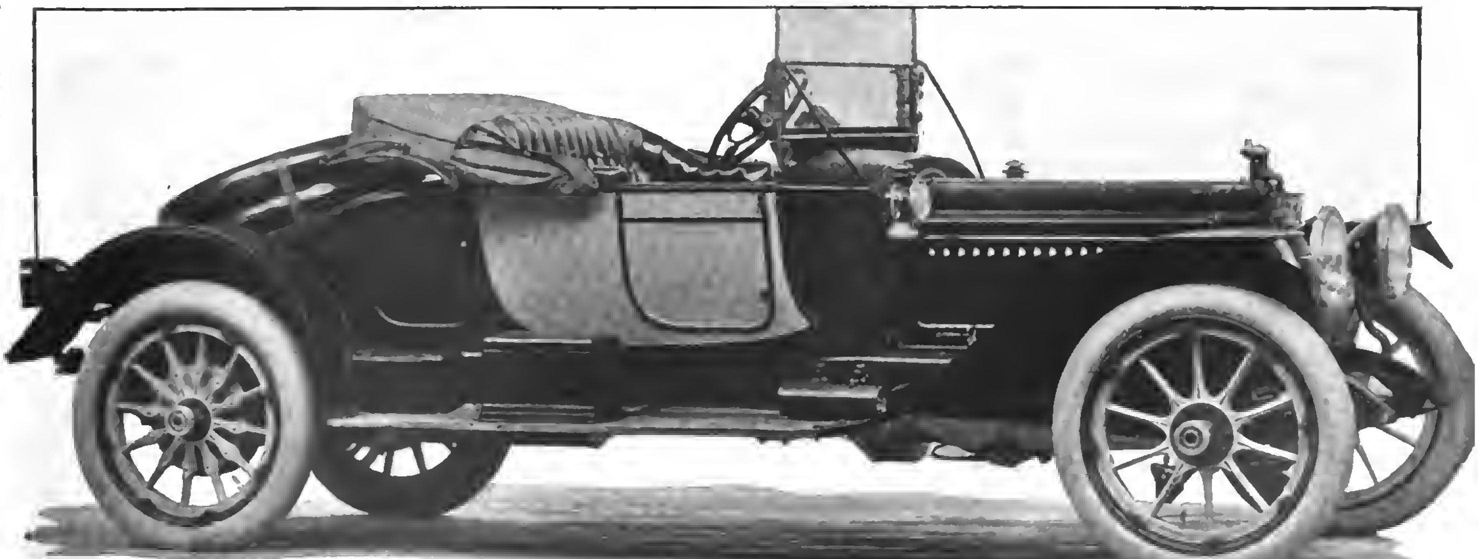

Fig. 4—Packard 48 runabout with body built along phaeton lines—an innovation for the 1913 season

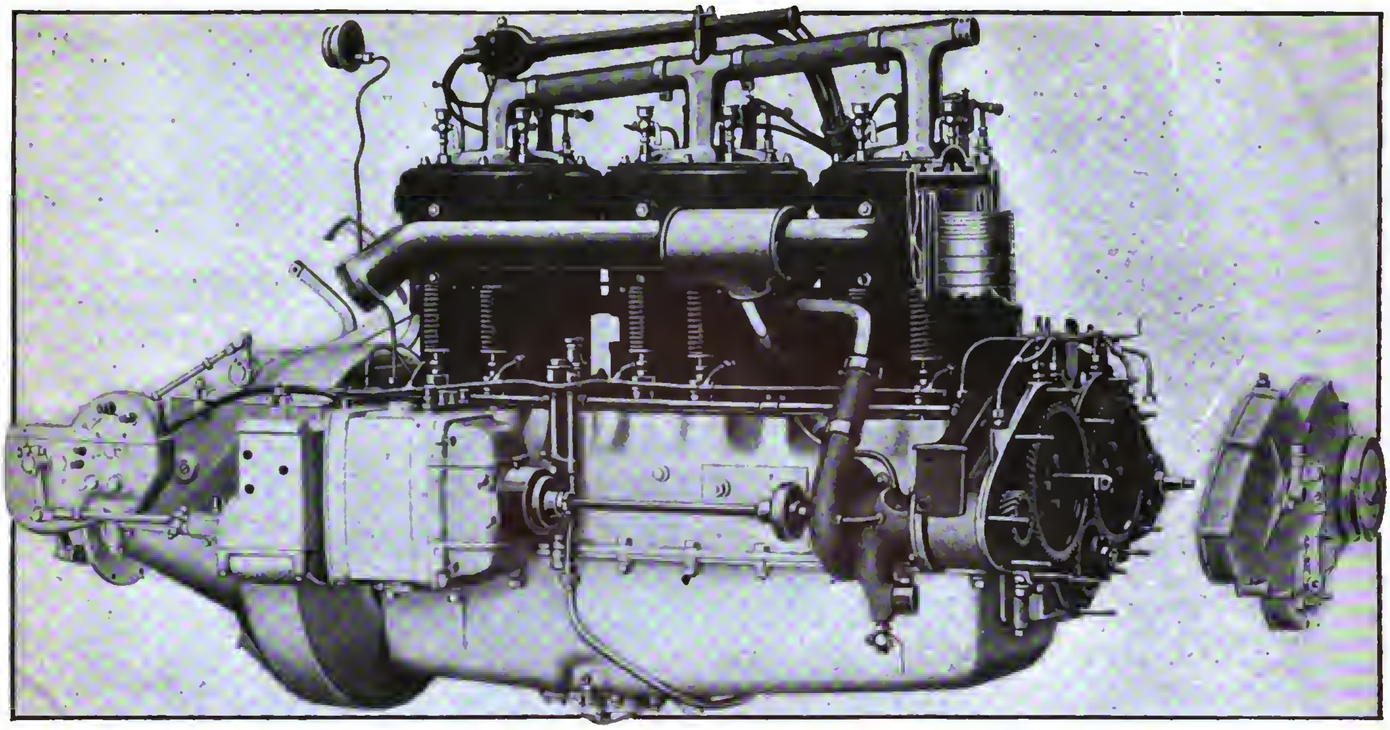

Fig. 5—Showing the new Packard motor with the front cover removed, displaying timing gears

oil capacity is 1 gallon and the oil level is indicated within a gauge glass on the left side.

The dry-plate clutch is used and designed for gradual engagement. The casing plates are faced with friction material, and the shaft plates have plain ground metal faces. An integrally cast rearward extension of the upper half of the crankcase supports the rear clutch shaft, clutch shifter and clutch pedal bearings. This extension also completely houses the clutch in a manner shown in the chassis illustration. To aid in gear shifting, a clutch brake is fitted to the clutch pedal.

Looking at the chassis as a whole, it is seen that the Packard design of two main units remains unaltered. The forward unit comprises the motor and clutch, and the rear one takes in the gearset, differential and final axle drive. The transmission unit reveals no new features. The gearset bolts directly to the differential housing through a flange. The housing for speed change gears, bevel gears and differential are of aluminum, internally ribbed for strength and rigidity. Throughout the transmission, annular ball bearings are used. The rear axle tubes are of large diameter and heavy gauge, pressed into and riveted within flange collars bolted to the housing. The hubs are ribbed from steel forgings, and the hub flanges are of heavy gauge pressed steel.

There are four brakes, the service being continuous external contracting bands operated by the right pedal. The emergency brakes expand internally. The internal brakes are inclosed and are protected by the drum disks. They are provided with bayonet locks against rattle.

The steering is by worm and nut, the worm and worm shaft being forged integrally with the flange joint. The nut has trunnion disks which operate the yoke. The latter is forged integrally with its shaft, the end of which is squared to receive a heavy ball arm. The steering connecting-rod is so arranged that the car may be turned around in a circle 45 feet in diameter.

The Packard 48 is furnished in three forms—touring, phaeton and runabout. The wheelbase of the touring and phaeton types is 139 inches, while that of the runabout is 121 1-2 inches.

Several new body types have been added to the former wide range of styles in open and closed designs. The phaeton-runabout is a distinctly new style of body which has been added to the open line. It is a rakish body designed to fit the phaeton chassis, thus giving the advantage of the longer wheelbase.

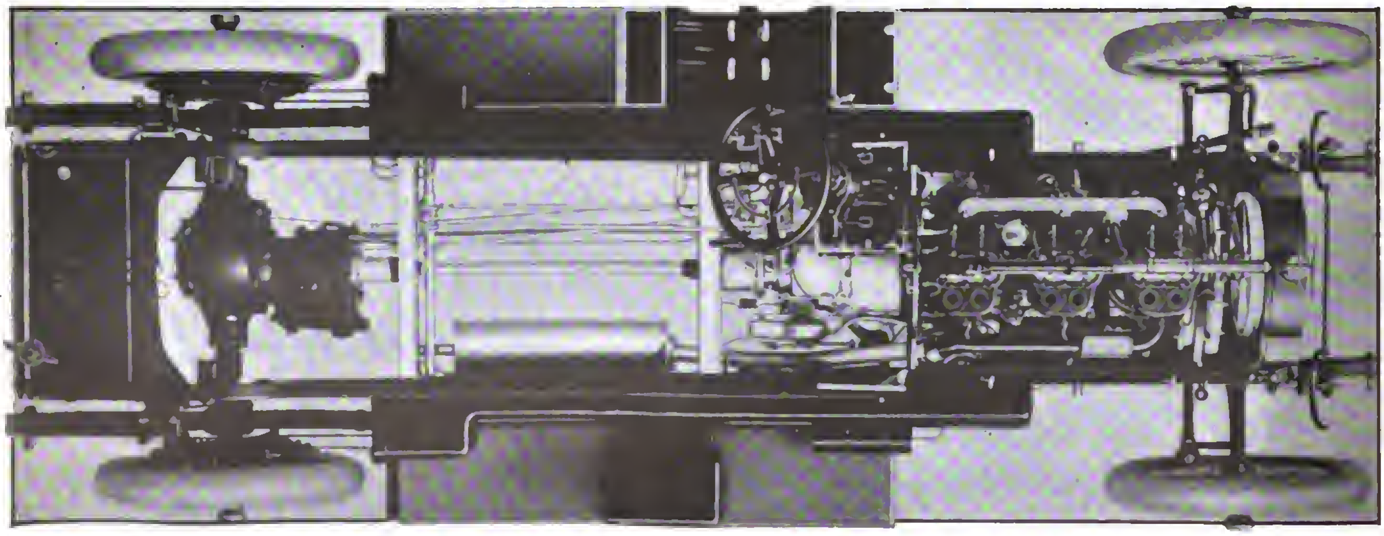

Fig. 6—Plan view of the new Packard 48 chassis, showing mounting of drive and torque members

Jules Goux in the Peugeot which he is to drive at Indianapolis, Ind., in the 500-mile race

Foreign Drivers Preparing for the 500-Mile Race

PARIS, March 1—Before starting in the French 15-day reliability trial today on a Pierron car, Albert Guyot did a little practising on the six-cylinder Sunbeam entered for the Indianapolis 500-mile race. Guyot declares himself delighted with the car and believes that his rivals will have to possess an unusual turn of speed to keep ahead of the English record-breaker. The car has now been returned to the factory for slight modifications. Since it established its records at Brooklands it has been made several miles an hour faster. Among the new features is a radiator for cooling the lubricating oil. The Sunbeam car has six cylinders in pairs of 3.54 by 6.29 inches bore and stroke, giving a cylinder area of 380.8 cubic inches. The valves are on one side with their stems inclined so as to obtain a more efficient form of combustion chamber. The motor has a force-feed water circulating system, high-tension Bosch magneto and Claudel carbureter. The lubrication is under high pressure to the main bearings and through the hollow shaft to the connecting-rod ends. A large quantity of oil is in circulation and arrangements are provided for cooling it while in circulation. Up to the present this car has always been equipped with Sankey steel detachable wheels. It is probable that the same will be used at Indianapolis, with Palmer cord tires.

Albert Guyot, who has been selected to drive the Sunbeam, is a Frenchman of 32 years of age whose first important victory was the winning of the light car Grand Prix at Dieppe, in 1908, on a Delage single-cylinder model. A spectator of Bleriot's flight across the English Channel, Guyot took to flying in 1909 and on August of that year secured his license on a Bleriot monoplane.

To come within the Indianapolis rules, the cylinder bore of the Peugeot racers has been decreased from 110 to 108 millimeters. As their stroke is 200 millimeters, the cylinder area will be very close to the 450 cubic inches allowed under the rules. With the exception of the fitting of the smaller-bore cylinders the cars have undergone very little change. They have overhead valves directly operated by a patented type of camshaft and pushrods placed over the center line and some distance away from the cylinder heads. The cars are fitted with Bosch magneto and Claudel carbureter and have lubrication under very high pressure to all parts. The oil is cooled by deep ribs on the base chamber. A three-point suspended sub-frame carries the motor and gearbox, the final drive being by propeller shaft without the use of radius rods or torque tubes. The cars will be fitted in the race with Rudge-Whitworth wire wheels; the tires have not yet been chosen. At present the gear ratio is 2 to 1. This will doubtless be retained, changes being made on the wheels to get the exact ratio necessary for the track. Jules Goux and Paul Zuccarelli will be in charge of the Peugeot pair.

The six-cylinder Sunbeam to be driven by Albert Guyot in the 500-mile race at Indianapolis, Ind.

Many Fittings for Cars and for Drivers

Novelties Seen at the Boston Show—Devices Which Have Not Been Described Previously, and Which Are of Value to Owner, Manufacturer, Garageman and Repairman

Part 1

MANY new accessories have appeared for the first time at the big shows held in New York, Chicago and Boston this year. A number of these have been covered in past issues of THE AUTOMOBILE which dealt with the novelties shown at New York and Chicago. At the Boston show a number of the New England manufacturers displayed accessories which are new to the automobilists.

It is purposed to take up the accessories which seem to have an unusual merit as factors in increasing the comfort or reducing the expense in running an automobile. Most of these accessories appeal to the car owner although there are others which are interesting to the garage keeper. Among the latter are portable tire inflators and jacks which lift the entire end of the car in one stroke.

The following descriptions give a brief outline of the principles involved in each accessory as well as outlining its purpose. It will be noted that the attention of the accessory makers are not confined to one particular line of endeavor nor to the cheaper type of car. Tires, ignition and lighting devices, primers, speedometers, etc., of improved design will be found mentioned in these columns. While many of these have been brought out by new concerns there are several devices which are the outgrowth of similar accessories placed on the market some time ago. Ease of manipulation of tools and legibility in gauges and measuring devices has been made a subject of study by accessory manufacturers.

F. & S. Ball Bearings are characterized by a new retainer. The shape of this retainer and its construction are shown in Fig. 1. It allows the very small space between the balls so that a maximum number of these may be carried in addition to the fact that they are guided perfectly and that there is no possibility of inter-ball contact. A solid-cage construction is used and its form is such that no parts can get between the balls and wedge them in case the cage breaks. The makers claim that, should the cage break, the work of the bearing will not be disturbed. They are imported by the J. S. Bretz Co., New York City.

Tyrian tires and inner tubes made by the Tyer Rubber Company, Andover, Mass., are manufactured by a concern which has been in the rubber goods business for over 50 years. Casing are made in plain or non-skid tread. The non-skid tread consists of two rows of T-shaped depressions in the tread. These depressions are positioned so that the stems of the T's point toward the hub, one row on the outside of the tire, the other on the side next to the body and a smooth tread strip remaining between them. This style of non-skid carries with it the argument of having sharp edges of rubber to offer resistance to skidding to either side as well as to a circumferential slip. Tyrian casings are built up of Para rubber and Sea Island cotton.

The Expanson tire of the Expansion Spring Rim & Tire Company, Boston, Mass., has an outer shoe similar to the standard pneumatic casing, but instead of using an inner tube filled with air employs what is termed an expansion core supported in conjunction with a crescent-shaped retainer which holds the core outward against the tread portion of the casing. The core is made up of alternate sections of rubber and a non-compressible material. It normally fills not more than one-half of the internal space in the casing, the space occupied being that closest to the tread. In operation the flexible core, in combination with the spring retainer, is looked upon to absorb the jar and it is claimed to distribute this jar around a considerable portion of the wheel periphery.

Bethlehem Five-Point Spark-Plug—The five points of the plug are arranged with one in the center which forms one electrode and the other four distributed in a hollow square about the central point and forming the other electrode. The object of the plug is to prevent carbonization, the use of two of the points at one time allowing the carbon to be burnt out of the other points during that time. Increasing the temperature of an electric conductor also increases its resistance. When two of these points become hot the spark will jump across the coolest gap. The body of the plug is made of Bethlehem steel insulated with German porcelain. A feature of the plug is the distance that the points extend below the body. The plugs are made by Victor G. Goulding, Holyoke, Mass.

Dunn-Ray Lighter—Utilizing a new principle for igniting acetylene lights from the seat, the Dunn-Ray lighter is particularly convenient. Every other device of this type requires a jump or make-and-break spark. This device consists merely of a platinum wire passing through the gap between branches and an electric battery. The wire be-

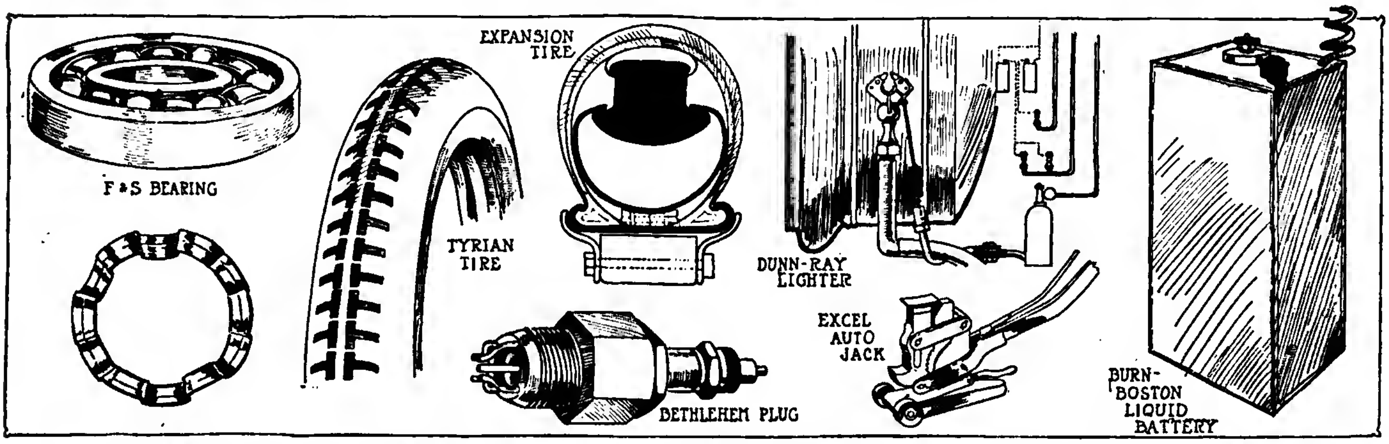

Fig. 1—F and S bearing with new retainer. Tyrian T-tread. Expansion tire. Bethlehem high point plug. Dunn-Ray electric gas lighter. Excel Jack. Burns-Boston liquid battery

comes incandescent in about 2 seconds after the switch is thrown on and lights the gas by means of this incandescence. By the aid of the device which is equipped with a controller on the dash the lights may be turned higher or lower from the seat. It is made by the Dunn-Ray Co., Boston, Mass.

The Excel motor jack, built by the Excel Jack Mfg. Co., Boston, Mass., is of the long-handle style, and designed to be used by the operator standing up. In other words, the jack can be positioned under either the front or rear axle and operated without the operator having to assume an impossible position. To facilitate this the pedestal, or stand, is mounted on two wheels at its forward end, these wheels enabling the jack to be readily pushed into any position under the axle. The jack is operated by an up-and-down movement of the handle.

Burns-Boston Battery is a liquid cell using a special form of salt solution electrolyte. The design of the battery is such that rapid circulation is allowed to permit of excessive overload and of obtaining an even distribution of wear through all parts of the current-producing material. The zinc sheet is insulated from the electrolyte and cannot be acted upon by it, except for a pinhole vent. The cell is tightly sealed, thereby doing away with all sources of leakage. The liquid employed in the electrolyte gives forth no noxious gases and is non-freezing. These cells are made by the Burns-Boston Battery and Mfg. Works, Boston, Mass.

Bair Auto Top Holders have been adopted as standard equipment on nineteen important makes of automobiles for the 1913 season. They hold the top tightly in place, keeping the bows separate and tightly in place by a strap and spring. The bows fit into separate notches arranged in a line on the top holder and when clamped in place cannot move. Bair bow hinges are adjustable and can be arranged to bring the top to the desired shape. This is effected by setscrews under each flap. They are made by the Auto Specialties Mfg. Co., Chicago, Ill.

Crankless Gasoline Primer supplies an evaporized mixture of gasoline to a point in the inlet manifold close to the cylinders in order that the motor will respond promptly to the electric starter and reduce the current consumption and wear on the starting device. Besides this its object is to make starting more certain. The crankless primer consists of the valve casing containing two valves. The casing is mounted on the inside of the dash. Projecting on the inside of the dash is a valve stem made of selected Tobin bronze on which is mounted a lock-nut and nickel-plated foot button. Should the starter not operate quickly, the foot button is pressed, allowing a mixture of gasoline and air to be forced into the manifold. As shown in the illustration, Fig. 2, the gasoline is taken from the feed pipe between the carbureter and the tank. The two valves draw in the gasoline and air and a pressure on the button forces the mixture into the manifold. This device is made by the Cox Brass Mfg. Co., Boston, Mass.

The Ingersoll-Sargeant Drill Company, Boston, Mass., has a various line of air compressors for garage use, some of these being air-cooled and others water-cooled. Some types are stationary and others mounted on three-wheel trucks, on which are also mounted the electric motor for operating the compressor. The motors used in these air compressors are for 110 and 220-volt circuits. They are also made for three-phase, 60-cycle, 110, 220 and 440-volt circuits. The company also furnishes them for single-phase alternating circuits of 110 and 220 volts. These compressors are made with various cylinder sizes, namely 2.5 by 3 inches, 3.5 by 4 inches, 4.5 by 5 inches, and 1 by 1.25 inches. What is known as the Imperial tire pump, is a combined air-cooled single cylinder pump with an electric motor on a three-wheeled truck, has 1 by 1.25-inch cylinder. It operates at 1,700 revolutions per minute, and is claimed to inflate a 35 by 4-inch tire up to 70 pounds pressure in 3 minutes. The Imperial 12 is also a combined pump and motor mounted on a truck. The single cylinder air-cooled motor measures 2.5 by 3 inches bore and stroke. It operates at 450 to 700 revolutions per minute.

Blazer Horn is an exhaust horn for Ford cars and is one of the most simple devices of its kind ever produced. It can be attached by slipping the pipe holding the horn over the end of the Ford exhaust pipe and by connecting with a pedal. It consists of two whistles which are blown by the exhaust gases diverted by a flap valve operated by a bell crank leather and held in place by a coil spring. As the horn is tilted down it is impossible for it to become clogged, the dirt being shaken out by the vibration of the car. It is made by the Motor Specialties Co., Cambridge, Mass.

The Cataract diagonal block tire for motor trucks differs from other block tires by virtue of the diagonal positioning of the blocks on the rim. The blocks are of such size that upward of a dozen are used to extend around the wheel. They are made in either single or double rows, according to the width required. The blocks are flanged on both sides and have steel trellised bases moulded into the rubber and extending to the extreme edge of the side flanges which secure the blocks in position. The blocks are flanged on both sides in order to fit snugly into the row of steel rims and are also fastened by cross-sectional steel strips with three bolts inserted through the strip and wheel, and tightened by nuts on the inside, this being done to avoid any possibility of creeping and stretching. The diagonal construction is used to eliminate vibration, as with it there are three blocks at a time in contact with the road, and at all other times two blocks carry the weight, in this way making rolling smooth. In case of damage a block is removed as in the various types of block tires now on the market. These tires are made by the Cataract Rubber Co., Buffalo, N. Y.

Standard Speedometer—A new Standard centrifugal speedometer which has made its first appearance at the Boston show indicates the speed by large figures shown at the top of the dial. The slogan adopted by the company in selling this speedometer is "A Figure for Every Mile." The total mileage is shown below the speed dial and below this is the trip mileage. There are two sets to the instrument, first a selective set by which the mileage may be set at any desired point, and second, a zero set by which the mileage is set back to zero. These speedometers are made by the Standard Thermometer Company, Boston, Mass.

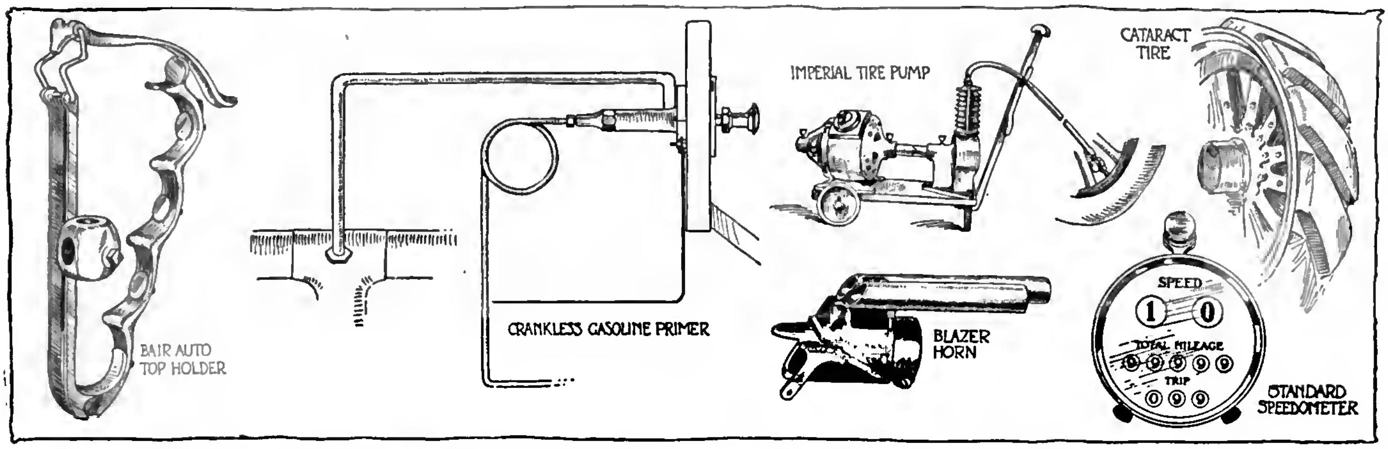

Fig. 2—Bair top holder for top bows. Crankless primer for gasoline. Ingersoll Imperial tire pump. Blazer horn for Ford cars. Cataract diagonal block tire. New Standard speedometer without indicator

Boring machine used in the factory of the Haynes Automobile Co., Kokomo, Ind. It requires only one man to operate it

THE machine shown in the above illustration can do two things. It can bore the cylinders accurately to size and it can face them off. It takes but one man to operate both processes. Time is saved with this machine because it is only necessary to set up the job once for both operations, instead of making two separate settings. The illustration shows the cylinders in place ready to be worked upon. As may be noted, there are two blocks of cylinders in the machine at one time, so that the time spent upon the work is cut down to its furthest degree. This machine is used in the shop of the Haynes Automobile Company at Kokomo, Ind.

CANADIAN Industry's Growth—Since the first automobile show was held in Toronto, Ont., 8 years ago, automobile factories have been started in seventeen Ontario towns and cities. There are large manufactories in Brantford, Orilia, Brockville, Oshawa, Windsor, St. Catherines, Berlin, Amherstburg, Petrolia, London, Ottawa, Bowmanville, Ingersoll, Guelph, Galt, Walkerville and Kingston. Toronto and West Toronto have several large plants making automobile engines, batteries and other parts.

High Point's Addition—An addition is being erected to the plant of the High Point Motor Co., High, Point, Tenn.

Feilbach Buys Site—The Feilbach Motor Co., Milwaukee, Wis., has purchased a site of 5¼ acres upon which a new plant will be erected.

Erect Automobile Painting Plant—Ground has been broken by J. W. Schnabel for the erection of a plant for painting automobiles in Greensburg, Pa.

Morgan & Wright Builds—The Morgan & Wright Co., Detroit, Mich., has commenced work on a five-story addition to its plant. It will be 94 feet by 250 feet and will cost $100,000.

Baldner Contemplates Automobile Plant—The Baldner Automobile Mfg. Co., Xenia, O., recently organized, contemplates the erection of an automobile plant at that point.

Aluminum Goods Company Enlarges—The Aluminum Goods Co., which has plants in Manitowoc and Two Rivers, Wis., will enlarge both this summer. An addition, 100 feet by 20 feet, will be made at Two Rivers.

Dealers Visit Ford Plant—A. H. Smith, manager of the factory sales branch of the Ford Motor Co., Indianapolis, Ind., was recently host for a party of 150 Ford dealers, bankers and newspapermen on a trip to the factory at Detroit, Mich.

Peerless Building Plans Completed—Plans for a five-story brick, concrete and steel truck factory to be constructed in Cleveland, O., for the Peerless Motor Car Co., that city, have been completed. The plant will cost $250,000.

Vulcan Plant Started—The Vulcan Mfg. Co., which recently purchased property in Painesville, O., has perfected an organization and will start the manufacture of automobiles. The plant is expected to be finished by July 1 and will employ 150 men.

Standard Adds—The Standard Aluminum Co., of Two Rivers, Wis., will add a large rolling mill this year. An addition, 160 feet by 40 feet, will be erected at once to house the rolling mill equipment. The concern will become a large importer of French aluminum in the raw.

Gray & Davis Building—The Gray & Davis Co., Boston, Mass., has awarded a contract for a factory building to be erected on the Charles River near Cambridge. The contract calls for a five-story reinforced concrete building. The work will be pushed in order to reach completion by July 1.

Factory Office Removed—The factory office of the Pope Mfg. Co., Hartford, Conn., has been removed to the quarters in the west wing formerly occupied by the post office department as a sub-station of the local post office. The space vacated by the factory office will be given up to the factory use.

Republic's Factory Club—The Republic Rubber Co., Youngstown, O., has decided to build a clubhouse for its factory employees, which will be 60 feet by 130 feet in size and made of brick and three stories high. The new clubhouse will be partially under the control of the 1,500 employees of the plant.

Wisconsin Aluminum Builds—The Wisconsin Aluminum Foundry Co., of Manitowoc, Wis., a producer of aluminum castings for the automobile trade, has decided to remain in Manitowac, the Citizens' Assn. having come forward with a site for the new plant, which will be 200 feet by 75 feet in size, of steel and brick construction.

Dayton Engineering Purchases Factory—The Dayton Engineering Laboratories Co., Dayton, O., has purchased a site and factory building of the Pinneo & Daniels Co., wheel manufacturers, and will maintain a plant on the site in addition to its present one. This company manufactures the Delco self-starting and ignition systems for automobiles.

Mitchell-Lewis Plant Busy—The plant of the Mitchell-Lewis Motor Co. at Racine, Wis., is now operating on a 24-hour schedule, three shifts of men being employed 8 hours a day each. The company some weeks ago started a 20-hour schedule, soon afterward increased this to 22 hours, and now to a full day. Nearly 2,100 men are employed.

Continues Manufacturing Atlas Parts—The Auto Parts and Repair Co., Springfield, O., has leased a portion of the Atlas Motor Car Co.'s factory at that city and will have a full stock of parts of Atlas cars and will repair both Atlas cars and other makes of cars. The company may eventually continue the manufacturing of commercial cars of this type.

Prizes for Republic Employees—In order to insure a greater interest in its product, and to stimulate suggestions for the improvements on machinery and in methods of manufacture, the Republic Rubber Company, Youngstown, O., yearly awards a list of cash prizes. The awards covering the past season were recently made.

Automobile Wheel Factory Coming—A factory for steel automobile wheels will be established in Kansas City, Mo., during the spring by J. N. Carnahan, of Washington, D. C., representing a subsidiary corporation of the Bernsten Steel Wheel Company, Pittsburgh, Pa. An assembling plant is to be opened in April for the manufacture of wheels and automobiles..

Company Moving to Nashville—Nashville, Tenn., has secured an automobile factory, which will be built at a cost of $200,000 and which will offer employment for 500 men. The new company is the Automobile Manufacturing & Engineering Co., Detroit, Mich., which has been manufacturing the Evans commercial car. The new plant will be of steel and concrete sections, so that the facilities can be readily increased with the growth of the business. The first section will be 60 feet by 200 feet.

Aluminum Castings Wants Site—The Aluminum Castings Co., with headquarters at Cleveland, O., and its principal western foundries at Manitowoc, Wis., is looking for a new location, claiming unfavorable labor and transportation conditions. It is likely that Racine, Wis., will be selected as the site of the new works. The Manitowoc plant is running at a greatly reduced production due to the inability to obtain sufficient labor. This concern manufactures crank-cases and other aluminum castings for many of the large automobile factories of the country.

National Adds to Factory—Another addition has been made necessary at the National Motor Vehicle Co.'s buildings at Indianapolis, Ind. The newest addition is a modern brick and cement building, adding 20,000 feet of floor space and three floors. On the first floor will be a general expansion of machine shops. On the second floor will be an enlargement of the painting department. The top floor will be an enlargement of the trimming and upholstering departments and has been especially arranged so as to afford exceptional good light and ventilation.

The Automobile Calendar

Shows, Conventions, Etc.

March............Indianapolis, Ind., Spring Automobile Show, State Fair Grounds, Indianapolis Automobile Trade Association.
March............Nashville, Tenn., Annual Show, Nashville Automobile Dealers' Association.
March 8-15........Boston, Mass., Annual Automobile Show.
March 8-15........Columbus, O., Annual Show, Billy Sunday Tabernacle, Automobile Club and Traders' Association.
March 10-15.......Columbus, O., Opening Week, Columbus Automobile Trades Association.
March 11-15.......Buffalo, N. Y., Commercial Vehicle Show, Auditorium, Automobile Dealers' Association.
March 12-15.......Ogdensburg, N. Y., Automobile Show, Louis Blumenstein, Manager.
March 17-22.......Norfolk, Va., Annual Show, Armory Building, Norfolk Automobile Trade Association, Inc.
March 19-22...... Springfield, Ill., Annual Show, Springfield Commercial Association, W. L. Chapin, Mgr.
March 19-26.......Boston, Mass., Annual Truck Show.
March 20-24.......New Orleans, La., Annual Show, N. O. A. D. A.
March 24-29.......Indianapolis, Ind., Annual Automobile Show.
Mar. 27-April 3....Quincy, Ill., Mississippi Valley Automobile Show, H. F. Hofer, Director.
March 31-April 5...Manchester, N. H., Automobile Show, Dealers' Association, J. H. Graham, Manager.
April 1-6...........San Francisco, Cal., Motor Truck Show, Coliseum Hall, *Motor Field.*
April 5-19.........Pittsburgh, Pa., Annual Show, East Liberty Market House, Dealers' Association.

Race Meets, Runs, Hill Climbs, Etc.

May 30...........Indianapolis, Ind., 500-Mile Race, Speedway.
July 1.............Indianapolis, Ind., Tour of Indiana Automobile Manufacturers' Association to the Pacific Coast.
July 1-16..........Winnipeg, Man., Motor Plow Competition, Dr. A. W. Bell, Manager.
July 8-16..........Winnipeg, Man., Midsummer exhibition, A. C. Emmett, Manager.
July 27-28.........Tacoma, Wash., Tacoma Road Races.
Nov. 24...........Savannah, Ga., Vanderbilt Cup Race, Motor Cups Holding Company.
Nov. 26...........Savannah, Ga., Grand Prize Race, Automobile Club of America.

Foreign

March............France, Sealed Bonnet, 3000-Mile Run.
March 31.........Montevideo, Uruguay, International Competition of Agricultural Motor Vehicles.
April.............Barcelona, Spain, International Exhibition.
May..............St. Petersburg, Russia, International Automobile Exposition, building of Michael Maneze, Imperial Automobile Club of Russia.
July 12...........Amiens, France, Grand Prix Race.

Showing a recent addition which allows 20,000 feet of floor space to the National Motor Vehicle Co., Indianapolis, Ind.

Daily scene in front of the Studebaker Corporation's plant 1 in Detroit, Mich. Every Detroit juvenile hopes to grow up to be a tester

AUTOMOBILES in Australia—There are about 135 automobiles in use in the Newcastle district, Australia, about 75 per cent. of which are runabouts, usually of 20 to 30 horsepower and four cylinders, selling at $1,000 to $1,200. Touring cars sell for $1,800 to $2,500, but the market for high-priced cars is very limited and is practically confined to European makes. Medium and low-priced cars are meeting with a good sale, and about 50 per cent. of this grade of cars in use are American. As the climate is semitropical the extra air pipe, besides the water-cooling device, is in general use.

Ogdensburg Holding Show—Ogdensburg, N. Y., is holding its annual automobile show this week.

Beyer Resigns—E. C. Beyer, manager of the Mitchell Motor Co., Kansas City, Mo., has resigned.

Bregstein Opens Supply House—C. Bregstein recently opened a supply house in New York City.

Inspector General Now—H. G. Harper has been appointed inspector general of the Studebaker Corporation's automobile division, Detroit, Mich.

Venice Purchases Pope Truck—The city of Venice, Cal., has purchased a 3-ton Pope-Hartford motor truck which will be used for the collection of garbage.

Baldwin with Stewart-Warner—R. H. Baldwin has accepted a position as assistant to E. W. McGookin, of the Stewart-Warner Speedometer Corporation, in Detroit, Mich.

Workman President—The Fargo Automobile Retail Dealers' Association, Fargo, N. D., has elected W. H. Workman president of the association for the ensuing year.

Jewell Sales Manager Kelly—W. S. Jewell has been appointed sales manager of the Boston, Mass., branch of the Kelly-Springfield Motor Truck Co., Springfield, O.

Schwitzer Columbia Chief Engineer—Charles Schwitzer has been appointed chief engineer of the Columbia Motor Car Division, Hartford, Conn., of the Maxwell organization.

In New Quarters—The E. V. Stratton Co., Albany, N. Y., Hudson and Stewart distributor for eastern New York, has leased for a term of years the premises now occupied by C. S. Ransom on Chapel street.

Garabrant Franklin Sales Manager—W. W. Garabrant has been appointed Franklin district sales manager for the states of Nebraska, Kansas, Missouri and Oklahoma. His headquarters are at Kansas City, Mo.

Buffalo Sends Delegation—Buffalo, N. Y., will send a big delegation to Albany at the hearing before the internal affairs committee of the Senate and tbe Assembly in regard to numerous bills affecting automobilists.

Denniston Appointed Manager—E. E. Denniston, Buffalo, N. Y., has been appointed manager of the truck sales department of J. A. Cramer, that city. Mr. Denniston will have sale of Federal, Jeffrey and Standard trucks.

Automobile Line Possible—There is talk of establishing an automobile line from Monessen, Pa., to Charleroi with a 5-cent fare. The cars will seat forty people, will be ligbted by electricity and made in every way comfortable.

Truncer Garage in Bankruptcy—E. C. Truncer, proprietor of the Northern Garage, filed a petition in bankruptcy in Buffalo, N. Y., his liabilities being $1,358.35 with assets totaling $87.90, of which $60 worth of clothing is exempt.

Inner Liners Manufactured—The Hampton Manufacturing Co. has been organized at Indianapolis, Ind., to manufacture inner liners for tires. Those interested in the company are Simon B. Nusshaum, Samuel Rubens and M. Moskin.

Little Sales Manager Borland—W. C. Little has severed his connection with the Lozier Motor Co., of Detroit, Mich., to accept a position as sales manager of the Borland-Grannis Co., of Chicago, Ill., manufacturer of the Borland electric.

Buffalo Wants Fire Trucks—Buffalo, N. Y., is in the market for two city service motor fire-fighting trucks and one automobile truck. Appropriations for purchase of these vehicles have been included in the city's estimates for this year.

New Studebaker Salesrooms—Before tbe spring is far advanced Studebaker automobile branches in St. Louis, Mo., Atlanta, Ga., Omaha, Neb., Minneapolis, Minn., Salt Lake City, Utah, and Washington, D. C., will all be housed in new homes.

Automobile Transportation Building at 'Frisco—An automobile transportation-building is to be erected by the National Association of Automobile Manufacturers at San Francisco, Cal., for the Panama-Pacific International Exposition to be held in 1915.

Internal Combustion Engine Exposition—The first annual exposition of internal combustion engines, under the auspices of the College of Engineering and Department of Agricultural Engineering of the University of Wisconsin, Madison, Wis., was held for four days recently.

New Hartford Dealers Association—Plans are under way for the formation of a new dealers association in Hartford, Conn. Due to a ruction by two business rivals in the organization a few of the members resigned. As a result it is understood that most of the members of the old association will resign from that and join the new.

Indianapolis, Ind.	Ohio	Ohio Electric Sales Co.

Add Motor Fire Equipment—Glendale and Bakersfield, Cal., have recently added motor equipment to their fire departments.

Higher License Rate—Talk of a higher license rate in New Orleans, La., has raised a determined protest from owners and dealers.

Benson Vice-President—E. R. Benson of the Studebaker Corp., Detroit, Mich., has been appointed vice-president of that company.

Large Californian Registration.—Twenty-six thousand and four automobiles were registered by the secretary of state of California in February, 1913.

Pritchards Sales Manager—T. B. Pritchards has been appointed sales manager for the V. S. Bringham Motor Car Co., Cadillac agents in Seattle, Wash.

Bailey Goes to Goodyear—I. R. Bailey has recently been appointed manager of the mechanical goods department of the Goodyear Tire & Rubber Co., Akron, O.

Firestone Branch Moves—The San Francisco, Cal., Firestone tire branch recently moved to new quarters at Van Ness avenue and Bush streets with W. M. Bell, manager.

KisselKar Agency Transferred—The Philadelphia, Pa., agency of the KisselKar has been transferred from C. H. Miller to C. H. McCausland, with J. J. Kane, Jr., as the new manager.

Suydan Goodyear Manager—James Suydan, manager of the St. Paul, Minn., branch of the Goodyear Tire & Rubber Company, Akron, Ohio, has been appointed manager of the Wisconsin, Wis., branch.

Bus Line Established—An automobile bus line has been established between Santo Domingo and San Geronimo. The same conveyances make trips to portions of the capital of the Dominican republic.

MacDonald Entertains Successor—Former highway commissioner J. H. MacDonald, of Connecticut, entertained his office associates and his successor in office, C. J. Bennett, at the Hotel Garde, Hartford.

Good Roads More Purchases—Recent improvements of the streets of Port au Prince, Haiti, has resulted in the purchase of ten pleasure cars and one truck. A rapid increase in the number of cars is expected.

Case Opens Branch House—The J. I. Case T. M. Co., Racine, Wis., recently opened its new branch house at Milwaukee, Wis., devoted exclusively to its automobile interests in the eastern half of Wisconsin.

Many Good Roads Bills—Twenty-one separate bills for new main highway routes, in addition to those included in the act of 1911, have been introduced into the present legislature in Pennsylvania and are in the hands of the public road committee of both houses awaiting action.

Reorganize Alco Sales Forces—Leigh Post, one of the vice-presidents of the American Locomotive Co., Providence, R. I., has been made head of the automobile department, and will have complete charge of the company's production and marketing of automobiles.

President Wilson Uses Horses—Contrary to expectations, President Wilson did not make appearance in the parade down Pennsylvania avenue after taking the oath of office in an automobile. Instead he and former President Taft used a large carriage pulled by four horses.

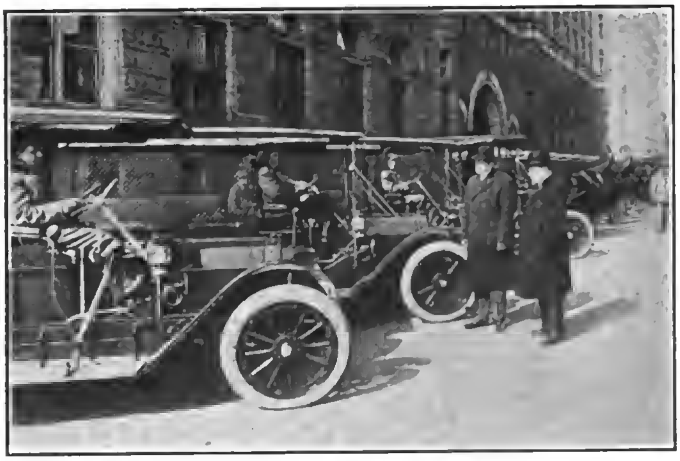
Buenos Aires' Automobile Driveway—A contract has been let by the municipal government of Buenos Aires, Argentina, providing for the construction of an asphalted automobile driveway along the Rio de la Plata, in front of the city. The work calls for the expenditure of $1,255,000.

Reynolds with New Company—E. W. Reynolds, the founder of the E. W. Reynolds Co., of Omaha, Neb., and who some time ago disposed of his holdings in that concern, has been made manager of the top department of the Western Auto Sales and Manufacturing Co., that city.

Gettysburg Taxies Taxed—By a decision of the Supreme Court the borough of Gettysburg, Pa., is now able to enact and put in operation an ordinance taxing automobiles which are used for hacking purposes on the battlefield, and the town council will likely pass such a measure in time for the coming celebration in honor of the fiftieth anniversary of the battle to be held July 1 to 4.

Club's Secret Service Bureau—In putting into effect its secret service bureau the Columbus, O., Automobile Club has a unique idea which so far has been quite a success. The club has employed a detective bureau to take care of all thefts of cars or contents from club members without any cost excepting the necessary transportation charges when the detectives are called out of the city.

President Woodrow Wilson and a party of friends in a Lozier six, near the Wilson home, Sea Girt, N. J.



An interesting occasion. Postmaster-General Hitchcock and Postmaster N. A. Merritt, of Washington, D. C., inspecting the equipment of the Washington office. At the left, under the inspection of the two officials, are the KisselKars used in parcel post work

Elmira Goodyear Agency—The Elmira Arms Company, Elmira, N. Y., has secured the agency for Goodyear tires.

Holds Speeding as Negligence—In New Jersey violation of the automobile law is evidence of negligence and may be so considered in an accident trial.

New Factory Branch—The Krit Motor Car Co., Detroit, Mich., has established a direct factory branch in Kansas City, Mo., with G. V. H. Cairns as manager.

Buick Garage Buys Property—The Buick Carage Co., Hartford, Conn., has acquired the Atterbury Garage and will remove the taxicab business to that place.

Martin Sales Manager—F. H. Martin has been appointed Eastern sales manager for the Stewart-Warner Speedometer Corp., Chicago, Ill., with headquarters in New York City.

Swinscoe Changes Position—The Weston-Mott Co., Flint, Mich., has secured the services of John Swinscoe, formerly chief engineer of Driggs-Seabury Ordnance Corp., Sharon, Pa.

Reilly Moline Manager—C. R. Reilly has been appointed manager for the Minneapolis, Minn., branch of the Moline Automobile Co., Minneapolis, Minn., to succeed W. J. Lawrence.

H. M. S. Company Formed—The H. M. S. Motor Co., New York City, recently incorporated, will deal in trucks, build bodies and repair and paint them. It is incorporated for $22,500.

Austin Studebaker Engineer—J. C. Austin, formerly chief engineer at the Regal Motor Car Co., Detroit, Mich., is now engineer of passenger cars under Chief Engineer J. G. Heaslet of the Studebaker Corp., Detroit, Mich.

Baker Manager on Jaunt—G. H. Kelly, manager of the truck department of the Baker Motor Vehicle Co., Cleveland, O., has started on an extensive Western tour in the interests of big business and service developments.

Firestone Acquisitions—G. J. Bates has recently connected with the Firestone Tire and Rubber Co., Akron, O., having charge of the sales in the pneumatic tire department. R. G. Harris has recently joined the same company as assistant advertising manager, with headquarters in Akron.

Hudson Donates $100,000—The Hudson Motor Car Co., Detroit, Mich., has agreed to donate $100,000 for the construction of the trans-continental stone road, the conditions being the same as in the case of the Packard and Willys donations.

Bellamore Armored Claimed Bankrupt—Three claims totaling $569.23 are the basis on which the Bellamore Armored Car & Equipment Co., New York City, is claimed to be insolvent. The application for involuntary bankruptcy was filed on February 26.

Chauffeurs Undergo Physical Examination—Applicants for chauffeurs' licenses in New Orleans, La., will have to undergo a physical examination in the future. Special attention will be given vision. No license will be issued to a person who is color blind or who has any other defect in sight.

New Chauffeurs' Organization—The Capital City Society of Automobile Engineers is a new chauffeurs' organization with seventy-five members in St. Paul, Minn. The society is formed to give chauffeurs opportunity to discuss automobile problems and proper care of them, and to furnish a reference to accredited chauffeurs to car owners.

Supply Dealers Organize—The Omaha, Neb., Automobile Supply Jobbers Credit Association was recently organized with C. G. Powell as president. The purpose of this association is to advance the interests of automobile supply dealers throughout the Omaha territory, investigate and regulate prices and in general work for better conditions in the trade.

Chalmers to Issue $1,500,000—With the consent of the majority stockholders, the Chalmers Motor Co., Detroit, Mich., is preparing to issue $1,500,000 in prepared stock through the banking firm of Spencer Trask & Co., bankers, New York City. The issue will permit the company to take up the floating indebtedness and will provide ample ready working capital, so that it will not be necessary to seek periodic accommodations from the banks.

Total Production Crude Oil—The total production of crude oil in the year 1911 was 220,000,000 barrels. The total production in the year 1912, as far as this can be gathered from reports at the present, will be somewhat less. The total production for the year 1910 was approximately 200,000,000 barrels. The gasoline producing crudes in 1910 figured 126,000,000 barrels; in 1911, 127,000,000, and in 1912, 124,000,000, approximately.

U. S. Interested in Tour—The United States Government has been asked to take an interest in the big pathfinding tour which the Indiana Automobile Manufacturers' Association is promoting for the proposed trans-continental stone automobile road. Permission has been requested to send a company of infantry on the tour, the soldiers to ride in a fleet of five motor trucks as a demonstration of the possibiilties of this method of transportation for the army.

Automobile Insurance Barred—The Iowa Supreme Court has held that under the Iowa laws an insurance company cannot write insurance against personal injury damage cases growing out of automobile accidents. The insurance department held that such insurance was not covered by the laws, while the attorney general held that it was against public policy. The decision says that special legislation will be necessary to legitimatize this class of insurance.

Automobile Incorporations

AUTOMOBILES AND PARTS.

Chasleston, S. C.—Only Automobile Co.; capital, $200,000. Incorporators: Santo Sottile, M. R. Rivers, Lawrence M. Pinckney.

Charlotte, Va.—Lyerly Motor Company: capital, $15,000; to do a general automobile business. Incorporator: D. K. Lyerly.

Cincinnati, O.—Fred M. Ross Spring Wheel Co.; capital, $100,000; to manufacture and deal in bubs and wheels for automobiles. Incorporators: Theodore Horstman, Fred M. Ross, W. W. Baxter, Horace Horstman, Otto Huber.

Cleveland, O.—Cleveland Motor Trucking Co.; capital, $10,000; to do a general trucking business witb motor propelled vehicles. Incorporators: J. Cbas. Ross, C. B. Goetzfreid, C. A. Cochran, Robert W. Blake, Henry Eckhoff.

Indianapolis, Ind.—Capitol Vody Co.; capital, $10,000; to manufacture metal automobile bodies. Incorporators: Elmer Hinshaw, Fred W. Henschen, Elmer W. Hughey, W. A. Lyons, R. Cogbill.

Mount Vernon, N. Y.—Motor Truck Mfg. Corp.; capital, $150,000; to manufacture engines, machinery. Incorporators: Artbur J. Albert, Louis Bertscb, Henry Hilchenbacb.

New York, N. Y.—American Truck Co.: capital, $3,000,000; to manufacture, sell and deal in automobiles, motor trucks, etc. Incorporators: Josepb F. Curtin, H. O. Coughlan.

New York, N. Y.—Veerac Motor Truck Co.; capital, $10,000. Incorporators: Harry B. McGinley, Edward L. Whittemore, George H. Hinnau.

Ravenna, O.—Ravenna Motor Truck Co.; capital, $200,000; to manufacture and sell self-propelled vehicles. Incorporators: W. F. Travos, A. N. Knutb, H. Schwartz, L. N. McKenzie, C. O. Liggett.

Rochester, N. Y.—Cartbage Auto Co.; capital, $5,000; to deal in motor vehicles. Incorporators: Frederick V. Kuhnert, Arthur W. Alderman, Chas. L. Pierce.

Rochestea, N. Y.—Rochester Automobile Exchange: to do a general automobile business. Incorporators: Ezra J. Beller, Bertram E. Wilson, W. Hayes Mitchell, Owen D. DeWitt.

Waynesboso, Va.—Waynesboro Automobile Co.; capital, $15,000. Incorporators: B. E. Watson, J. B. Young, H. M. Hanger.

GARAGES AND ACCESSORIES

Andesson, Ind.—Pierce Speed Controller Co.; capital, $25,000; to manufacture speed indicating and controlling devices. Incorporators: George W. Pierce, F. F. Mustard, U. M. McCullough.

Baltimore, Md.—Dreadnaught Tire & Rubber Co.; capital, $1,000,000; to manufacture automobile tires. Incorporators: A. F. Gilbert, Wilmer Dunbar, Walter E. Hill, C. P. Triplett.

Bedfosd, O.—Bedford Motor Bus Co.; capital, $10,000; to operate a motor bus line. Incorporators: Michael Wallner, Albert E. Smith, C. K. Brock.

Canton, O.—Harper Tire & Rubber Co.; capital, $400,000; to manufacture and deal in automobile tires. Incorporators: Warren D. Harper, James Tbomas, Albert H. Vayo, Byron B. Vaughman, Carroll Brady Bour.

Ford Adds to Establishment—The Ford Motor Co., Vancouver, B. C., has added to its establishment, a spare parts department. It has parts enough to build about forty cars.

Fire Destroys Walkerville Garage—Fire destroyed the garage of the American Auto Trimming Co., and caused a damage of more than $7,000, only part of which was covered by insurance.

San Marcos' Passenger Service—An automobile passenger service has been established between San Marcos and Luling, Tex., by Merritt & Wills. Daily trips will be made between the two towns.

Oshkosh Buying Fire Truck—The city of Oshkosh, Wis., has awarded the contract for a combination hose and chemical car for the fire department to the F. S. Hoaglin Automobile Co., that city, at $3,500.

Transfers Salesrooms—King & McDonnell, Sacramento, Cal., have transferred their salesrooms to the old Lutheran Church building at the corner of Twelfth and K Streets. They handle Michigan cars.

Banquet for Show Committee—Active, associate and contributing members of the Philadelphia, Pa., Automobile Association, recently tendered a banquet to the 1913 automobile show committee, as an appreciation of the committee's efforts in the success of the recent show.

Rubber Goods Declares Dividend—A regular quarterly dividend of 1 3-4 per cent. on the preferred stock and 6 per cent. on the common stock has been declared by the Rubber Goods Mfg. Co., of New York City, both payable on March 15 to stockholders of record on March 10. The common dividend is the same as was declared last year at this time.

Baltimore to Spend $50,000—The city of Baltimore, Md., plans to spend $50,000 this year to motorize municipal departments. Chief among these will be the conversion of ten hose wagons into automobiles, trucks for street cleaning department and park board and runabouts for the eight district engineers of the fire department, the superintendent of street lighting and the electrical engineer.

Opposed to Toll Reduction—Contending that a reduction of tolls over the Connecticut River bridge at Lyme and Old Saybrook would materially reduce revenue, the bridge commissioners are opposed to any such proposition as has been agitated of late. Mr. Haynes, who introduced the bill, claims that if the tolls were reduced there would be an increase in traffic with consequent gain in tolls.

The way icy weather drives the horses to the blacksmiths' shops. A scene in Cleveland, O., during a recent cold spell. Its significance to the motor truck manufacturer appealed to one of the officers of the Mora Power Wagon Co.

Opportunities in Foreign Markets—A foreign city has appropriated $14,280 for the purchase of four motor ambulances. File No. 10,269. A municipality in South America desires to purchase two automobile ambulances, fully equipped, and two motor buses, capable of carrying 24 soldiers. A merchant in the same city wants to hear from American manufacturers of heavy duty trucks, capable of carrying heavy loads and drawing a train of trailers as well. File No. 10,236. A business man in Portugal desires to act as agent for an American automobile manufacturer. He states that he has had experience in the automobile business. The machines must be good hill climbers and able to stand hard usage. Correspondence may be either in Portuguese or French. File No. 10,164. A foreign business man desires to receive catalogs, prices, shipping weights and measurements of the better grade of American automobiles. He is now agent for a large line of machinery. File No. 10,290. An American consular officer in a European country reports a good market for American automobiles in his district. A number of American cars have already been sold there, and a local sporting goods house desires to obtain the agency for a car. Correspondence in English. File No. 10,149. A report from an American consul states that a resident of his district desires to hear from American manufacturers of automobile tires. He desires to represent them in his country, either as general agent on a commission basis, or as exclusive selling agent. Correspondence in Italian, French or Spanish. File No. 10,309. An American consul has compiled a list of the automobile dealers and garages in his district, where American cars have had considerable success. There is a good field for increased sales, the machines being already held in high esteem. The list, as well as any of the other reports, may be had from the Bureau of Foreign and Domestic Commerce. File No. 10,322. An American now in business in a thriving agricultural manufacturing province in Europe informs an American consulate that he would like to secure an agency for a cheap runabout that can be converted instantly into a delivery wagon. He saw such a vehicle several years ago in the United States which sold for not more than $500. He is sure that a considerable business can be done with it among the farmers, but will not consider a more expensive car. Those interested will receive all information wanted by addressing the Bureau of Foreign and Domestic Commerce and by referring to File No. 10,391. An American consular officer reports that the owners of an automobile and mechanic workshop in his district desire to enter into correspondence with American manufacturers of small automobiles of 6 to 8 horsepower, accommodating two or three persons, strongly built and attractive, which could be sold for $1,000 or less. This firm is of the opinion that such a car would be in great demand, which has not yet been apparent because cars of this type have not yet been offered for sale. This company is willing to pay cash on delivery. American manufacturers of the type of cars described would do well to write at once to this firm, giving lowest terms and conditions of sale. Correspondence may be in English. File No. 10524.

Automobile Incorporations

CLEVELAND, O.—Cleveland Speed Indicator Co.; capital, $10,000; to manufacture and deal in speed indicators of all kinds. Incorporators: Arthur Friedman, Leo Friedman, O. Friedman, Marshall R. Stewart.

DOVER, DEL. Morgan & Marshall Co-Operative Rubber & Tire Co.; capital, $50,000; to manufacture rubber tires. Incorporators: R. J. Marshall, Ila P. Marshall, Morgan Howell.

EAST ORANGE, N. J.—F. C. D. Inner Tube Protector Co.: capital, $150,000; to manufacture automobile tires. Incorporators: Gilbert H. Field, James H. Christian, Thomas Dick, and Harry H. Pickings.

HARTFORD, CONN.—Hartford Auto Pump & Supply Co.; capital, $50,000. Incorporators: Henry P. Scbale, Edward E. Tryon, Thomas Lockwood.

McCOMB CITY, MISS.—Causey's No-Leak Mfg. Co.; capital, $1,000; to manufacture tire fluid.

MUNCIE, IND.—Derrickson Mfg. Co.: capital, $125,000; to manufacture a puncture proof compound for tires. Incorporators: H. S. Osborn, H. L. Kitselman, R. C. White.

NEW YORK, N. Y.—American Road Machinery Co.; capital, $1,000,000; to manufacture road machinery.

RICHMOND, O.—Sedgwick Mfg. Co.; capital, $10,000; to operate a factory for the making of a jack device for lifting automobiles from the ground. Incorporators: Richard Sedgwick, J. R. Sedgwick, James M. Judson.

ROCHESTER, N. Y.—Central Motor Supply Co.: capital, $30,000; to deal in electrical and mechanical devices. Incorporators: P. B. Barager, R. F. Glose, W. Wood, C. W. Gallinger.

ROCHESTER, N. Y.—Zimbrich Taxicab Co.: capital, $3,000. Incorporators: Herman J. Zimbrich, Alexander G. Wall, Fred Simmons.

TOLEDO, O.—D. & A. Paint Mfg. Co.: capital, $30,000.

VICTORIA, TEX.—Park Garage: capital, $10,000. Incorporators: Wilford B. Smitb, Harry U. Campbell, Geo. Clifton Edwards.

CHANGES OF CAPITAL AND NAME

BOWLING GREEN, O.—Bowling Green Motor Car Co.; capital increased from $50,000 to $100,000.

CHICAGO, ILL.—Automobile Construction Co.; capital increased from $27,000 to $100,000.

CLEVELAND, O.—Pennsylvania Rubber & Supply Co.; capital increased from $25,000 to $75,000.

COLUMBUS, O.—Midgley Mfg. Co.; capital decreased from $250,000 to $25,000.

COLUMBUS, O.—Rogers Supply & Tire Co.; capital, increased from $10,000 to $25,000.

DAYTON, O.—Air Friction Carbureter Co.; capital increased from $20,000 to $30,000.

EAST PALESTINE, O.—McGraw Tire & Rubber Co.; capital, increased from $100,000 to $1,000,000.

TOLEDO, O.—Matber Spring Co.; capital, increased from $100,000 to $300,000.

TOLEDO, O.—Rapp Mfg. Co. will change its name to Tbe Toledo Spark Plug Co.

COMBUSTION Motor Valve—Consisting of two concentric horizontal sleeves in the cylinder heads, which are divided by vertical partitions into three chambers.

The subject matter of this patent, consisting of two concentric, horizontal sleeves formed with transfer ports and positioned in the heads of a pair of cylinders is shown in Fig. 3. A valve chamber is formed across the highest portion of the combustion space and an outer sleeve O and an inner sleeve I are concentrically mounted in this chamber with a clearance just sufficient to permit of reciprocation of the sleeves. Two partitions divide the inner sleeve into two exhaust compartments and one inlet compartment and ports P E and P I in the cylinders serve to provide transfer passages between the combustion chambers and the exhaust and intake manifolds respectively. The sleeve valves are operated by means of a gearing G, consisting of a bevel gear driven off the crankshaft and two connecting-rods pinned eccentrically to the driven bevel gear, and each being connected to one of the sleeves.

No. 1,053,894—to Robert H. Adams, Detroit, Mich. Granted February 18, 1913; filed November 25, 1911.

Movable Headlight Support—Consisting of a cross-rod connected to the steering machanism and operating the rotatable lamp supports by yokes.

The device described in this patent Fig. 4 includes a pair of bearing brackets carried by supports, lamp supporting shafts S which are mounted in the brackets B and yoke members carried by the shafts S. Means for imparting rotatory motion to the operating members O consist in links which connect O to the steering mechanism, oscillating the ends of the members O when the steering gear is operated.

No. 1,053,832—to Ned Gensemer Krimmel, Pine Grove, Pa. Granted February 18, 1913; filed April 16, 1912.

Tire Construction—Being formed with two annular air spaces in the casing which preserve the shape of the inner tube.

This tire consists of an inner case C, Fig. 5, a tread T which is formed with a rib engaging C at its periphery and an intermediate case formed between the tread T and the case C. This intermediate is composed of a portion O and an inner portion I which are spaced at their centers so as to form a pair of air chambers A extending all around the tire. The inner and outer portions are engaged in the rib and their ends are held in close contact by the tread and the case C.

No. 1,053,238—to George A. Stewart and Harlan E. Goodell, Ridley Park, Pa. Granted February 18, 1913; filed January 23, 1912.

Automobile Spring Tire—In which circumferential and radial coil springs supplant the resiliency of the pneumatic tire ordinarily used.

As Fig. 1 shows the tire described in this patent is of the coil spring class and consists of an inner rim I and an outer rim O, which are mounted concentrically on the wheel felloe and between which the resilient springs are contained. There are two kinds of springs. The first kind S has the spring ends in engagement with the hooked ends of elements E which are fastened to the outer rim O, by means of serrations engaging oppositely formed serrations on the inner face of the rim O. The inner rim I carries on its outer surface an annular series of studs S 1 at which compression springs C are mounted, the outer ends of which are secured to eyes formed in blocks B, which latter are fastened to the elements E carried by rim O. It is seen that the compression springs C take the place of the inflating air used in pneumatic tires, while springs S keep the elements E from mutual displacment and the outer rim O, which carries the tread of the tire, from deformation.

No. 1,053,707—to Samuel J. Casey, Keeseville, N. Y. Granted February 18, 1913; filed April 5, 1912.

Electric Spark-Plug—The insulated electrode is inclosed in a tapered metal sleve fitting into a tapered shell.

The spark-plug, Fig. 2, consists of a metal shell S which has a tapered opening and is provided with longitudinal grooves in the walls of the inner end thereof. A tapered metal sleeve M is removable fitted into the shell S, M being formed with an outer flange in the handle H projecting from the same and through the use of which the sleeve M may be turned inside the shell S. M is formed along its side surface with off-standing lugs passing through the grooves of the shell. Inside the sleeve is a core of insulating material I surrounding an electrode passing through the entire length of it; a second electrode E through which the ignition current returns to its source is secured to the metal sleeve as shown.

No. 1,053,470—to Frank R. Blake, Malden, Mass., assignor to Blake Spark Plug Co., Boston, Mass. Granted February 18, 1913; filed January 24, 1912.

Carbureter Construction—Having air and fuel regulation valves operated by the same means.

This carbureter has a venturi tube, a fuel supply which discharges into the smallest part of that tube and a valve for the discharge. An air valve is located in the outer end of the venturi tube and it is adapted to control the pure air which enters the tube. Means for connecting both valves are provided.

No. 1,055,042—to William H. C. Higgins, Jr., Laporte, Ind. Granted March 4, 1913; filed August 20, 1910.

Automobile Headlight—For electric lamps.

In the headlight described in this patent an annular sleeve is secured to the rear end of the reflector and has a longitudinally extending recess serrated on one side. A curved spring member is secured to the sleeve and at its free end is provided with a slotted guideway adapted to register with the recess, but of less width than the latter. A socket member extends through the sleeve and has a locking lug projecting through the recess mentioned, a terminal plug being connected to the rear end of the socket and a bulb to the front of the terminal.

No. 1,054,746—to Walter E. Christian, Kenosha, Wis. Granted March 4, 1913; filed May 27, 1912.

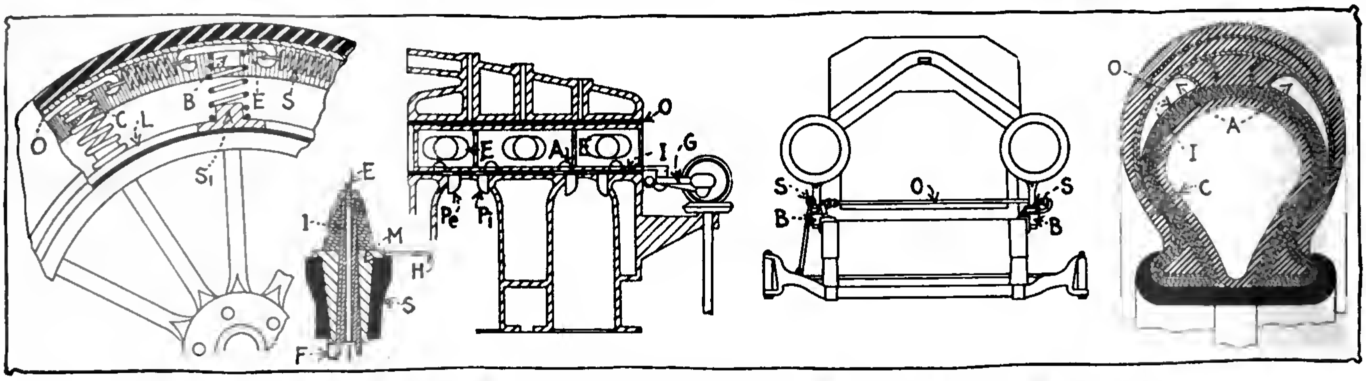


Fig. 1—Casey spring tire. Fig. 2—Blake spark-plug. Fig. 3—Adams motor valve. Fig. 4—Krimmel movable headlight support

VOL. XXVIII NEW YORK—THURSDAY, MARCH 20, 1913—CHICAGO No. 12

The AUTOMOBILE

Road Building in the United States

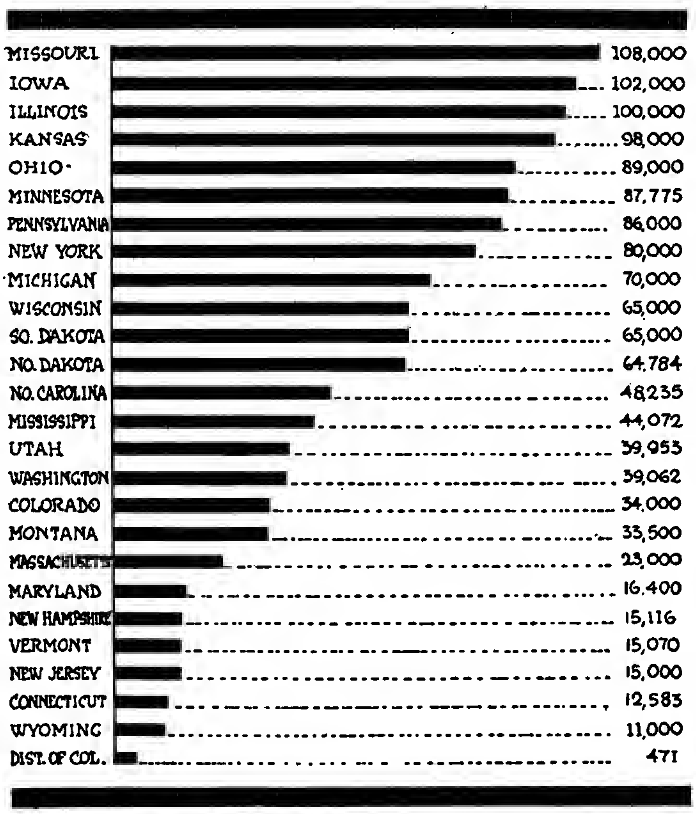
Statistics from Thirty States Representing More than 1,300,-000 Miles of All Types of Road Show What It Costs To Make Improved Highways Throughout the United States

DURING the year 1912 $62,691,425 was spent by twenty-nine states and the District of Columbia in the construction of good roads. It is impossible to obtain data from the remaining states for various reasons. They have either no organized road department, or are still in an experimental stage, or have no accurate cost-keeping system. The twenty-nine states which are named in the table published on page 667 are of interest, however, because they have gone into the matter in such a way that data on the construction of American roads is at last becoming obtainable

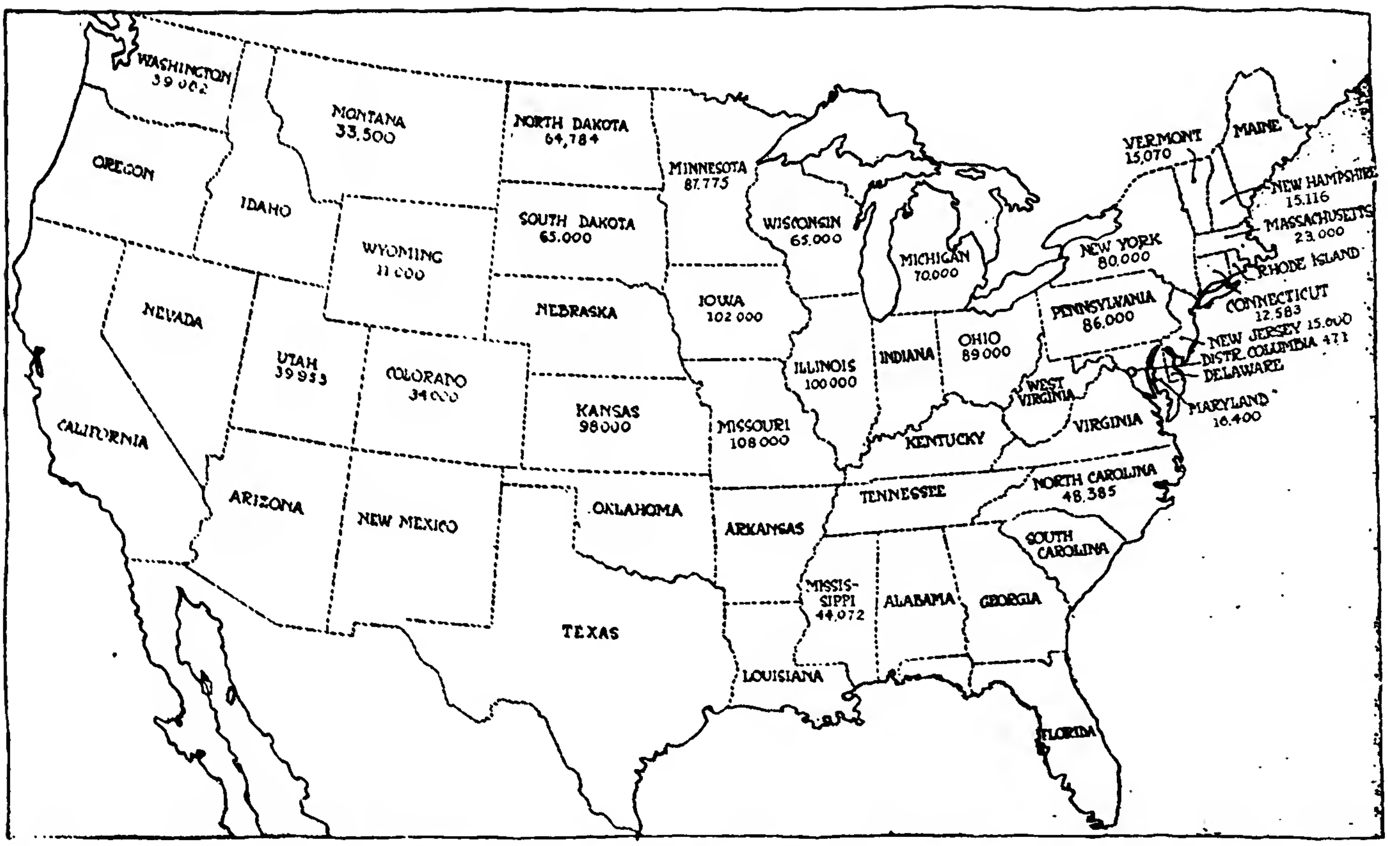
New York spent more money than any other state in the Union. During the year of 1912 approximately $15,-000,000 was expended on the highways of this state. More than 3,000 miles of new road were built and more than 10,000 miles of highway were shaped, crowned and standardized as to width. There are more than 80,000 miles of various kinds of roads throughout the state of New York, 11,000 of which may be classed as improved roads. It cost the state $1,363 per year for each mile of improved road, including the new construction work.

Illinois spent $7,500,000 during the fiscal year ending July 1, 1912. There are 100,000 miles of roads in the state, of which approximately 10 per cent. are improved. The improved roads consist of gravel, crushed stone and macadam, while the remaining 90,000 miles of unimproved roads are dirt. Many of the dirt roads are excellent and are cared for by local authorities. The State Highway Department secures its funds from appropriations made at each session of the Legislature, that for the past fiscal year being $100,000. The township road and bridge funds for the state amount to approximately $6,000,000, and in addition there is a hard road tax of $1,500,000. The state commission maintains a force of bridge and road engineers whose services are furnished the township officials when requested. The commission itself has no authority over road and bridge matters, and the advice given by its engineers can be taken or not as seen fit by the township authorities. It cost the state of Illinois $750 per year for each mile of improved highway, including construction work, figured on the basis of last year's reports.

Iowa has a total of 102,000 miles of highway, upon which it has spent during the past year $7,000,000. There are but 2,500 miles of improved highway in the state, of which a very small percentage is macadam. There are between 2,000 and 3,000 miles of stone road in the state, while the remaining 100,000 miles are dirt. Scattered sections of the roads are faced with gravel or some bituminous material. Most of the roads built during 1912 were dirt, the small percentage of gravel and similar roads being negligible in comparison. The money for road building in Iowa is secured by direct taxation, although some of the local



Comparative diagram showing the total miles of road in the twenty-nine states and the District of Columbia, the only divisions of the United States in which figures are obtainable at the present time



Map of the United States showing the total number of miles of road in each of twenty-nine states and the District of Columbia. No figures are obtainable on other sections of the country

organizations in various parts of the state help buy subscription work.

Washington has 39,062 miles of highway. Of this, 11,896 are improved; 7,826 miles of the improved roads are dirt, while the remaining improved roads are mostly gravel, the total mileage of macadam being but 184. During 1912 there were 400 miles of new roads built. These were chiefly gravel, with some bituminous macadam, water-bound macadam, brick and concrete. The mileage of highway improved last year is 2,000, the work done being chiefly regrading, crowning and draining, and in some cases by the addition of a hard surface. The cost per mile of improved highway was approximately $450 per mile for the year of 1912. This low cost per mile is doubtless due to the large mileage of improved dirt roads which require little labor and practically no foreign material requiring cartage and its ensuing expenses.

Kansas is another state which spent considerable money during the year of 1912 on roads. There are 98,000 miles of highway in the state, of which but 480 miles are improved. The remaining 97,500 are principally dirt. In the construction of new roads and maintenance of the old the state spent $4,275,-000. The total of miles of improved highway, as given above, does not include the improved dirt roads which comprise the majority of those listed in the mileage above. The state spent about $50 per mile of road, which would indicate that very little work was done through vast sections of the state, and that it was possible to do what repairing was necessary at a very low figure on account of the great mileage of the dirt roads. Only 60 miles of new roads were built during the year, these being of macadam, gravel, sand-clay and oiled earth.

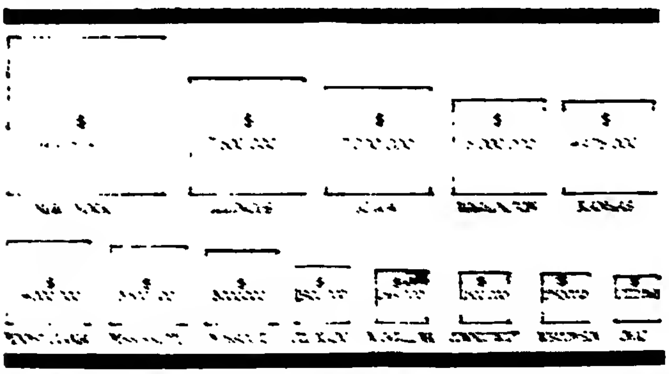


Diagram showing the relative amounts of money spent by all states which expended over $1,000,000 on roads during 1912

Mississippi has a total road mileage of 44,072. Of this 1,000 miles are improved. Of the improved roads 40 miles are macadam, 30 miles are crushed stone and about 500 miles are gravel. One-third of all the improvement work on road-building varies throughout the different counties of Mississippi, but on an average is somewhere in the neighborhood of $30 per mile, according to statistics furnished by the Department of Agriculture and Commerce. Mississippi spent $3,500,000 for roads during the past year. This makes an average of $3,300 per mile of improved road, including the new roads built. This cost is higher than that of other states when it is figured to include 333 miles of road which were improved during 1912.

Pennsylvania has a total road mileage of 86,690, of which 861 miles have been constructed by the State Highway Department. During the year ending September 1, 1912, 4,500 miles of road have been repaired and put in good condition for travel. Four million dollars have been spent on the construction of the new roads and the maintenance of the old. The money for the state highways is appropriated by the State Legislature, which in May, 1911, voted sufficient funds for the two fiscal years ending June 1, 1913. This means that a total of $2,000,000 per year during the years of 1911-1912 and 1912-1913 is available for highway use.

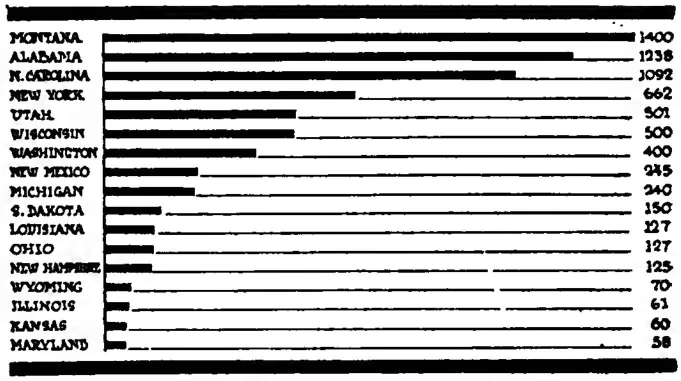
Ohio has 89,000 miles of road. Of this 25,000 is improved highway. The percentage of improved highway, the total highway is probably higher in Ohio than in any other state. Of the improved roads 10,000 miles are macadam and stone, 14,500 of gravel and 500 of brick and concrete. There are 64,000 miles of dirt road in the state, most of which are unimproved, but which are passable in good weather. The money spent in Ohio up to October 1 during the year 1912 amounted to $1,122,060. This was all given out in contract work. The cost per mile for the year of improved roads, including those freshly constructed, amounted to $400 per mile. Money is secured by appropriation through the Legislature at Columbus.

Missouri is another state which has spent a large amount of money last year in the construction of roads. About $3,000,000 being spent during 1912. There are 108,000 miles of road in this state, of which 4,750 are improved; 103,250 miles are dirt roads and are in good condition at favorable periods of the year. Of the improved roads the larger part are gravel, this type claiming about 3,500 miles, while the stone roads make up the remainder of 1,250 miles. There is established in connection with the state treasury a fund known as the general state road fund, which shall be used for no other purpose than that of the permanent improvement of the highways within the state.

Wisconsin has approximately 65,000 miles of highway. According to the United States Office of Public Roads there are 10,000 miles of these highways that have been improved, but the number is closer to 12,000. Most of the roads are dirt, but considerable work is being done along the line of macadam. Along the Fox River Valley experimental concrete roads have been constructed for the first time in Wisconsin.

Not a few states are carrying on experimental work with a view of determining the best surface to withstand wear of both climate and traffic and at the same time to be moderately cheap. The state of Illinois, for example, built 61 miles of experimental roads of different types during the year 1912. Results from these are not yet obtainable, but are expected to be of great value in determining cost and advantages of roads of different type.

The vast stretches of roads throughout this country are still of the dirt or earth type. These make excellent surfaces in good weather and after a stretch of bad weather can be restored by dragging. Where the percentage of dirt roads is greater compared to improved roads and macadam, asphalt and other artificial surfaces it will be noticed that the cost per mile of the road is materially less even where the dragging is thoroughly



Comparison of the number of miles of road constructed in 1912 by those states which have kept records

carried out and the dirt road kept in the best possible condition. The main disadvantage of this road is, of course, its tendency to rut wherever traffic is frequent. In the neighborhood of the larger cities and towns throughout the country it is necessary that some such hard artificial surface be used.

The majority of states which use convict labor are in favor of this method of maintaining and constructing the roads. There are, however, many dissenting opinions, even among the counties of the states which, as a whole, favor the use of convicts. In Mississippi the question was put to those various counties using convict labor what was thought of it and if it was profitable. Some thought the results were good and others did not. Alcorn County, for instance, says that it costs 80 cents per day for convict labor and the value of the work is 50 cents. It is a loss. Clay County, on the other hand, says it costs 80 cents per day with very good results. Pontotoc County says it costs about $3 per day and the value of the work is about $1.50, and is, therefore, a loss. Greene County says it costs about $1 to handle the convict and the value of the labor is $1.50 per day.

It has always been stated that American road construction was devoted too much to the building of roads and not enough to the maintenance.

TABLE OF HIGHWAY STATISTICS OF ALL STATES IN WHICH FIGURES ARE AVAILABLE.

Thomas Stock in Trade Brings $51,000

C. A. Finnegan Makes Purchase—Good Will, Patents and Patterns Valued at $400,000 Included in Sale

BUFFALO, N. Y., March 18—*Special Telegram*—C. A. Finnegan, of the Empire Smelting Co., Depew, N. Y., purchased today, at the receivers' auction in this city, the good will of the E. R. Thomas Motor Co., all of its patents, patterns and stock in trade at the plant here and also at its branch departments in New York, Boston, San Francisco and Los Angeles for $51,000. In the catalog of the receivers these assets of the company were valued at $400,000.

Mr. Finnegan is a former Louisville, Ky., man, and it is reported, by a dispatch from that city, that he is considering Louisville as a location for an automobile manufacturing plant. He formerly headed a similar concern in that city.

The sale opened Monday, March 17, and it is expected that it will be concluded by Friday of this week when the last article to be sold will be the Around-the-World Trophy, presented by *Le Matin* of Paris and the *New York Times* to the Thomas company as winner of the New York to Paris race some years ago. The sale includes 5,843 catalog lots and over 400 bidders are at present in the city looking after various parcels of the sale.

Opportunities are being given at this auction to prospective buyers to examine the various parcels of goods in advance so that the auctioneer refers to each parcel by his catalog number when put up for sale.

During yesterday and today many of these parcels have been sold including paints and brushes, automobile tires, electric motors, sheet metal working tools, lathes, electro plating machinery and thirty-five lots of machinery from the experimental shop.

This auction gives promise of being one of the biggest ever conducted in this country. It was authorized last December by Judge Hazel, who issued orders to receivers George C. Finlay and Adolph Rebadow. J. E. Conant & Son, auctioneers, Lowell, Mass., are conducting the sale.

Those in attendance at the auction not only represent the entire American industry but many European representatives are present. More than 10 inquiries from foreign buyers were received previous to the opening of the sale and their interests are being looked after by American buyers.

Crown 30 To Make Its Debut

LOUISVILLE, KY., March 15—The Crown Motor Car Co., a new automobile concern, announces that during the coming year it will build a car to be known as the Crown 30. The car is listed at $350. The main plant is to be located in this city.

The new car will be fitted with a four-cylinder, two-cycle block motor with 2.875-inch bore and 3.5-inch stroke having a five-bearing crankshaft, and being suspended at three points. It has no valves nor gears to create noise. The motor operates on either gasoline or kerosene, the makers claiming 30 miles to the gallon. Cooling is by means of a tubular radiator. Wheelbase is 80 inches. The 14-inch steering wheel is to be at the left as well as the control lever. Drive is by friction, the makers claiming a variation from 1 to 60 miles per hour and reverse. A feature of the construction is the use of wire wheels. Chrome nickel steel is used throughout shafts and rear axle and high carbon manganese steel in all parts requiring stiffness. The body is of the English torpedo type and full equipment is standard.

C. H. Lambert is secretary and treasurer of the company, which was incorporated in South Dakota last February for $500,000. Half of this capital is paid in.

Petition Filed Against Bergdoll

PHILADELPHIA, PA., March 17—Three creditors of the Louis J. Bergdoll Motor Co., of this city, instituted proceedings today in the United States District Court to have the motor car company adjudged an involuntary bankrupt.

The creditors who petitioned the court and their claims are: W. C. Rhodes, Inc., $1,696.85; Chilton Co., $505, and the Castle Lamp Co., $1,772.85. It is alleged that during the past 30 days preferential payments amounting in the aggregate to over $33,000 have been made by the automobile company as follows: to Erwin R. Bergdoll, $31,200; C. A. Bergdoll Coal Co., $400. and the North Broad Street Realty Co., $1,500.

An official of the Bergdoll company declared this afternoon that if the proceedings did not interrupt the marketing of the company's output it would continue solvent.

Judgment for Willys-Overland

BUFFALO, N. Y., March 19—(*Special Telegram*)—The Willys-Overland Co., Toledo, O., was awarded a judgment of $5,895.83 against Gustave R. Poppenberg, Buffalo, in a decision filed with the county clerk at Buffalo Tuesday by Clark H. Timerman, referee. The papers filed claim Mr. Poppenberg in 1909, and 1911, was agent in Buffalo for Overland cars. Contract expired in 1910, but Poppenberg was unable to ascertain whether he was to have new contract and consequently in August, 1910, Mr. Poppenberg bought Overland cars amounting to $19,630. But when time came to renew contract Ohio manufacturers refused to grant renewal. Poppenberg demanded settlement of account under previous contract claiming rebates and damages for sales in his territory and other items. Willys-Overland company then sued to recover purchase price of automobiles bought by Poppenberg. Purchase price of cars amounted with interest to $22,675.83, which amount was undisputed by the Poppenberg concern. Timerman, as referee, awarded Mr. Poppenberg in his counter claims $16,780, Willys-Overland Co. securing balance.

Auto-Ette Announces Cyclecar

CHICAGO, March 15—The Auto-Ette Co., Chrisman, Ill., is announcing a light car for $368, which, although of small-car size and of standard tread, is built along cyclecar lines. It has a 96-

inch wheelbase and a 56-inch tread, but uses 26-inch motorcycle wheels and motorcycle tires.

The motor is a De Luxe twin motorcycle motor made by the Spacke Machine Co., Indianapolis, and is rated at 9 horsepower. This is air-cooled and with the two cylinders set at an angle. The engine shaft chain-drive connects to a countershaft with an epicyclic gear in connection, giving two speeds and reverse. From the countershaft the drive is taken by two 28-degree motorcycle belts, thus doing away with differential and tending toward great simplicity. The weight is given as 400 pounds and the speed at from 2 to 50 miles per hour. The Auto-Ette company is planning on 1,000 cars for this year.

The Niagara Motors Mfg. Co., which recently moved its plant from Buffalo, N. Y., to Dunkirk, N. Y., turned out its first machine from the new factory Saturday, when shipment was made to New Orleans. The company now employs twenty-five men, new machinery is being installed and the average output weekly from the start will be five automobiles.

G. R. Truck Co. Needs Money

GRAND RAPIDS, MICH., March 17—A committee comprising E. Alfred Clements, L. A. Cornelius, M. Kirsch, Frank T. Hulswit and William F. McKnight has issued a statement to stockholders of the Grand Rapids Motor Truck Co. setting forth the need of additional capital and proposing that the holders of the $154,000 in preferred stock turn in their certificates in exchange for common stock, and that an additional $100,000 in 7 per cent. preferred stock be issued. The members of the committee agree to take $50,000 worth of the new preferred stock, providing the whole amount be raised. The proposed preferred stock would carry a bonus of 50 per cent. in common stock.

Wagenhals Plans Stock Increase

DETROIT, MICH., March 15—The Wagenhals Motor Car Co. is planning a capital stock increase from $100,000 to $500,000 within the next week or 10 days. With the coming of the parcels post, which has been very favorable to the tri-car types of delivery machines, such as the Wagenhals, the concern's activities have been greatly increased and orders have been placed by it for parts for 500 of the three-wheelers, according to W. G. Wagenhals.

U. S. Truck Bids for April 15

WASHINGTON, D. C., March 18—*Special Telegram*—Sealed proposals for furnishing the United States government with a number of motor trucks have been issued by the General Supply Committee. The bids will be opened in this city April 15. The bids call for one electric motor mail wagon of 1,000 pounds capacity, one gasoline motor wagon of 1,000 pounds capacity, four electric trucks of 2,000 pounds capacity, four gasoline motor trucks of 2,000 pounds capacity, one electric truck of 3,000 pounds capacity and one gasoline truck of 3,000 pounds capacity. Manufacturers desiring to put in bids should make application to the General Supply Committee for specifications and blank forms. Successful bidders will likely be called upon to furnish more trucks than the schedule now calls for.

Shipment Book Completed by N.A.A.M.

Is a Ready Reference To Facilitate Return of Automobile Freight Car Equipment To Detroit Factory Rails

DETROIT, MICH., March 11—Continuing its work of furthering the shipments of automobiles from Detroit and other cities, the Traffic Department of the National Association of Automobile Manufacturers has just completed the compilation of a booklet containing a list of all the automobile freight car equipment of all railroads. This booklet, which is intended as a ready reference to facilitate the return of this equipment to the home rails and to automobile manufacturing territory, is being sent to all railroad officials and to automobile makers as well.

As the automobile industry is dependent for its shipping facilities on the freight cars listed in the booklet, the co-operation of all railroad officials and employees in the prompt and proper handling of these cars is urgently requested in a letter which accompanies the list and which reads as follows:

"To railroad officers:

"It is well known that automobile factories cannot use ordinary hox cars hecause the doors in such cars are too small.

"We are inclosing a pamphlet which shows cars which have doors of special sizes and construction for handling automobiles, and it is on these cars and the efficient handling of same that the automobile industry must depend for its transportation.

"This automobile equipment has an important duty to perform. It must handle annually more than 100,000 carloads of automobiles valued at something like $300,000,000.

"We appreciate the effort made hy railroads to handle this situation. Nevertheless, it is apparent that the importance of prompt and proper handling of automohile equipment is not fully appreciated hy many under whose jurisdiction these cars come. Location statements of automobile equipment show such a scattered condition of these cars that we are forced to the helief that automohile equipment is counted and figured as part of the general car balance, in other words, as so many hox cars. An examination of car records indicates that many of these automobile cars, after being relieved of a factory load in the West or South, are used as ordinary hox cars, and either retained in local service or reloaded and routed at variance with railway rules and without regard to the requirements of the automohile industry. There are a great many such 'tramp' automobile cars scattered through the West and South today.

"The shipping of automobiles from factories is now at its height and for the next few months will approximate 10,000 carloads per month.

"Unless there is steady movement of automobile equipment hack into manufacturing territory the railroads serving the shipping points will be unahle to meet the demand.

"Therefore we appeal to Western and Southern railroads to recognize this condition, and to check their records for these automobile cars, sending home any that you find on your rails. And we urge Eastern railroads to issue renewed and positive instructions that will insure control of all automohile equipment coming to your rails from now on for use in automobile traffic. National Association of Automobile Manufacturers, Inc. J. S. Marvin, General Traffic Manager."

Case Company Shows Gain

RACINE, WIS., March 17—The annual report of the J. I. Case T. M. Co., Racine, Wis., shows a splendid increase in the automobile department for 1912 as compared with 1911. The general income account of the big concern is as follows:

	1912.	1911.
Gross sales	$14,854,945	$9,163,749
Operating expenses	12,084,172	7,654,559
Net income	2,770,773	1,509,191
Charges	606,338	448,240
Surplus and dividend	2,264,485	1,060,951

Gross sales in all departments show an increase of 60 per cent. and the increase in net income is approximately 50 per cent. The amount available for dividends on the $12,000,000 preferred, 7 per cent. cumulative, outstanding was 2.7 times the amount required, leaving a surplus of 18 per cent. available for the common stock.

Of the gross sales of $14,026,633.93 in 1913, the domestic sales aggregated $9,841,782 and the export sales $4,184,851.93.

The Schildwachter Carriage Co., New York City, has filed a voluntary petition in bankruptcy. The assets of the company are $23,583 and its liabilities $36,486.

Associations Are United

Automobile Chamber of Commerce, Inc., Is Formed by Merger of the N. A. A. M. and A. B. of T.

New Corporation to Continue Present Work of the Parent Organizations—Has Over 100 Members

NEW YORK CITY, March 19—The Automobile Chamber of Commerce, Inc., was organized here today by a formal merger of the former National Association of Automobile Manufacturers and the Automobile Board of Trade. The purposes of the new body are to advance each and every interest of the automobile industry and its members, to work for the enactment and enforcement of beneficial laws and to promote harmony among the members of the industry; finally to "acquire by grant, gift, purchase, devise or bequest, to hold and to dispose of such property as the purposes of the corporation shall require, subject to such limitations as may be prescribed by law, including inventions, letters patent and processes, or rights thereunder, for the benefit of its members and not for pecuniary profit."

The officers of the corporation are: Charles Clifton, president; W. C. Leland, vice-president; Col. George Pope, treasurer; R. D. Chapin, secretary. The board of directors is composed of the following: Charles Clifton, Charles C. Hanch, Hugh Chalmers, Sydney Waldon, Samuel T. Davis, W. C. Leland, Windsor T. White, William E. Metzger, H. O. Smith, Albert L. Pope, L. H. Kittredge, R. D. Chapin, G. W. Bennett and H. H. Rice.

In a general way, the work of the new corporation will be along the same lines as that of its parent bodies. There is a possibility, however, that new kinds of work will be taken on. As for the arrangement of Dyer licenses for the members, who number 100, this will be settled in the near future.

Akron Situation Is Quiet

AKRON, O., March 18—The situation in the rubber workers' strike here has been exceedingly quiet during the past 3 or 4 days. The manufacturers say that more men are constantly returning to work. The Goodyear plant is now working day and night and the Goodrich-Diamond and Firestone plants are about to put on night shifts.

AKRON, O., March 19—(*Special Telegram*)—D. M. Goodrich was elected director of the B. F. Goodrich Co., in place of W. B. Miller at annual meeting last week. No election was made to fill place of W. B. Miller, who resigned, as vice-president.

Automobile Union Formed

MILWAUKEE, WIS., March 17—A new federation of union workmen, membership in which will be confined to employees of automobile and parts factories, has been organized at Milwaukee as the result of the Smith and Milwaukee Motor Co. strikes. The title is United Metal Mechanics' Union, auxiliary of Milwaukee Lodge No. 66, International Association of Machinists.

Have Operating Plan for Columbus

COLUMBUS, O., March 17—Proposal that the Columbus Buggy Co., which recently went into the hands of a receiver be taken over by the creditors and operated until all of the uncompleted product on hand can be finished and sold, is made in the report of the committee of creditors named on February 13, to investigate the status of the company and make recommendations as to the best method of procedure. The committee is composed of George W. Bright, E. R. Sharp, George W. Lattimer, T. C. Dunlap, B. G. Watson and D. N. Postelwaite.

The committee says that it believes if the business of the company is revived and continued under proper management, the creditors' claims might be paid eventually almost in full. On the other hand, the committee thinks, if the business were to be disposed of in the usual course of a receiver's sale, without the co-operation of creditors, the percentage paid to the creditors would be very uncertain.

DETROIT, MICH., March 15—W. M. Anthony, comptroller of the Maxwell Motor Co., Inc., has moved the executive offices of the concern all to Detroit, the accountants and others connected with this department all coming to this city last week. The general offices at Woodward and Warren avenues are now in full swing and here will be handled all of the business of the $37,000,000 concern.

MILWAUKEE, WIS.—At the annual meeting of the Sternberg Mfg. Co., of Milwaukee, manufacturing commercial vehicles, all of the officers were re-elected as follows: President, William Sternberg; vice-president, E. M. Sternberg; secretary, Victor L. Brown; treasurer, Robert L. Hayssen. Mr. Brown was also continued as general manager.

NEW YORK CITY, March 19—The midsummer meeting of the Society of Automobile Engineers will be held on the steamer City of Detroit on Lake Michigan on June 5, 6 and 7. The

Automobile Securities Quotations

Despite the fact that the Akron situation is apparently improving constantly, the market was rather unstable this week, and it was especially in rubber and tire stock issues that a downward trend was in evidence. Goodyear common led in this respect, with a drop of 40 points as against last week's closing figure; Firestone common lost 22, Goodrich common 12, Miller 10 and Swinehart 7. The other stocks, as a consequence, were also weak.

details of the program for this meeting have not been settled upon as yet. It is known, however, that a number of members of the Institution of Automobile Engineers and the Society of Motor Manufacturers of England will be guests of the S. A. E. at the time of the midsummer meeting. The itinerary program of the English Society follows:

Wednesday, May 17—Leave Tilbury by the SS. *Minnewaska.*
Monday, May 26—Arrive New York.
Monday and Tuesday, May 26 and 27—In New York.
Wednesday, May 28—Leave New York for Pittsburg.
Thursday, May 29—In Pittsburg.
Friday and Saturday, May 30 and 31—In Indianapolis.
Sunday, Monday, Tuesday and Wednesday, June 1, 2, 3 and 4—In Detroit.
Thursday, Friday and Saturday, June 5, 6 and 7—Lake trip on steamer (S. A. E. Summer Meeting).
Sunday and Monday, June 8 and 9—In Cleveland.
Tuesday, June 10—In Buffalo. Here the party will be divided, and those who wish may return direct to New York. The remainder will proceed to Providence.
Wednesday, June 11—In Providence.
Thursday, June 12—In Bridgeport and New Haven.
Friday, June 13—In Hartford.

Among the works and factories which it is the intention of the party to visit are the Cole, Henderson, Marion, Marmon, National, Stutz, and Waverley at Indianapolis; the Cadillac, Ford, Chalmers, Hudson, Packard, and Timken Axle at Detroit; the Peerless, Winton and Stearns at Cleveland and the Pierce-Arrow at Buffalo.

As the program notifies that ladies are specially invited it would seem that the customary excursions are to form a part of the approaching visit.

Members of the party who continue the trip to Providence will visit Brown & Sharpe Works there, and later the Locomobile factory at Bridgeport. Some carriage works at New Haven and various tool and other factories at Hartford will also be inspected.

Market Changes of the Week

Tin proved again to be the most important change in the markets. A loss of $2.65 occurred, though higher opening cables from London had the effect of renewed interest in the local market, prices advancing under the influence of the better cables. This lack of interest has been the cause of the recent slump. While the market for refined copper is very quiet and actual business of small dimensions, stock for early shipment is under pretty good control, and for prompt delivery from $.14 7-8 to $.15 a pound for electrolytic and Lake copper. The lead market is quiet. A fair volume of sales is reported. Lead fluctuated throughout the last week and ended on Tuesday with a gain of $.05. There was an absence of new developments of importance in the linseed oil situation, as there were no changes in prices. Both petroleums from the Pennsylvania and Kansas wells remained constant and firm. Automobile scrap remained constant at $.09 7-8.

New Fuel For London

Shell II Has Specific Gravity of .728 to .735 and Sells for 38 Cents Per Gallon

Benzol Seems a Way Out of Fuel Difficulty—Petroleum Discovered in Large Quantities in Papua

LONDON, March 5—The price of gasoline has again been raised, and the proprietors of Shell announce that in order to meet the enormous demand, a new grade of gasoline is to be put on the market. This new fuel will be known as Shell II. It has a specific gravity of .728 to .735 and it will sell at 38 cents per gallon, while the ordinary gasoline, packed in the red cans, with a specific gravity of .713 to .720 will be sold at 42 cents per gallon, which is 2 cents per gallon in excess of that paid last week. Pratt's spirit has not been advanced and still sells at 38 cents per gallon, with Taxibus only 36 cents per gallon. Carless, Capel & Leonard have raised their Standard gasoline up to 44 cents per gallon, Movril at 42 cents, and Car-bus at 36 cents per gallon.

As has repeatedly been pointed out, the only way out of the fuel difficulty is to use an alernative fuel, preferably benzol.

LONDON, March 8—In view of the present fuel crisis, the official report received by the Australian Commonwealth authorities that a new source of petroleum supply has been discovered in Papua (or British New Guinea), is of much interest. Investigations made so far disclose the existence of gas springs and oil seepage over an area of 900 square miles. An examination of surface evidence and general geological conditions is now being made, but no applications of oil leases have been granted by the administrator while the field is being fully tested by boring.

Batavia Sues Seamless Tires

NEW YORK CITY, March 19—After having advised various tire-manufacturing companies of the alleged illegality of making casings the treads of which resemble the Batavia non-skid type, the Batavia Rubber Co., of Batavia, N. Y., has brought suit in the U. S. District Court, Southern District of New York, against the New York branch of the Seamless Rubber Co., New Haven. Conn. The claim of the bill of complaint, filed for the plaintiff by Holmes, Rogers & Carpenter of New York, is that by making a tread stated to be an exact copy of the Batavia type, the Seamless company exerted unfair competition. The Batavia company demands a perpetual injunction against the Seamless Rubber Co., to prevent it from making treads which, according to plaintiff's claims, were in several cases mistaken by buyers for Batavia treads, and it also calls for accounting of the business done in such treads in the past.

BUFFALO, N. Y., March 19—*Special Telegram*—An injunction was issued through United States District Court by Chief Justice White on Tuesday in case of Lovell-McConnell Mfg. Co., Hutchison Electric Horn Co. and Miller Reese Hutchison against International vs. Automobile League of Buffalo ordering the defendants, their officers, agents and attorneys to refrain from advertising, circulating or offering deduction, discount or rebate from prices designated by complainants at which the automobile horns made by the latter must be sold to the public as shown by tags during pendency of this action. The injunction is the continuation of a preliminary order handed down when the appeal was granted to the complainants in the Circuit Court on refusal of the court to grant certain injunctions.

Fight Bad New York Bills

Hearing To Be Given Automobilists and Makers on Tire-Dating Measure Thursday—Owners, Dealers and Manufacturers Unite in Pilgrimage to Albany To Kill Unjust Bills

NEW YORK CITY, March 19—One of the most striking of the examples of ignorant and pernicious legislation which the automobilists, dealers and manufacturers of the country have been called upon to combat in the Empire State is the tire-dating bill which was resurrected last week by the Hon. Christy Sullivan. Representatives of the tire companies and many automobilists and dealers hastened to Albany at once to protest against its passage, but they were refused a hearing and the measure was rushed through for some reason not apparent.

This is practically the same bill that was brought up last year and on which a hearing was given March 19. It was later amended and finally dropped out of sight. It appears now as an amendment to Section 394-A of the laws of 1909 and provides that:

"Motor vehicle tires are to be dated. No person or corporation shall manufacture, sell, offer or expose for sale in this state a tire for use on a motor vehicle unless the date when such tire was manufactured shall be impressed or branded upon the material of which such tire is constructed, or otherwise indicated by label securely attached thereto."

The act also provides a penalty of $50 for violation of its provisions.

Representatives of the tire manufacturers, dealers and car owners have called Governor Sulzer's attention to the pernicious character of the measure and will be given a hearing on Thursday before the Senate Committee on Miscellaneous Corporations at Albany. The bill must have the Governor's signature, of course, before it will become a law.

The worst feature of the situation is that the bill will be of benefit to no one, except, perhaps, the unscrupulous dealers against whom it is ostensibly aimed. For it would be an easy matter to fool the public with a dated tag, which could be readily changed to suit the occasion, as to the real age of a tire.

Moreover, the manufacturers' guarantee obviates the necessity for such legislation. The tire-dating feature would be the cause of hardship to the tire makers because the public, misled as to the true facts of the case by the provisions of the bill, would demand brand new tires continually. The result would be that when winter came and trade was dull the makers would have to close down their plants as no one would buy last fall's tires in the spring and when spring came there would be no possibility of supplying the tremendous demand for new tires. This is one reason the bill would make things bad for the consumer.

But to come to the fact which renders the whole measure ridiculous to the veriest tyro, automobile tires kept in the proper way are better 6 months after they leave the factory than new.

Years ago when the industry was new there was some excuse for the seeming childlike ignorance of our would-be legislators, but nowadays, when nearly all of them have cars themselves, it is not only an insult to their own understandings to promote such measures as the tire-dating bill, but an aspersion on their motives.

Correction—In THE AUTOMOBILE for March 6 the cylinder dimensions of the new six-cylinder Columbia car were given as 4.5 by 4.5 inches. The stroke of this motor will be 5.5 inches.

ALBANY, N. Y., March 13—Over sixty motor clubs of this state and representatives of dealers from New York and other cities were present here today for the hearing before the committee on internal affairs on the new motoring legislation, the delegates filling the assembly chamber which was used for the hearing. Never before has motoring New York presented such a united phalanx and never before have legislators realized the determination of motorists to have fair play in legislation. As a result of the hearing it is generally conceded that nearly all of the bills will be allowed to die in committee and that practically the Callan law of today will continue. President A. J. Deer, of the New York State Automobile Association, had charge of the delegates for the hearing. Melvin P. Bender, counsel for the organization, opened the hearing and was followed by Charles Thaddeus Terry, counsel for the dealers. Many others spoke. The new legislation aimed at was that doubling present registration fees and increasing them three- and five-fold in trucks; and that giving the secretary of state power to revoke licenses at will with hearings or not as desired. The bills arranging for owners and chauffeurs to have to give bonds before being registered were also the center of attack. Three years ago when the Callan bill was made the law of this state, the motorists only consented to a registration charge to defray the cost of identification and secure a rational operating law. It was practically a gentleman's agreement on the ground, and now when the government aims at doubling the fees without any reason other than getting more revenue it is looked upon as a breach of faith by the motorists. They threw the gauntlet down publicly, declaring that if fees are raised the constitutionality of the present registration law will be carried to the highest courts and in the meantime all registrations will be paid under protest.

Ohio Bill for Sliding Scale

COLUMBUS, O., March 17—Representative M. A. Warnes, of Holmes County, has introduced a bill in the Ohio General Assembly providing for a sliding scale in assessing fees for the registration of automobiles in Ohio. The bill supersedes the one which was introduced in the Legislature at an earlier date, but was withdrawn because it was believed to be unconstitutional. Fees ranging from $5 to $25 are proposed for the various horsepowered cars, while motorcycles are assessed $3 each.

New License Law for Indiana

INDIANAPOLIS, IND., March 17—The Indiana Legislature has passed a law requiring an annual state automobile license, which has been approved by Governor Ralston, and will become effective May 1. Heretofore it has been necessary only to pay the state a registration fee of $1, which did not have to be renewed. The new law forbids any municipality from exacting a license fee and this will mean a loss of $30,000 a year to the city of Indianapolis alone.

Under the new law the state license will be as follows: Motorcycles, $3; motor trucks, regardless of horsepower, $5; electric cars, $5; pleasure cars, 15 horsepower and under, $5; 15 to 25 horsepower, $7.50; 25 to 35 horsepower, $12.50; 35 to 50 horsepower, $15; and over 50 horsepower, $20. The purchaser is to be allowed to operate under the license number of the dealer for 15 days after buying a car or motorcycle.

The numerals on the number plate are to be 4 inches high and the color is to be changed each year. Manufacturers and dealers are to pay a license of $15 a year and may obtain as many duplicate number plates as may be required at $1 each. Automobile owners from other states, complying with the motor license regulations of their own states, need not pay an Indiana license, provided their own states grant similar reciprocity.

There is also a provision for the licensing of chauffeurs, requiring an examination by examiners to be appointed by the secretary of state. The annual license fee is to be $5. The legal speed is fixed at 10, 15, 20 and 25 miles an hour, graduated according to the manner in which each district is built up.

The revenue under the act is to be placed in a road fund and prorated among the counties of the state. Upon a second conviction of the act a chauffeur's license may be revoked three months and upon a third conviction for 6 months, to which not exceeding 60 days' imprisonment may be added.

There is also a new law in Indiana making it a misdemeanor for any person to take or use a motor car without the owner's consent.

Ohio Might Tax Automobiles

FINDLAY, O., March 15—A bill has just been introduced in the legislature providing for automobile fees to be materially raised, as follows: Electrics, $5; gasoline cars under 20 horsepower, $5; from 20 to 30 horsepower, $10; from 30 to 40 horsepower, $15; from 40 to 50 horsepower, $20; and over 50 horsepower, $25; manufacturers' and dealers' licenses, $25; copies of licenses, certificates, $25 each.

The proceeds of the licenses, less the cost of operating the department, are to be paid in to the state treasury for the improvement and repair of the roads of the state.

Idaho Has Good Road Laws

BOISE, IDAHO, March 8—On the very last day of the legislative session the Senate passed the Koelsch and Shattuck bills, both good roads measures.

The Koelsch bill provides for the creation of a state highway commission; a special tax on motor vehicles, and for convict labor on the highways. The highway commissioners will receive no pay except necessary expenses and the commission will have entire jurisdiction over the highways of the state.

A special tax is assessed on automobiles as follows: Under 30 horsepower, $20; 31 to 40 horsepower, inclusive, $25; 41 to 50 horsepower inclusive, $30; above 50 horsepower, $40. All moneys raised from this tax and from registrations and fines will go into the road fund and will be used for no other purpose.

The Shattuck bill provides for the issuance of $200,000 state bonds, the money to be used in laying out, surveying and constructing a system of state highways.

A senate joint memorial was introduced by Mr. Hart, rquesting Congress to transfer 50,000 acres of timbered land now held within the National forests by the United States within the boundaries of Idaho for the purpose of creating a fund to be used by the state for the establishment and maintenance in good repair of a system of public roads within the borders of the state.

Bad Roads Cost Third of Crops

WASHINGTON, D. C., March 16—According to a statement issued by the federal department of agriculture, an improvement in the distribution of one-third of the crops of the farms of the country would be effected through the construction of a better system of public highways in the United States. This would eliminate much of the nation's waste and effect a saving of many millions of dollars, it is declared.

As a result of investigation of the economic value of improved roads, it has been found that on the basis of a $9,000,000,000 crop, which was harvested last year, at least one-third remained on the farm. The consumer paid about $13,000,000,000 for $6,000,000,000 worth of products sold by the farmers, the latter receiving only 46 per cent. of what the consumer paid.

On the basis of these figures Logan Waller Page, director of the office of public roads, has declared that if the roads of the country were put into better shape and properly maintained it would be possible for farmers to get to shipping points at all seasons of the year and dispose of this one-third crop, which now goes to waste. The good roads would soon pay for themselves, Director Page declares, with corresponding improved conditions for all time.

Texas To Have Highway Department

AUSTIN, TEX., March 14—Prospects are favorable for the enactment by the state legislature of Texas of a bill creating a state highway department and establishing a state highway commission and the office of state highway engineer. The measure, of which Senators H. B. Terrell and H. L. Darwin are the authors, has been favorably reported by the committee on roads, bridges and ferries. It carries an appropriation of $10,000 to pay the general running expenses of the proposed department up to and including January 31, 1914. The funds for maintaining the department are to be provided for by taxing each motorcycle $2 per annum and each motor vehicle of other description $5 per annum.

SEATTLE, WASH., March 14—A new measure regulating the use of motor car signals went into effect in this city today, and covers the use of signals on motor cars and fire department vehicles. According to the new regulations the signal used must be capable of producing an abrupt sound sufficiently loud to be heard above the noise of traffic and to serve as an adequate warning of the approach of such motor cars, motorcycles or other vehicles, and of the danger to any person caused thereby. The law further stipulates that it is unlawful for persons driving motor vehicles other than fire department wagons, police department vehicles, and health and sanitation department vehicles to sound the signal more than three short, abrupt blasts in succession.

MILWAUKEE, WIS., March 14—The latest freak among Wisconsin motorists are facing at the hands of the Wisconsin Legislature is the Richardson bill, which attempts to make certain that no motorist will exceed the speed limit by requiring all motor cars sold in Wisconsin to be so geared that the maximum speed to be obtained from any car will not be more than 25 miles per hour.

Benjamin Takes Alco Sales

NEW YORK CITY, March 19—C. Arthur Benjamin has taken over the office of general sales manager of the automobile department of the American Locomotive Co., his headquarters being in this city. Before taking the place of Harry S. Houpt, who left the Alco company a short while ago, Mr. Benjamin was engaged in the automobile business in Syracuse, where he handled Packard and Hudson cars.

NEW YORK CITY, March 17—John Calder, formerly associate general manager of the Cadillac Motor Car Co., has just accepted the appointment of acting vice-president of the International Motor Co., manufacturer of Mack, Sauer and Hewitt trucks.

Paris Show Date Changed To October

Proposed To Reduce Present Slack Season Between Active Selling and Announcement of New Models

This Change Will Probably Be Accompanied by a Shortening of From 19 or 20 Days to 10

PARIS, March 8—Paris will open the European show season with its exhibition in the Grand Palais during the month of October. This change from December to October was proposed in order to reduce the present slack season between the end of the active selling period and the placing on the market of the following season's models. It is believed that by making this change at least 2 months will be gained to the French trade, for work on the 1914 models will be begun about July, instead of being held back until September, as at present. Recently the whole of the French trade has been consulted on this matter, with the result that a unanimous decision has been arrived at in favor of the early show. No official announcement has yet been made on the date of the Paris exhibition, but in view of the favorable opinion expressed by the six individual trade associations responsible for this event, the adoption of the early date cannot be doubted. There appears to be but one difficulty in the way, and this can doubtless be removed. A society of artists has an option on a portion of the Grand Palais for an art exhibition during the month of October. In view of the enormously greater importance of the automobile show, a request will be made to the artists either to change their date or find another hall, and it is not supposed that this request will be refused. Already the aeroplane manufacturers, who usually have their show in the Grand Palais in October, have agreed to change the date in order to give the automobile manufacturers a preference. With a show in the Grand Palais in October, Paris will have the first exhibition in Europe, coming before London, which has had the advantage in this respect up to the present. It is declared by the French manufacturers that the change of date has not been made in order to gain an advantage over London, but entirely in view of economic home conditions. Nevertheless, it is felt in England that Paris will secure an enormous commercial advantage by being able to have the first display of the new season's models. The date of the London show has not yet been fixed, but it will probably be held in November.

The change in the date of the Paris show will doubtless be accompanied by a change in the duration of the show. Up to the present the Paris Salon has lasted from 19 to 22 days, being open both on weekdays and Sundays. It is now proposed to reduce the period to 10 days, the show opening on a Friday or Saturday and closing on the following Sunday or Monday week. This will give 10 clear days, including two Sundays. This change is proposed by members of the trade who find that a 22-day show causes considerable inconvenience to the commercial staffs. If the short show is adopted, the exhibition will probably be kept open until 7 or 8 o'clock in the evening, instead of closing at 6, as at present. It will also be necessary to diminish, if not entirely abolish, the free passes now granted. It is believed that the total attendance will be just as great with only 10 days as with twice that number, and that the volume of business will not be diminished.

The 1913 show will again have Henri Cezanne as its general manager. A joint committee representing the six trade associations has full control over the exhibition. The president of the joint committee is Armand Peugeot, and the other members are J. Niclausse, C. Rodrigues Ely and M. Cottenet, vice-presidents; A. Citroen, secretary; M. Turcat, treasurer.

COLUMBUS, O., March 18—The big automobile carnival given here for the week ending March 15 by the Columbus Auto Trades Association was a success despite unfavorable weather conditions which prevailed for the greater part of the time. The crowds were good and sales were numerous.

HARRISBURG, PA., March 15—The fourth annual show of the Harrisburg Automobile Dealers' Association was opened this evening at the Rex Garage and Arena Theater. Hundreds of persons visited the show on the opening night. The show will continue for 2 weeks. The 20,000 feet of floorspace is taken up by thirty-five exhibitors and over 100 automobiles, including thirty different makes of pleasure cars and trucks.

BUFFALO, N. Y., March 18—At the first annual commercial vehicle show held in Buffalo, March 11-15, under the auspices of the Buffalo Automobile Dealers' Association, thirty exhibitors displayed their trucks and sales were numerous, one firm disposing of several trucks to a Niagara Falls company, while one motor vehicle was shipped to New Orleans. It is estimated that 30,000 persons attended the show, which closed Saturday night.

Alco to Make Philadelphia-Pittsburgh Trip

PHILADELPHIA, PA., March 17—A striking contrast of the old and the new methods of transportation was furnished yesterday morning when, escorted as far as the city limits by the original prairie schooner in the service of the paint company, a 3.5-ton Alco truck laden with a cargo of paint consigned by John Lucas & Co., of this city, to Joseph Horne & Co., of Pittsburgh, left Philadelphia for the first delivery of merchandise to be made by a commercial vehicle across the state of Pennsylvania.

The total distance to be traversed is over 350 miles, and as it is expected to complete the jaunt in 5 days a daily mileage of 70 miles will have to be maintained.

The old and the new—striking contrast of transportation methods by John Lucas & Co., Philadelphia, Pa.

Stock Car Race of 300 Miles for England

Race Is for Four-Cylinder Cars with Bore not Exceeding 3.543 Inches and 5.512 Inch Stroke

To Be Held on the Isle of Man September 25—Race May Be Cancelled If Entries Are Few

LONDON, March 7—The regulations governing the international stock car race for the Tourist trophy to be held on the Isle of Man, September 25, have at last been issued and they show the race of approximately 300 miles or eight laps of the circuit. The race is for four-cylinder cars with cylinder bore not exceeding 90 millimeters, or 3.543 inches, and 140 millimeters, stroke, or 5.512 inches. The minimum weight is 2,000 pounds as cars will compete in the race and includes driver, mechanic, fuel, oil, water, tools, etc. The cars must be stock in all particulars excepting that the angle of the steering column may be altered to suit the driver.

To insure stock throughout the rules are framed with special care and call for same make and size of carbureter and intake manifold as stock; stock exhaust manifold and muffler without cut-out, even if such is stock; no higher gear ratio may be used than the highest ratio fitted to stock cars; shock-absorbers may not be fitted; no extra oil feed arrangements to the motor permitted and any oil tank must be of stock size and in stock position; a gasoline tank to carry not less than 30 gallons may be used; mud guards for the wheels with continuous running boards must be used, the front guards being not less than 10 inches wide and the footboard and rear mud guards not less than 8 inches wide, and only wheels of sizes specified in the maker's catalogue shall be allowed.

The entry fee is $250 per car. The race may be canceled if not more than twenty entries are received by May 31. Entries will close June 30.

Order Fixed for French Grand Prix

PARIS, FRANCE, March 7—Victor Rigal, driving No. 1 Sunbeam, will be the first driver to start in the French Grand Prix race at Amiens on Saturday, July 12. This position has been decided by the drawing of lots, the complete order in which the cars will get away, probably at intervals of half a minute, being as follows: 1, Sunbeam; 2, Delage; 3, Opel; 4, Mathis; 5, Excelsior; 6, Th. Schneider; 7, Itala; 8, Peugeot; 9, Sunbeam; 10, Delage; 11, Excelsior; 12, Th. Schneider; 13, Itala; 14, Peugeot; 15, Sunbeam; 16, Th. Schneider; 17, Itala; 18, Peugeot; 19, Sunbeam; 20, Th. Schneider.

The race being run on a fuel consumption basis, it has been decided to allow the competing cars to fit gasoline meters of the type approved by the "octroi" of the city of Paris, on condition that the fittings are of such a nature as to make the introduction of fuel through the meter or the connections an impossibility.

INDIANAPOLIS, IND., March 17—Definite word has been received from the Peugeot company, of Paris, that two of its fastest cars, with Jules Goux and Zucarrelli as drivers. will be entered in the third annual 500-mile International Sweepstakes Race at the Indianapolis Motor Speedway May 30.

According to present arrangements Goux and Zucarrelli will arrive in America about May 12, and will proceed immediately to Indianapolis to become thoroughly acquainted with the Speedway before the day of the race. Albert Guyot, who is to pilot the famous English Sunbeam car, will arrive in America about the same time and will also train at the Speedway. Owing to the fact that all of these drivers are scheduled to drive in the French Grand Prix on July 12, it will be necessary for them to return to France immediately after the Indianapolis race.

Three Isotta Fraschini cars will be entered in the May 30 race in Indianapolis. One of these is a specially constructed machine and will be driven by Harry F. Grant; Trucco, the Italian driver, will be also on an Isotta and Gilhooley is the third man.

F. E. Edwards, chairman of the technical committee of the A. A. A., has been appointed to the same position in the 500-mile classic which takes place at Indianapolis on May 30. Until Mr. Edwards reaches Indianapolis Chester S. Ricker will be his official representative and after will act as his first assistant.

Reliability Run for Columbus

COLUMBUS, O., March 15—A 4-day reliability contest which will be conducted under the auspices of the Columbus Automobile Club will be run April 29 and 30 and May 1 and 2. The *Ohio State Journal* of Columbus, O., originated the plan and the name will be taken from that publication. The direction of details for the run is under the charge of the contest committee of the Columbus Automobile Club, consisting of L. M. Browne, Jack Means, Herbert A. Mason, Frank Girard and J. C. McIntyre. It has been decided to lay out the route from Columbus via Dayton and Richmond to Indianapolis, from Indianapolis to Fort Wayne for the second day, from Fort Wayne to Detroit on the third day and from that point back to Columbus for the fourth day. Already a number of cars have been entered for the reliability, both agents and owners. Several cups will be provided for the winners.

PHILADELPHIA, PA., March 15—The first week of the sealed bonnet, road-conditioning test being conducted by the Touring Bureau of the Automobile Club of Philadelphia was completed today and, judging by the amount of territory covered and information gleaned, gives promise of being productive of more accurate data than anything heretofore attempted in that line.

During the week a total of approximately 1,225 miles has been covered, a daily mileage of 175.

NEW YORK CITY, March 17—The Ajax-Grieb Rubber Co. has prepared for a mileage contest of its products from March 31, 1913, to April 1, 1914. There are 208 prizes ranging from $500 to $10 and aggregating $5,000 which will go to the drivers who get the most mileage out of their Ajax tires. When a tire is sold, the date and odometer readings are taken and a statement giving them is signed by the driver and owner. When the tire has arrived at the state of unserviceability the date and odometer reading are again taken by the company, when the tire is returned.

WASHINGTON, D. C., March 16—The tentative route for the motor truck reliability run of the *Washington Post*, May 5-8, has been selected, and the work of blazing the trail began today when a Marmon car, driven by Arthur Foraker and carrying Pathfinder Harry Duckstein, was sent over the course. The tentative route will carry the trucks through two states and the District of Columbia and will afford varying road conditions, including numerous hills and sandy stretches. The distance will be between 300 and 350 miles. Among the towns the contestants will pass through are Frederick, Md., Hagerstown, Md., Harrisburg, Pa., Shippensburg. Pa., and Baltimore, Md. Government officials are taking an active interest in the run and a number of them will be selected as officials.

NEW YORK CITY, March 19—The Orphans' Automobile Day Association of New York, Inc., will hold a meeting April 1 to talk over plans for this year's Orphans' Day on which some 3,000 children are to be taken out.

Array of Reasons Which Make French Truck Builders and Users Highly Conservative in the Selection of Wheels and Tires—Standardization for Draughtsmen —Practice of Oiling Through Fuel Spreads—Recent Technical Treatises

ANALYSIS of Requirements in Truck Wheels.—The data in the present state of the art of building wheels for motor trucks are presented at length by Captain D. Renaud with special reference to the types of wheel and tire which should be selected. The leading points in his exposition of the subject are, with some omission of obvious arguments and much abbreviated, substantially as follows:

Wood wheels have so far been found most acceptable in practice for heavy loads, and they are found more durable if slightly cambered, so that the spokes are assembled in a slightly conical formation, and it is an advantage to have the wheel shaft inclined correspondingly, so that the spokes are in a practically vertical position when they support the load, but the adoption of inclined wheel spindles for the driving-wheels has met with the hindrance that this construction cannot be reconciled with the customary mechanical system of driving by chains or through one central driving-shaft actuating a set of bevel-gears on the differential. The cambered wheel has the advantage of a superior elasticity, as compared with a wheel having the spokes all in one vertical plane, of greater strength against shocks from the side—having brute strength in one direction and elastisicity in the other—and in being contracted more uniformly when a steel or an iron tire is shrunk onto the felly. But in a wheel with a conical spindle there is a decided tendency to push the hub and its bearings outwardly, causing considerable end-thrust, unless the spindle is inclined. The camber of the wheel and the angle of the spindle should therefore, if possible, go together, especially as the slant of the spindle is of advantage in getting square contact of the tire with the road, if the latter is crowned, as most hard roads are.

In a number of recent constructions with shaft drive, electric transmission, special four-wheel drives or in which the driving is done through transverse wheel shafts actuating gear-and-pinion sets on each wheel, the combination of camber and set has been realized. The shaft drive used in La Buire trucks is notable in this respect, the desired angle of the wheel shafts being obtained by a new design of the differential. This is shown in Fig. 1. The driving-shaft A turns the cross-spindle carrying the two satellites BB of the differential around in its own plane, thereby turning the sleeves C and D, each with two bevel-pinions, and one of these bevel-pinion sleeves thus turns the bevel-gear E while the other turns the bevel-gear F; and it is plain that with this arrangment E and F may be inclined at any desired angle of set, as exemplified to the right in the illustration. [A similar type of differential is employed in one of the Daimler-Mercedes truck models, as described and illustrated in THE AUTOMOBILE of June 13, 1912, page 1327.—ED.]

The practice which has lately been somewhat widely adopted of forcing iron or steel rims upon the wooden wheel rim by cold pressure, instead of shrinking them on hot and allowing them to contract, cannot be recommended, as it has often been found to result in diminished durability. This is because the iron rim expands after the cold pressure ceases and allows the wooden structure to loosen up after having been compressed successively. The need of retightening the wheel from the hub follows.

The diameter of truck wheels is decided in practice by a compromise between conflicting considerations. The small wheel has the advantage of strength and small weight; it also subserves the need of a large gear-reduction in the power transmission and contributes to stability by lowering the center of gravity of the vehicle. On the other hand, all roughness of the road surface becomes a matter of importance—a drain upon the power and severe upon the spring suspension and the occupants of the vehicle—if the wheels are too small. It has been observed that a truck with driving wheels of 60 centimeters diameter could not climb a paved grade of 3 per cent. which was only slightly slippery, because the wheels slipped at every projection in the pavement. Experiments with the military trucks have resulted in demanding a minimum diameter for the driving-wheels of 95 centimeters and of 85 centimeters for steering wheels.

When it is admitted that a certain capacity for the cushioning of shocks is a desirable quality in a vehicle and that it cannot be obtained from the vehicle springs alone at the speeds demanded of motor trucks—largely because after each shock there is a period of reaction and recoil in a vehicle spring during which it is not in a fit position to receive a new shock, although the vehicle is moving on and may receive such a new shock—it becomes necessary to decide in what particular manner elasticity shall be incorporated in the vehicle wheel, where, by reason of the wheel's rotation, the elastic element can always be in readiness to act as desired and with a yield proportionate to the severity of the shock.

To make clear the requirements, elastic wheels may be classified as those with rigid rims, comprising those with an elastic hub, elastic spokes or with concentric rims movable in relation to one another, and those with deformable rims, comprising all wheels fitted with elastic tires. The latter class falls into two sub-classes; those in which the tire is continuous and those in which the elastic element is composed of a number of units distributed upon the wheel rim at more or less distinct intervals. [The author seems to overlook the combination of concentric rims with a continuous elastic tire on the outer one.—ED.]

The work demanded of the wheel is (1) to absorb vertical

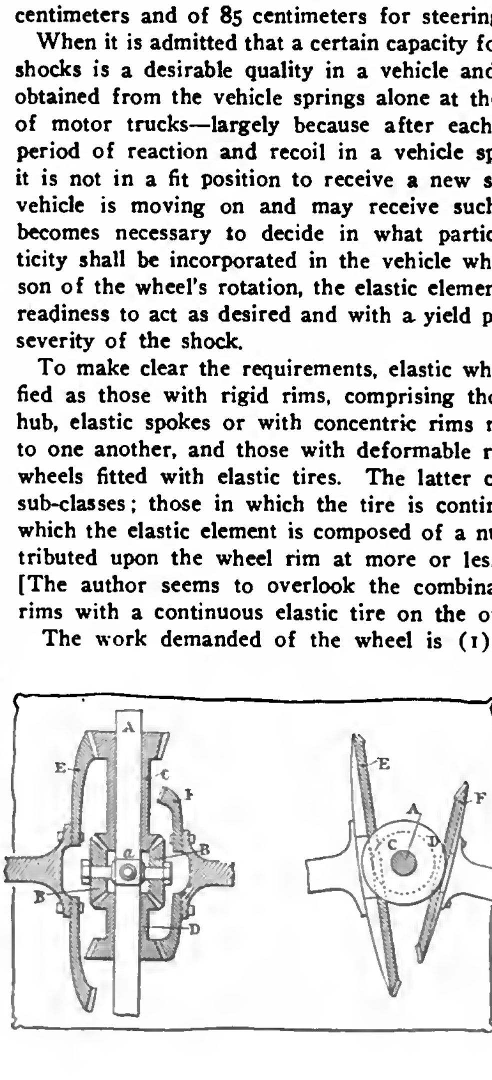

Fig. 1—The style of differential used on La Buire motor trucks, admitting of inclined wheels—driving shafts and reduced stresses upon teeth of bevel gears; thereby also rendering a greater gear-reduction practicable.

shocks acting in the plane of the wheel, (2) to obviate vibrations of materials, (3) to transmit the power yieldingly, (4) to assume transverse stability, to which may be added that (5) the circumference of the wheel must remain approximately circular, that the wheel must be (6) insensible to rain, mud, dust and snow and must be sufficiently robust without being too heavy. The adhesion to the road by which the traction through the driving-wheels is obtained must of course also be assured.

The very discussion of these diverse conditions will point out the type of wheel which is most logical.

When a wheel rolls over a lumpy road surface, the loss of momentum is so much more important as the weight of the parts which are caused to rebound is more considerable. And the shocks received are the better mitigated and absorbed the more directly they reach the elastic medium interposed between them and the rigid parts. These considerations argue directly for placing the elastic material in contact with the ground and for having the density of this material as low as possible; the property of low density being of especial value for the absorption or prevention of vibrations.

From this point of view, the wheels which respond best to the first and second of the working requirements are those fitted with elastic tires, and the elastic material ranks in this order:—Air, hollow rubber, solid rubber, metallic springs.

The elastic transmission of the motor power is well-enough met in all types of wheels excepting those equipped with telescoping spokes.

The need of lateral stability, on the other hand, eliminates the majority of special elastic wheels from consideration. At all turns of the vehicle and on roads which slope to one side, it is the wheels which must sustain the transverse stresses and safeguard the steering. The distance from the ground to the axle represents the lever arm by which the strains are applied. To reduce transverse displacement to a minimum, it is evident that the elastic medium should be placed as near as possible to the road surface. The nearer it is placed to the center of the wheel, the more it is necessary to provide special guide plates to prevent the buckling of the wheel. This consideration thus places the wheels in the following order of preference:—Wheels with elastic tires, wheels with double rims elastically joined, wheels with elastic spokes, wheels with elastic hubs.

All special provisions for strengthening an elastic element laterally involve increased weight, heavier shocks, more vibrations, sticking of sliding parts, increased care of maintenance and usually some form of lubrication, and for the latter only castor oil can be used, if rubber is employed in the construction, all other lubricants injuring this material.

With regard to the circularity of the wheel, it is evident that any flexion which constantly places the hub eccentric to the wheel rim results in a resistance equal to that met on an incline which is comparable in degree to the eccentricity [The author at this point seems to embrace a popularly accepted theory unthinkingly and without the necessary reservations, the theory holding true only if the elasticity is not exhausted in the flexion and if the flexibility curve is uniform, but not, as in the case of rubber tires, when this curve is strongly retrogressive, rendering the resistance to flexion very small at first and very great toward its limit.—Ed.]; and if the eccentricity of the wheel is made irregular by the use of separated rubber block tires, elastic spokes or multiple metallic springs, there are produced sinuous and periodic movements of rise and fall of the axle accompanied by trepidations or vibrations which are more or less harmful and detract from the quality of the transportation work.

All non-continuous elastic mediums should therefore be rejected in favor of the homogeneous elastic tire by the use of which the eccentricity created by the load is rendered regular and is reduced to a minimum.

Finally the simplest system admits most readily of robustness, and in this respect the wheel with solid rubber tires is pre-eminent, as this type of tire can be secured directly upon the smooth steel rim of the wheel by pressing onto the latter the metallic base of the tire, on one of the plans shown in Fig. 2.

The silence and road adhesion of the solid or hollow rubber tire clinch the logical preference for it, even if a wheel with additional elastic elements is chosen. At the last public tests of elastic wheels, the only type which performed satisfactorily under the conditions imposed—air-inflated tires being excluded—was the Ducasble wheel with hollow rubber tire, and while, like a solid rubber tire of 135 millimeters, of twin pattern, it can be fitted to vehicles carrying a load of 3,000 kilograms on the rear axle, it is most satisfactory at low-speed work. For truck work generally, the wood wheel with solid rubber fires is so far indicated as the most practical one by all civil and military experience, provided the dimensions of both wheel and tires, as well as rubber composition employed in the latter, are selected with close reference to load, speed and road conditions.

The all metal wheel, especially the cast-iron wheel, is superior in its resistance to climatic influences, as in the tropics, and it endures equally well or better, if it is protected against vibrations by means of a solid-rubber or pneumatic tire, but not otherwise. During the last half of the life of a solid-rubber tire fitted to it, the cast-iron wheel becomes subject to serious vibrations which are injurious to the vehicle and motor. Owing to its greater weight and uncompromising rigidity, it wears out the tire which is fitted to it at a comparatively rapid rate.

All the metallic wheels which are assembled by bolts and rivets have so far been found unable to endure speed and are, moreover, very noisy.

Since 1909 the French government has offered a subsidy for motor trucks, and the rate of this bonus is figured solely according to the economy per ton-kilometer demonstrated in practice for each truck type and without any restrictions regarding the wheels and tires. Out of 56 subsidized types, 44 are equipped with rubber tires, 8 have the rear wheels shod with iron tires and 4 have iron tires on all four wheels, but the last-named are in the way of disappearing from the field.

It is then clear that there can be no intrinsic economy in dispensing with the rubber tire equipment, since otherwise all would do so and gain a greatly reduced first cost, as well as a much wider market through their ability to sell at a much lower price.

The cost of solid rubber tires per kilometer, it has been ascertained, ranges from 10 or 11 centimes (2 cents) for a truck of 3,000 kilogram capacity to 16 or 17 centimes for a truck of 6,000 kilogram capacity, but these moderate figures can be realized only if the following rules are strictly observed.

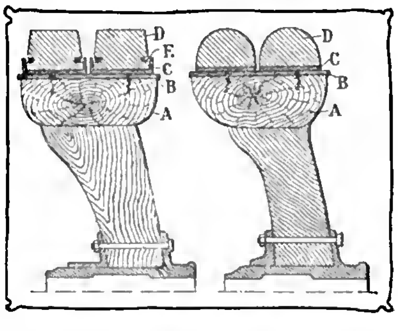

Fig. 2—Two systems of mounting solid-rubber truck tires on the iron rim of wood wheels. First, the Torrilhon method; tire secured by endless wire in channel-rim C. Second, the Bergougnan method; tire vulcanized to iron base C and latter forced hot upon wheel rim. Latter considered the superior method.

(1) Select tires according to the loads for which they will be used, and avoid overloads absolutely.

(2) Do not exceed an average speed of 25 kilometers per hour, and avoid blocking the wheels when braking.

(3) Have spare wheels, so that interruptions of service may be avoided.

(4) Examine tires every day and extract all foreign bodies which may have entered into them.

(5) During any prolonged interruption of work, jack up the wheel and axles and relieve the rubber from a continued load at a single spot.

The tire manufacturers have done their share toward economy by developing different compositions of rubber, each best adapted for certain loads. Ranging from the material used for inner tubes to ebonite, these compositions attain different degrees of hardness and toughness by vulcanization. Only the hardest will vulcanize into a firm joint with iron or steel. Only those of neighboring grades will vulcanize together. These facts have led to the simplest tire construction, in which the steel rim base of the tire is vulcanized to a rubber composition which turns perfectly hard, this to the next grade, this again to the next softer one, and the last one of these thin layers to the body of the tire. A tire of this kind endures a load of 130 kilograms per square centimeter and resists a traction pull of 75 kilograms per square centimeter. If properly dimensioned for its work, it sustains in practice only 10 to 11 kilograms of load, and the traction pull on its material does not amount to more than.4 to 5 kilograms in the case of a 7-ton truck driven over a 12 per cent. gradient.

In stating the data of wheels and tires which have so far been established by the experience of the past five years, and all of which point to the wood wheel shod with solid rubber tires, it is understood that wire wheels for trucks have not yet been tried sufficiently or in fact been sufficiently developed to offer a basis for comparison; also that a possibility for effecting economy and efficiency with rigid wheels naturally continues to exist with reference to lines of work in which slow work and soft roads constitute the predominating condition. But the average motor truck finds it economical *raison d'être* only through the time and wage it saves by its speed and the expansion of the working radius which is due partly to speed and partly, in comparison with horses, to its indifference to fatigue—From *Le Génie Civil*, Feb. 22 and March 1.

STANDARDIZING the Draughting Room.—The firm of Seehase & Pansegrau in Berlin is now offering stencils and shapes by means of which draughtsmen can mark bolts and nuts of standardized dimensions without constructive effort, and similar contrivances are under preparation for other parts which have become standardized in various industries. The method used consists mainly in providing perforations of a transparent sheet at the determining points in the contours to be drawn. The pencil point is inserted in these holes and the marks so made are connected; though not necessarily before the inking. Some of the holes indicate centers of curves; others fix the relation to median lines of the construction. The supposition is of course that drawings are made only to a few standardized scales. For the factory's own use it is clear that the drawing of standardized parts may be entirely omitted, and the stencils may then be used only as a means for checking up the dimensions of the construction.—From *Werkstattstechnik*, March 1.

OIL in the Gasoline.—One of the leading automobile manufacturers in France is now recommending the American expedient of mixing some lubricating oil in the gasoline in order to obtain a cylinder lubrication proportionate not only to the motor speed but also to the power and heat development of each explosion. Five per cent. of oil is said to be a suitable admixture, but it is recommended to follow this practice only while the motor is new and until the cylinder walls have become ground in. The motor is in this instance lubricated from a force-feed pump which is not co-ordinated with the throttle in any manner. *Omnia* now places the matter under the discussion with the query: If the practice is advisable in the case of a new motor, why is it not advisable always? At the same time the *Chauffeur Français* finds that a number of well-known expert drivers employ this auxiliary oiling method, usually in a three per cent. proportion, and that one manufacturer uses it in testing motors.

PRIZE for an Automobile Diesel Motor—The Royal Hungarian Automobile Club, through its president, Count Alexander Andrassy, and its technical committee, has addressed a memorial to the International Association of Recognized Automobile Clubs recommending that a large prize be offered not only for a cheap and universal fuel which may be used in automobile motors, as these are now constructed, on which subject the international association has already taken action, but also for a motor construction which is fully adapted for automobile purposes and in which the cheap varieties of fuel now actually used in Diesel motors may nevertheless be successfully employed. The recommendation also includes a smaller prize for a motor which may be operated optionally with a variety of fuels without changes in its mode of operation.—From *Automobilwelt*.

CONSUMPTION of Fuel and Lubricant in Trucks.—From a table compiled by the authorities in charge of the event it is noticed that the relation between the consumption of fuel and that of lubricant in the trucks which took part in the French annual military trials of 1912 varies widely. One of the Berliet trucks holds the record in both directions, having used only 0.0412 liters of benzol per ton-kilometer and 0.90 grams of lubricant, but seven other Berliet trucks show much higher figures, though one of them comes close to the record for lubricant. Two Aries trucks both show very low figures for fuel and also below the average for lubricant. Four Renault trucks show a fuel consumption from 0.0454 to 0.0477 and a lubricant consumption from 1.10 to 1.50 grams; a very consistent performance. In two Cohendet trucks whose fuel consumption was within the same limits the lubricant consumption, on the other hand, almost reached the permissible maximum of 7 grams per ton-kilometer.
